Antonia Minor (38 or 37 BC-AD 37), sister of the preceding, and the wife of Drusus Nero, the brother of the Emperor Tiberius. A. had 3 children, Germanicus, Livia, and the Emperor Claudius; she was noted for her beauty and her chastity.

Antonine Column, lofty pillar which stands in the Piazza Colonna at Rome. It was raised by Commodus in commemoration of the victories of Marcus Aurelius Antoninus over the Marcomanni and other Ger. tribes. The total height is 163½ ft, but the pedestal is disproportionate to the shaft. The capital is Doric, and the shaft is made of 28 blocks of white marble. A spiral interior staircase of 190 steps leads to the gallery on the top, which is surrounded by a balustrade. The exterior of the shaft is covered with bas-reliefs, representing the miracle of the Thundering Legion and the victories of Marcus Aurelius.

W. F. Mansell

ANTONELLO DA MESSINA

Self-portrait in the National Gallery, London.

Antonine Wall, earthen rampart and ditch, built to strengthen the line of fortifications already laid down by Agricola, constructed c. AD 140. The mound (*vallum*) ran from Bo'ness on the Forth to W. Kilpatrick on the Clyde, a distance of about 37 Eng. m. The width of the mound and ditch seems to have been about 25 yds; its depth from the top of the mound to the bottom of the ditch has been variously estimated at between 40 ft and 20 ft. It had in it between 10 and 20 fortresses with small watch-towers in between. A military road ran at the back of the *vallum*. It marked the N. limits of Rom. Britain.

Antonini Itinerarium, a register of stations and distances from Rome along the imperial roads and sea routes. The original ed. may be due to the Emperor Caracalla (211-17), but the extant portion is generally believed to date from the reign of Diocletian (284-305).

Antoninus Liberalis (2nd cent. AD), Gk grammarian. He is the author of a work entitled *Collection of Metamorphoses*. This collection is borrowed from a variety of authors, and is valuable as containing many passages of poets who are now lost. The best ed. is that of H. Verheyk, Leyden, 1774.

Antoninus Pius (AD 86-161), Rom. emperor, whose full name was **Titus Aurelius Fulvus Boionius Arrius Antoninus**. He was the son of Aurelius Fulvus, and was consul in 120. Adopted by the emperor Hadrian in 138, he succeeded him in the same year. A. P.'s reign was one of virtually unbroken peace. He was intelligent, experienced, humane, and in all things sincerely anxious for the welfare of his subjects. The provs. were well administered, legal reforms were instituted, art and science encouraged, fine buildings were erected, and the public welfare services improved. The title 'Pius' was conferred by the senate in recognition of the emperor's devotion to Hadrian's memory. A. P. died at Lorum in Etruria, leaving a daughter who was married to Marcus Aurelius.

Antonio, Prior of Carto (1531-95), was the natural son of Louis, younger son of Emanuel, King of Portugal. On his return from captivity in Morocco he claimed the throne of Portugal on the death of Cardinal Henry. He was opposed by Philip II of Spain, who had a much better claim, as had also the Duchess of Braganza. Being supported only by the peasantry, he was easily defeated, and fled to France and later to England, by both of which countries he was supported out of hostility to Spain. Expeditions fitted out by France and England alike failed, and he d. a disappointed claimant. See PORTUGAL, *History*.

Antonio, Nicolás or Nicolao (1617-84), Sp. writer, b. Seville. His most important work is *Bibliotheca Hispana*, a bibliography of Sp. writers from 1500 to 1664 (Rome, 1672, 2 vols., 2nd ed. Madrid, 1783), which is still an invaluable guide for Sp. literature.

António Enes, or Angoche, tn, riv., and coast dist. of Portuguese E. Africa. The dist. produces sisal, copra, beans, ground-nuts, cashew nuts, rice, and manioc which are collected and exported through A. E.

Antonius, Gaius, nicknamed Hybrida, second son of the orator and uncle of Mark Antony. As consul with Cicero in 63 BC, he was entrusted with the campaign against Catiline; but since he was unwilling to fight against his former friend and associate, he gave the command on the day of battle to his colleague M. Petreius. Appointed proconsul of Macedonia in 61, his extortions led to his prosecution when he returned to Rome in 59. Though defended by Cicero, he was found guilty and condemned to exile. Recalled by Caesar in 47, he is known to have been living in 42 BC.

Antonius, Marcus, the Orator (143-87 BC), son of Gaius A. In 99 BC he was the colleague of Aulus Postumius Albinus

in the consulship; and in the following year he defended M. Aquilius on a charge of extortion during the Servile war in Sicily. In 97 he was censor. He fell a victim to the fury of Marius and Cinna, when they took forcible possession of Rome (Plutarch, *Marius*, xlii). His eloquence is celebrated by Cicero in his *Brutus*, xxxvii, xxxviii.

Antonius, Marcus (d. 72-71 BC), eldest son of the Orator and father of Mark Antony. As praetor in 74 he was entrusted with an extraordinary command against the Mediterranean pirates. He took advantage of his authority to gratify his avarice, plundered the provs., and was heavily defeated by the pirates and their allies in Crete, thereby winning the derisive title Creticus.

Antonius, Marcus (Mark Antony) (c. 83-30 BC), the triumvir, son of A. Creticus. After serving with distinction under Gabinus in Syria (58-57) he joined Caesar in Gaul; quaestor 51; tribune of the plebs 49, in which capacity he vetoed the decree depriving Caesar of his command, was expelled from the senate house, and fled to Caesar's camp in Cisalpine Gaul. Throughout the ensuing struggle he was one of Caesar's most trusted supporters: deputy-governor of Italy in 49 and again in 47, second in command at Pharsalus (48). In 44 he was consul with Caesar, after whose assassination on 15 Mar. in that year he made a skilful but abortive attempt to gain supreme power. Checked by the arrival in Italy of Octavian (see AUGUSTUS), and defeated by the latter before Mutina, A. agreed to a reconciliation, and with Octavian and Lepidus (q.v.) formed a triumvirate in 43 BC. After the proscriptions, in which Cicero fell victim to A.'s lifelong hatred, A. and Octavian crushed the republican forces of Brutus and Cassius at Philippi in Macedonia. A. then went E., and met Cleopatra for the first time in Cilicia (41 BC). He was captivated by her charms, followed her to Alexandria, and there spent the winter in her company. His character had always been unstable, and from this time it rapidly deteriorated. But even the delights of Alexandria had to be postponed when news arrived that the Parthians had invaded Syria and that his brother Lucius, instigated by A.'s wife Fulvia, had fallen foul of Octavian. Hurrying to Italy, he found Octavian already victorious; Fulvia d. in 40, the triumvirs were again reconciled, and A. married Octavian's sister. He then returned to the E. and made several, though not altogether successful, attempts to subdue the Parthians. At this point he seems to have approached the borders of insanity; for while visiting Athens in 39 he assumed the attributes of the god Dionysus. Ambition, however, was not yet dead: A. travelled to Italy in 37, renewed the triumvirate, and returned to the arms of Cleopatra. But sensuality destroyed the last vestiges of self-respect. A. took upon himself to dispose of provs. and kingdoms in Cleopatra's favour, abandoning himself meanwhile to all the

pomp and indulgence of an oriental despot. The indignation of Rome would tolerate no more: in 32 the senate deprived him of his powers and declared war on the Egyptians. On 2 Sept. 31 BC the combined fleets of A. and Cleopatra were defeated by that of Octavian under M. Vipsanius Agrippa (q.v.) at the battle of Actium. A., deserted by his troops, returned to Alexandria where, like his paramour, he found a last refuge in suicide. See A. E. Weigall, *Life and Times of Mark Antony*, 1931, and J. Lindsay, *Mark Antony, his world and his contemporaries*, 1936.

Antonius Musa (fl. 10 AD), Rom. physician and a brother of Euphorbus. Is said to have been the first to recommend the use of cold baths, and treated the Emperor Augustus for gout by this means. His patients also included Virgil, Horace, Maecenas, and Marcus Agrippa.

Antonomasia (Gk *anti*, instead of; *onoma*, name) is the figure of speech by which the name of some famous character is used for the class he typifies, as in 'A Daniel come to judgment.' See also **FIGURE OF SPEECH**.

Antonov, military leader of a peasant anti-Communist movement in the Tambov prov. of Russia, 1919-21. A Socialist Revolutionary (see **SOCIALIST REVOLUTIONARIES**) since 1905, A. returned from banishment in 1917 and was chief of district militia (police). The uprising started by A. was joined by 50,000 peasants and deserters from the Red Army, who were organised in 2 armies. Political leadership was provided by the Socialist Revolutionary party through the Unions of Telling Peasantry headed by the Prov. Committee, which exercised the civil authority. A. suffered several defeats from gov. troops under Tukhachevsky, but the movement finally collapsed as a result of the New Economic Policy (q.v.).

Antony, Saint (AD 251-356), called the Great, was b. at Roma in Upper Egypt, and was the inaugurator of monastic life. He distributed his property among his neighbours and the poor, and retired to a wilderness near his native vil. He afterwards went farther into the desert, where he lived in solitude until 305, when he founded his first monastery in the Fayum, near Aphroditopolis. Seven of his letters, written originally in Coptic, but trans. into Lat., are extant in the *Bibliotheca Patrum*. In 1089, cures of the distemper called the 'sacred fire' were believed to have been wrought by his intercession. From that time it was called St A.'s fire, and in modern days erysipelas. His feast is on 17 Jan.

Antony of Padua, St (1195-1231), devoted follower of St Francis of Assisi, b. at Lisbon. In 1220 he entered the Franciscan order. He desired to devote himself to missionary labours, but being wrecked on the coast of Sicily he wandered through Italy, gaining a great reputation as a preacher. He is also revered as a wonder-worker and as a finder of lost articles. He was canonised by Gregory IX (1232); his feast is on 13 June.

Antrim, Randal Macdonnell, 1st Marquess of, and Earl of Dunluce (1609-83). Irish nobleman and royalist. Introduced to court, 1634, and created a marquess, 1643, on account of his (subsequently unfulfilled) promise to raise an army of 10,000 in Ireland for the service of Charles I.

Antrim: 1. Maritime co. of N. Ireland. The formation in the N. and E. is hilly, the interior sloping in the direction of Lough Neagh. The prin. elevations are Trostan, 1810 ft, and Slemish, 1782 ft. The prin. streams are the Bann, the Main, and the Bush. The coastline is distinguished by its basaltic rock formation, the Giant's Causeway being one of the finest specimens of columnar basaltic rock. Peat bogs are frequent in the interior. Salt, iron, and limestone are extensively worked, and there are coal-fields near Ballycastle. A. is the centre of the Irish linen manuf. The other staple industries are agriculture (flax, oats, and cereals), and the manuf. of cotton and wool. It has important coast fisheries. The co. returns 7 members to the Parliament of N. Ireland and 2 to that of Great Britain and Ireland. The predominant form of religion is Presbyterianism, an effect of the Scottish colonisation. Catholics are also numerous. Area 1090 sq. m., of which about one-third is under cultivation. Pop. 231,000, exclusive of the co. bor. of Belfast.

2. Tn of co. A., 17 m. NW. of Belfast, picturesquely situated on Lough Neagh. Pop. 1700.

Antrum of Highmore, in anatomy, term applied to the maxillary sinuses, a cavity in the body of the upper jaw-bone, forming an accessory air cavity to the cavities of the nose (q.v.). The roof forms the floor of the orbital cavity.

Antsirane, seaport on the N. coast of Madagascar, on Diego-Suarez Bay, founded in 1855. With Diego Suarez, A. is an important naval base; the combined pop. is 15,000.

Antung, one of the chief ports of Manchuria, near the mouth of the Yalu R. It is a junction of the railway from Mukden and the Korean railway. Its industries include lumber milling, paper and match manuf., non-ferrous metal refining, cotton and silk weaving, and agric. processing. It also has ship repair yards. Pop. (1951) 310,000.

Antunnaacum, see **ANDERNACH**.

Antwerp (Fr. **Anvers**, Flem. **Antwerpen**): 1. prov. of Belgium, bounded on the N. and NE. by the Netherlands, S. by Brabant, SE. by Limbourg, and SW. by E. Flanders. It has an area of 1104 sq. m. and a pop. of 1,362,908 (1955).

2. Cap. of the above prov., on the R. Scheldt, 27 m. N. of Brussels. It is the chief seaport and commercial centre of Belgium. Excluding the suburbs, the area is 33.4 sq. m. and the pop. 256,000; including the suburbs (Berchem, Borgerhout, Deurne, Ekeren, Hoboken, Merksem, Mortsel, and Wilrijk) the area is 64.4 sq. m. and the pop. 547,000. The completion of the new docks has brought up the total quayage length to about

150,000 ft, making A. one of the largest ports in the world. In 1956, 15,000 vessels entered the port. The chief of its many manufs. are sugar, beer, spirits, soap, candles, tobacco, cigars, chocolate, biscuits, sewing-silk, chemicals, furniture, and textiles. It is also extensively engaged in the industries of shipbuilding, diamond-cutting, petroleum-refining, tanning, etc. Surrounded by two circles of fortifications, A. was considered before the First World War to be one of the most strongly fortified places in Europe. The city is exceptionally rich in treasures of architecture and painting. Amongst the

Belgian Embassy: Cliché C.G.T.
ANTWERP

most notable of these are the superb Gothic cathedral of Notre-Dame (1352-1543) with its 6 aisles, its famous chimneys, and Rubens's masterpieces 'The Descent from the Cross' and 'The Elevation of the Cross'; the church of St James (1491-1656) containing the tomb of Rubens and a beautiful altar-piece by the master; the Museum Plantin-Moretus, residence and workshop of this famous printer's family since 1520; Rubens House (reconstructed recently); the old castle Steen (10th cent.), and the Butchers' Hall (16th cent.), now historical museums; the Hôtel de Ville (1565) and the Exchange. The Royal Gallery of Fine Arts contains a fine collection of masterpieces of all ages and schools, comprising numerous pictures by Van Eyck, Memling, Massys, Rubens, Van Dyck, Jordaens, and many other Flem. painters. A. has had a varied and eventful hist. It appears to have been founded as a mkt tn by a Frankish tribe some time before the 8th cent. In the beginning of the 9th cent. A. was destroyed by the Northmen. The foundations of the Steen castle date from the

period when A. was rebuilt in the 10th cent. From the 11th cent. its importance increased steadily, but its commercial traffic was confined to local needs until the 15th cent., when, with the decline of Bruges, began the modern prosperity of A. In the 16th cent. it was the most prosperous city of N. Europe. It lost this position when religious quarrels divided the tn, and in 1576, 8000 of its inhab. are said to have been butchered and hundreds of buildings burned during the Sp. terror. The city was captured in 1585 by Alessandro Farnese, Duke of Parma, who sent all Protestant citizens into exile. In 1648 the Scheldt was closed by the treaty of Westphalia (q.v.). The city fell into the hands of the French in 1794. Napoleon I visited it in 1803 and took a great interest in its potentialities. He wished to make it a strong commercial and military centre, with special reference to its possible use against England. He ordered the construction of the 2 first docks and of new shipbuilding yards. From 1815 to 1830 as part of the kingdom of the Netherlands, A. received a new impetus from the trade with the Dutch colonies. During the 1830 revolution A. was stoutly defended by the Dutch general Chassé, but surrendered to the French in 1832, and was finally ceded to the Belgians, whose possession was confirmed by the treaty of 1839. In 1863 Belgium paid 36 million francs to obtain from the Netherlands the freedom of traffic on the Scheldt. From that time it steadily advanced in prosperity to its flourishing condition prior to the Second World War.

Siege of Antwerp (1914). While Liège was still holding out, King Albert on 12 Aug. decided to retire on A., so as to be in a position to attack the flank of the enemy advancing through the S. of Belgium into the N. of France. On 28 Sept. the Germans launched their attack against the A. stronghold by a direct advance on the Scheldt from the S. and S.E., the quarter in which the outer defence works of A. extended 9 m. along the crescent formed by the riv. and its tribs. In a few days, one by one, the main forts were put out of action. The garrison took up a new position behind the Nethe r. Next day (3 Oct.) a Brit. marine brigade 2200 strong and 2 Brit. naval brigades with 6 heavy guns arrived. Repeated enemy attempts to cross the riv. were repulsed between 3 and 5 Oct. with heavy loss, but on 6 Oct. the Belgian line was pierced. The whole Belgian force and the Brit. marines then fell back within the inner forts to make a final stand. The successful withdrawal of the army began in the same night, the great oil-tanks of the port having previously been destroyed to prevent capture. About 200,000 inhab. crossed the Dutch frontier. Three battalions of the 1st Brit. Naval Brigade were also compelled, through not having received the order to retire, to enter Holland and so were interned. The tn was formally surrendered on 10 Oct. As a result of the fall of A. Ostend and Zeebrugge were evacuated and the

Belgians took up fresh positions on the Yser.

Antwerp in the Second World War. The Germans entered A. on 18 May 1940, remaining in occupation until 1944, when the town was liberated by the Brit. advance. The 11th Brit. Armoured Div. entered the city on 4 Sept. after a daring drive northwards of 110 m. in 8 days. The undamaged, well-equipped port was a valuable weapon in the hands of the Allies. The Germans offered some resistance just N. of A. on the Albert Canal until 4 Oct. From 13 Oct. until the end of March 1945 the city was subjected to incessant flying-bomb and rocket attacks, causing much loss of life and damage; but this did not interfere with the working of the port and the moving of military supplies, which began to reach A. on 28 Nov. after the complete liberation of Walcheren at the mouth of the Scheldt.

The Albert Canal, linking Liège with A., was completed in 1939. It figured prominently in the fighting for the relief of the Low Countries in 1944.

Antyllus (c. 150 AD), Gk surgeon. Much of his writing is available to us only through the industry of Oribasius (q.v.), who included it in his compilations, but he is considered the greatest surgeon of antiquity. His most daring operation was the treatment of aneurysm by tying the artery on each side and excising the aneurysm. He gave precise directions for many individual operations on the eye, abdomen, breast, bones, and joints; he wrote on plastic repair of the eyelids, nose, ears, and cheeks, and he employed the cautery for controlling haemorrhage. A Lat. trans. of his fragments was pub. in 1842.

Anu, head of the prin. Sumero-Akkadian triad of deities (with Enlil and Ea, q.v.), father and king of the gods. As 'The High One' A. was thought to be god of the air and atmosphere and thus of the heavens. His consort was Antum ('Anat) and the prin. seat of his worship was Erech (q.v.). The attributes of A. were largely transferred to the later Assyrian national god Ashur (q.v.).

Anubis, early Egyptian deity, originally a dog, so usually represented with the head of a dog. Always a god of the dead and protector of burials. He attended the weighing of the heart, and was chief embalmer of Osiris (q.v.).

Anura, the order of tailless Amphibia consisting of about 1500 species of frogs and toads. There are two suborders, the Phaneroglossa, the tongued-species and the Aglossa, tongueless species. The only members of the latter suborder are the Pipidae, such as the Surinam toad.

Anuradhapura, or **Anuradha**, tn, Ceylon, 80 m. N. of Kandy. From the 5th cent. BC to the 8th cent. AD it was the cap. of the is. It possesses the famous bo-tree, which is supposed to have sprung from the tree under which Gautama was transformed into Buddha.

Anus, external termination of the rectum, or opening of the lower end of the alimentary tract. The aperture is closed, except during the act of defecation, by

the external and internal sphincter muscles. A congenital closure of the rectum by an imperforate A. is sometimes met with in infants, but can usually be remedied by surgical operation. Other affections of the part are spasm of the sphincter muscle, ulceration or fissure of the A., pruritus ani, characterised by intense irritation. The usual treatment consists of strict attention to cleanliness and the use of suitable ointments.

Anville, Jean-Baptiste Bourguignon d' (1697-1782), Fr. map-maker and geographer, b. Paris, and became geographer to the king. His maps and studies in anc. geography are still used. His chief pub. are the *Atlas général*, 1737-80, and the *Atlas Antiquus Major*, with its 3 vols. of *Géographie ancienne*, 1769.

Anwari (fl. 12th cent. AD), court poet of Sanjar, ruler of Persia (1117-57). He was a master of the *qasida* ('purpose-poem' or elegy). He was also an astrologer of some repute. A poem of A. is trans. by W. Kirkpatrick in *Asiatic Miscellany*, vol. 1 (Calcutta, 1785), under the title 'The Tears of Khorasan.'

Anxanum, see LANCIANO.

Anxiety States (Anxiety Neurosis, etc.), are a form of psycho-neurotic reaction characterised by morbid or pathological anxiety. They are the commonest of all the psychoneuroses and fortunately the most amenable to treatment. While the patient may frequently ascribe his condition to some trifling situation or environmental difficulty, the picture as thus presented will be clearly illogical, for the emotional reaction will be obviously out of all proportion to the alleged cause. The real stress or conflict is endopsychic, though the patient may be unaware of its existence or at least of its connection with his symptoms. According to Freud the basis of anxiety neurosis is always in the sexual life, but this theory is not universally accepted. Among the predisposing causes may be included a morbid heredity, a morbid family environment (e.g. maternal anxiety), and an emotionally unstable, timid, worrying type of personality. Any type of external stress (e.g. fear, frustration, or failure in the domestic, financial, sexual, or other sphere), may serve as a precipitating factor. Freud distinguished 2 types of anxiety state: (1) anxiety neurosis and (2) anxiety hysteria. The former term he applied to the type of case in which the anxiety is experienced primarily in the mental field, and the latter to conditions in which somatic manifestations constituted the most prominent feature. This classification, however, is liable to lead to some confusion and is not by any means universally accepted or used. The symptoms of anxiety states may be both very numerous and very varied. The mental symptoms include fears of all kinds, from vague inexplicable states of tension and apprehension to specific phobias, in which the fears have become focused on or attached to various objects and situations, and secondary to these fears, irritability, depression, excitability, difficulty in concentrating, faulty memory, intolerance of noise, etc.

The somatic symptoms may be referred to any one of the bodily systems, and frequently it is with them that the patient is mainly preoccupied and because of them that he first seeks advice. Palpitation, hyperpnea, dyspnoea, dyspepsia, constipation, diarrhoea, tics, tremors, pains of various kinds, and easy fatigability are only a few of the very many forms in which psychosomatic anxiety may manifest itself. Treatment in the first place demands that the patient should be firmly reassured regarding his physical health, and he must be helped to accept such reassurance by a thorough investigation of his physical condition. The true cause of his symptoms is then sought by psychiatric examination and explained to him. Since all psychoneurotic reactions are, to some extent, defence mechanisms against some unpalatable truth, it is not surprising that the most difficult part of the treatment frequently lies in overcoming the patient's 'resistance' to accepting the explanation. (See also PSYCHONEUROSIS.)

Anxur, thriving tn of the Volsci, long before the Rom. Conquest, situated in Latium. It was taken by the Romans 403 BC (Livy, iv. 59), retaken by the Volscians, 399 BC (Livy, v. 8), and again taken by the Romans 396 BC (Livy, v. 13). It afterwards became a Rom. colony (Livy, viii. 21), under the name of Terracina, or Terracina (q.v.).

Anyang (Changteh), Chinese city in the N. part of Honan prov. on the Peking-Hankow railway, S. of R. Yuan. It was the old capital of the Shang Dynasty up to the 12th cent. BC. During the Three Kingdoms period (216-63) it was the cap. of Wei. In 1899 a great number of oracle-bone inscriptions, the earliest Chinese writing extant, were recovered from the tombs of the Shang kings (see CHINESE LITERATURE). A. has since been frequented by archaeologists of many countries.

Anytus, wealthy leader of the Athenian democrats, and son of Anthemion. With Thrasylbus he helped to overthrow the Thirty Tyrants. He was the most powerful of the accusers of Socrates (399 BC), and the Athenians, on repenting of the latter's death, sent A. into exile.

Anzacs, the Australian and New Zealand Army Corps which served in the First World War, the word being formed of the initial letters of the corps. The Anzacs' most conspicuous service was rendered in the ill-fated Gallipoli campaign of 1915. The Corps effected a heroic landing under intense difficulties at Gaba Tepe, later named Anzac Cove in memory of the exploit (25 April 1915, 'Anzac Day'). (See also GALLIPOLI CAMPAIGN.) After the evacuation they fought in Macedonia, on the Salonika front, in Egypt, and in France. In Egypt a number of A. formed the force which, under Sir Charles Dobell, attacked the Turks at Gaza (1917). In France they fought with characteristic dash in the Somme battle, 1916, notably at Pozieres. **Anzengruber, Ludwig** (1839-89), Austrian dramatist and novelist, b. Vienna.

His best work, mainly dealing with peasant life, was produced after 1867. His anti-clerical play, *Der Pfarrer von Hirschfeld*, made him famous in 1870, and was followed by *Der Meiseldbauer*, 1871, *Die Kreuzelschreiber*, 1872, *G'wissenssurm*, 1874, *Das vierte Gebot*, 1878, and *Aus'm gewohnten Gleis*, 1880. His most original work is his realistic novel *Der Sternsteinhof*, 1885. His collected works were first pub. in 1890, and a biography by A. Bettelheim in the same year.

Anzhero - Sudzhensk, tn in the Kemerovo oblast of S. Siberia, 45 m. N. of Kemerovo, on the Trans-Siberian Railway. It is a major centre of coal-mining in the Kuznetsk Basin; mining equipment is manuf. Pop. (1956) 116,000 (1913, 15,000; 1936, 100,000; 1939, 71,000). Founded 1896; tn since 1930's.

Anzin, Fr. tn in the dept of Nord, a suburb of Valenciennes, on the Scheldt. It is an important coal-mining centre, and has machinery manufs. and metal industries. Pop. 14,000.

Anzio, Porto D' (anct Antium), It. port, in Lazio (q.v.), on the Tyrrhenian Sea, 33 m. S. of Rome (q.v.). It has been a popular resort since the time of the Romans (see ANTIUM). The modern tn dates from the restoration of the harbour in 1698. Pop. 12,600. The A. and Nettuno (q.v.) beachhead formed an important subsidiary front in the Allies' campaign against the Germans in Italy in the Second World War. An apparent deadlock on the Ger. defensive line between the Apennines and the sea was resolved by the surprise landing of a strong detachment of the Fifth Army behind the Germans' flank at A. and Nettuno (22 Jan. 1944). The bridgehead thus estab. at the extreme range of allied support by fighter aircraft, was heavily counter-attacked and the defenders passed through a precarious phase, but held out until, on 18 May, other allied troops stormed Monte Cassino (see CASSINO, BATTLE OF), and burst through the Gustav line to effect a junction with them. See ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON.

Aomori, see AWOMORI.

Aorist (Gk *aoristos*, indefinite), the Gk tense used to express indefinite past time, i.e. unlike other past tenses it denotes a simple past occurrence without specification of completion, continuance, etc. It corresponds to the Eng. past tense, 'died,' 'went,' 'did,' and is especially suitable for the narrative style. The distinction between first and second A. was not observed in practice.

Aorta, large blood-vessel leading from the left ventricle of the heart and sending arterial blood to all parts of the body. It descends through the thoracic and abdominal cavities, lying in front of the vertebral column, and ends by bifurcating into the common iliacs at the level of the fourth lumbar vertebra.

Aosta (anct Augusta Praetoria Salas-sorum), It. city, cap. of the region of Valle d'A (q.v.), on the Dora Baltea, 370 m. NW. of Rome (q.v.). It stands in the beautiful A. valley, surrounded by

mts, and has a cathedral (12th-19th cents.) and impressive Rom. remains, including an arch of Augustus, walls, a three-arched gateway, and an amphitheatre. It was the bp. of St Anselm (q.v.). There are iron and steel industries, and there is a tourist trade. Pop. (tn) 13,500; (com.) 23,600.

Aoudad, see BARBARY SHEEP.

Apaches, formerly a fierce and predatory tribe of N. Amer. Indians of the S. Athabascan linguistic family, inhabiting parts of N. Mexico, Arizona, and Texas. At one time very numerous, they have been largely exterminated, chiefly in the numerous and fierce wars they fought with the Spaniards and the white Americans, and now number about 6000. The name *apache* has more recently been applied to the criminal type of Paris.

Apafi, family whose members were princes of Transylvania, the most notable being Michael I (1632-90). He was chosen prince in 1661 and remained faithful to the Sultan, under whose protection he reigned till after the siege of Vienna in 1683. In 1687 he obtained a declaration of Transylvanian independence under Hapsburg protection by a treaty with the Emperor, Leopold I, and under his son, Michael II (1677-1713), Transylvania was incorporated with Hungary (1699).

Apalachicola: 1. Riv. of Georgia and Florida, U.S.A. The A. has 2 main branches, the Chattahoochee and the Flint, which rise in Georgia and meet at the extreme SW. of the state, and that part which then flows 112 m. through Florida into the A. Bay is called the A.

2. City and port of Franklin co., Florida, U.S.A., on riv. and bay of same name. Noted for oyster, tarpon, and other fisheries. There is a monument to J. W. Gorrie, the physician, who discovered the cold-air process of refrigeration. Pop. 3222.

Apanage, see APPANAGE.

Aparrí, port of Cagayan prov., Luzon, Philippines, on estuary of Cagayan R., the only serviceable harbour on the N. coast of the is. Pop. 24,974.

Apartheid, coined word meaning 'separatism, or 'being kept apart,' used to describe the general nature of the S. African Gov.'s policy towards the various racial groups in S. Africa. The guiding principle behind the policy is that the less developed non-whites, especially the Bantus, should be guided by the whites towards self-realisation and self-gov. within their own communities and in their own areas. It is planned to give the Bantu full rights, in their own sphere, as and when they become capable of exercising them, and to teach them to shoulder the duties and responsibilities which accompany the rights and powers of self-gov. The Bantu's ambitions will be directed into the framework of his own Bantu society, so that as he progresses he will not abandon his people in order to penetrate the white man's society or to participate in the latter's institutions of gov. The A. policy aims at giving him ample opportunities for

the service of his people. While total and absolute segregation may be the ideal of extremists, it is accepted by all serious thinkers in S. Africa that complete segregation is neither practical nor desirable. A. is based on S. Africa's traditional policy of separate or parallel development of the races. See also COLOUR BAR; SOUTH AFRICA. UNION OF.

Apartment, see FLAT.

Apathy (Gk *a*, privative; *pathos*, affection) The Gk doctrine of A.—unruffled tranquillity of mind as a virtue—is generally associated with the Stoic school of philosophy. Yet it is really much earlier and there are clear indications of it in the Cynic school. Democritus describes human happiness in the same way as A. is described by later philosophers. This idea is in accordance with the general feeling of the Hellenistic period, which was always ready to recognize the happiness of the individual as existing in a kind of quietism. But this extreme view found opponents in Plato and others. Plato always deliberately opposed A. and later philosophers are strongly influenced by the more moderate attitude. In the eyes of the Neo-Platonists—especially Philo—A. appears as the highest stage of virtue. Modern psychologists describe A. as visceral anaesthesia. James argues that emotional A. keeps pace with sensory anaesthesia, assuming that a subject absolutely anaesthetic could experience no emotion. This—the James-Lange theory of emotion—is, however, opposed by others. See J. Ward, *Psychological Principles*, 1920.

Apatite, mineral, very widely distributed, which consists mainly of phosphates of calcium. Most varieties correspond to the formula $3\text{Ca}_3(\text{PO}_4)_2 \cdot \text{CaF}_2$ or $\text{Ca}_3(\text{PO}_4)_2 + \text{Ca}_3(\text{PO}_4)_2\text{F}$, but sometimes the fluorine is replaced by chlorine. It crystallises in a hexagonal form, and crystals are sometimes found over a foot in length. When found in large masses, as in Norway and Canada, it is mined for the extraction of phosphates. It is always a constituent of gneiss, granite, and diabase, usually in minute crystals, and probably the phosphates in the soil are due to A. from the disintegration of such rocks.

Ape, term used to denote (1) the anthropoid A.s (q.v.), the short-tailed or tailless A.s, and monkeys (q.v.) and baboons generally; (2) more specifically, the most man-like forms, such as the chimpanzee, the orang, the gorilla, and the gibbons.

Apeldoorn, tn in the prov. of Gelderland, Netherlands, 17 m. NNE. of Arnhem. Manufs. paper extensively, also blankets and woollen cloth. In the neighbourhood is the 17th-cent. Castle Loo, the royal hunting-lodge. Pop. 94,740.

Apella, Spartan assembly of freemen. It was composed of all citizens of 30 years of age and over. It was convened once a month between the bridge of Babyca and the Cnacion, the ravine of the Oenus. As the anct Homeric Agora had only been

able to shout its assent or dissent, so the A., though assigned a real part in the constitution, could only vote by acclamation. Before the A. were laid the subjects approved by the Gerousia (the council of elders). Declarations of war, treaties of alliance, depositions of kings, etc., were within its cognisance. No one could speak in it without the invitation of the president—a feature also to be found in the Rom. Comitia. In historic times the ephors presided.

Apelles, Gk painter of the 4th cent. bc, b. Colophon in Ionia. He studied at Sicyon, near Corinth. Becoming a favourite at the court of Philip of Macedon, he was appointed by Alexander to be his portrait painter. As none of his works now remains, it is impossible to judge them other than by reputation, but anecdote suggests a realistic power of suggesting three-dimensional effect, e.g. in his 'Alexander wielding a Thunderbolt,' where the hand according to Pliny seemed to come out of the picture. His 'Aphrodite Anadyomene' was one of his famous works. He wrote a (vanished) treatise on his art, and was renowned for his skill in using only four pigments: white, yellow, red, and black.

Apellicon (1st cent. bc), according to Strabo a native of Teos, but he was admitted as a citizen of Athens. He was a Peripatetic philosopher, and a great collector of books. He purchased the autograph MSS. of Aristotle and Theophrastus; but his entire collection was taken to Rome by Sulla after the capture of Athens in 86 bc.

Apennines (Lat. *Appenninus*), long mt range, often called the 'backbone of Italy.' Starting from the Maritime Alps (q.v.), the A. run 740 m. down the whole length of the peninsula, and are continued through Sicily, beyond which a line of submarine elevations connects them with the mts of N. Africa. Their name is probably derived from the same root *pen* which is found so frequently in Celtic lands (as in Penmaenmawr). Though spoken of by early writers as a single range, the A. are now generally classed as N., Central, and S. The N. div. includes the Ligurian, Tuscan, and Umbrian ranges, of which the first runs round the Gulf of Genoa (q.v.), from the Maritime Alps to the valley of the Magra, near Spezia. Its highest point is Monte Bue, 5915 ft. Between the Maritime and Ligurian mts and the sea lies the narrow strip of coast known as the Riviera (q.v.), while on the N. they sent off many tribs. to the Po. The Tuscan A., reaching across the peninsula to the sources of the Tiber, are slightly higher than the Ligurian, Monte Cimone rising 7103 ft. A spur on the W., called the Alpi Apuane, supplies very fine marble, at Carrara (q.v.). The chief rivs. of the Tuscan range are the Arno on the S., and the Panaro, Secchio, and Reno on the N. The N. end of the Umbrian range gives rise to 2 rivs. famous in hist., the Tiber and the Metaurus (q.v.), which rise within a few m. of each other, but flow into different seas. The S. extremity of

the range is not easy to define, as it becomes complicated with the great mass of the Central A. These, the loftiest in the peninsula, are broken up into sev. chains, of which the Gran Sasso (q.v.) has Monte Corno, 9580 ft, and Monte Amaro, 9170 ft, while the Sibillini and others have sev. peaks of 7000 and 8000 ft. The S. A. are very irregular, their chief ranges being the Matese (with Monte Miletto, 6725 ft), the Lucanian (Monte Pollino, 7325 ft), and the Calabrian. In these last, as in the Apuan dist., granite, gneiss, and other anct rocks are predominant; elsewhere the whole system is mainly of Triassic and later formations, a great part being limestone. The A. are not metalliferous, but furnish valuable stone. On the W. there are many traces of volcanic agency, but the only craters now active are those of Vesuvius, Etna (q.v.), and Stromboli. The highest peaks of the A. are covered with snow during a great part of the year, but there are no glaciers. In former times there were large forests of pine, oak, chestnut, and beech, containing many wild animals, but much of the timber has been felled, and only wolves are now troublesome, though a few bears still remain. Much more dangerous were the brigands who flourished, especially in S. Italy, down to very recent times.

Apennines, Lunar, extensive mt range similar in some respects to terrestrial features and visible to the naked eye when projecting into the dark part of the disk. It is 460 m. long and the highest summit, Huyghens, is 18,000 ft high.

Apenrade, Denmark, see AABENRAA.

Aperients, medicines which stimulate the natural action of the bowels. Sometimes the term is applied only to those milder purgatives which only slightly quicken the movement of the bowels. In the wider sense they may be divided as follows: (1) laxatives, which have a gentle stimulating influence on the bowel muscles, as figs, prunes, olive oil, etc.; (2) purgatives, which increase the movements of the intestines, and mildly stimulate the glands, as castor oil, aloes, etc.; (3) drastics, which act more intensely, increase the intestinal fluid, and cause painful fluid motions, as jalap, podophyllin, and large doses of purgatives; (4) hydragogues, which cause free secretion from the intestinal glands, and cause watery motions, as croton oil and large doses of cream of tartar, Epsom salts, Glauber's salt, etc.; (5) cholagogue purgatives, which stimulate the liver and increase the bile, producing greenish liquid motions, as aloes, rhubarb, iridine, etc.

Apetalous Plants are those in which the corolla is suppressed.

Apex Beat, stroke of the A., or point, of the heart against the pericardium, through which it can be heard and felt externally on the wall of the chest just below the left breast. Deviations in the position or force of this beat afford important indications of pathological changes in the heart.

Aphasia, partial or complete loss of the power of speech or of expression by writing, or of understanding spoken or written words. The term is not applied when the power is lost through lesions of the peripheral nerves or organs, but only when the central nervous system is affected. The memory-stores which enable us to use and understand the language we have so gradually acquired correspond with certain portions of the brain, and a consideration of the process of acquiring the power of speech will go far to explain why A. is so often restricted to certain functions connected therewith, while others remain intact. The child understands words before he can speak; these percepts are stored away in the brain in the first temporal convolution of the left-hand side in right-handed persons, and vice versa in left-handed persons. Later, the child learns to make the co-ordinated movements of the tongue, larynx, etc., necessary to pronounce a word. The memories of these movements are stored away in the foot of the third left frontal convolution. When he learns to read, the visual memories of the words are stored in the cerebral cortex, and so on. In health, there is constant communication between these portions of the brain, so that the image of a written word calls up the memory of the spoken word and of the movements necessary to give it utterance. If a lesion in any one of these areas occurs there is a corresponding loss of power of expression or understanding. Thus the patient may recognise a word when seen, but be unable to pronounce it; or may be able to pronounce it, but not recognise the sound when uttered, and so on. The condition sometimes improves of itself as the lesion heals, but it often happens that the patient has to learn all over again, as a child does, the art of speaking, reading, or writing, whichever has been lost.

Aphelion, position in the orbit of the earth or any other planet or a comet when it is farthest away from the sun. The orbit of the earth's revolution is an ellipse, with the sun in one of the foci. Thus the earth is at varying distances from the sun as it moves round in its orbit. It is nearest about 4 Jan., when the earth is moving its fastest; and farthest about 4 July when the earth's speed in its orbit is a minimum. The first position is called *perihelion* and the latter *aphelion*. (See **APSIDES**; **PERIHELION**.)

Aphemia, inability to articulate words from disease of the cortical speech centre and not of the peripheral nerves or organs. See **APHASIA**.

Aphides (plural of *aphis*), family of plant-lice belonging to the order Hemiptera, very common in Britain. They are characterised by their soft and oval bodies, small heads, jointed beaks, antennae of 7 joints, wings (when present) transparent and 4 in number. They feed on plants and from their food form an excretion, known as *honey-dew*, of which ants are very fond; in warm weather it may be seen like a coating of

varnish on leaves, where it is injurious to the plant.

The A. reproduce parthenogenetically and viviparously. In the early summer the unfertilised females may produce as many as 25 females alive in one day, and as these can also produce in a few days, their numbers increase enormously. In the autumn males begin to appear as well as females, and after mating the female produces a *winter-egg*, which in the spring develops into a female *aphis*—and again the cycle of generations begins. If it were not for birds, spiders, parasites, and ladybirds which prey on the A., probably all vegetation would be destroyed.

Aphis is the commonest type in Britain, but other well-known genera include *Phylloxera*, or vine-louse; *Nectarophora*, green pea-plant louse; *Phorodon*, or hop-plant louse; and *Chermes*, which produces galls on spruce firs. See G. B. Buckton, *Monograph of the British Aphides*, 1876-1883, and J. Davidson, *List of British Aphides*, 1925.

Aphis-lion, or lace-wing fly, is a member of the Chrysopidae, order Neuroptera, which feeds on the aphides. The genus *Chrysopa* is common in Britain.

Aphonia (Gk *a*, without; *phōnē*, sound), medical term to denote loss of voice; it differs from mutism in which sufferers frequently utter inarticulate sounds. Growths in the larynx, paralysis of the respiratory muscles, disease of the vocal cords, hysteria, and nervous disorders may all cause the malady.

Aphorism (Gk *apo*, from; *horos*, limit), short pithy saying conveying a general truth. The word was first used of the *Aphorisms* of Hippocrates, the first of which is 'Life is short, the art [of medicine] is long.' A proverb (q.v.) is an A. which has become universally accepted.

Aphrodite, Gk goddess of love, beauty, and fertility; frequently worshipped also as the patroness of seafarers and of war. She probably reached Greece from Cyprus, a common meeting place of E. and W.; for she is undoubtedly related to the Semitic Ishtar, Ashtoreth, and Astarte, and seems to have absorbed certain traits of pre-Hellenic divinities. In classical Rome she was identified with Venus. In the *Iliad* A. is represented as the daughter of Zeus and Dione; but later poets frequently relate that she was sprung from the sea-foam, whence they derive her name. She was the wife of Hephaestus; but she proved faithless and was in love with Ares (q.v.). She also loved the gods Dionysius, Hermes, and Poseidon, as well as the mortals Anchises and Adonis (qq.v.). A. surpassed all the other goddesses in beauty, and hence received the prize of beauty from Paris. She likewise had the power of granting beauty and invincible charm to others. In the vegetable kingdom the myrtle, rose, apple, poppy, etc., were sacred to A., as, in the animal world, were the sparrow, dove, swan, and swallow. Her chief shrines were in Cyprus and Cythera.

Aphroditopolis, see **ATFII**.

Aphthae (Gk *aphthai*, eruption), small

white vesicles in the mouth occurring chiefly in infants, commonly called *thrush*. See THRUSH.

Aphthonius (fl. c. AD 400), Gk rhetorician, b. Antioch; a pupil of Libanius (q.v.). His *Progymnasmatia*, an introduction to the study of rhetoric, was in common use for a thousand years. It has been ed. (1926) by H. Rabe, who also pub. (1928) the Byzantine commentary thereon by John Sardian.

Anderson

APHRODITE: CNIDIAN VENUS

Statue after Praxiteles in the Vatican.

Apia, seaport on the N. coast of Upolu, W. Samoa, cap. until 1914 of Ger. portion, but assigned to New Zealand under mandate by the treaty of Versailles. It is built on a curving bay, backed by a conical hill, Vaea, the burial place of Robert Louis Stevenson, beyond which rise the slopes of the high mt range. Copra and cocoa beans are exported. Under the mandatory administration the sanitation of A. has been greatly improved. There is a water supply, sewerage system, hydro-electric plant with electric lighting, and other modern conveniences. The tn has 2 motion picture theatres, sev. transport companies, engineering works, and other business enterprises. There is a high-power wireless station. Foreign consulates were set up in A. in the eighties of last century, a step which so exacerbated the traditional rivalry among the native clans as to lead to a dangerous crisis, and Britain, America, and Germany sent

warships to A. (1889). In Mar. of that year 4 Ger. and Amer. warships were sunk by a hurricane, and only H.M.S. *Calliope* escaped destruction. In 1899 there was a recurrence of the frequent trouble over the kingship question, when Mataafa, a Catholic exile, opposed Malletoa, youthful son of the late king. Britain and America favoured Malletoa, and when this led to a crisis Brit. and Amer. warships bombarded A. Pop. of urban dist. 14,840, inclusive of 3000 non-Samoans. See Felix M. Keesing, *Modern Samoa*, 1934, and R. Gibbins, *Over the Reefs*, 1948.

Apian, Peter (1495-1552), astronomer and astrologer, b. Leipzig. His real name was Bienewitz. *Biene* in German signifies a bee, whence the Lat. *apianus*, the full form of his name. He is principally remarkable for his observations of comets, and is said to have been the first who observed that their tails are generally turned from the sun; but this had been previously noticed by Fracastoro. In his *Cosmographicus Liber*, pub. in 1524 and subsequently revised by Gemma Frisius under the title *Cosmographia*, he pointed out the use which might be made of lunar observations in finding long.; he d. at Ingolstadt, where he was prof. of mathematics.

Apiary (Lat. *apis*, bee), place for keeping beehives. The name is derived in the same way that an aviary is taken from *avis*, a bird. Bee-keepers disagree as to the best position of the A., but all maintain it should be impervious to winds.

Apicius, name of 3 celebrated Rom. gluttons. The first lived c. 92 BC; the second c. AD 14; and the third about the middle of the 1st cent. AD. The second, M. Gavius A., is said to have invented sev. kinds of cakes and sauces. Having squandered a fortune in gluttony, he committed suicide. The extant *De Re Coquinaria*, wrongly attributed to one Caelius A., is a work of the 3rd cent. AD based on Gk originals.

Apion (1st cent. AD), Gk grammarian and head of the Alexandrian school, b. at Oasis in Libya. He was a member of Philo's deputation which visited Caligula in AD 38 to complain of the Jews. Fragments of his books against the Jews have been preserved by Josephus (*Contra Apionem*). A's story of 'Androclus and the Lion,' from his *Aegyptiacae*, survives in Aulus Gellius (*Noctes Atticae*, v. 14); and the extant fragments of his commentaries on Homer were printed in Sturz's *Etymologicum Gudianum* (1818).

Apis (Hapl), early sacred bull of Memphis. In the New Kingdom called a 'repetition of Ptah,' the chief god of Memphis, and after death so closely associated with Osiris that he eventually merged with him into one deity, Serapis (Usar-hapi). From the New Kingdom the A. bulls when dead were mummified and buried in huge stone sarcophagi in a subterranean gallery known as the Serapeum, in the Memphite necropolis, Sakkarah. In the Saite period coffins often bear a representation of the A. bull transporting the dead to the tomb.

Apium, genus of plants belonging to the Umbelliferae, found in ditches in Britain, and nearly every part of Europe. *A. graveolens*, the only important species, is the celery and celeriac, of which there are sev. cultivated varieties.

Aplanatic Lens, lens which is free from spherical aberration. See ABERRATION.

Apneumatosi, see COLLAPSE, PULMONARY.

Apnoea, technical term for the suspension of breathing. It denotes the prevention of breathing owing to the presence of too much oxygen in the blood.

Apocalypse, lit. trans. a revelation, i.e. something disclosed only to a chosen person. The term is usually applied to the last book of the N.T., the A. of St John. In the A.V. and the R.V., however, the name the Revelation of St John the Divine is given to this book. There were, however, a multitude of earlier writings of this kind (beginning perhaps with Daniel) which, in the form of parables and prophecy, were supposed to reveal the end or the future state of the world. The apocalyptic literature despaired of the present, and put its whole trust in the deliverance and reward which was to be the guerdon of present sufferings and sorrow in a new age that would soon follow a catastrophic judgment and the end of the world. In the O.T. parts of Isaiah, Ezekiel, and Daniel are apocalyptic in character. Among the non-canonical Jewish apocalypses the Book of Enoch and the Psalms of Solomon are outstanding. In the N.T., besides Revelation, Mark xiii (and parallels in Matthew and Luke) is apocalyptic. We find also in Christian times a number of apocalyptic writings, which are outside the canon, among them the Shepherd of Hermas, and the Revelations of Bartholomew.

Apocalyptic Number, or 'the Number of the Beast,' is the mystical number 666 (see Rev. xiii. 18). There have been various interpretations of this mystery. In Greek and Hebrew the letters of the alphabet were used for numbers, and so 'the number of the beast: for it is the number of a man' was the value of the letters composing the name. The most generally accepted solution is 'Neron Kesar,' the Hebrew for the Latin 'Nero Caesar.' In anct Hebrew the vowels 'e' and 'a' are not represented, but 'o,' being a long vowel, is. The value of the letters N R O N K S R is therefore 50 + 200 + 6 + 50 + 100 + 60 + 200 = 666. Another interpretation has been made from the Gk word 'Lateinos,' meaning the Rom. Empire.

Apocatastasis, in the theological sense the extension of the kingdom of God over all the earth, i.e. the ultimate conversion of the whole world to the Christian faith.

Apocrypha: 1. *Of the Old Testament*, or *Deuterocanonical Books*, consists of 1 and 2 Esdras, Tobit, Judith, Esther additions, Wisdom of Solomon, Ecclesiasticus, Baruch, Song of the Three Children, Susannah, Bel and the Dragon, the Prayer of Manasses, 1 and 2 Maccabees. See also BIBLE.

2. *Of the New Testament*, numerous

unauthentic Christian or heretical writings of the early cents. From them we distinguish the perfectly genuine but uncanonical writings of the 1st and 2nd cents. which are now known as The Apostolic Fathers. Of the Apocryphal works proper we may mention the *Gospel* (c. AD 150), the *Revelation* (earlier than the Gospel) and the *Acts* (c. AD 200) of St Peter. To the last we owe the *Quo Vadis* story. The Gospel of St Thomas (2nd cent.) deals with the infancy of Christ, and gives accounts of the miracles of that period. The Acts of Paul (and Theda) are fragments from a work of about AD 160. The *Proterangelium of James* is a popular life of the Blessed Virgin Mary from about AD 150. *The Assumption of Mary* (c. 4th cent.) gives a legendary account of her death and resurrection. *The Letters of Our Lord and of Abgar* are a 3rd-cent. legend. We should also mention the *Agapha*, a collection of sayings attributed to Christ, not recorded in the N.T., some of which may be genuine. Indeed though the Apocryphal works are very untrustworthy and legendary, they may contain some true traditions. See M. R. James, *The Apocryphal New Testament* (trans.), 1924.

Apocynaceae, family of dicotyledonous shrubs or herbs, mostly tropical, with poisonous milky juice, about 1000 species. Leaves simple, opposite, flowers regular, 5-parted, ovary superior. Chief genera are *Adenium*, *Allamanda*, *Amsonia*, *Apocynum*, *Carissa*, *Cerbera*, *Echites*, *Nerium*, *Plumeria*, *Strophanthus*, *Tabernaemontana*, *Trachelospermum*, *Valsesia*, *Vinca*.

Apodes, scientific name for the eels, which form an order of the bony (teleost) fishes. They are soft-rayed fishes with an open duct to the swimming-bladder and with long dorsal and anal fins. In all living eels there are no pelvic fins. The order includes the fresh-water eels (Anguillidae), the moray-eels (Muraenidae), and the conger-eels (Congridae). See also EELS.

Apodictic (Gk *apodeiktunai*, to show forth), logical term applied to a conclusion which is necessarily true, i.e. the opposite of which is impossible.

Apogamy, the curious condition met with in some ferns, e.g. in *Dryopteris filix-mas*, the male fern. In this case the new fern plant arises directly as a bud from the prothallus without aid of sexual organs. In other cases *A.* is effected parthenogenetically, the new plant arising from an unfertilised oosphere. See also APOSPORY.

Apogee (Gk *apo*, from; *ge*, the earth), point in the moon's orbit which is most distant from the earth. The term is applied also to the sun's position when it is at its greatest distance from the earth. It is used when the geocentric point of view is adopted; from the heliocentric point of view it corresponds to aphelion (q.v.). See PERIGEE and PERIHELION.

Apolda, Ger. tn in the dist. of Gera, 28 m. WNW. of Gera (q.v.). It has textile, machinery, bell-casting, and chemical industries. Pop. 33,500.

Apollinaire, Guillaume (1880-1918), Fr. writer, b. Rome. His real name was Wilhelm Apollinaris de Kostrowitzky, being the natural child of a Polish woman and a priest of Monaco. He wove legends on his early years, and all that is certainly known of him is that he had travelled much before he came to Paris in 1902. He was the chief protagonist of Cubism. He conducted a regular dept in the famous Fr. magazine *Mercur de France*. When the First World War broke out he served at the front, and d. of his wounds. He wrote fantastic prose and verse with equal facility. Prin. works: *Alcools* (poems), 1913; *Les Peintres cubistes* (essays), 1913; *Calligrammes* (poems), 1918; *Contes choisis*, 1923. A. had great influence on European art and literature. See A. Billy, *Apollinaire*, 1947.

Apollinaris, Sidonius (c. 434-88), b. Lyons of noble family, connected by marriage with the Emperor Avitus. His learning saved him when Lyons was captured by Majorian, and also when Rome was taken by the Goths. He became Bishop of Clermont. Some of his writings survive.

Apollinaris the Younger (d. c. 390), Bishop of Laodicea in Syria, was so bitter an opponent of Arianism that he even denied the existence of the human mind in Christ's human nature. His views were finally condemned at the Occumenical Council of Constantinople (381).

Apollinaris Water, alkaline mineral water from the Apollinaris spring in the valley of the Ahr, near Bad Neuenahr, in Rhineland-Palatinate (q.v.), Germany, 60 m. NW. of Mainz (q.v.).

Apollo, in classical mythology the son of Zeus and Leda; b., with his twin sister Artemis (q.v.) in the is. of Delos, where Leda had taken refuge from the jealousy of Hera. A. stands in Gk character and life for all we think of as civilisation. Yet all scholars are agreed that he is of non-Hellenic origin. Whence he is derived is uncertain: two main groups of scholars hold widely differing views. One, supported by Wilamowitz and Nilsson, assert that he came from the interior of Asia Minor; they believe it probable that he may have derived from Apulunas, the Hittite gate-god identified by Hrozy in 1936. Others, led by H. B. Cook and Prof. H. J. Rose, affirm that A. was originally a god of shepherds in the wild regions of the N. Whatever view is adopted, it must be remembered that the manifold characteristics of the classical A. are derived from numerous sources. The most important aspect of A. is his interest in all matters affecting law and order, as well in the physical and social as in the intellectual and moral spheres. It is certain that in his twofold character of judge (especially in cases of homicide, which involved pollution) and ritual purifier he forms a link between the Hellenic religion and the more ant. cult of chthonian gods. The Romans made their first contact with A. partly through the Etruscans and partly through the Gk states of S. Italy. There was a temple to him at Rome as early as 432

bc. In republican times he was venerated chiefly as a god of healing and prophecy; but his status was greatly enhanced by the devotion of Augustus who erected magnificent temples of A. at Actium and on the Palatine. The famous statue known as the A. Belvedere, in the Vatican, does not represent the Gk conception in the strictly classical age. This is better seen in more ant. figures, e.g. the 'Strangford A.' in the Brit. Museum, and in a splendid terra-cotta figure from Veii now in the Museo di Villa Giulia at Rome. From the 5th cent. bc A. was identified with the sun god. See also DELPHI and ORACLE.

Apollo of Rhodes, colossal bronze figure of the sun god, reckoned among the 7 wonders of the ant. world. It is said to have been the work of Chares of Lindus (q.v.) and to have been set up by the Rhodians about 280 bc in gratitude for the successful defence of the city against Demetrius. The height was probably about 90 ft., and the work is stated to have occupied the sculptor 12 years. It stood near the harbour, though a legend that it bostrade the entrance and ships passed between its legs is unfounded. In 224 bc it was overthrown by an earthquake. The metal was sold by Arabs after they captured Rhodes in ad 653. See also COLOSSUS.

Apollodorus, Athenian painter of the end of the 5th cent. bc and master of Zeuxis. He introduced some innovations in perspective and seems to have been the first to study light and shade. His works include an *Odysseus*, and an *Ajax* struck by lightning, admired by Pliny.

Apollodorus (2nd cent. bc), Athenian scholar to whom earlier critics falsely ascribed a celebrated work on Gk mythology entitled *Bibliotheca* (i.e. *The Library*) which was probably written during the early Christian period. See J. G. Frazer, *Apollodorus: The Library* (with trans.), 1921.

Apollodorus, famous architect of the 2nd cent. ad, was b. Damascus. He became a favourite of the Emperor Trajan, for whom he constructed a bridge over the Danube. He also designed a number of buildings and triumphal arches. He offended the future emperor Hadrian by his outspoken denunciations, and on Hadrian's accession he was put to death on trivial charges.

Apollonia: 1. Ant. city of Illyria, near mouth of It. Aous. Colonised by Corinthians and Corcyraeans, and famous as a place of learning in Rom. times.

2. Ant. city of Thrace, on the Euxine. Colonised by emigrants from Miletus. The colossal statue of Apollo by Calamis (5th cent. bc) was removed from here to Rome by Lucullus, 72 bc. The site is now occupied by Sisboli.

3. Ant. tn in Cyrenaica, bp. of Eratosthenes; now Marsa Suza.

Apollonius Dyscolus, or the Surly (fl. c. ad 150), Gk grammarian, whose *Syntax* was the leading work on that subject until the 19th cent. Priscian (q.v.) calls him *grammaticorum princeps*. There is an ed. of his surviving works by

R. Schneider and G. Uhlig in *Grammatici Graeci II*, 1-2, 1878-1910. See J. E. Sandys, *History of Classical Scholarship*, I (3rd ed.), 1921.

Apollonius of Perga (c. 262-c. 200 BC), Gk geometer of the Alexandrian school. He is classed with Euclid and Archimedes (q.v.) as one of the founders of mathematical science. His treatise on *Conics* was pub. in 1710 by Edmund Halley who in 1706 had pub. a trans. (from an Arabic version) of A.'s *Cutting off a Ratio* together with a restoration of the *Cutting off an Arca*. A restoration of the *Determinate Section* was pub. by R. Simson in *Opera quaedam reliqua*, 1776. See also T. L. Heath's ed. of the *Conics* with modern notation, 1896.

Apollonius of Tyana (c. 295-c. 230 BC), Gk poet and grammarian, b. at Alexandria. His most famous work is the *Argonautica*, a poem in 4 books on the legend of the Argonauts. After some time spent in Rhodes, he was recalled to Alexandria and appointed librarian at the Museum by Ptolemy Epiphanes (196 BC). There is an ed. of the *Argonautica* (with trans.) by R. C. Seaton, 1900, and a trans. by A. S. Way in the *Temple Classics*, 1901. See E. Delage, *Biographie d'Apollonius Rhodius*, 1930.

Apollonius of Tyana, Gk philosopher and mystic of the Neo-Pythagorean school; b. a few years before the Christian era. He studied at Tarsus, and became a follower of the doctrines of Pythagoras. He claimed for himself a divine mission, and gathering around him a number of disciples, he travelled widely in the east, visiting Nineveh, Babylon, and India, where he came under the influence of oriental mysticism. When he returned he was received with great honour, and many miracles were ascribed to him, though he himself claimed only prophetic vision. He was patronised by Rom. society, and during the height of his fame wandered through W. Europe. Later, after being accused of conspiring against Nero, he retired to Ephesus, where he opened a school, and d. there at the age of nearly 100 years. His biographer Philostratus gives an account of his life, which must, however, be stripped of its exaggeration and fiction before we can see a glimpse of the earnest striver after a higher life. There is an ed. with trans. of Philostratus's life by F. C. Conybeare, 2 vols. (Loeb Library), 1912. See also H. C. Schnur, *Mystic Rebels*, 1949.

Apollonius of Tyre, name of a medieval tale which is supposed to have a Gk origin. The first mention of the tale seems to be about the latter end of the 6th cent. The story relates how A. of T., having solved a riddle which revealed a guilty secret of King Antiochus, has to flee in order to escape the wrath of the king. In Cyrene he marries, and on the death of King Antiochus, he goes to claim Antioch, to which kingdom he is heir. On the voyage his wife apparently dies in giving birth to his daughter. The corpse is thrown overboard and the daughter left at Tyre. After 14 years of vicissitudes the three, husband, wife, and

daughter, are miraculously restored to each other. The story had great popularity during the Middle Ages in almost every country. Shakespeare used it in his drama called *Pericles*.

Apollon, Alexandrian Jew described in the Acts of the Apostles (xviii. 24-8), an eloquent speaker and a man mighty in the Scriptures. Until his 'conversion' by Priscilla and Aquila he appears to have preached only the baptism of John. There remains still some doubt as to exactly what form this 'conversion' took, since he appears always to have been in some sense a Christian. John the Baptist had pointed out Jesus as the Messiah, and there must have been many, besides his disciples, who had picked up some knowledge of Christianity and become serious Christians, only awaiting fuller instructions. A. became a follower and fellow teacher with Paul, and much of his work was done in Corinth, where he gained great influence (1 Cor. iii. 4). Martin Luther believed him to be the author of the Epistle to the Hebrews.

Apollyon (Gk meaning 'destroyer'), given in Rev. ix. 11 a sa. trans. of the Heb. 'Abaddon,' 'the angel of the bottomless pit.' A. forms a striking figure in Bunyan's *Pilgrim's Progress*. His identification with the Asmodeus of Tobit seems doubtful.

Apologetics and **Apologetics** (from the Gk *apologia*, a defendant's personal reply to his accuser, e.g. Plato's *Apology of Socrates*), explanation and defence of religious belief in general, and of the Christian faith in particular, covering much of the same ground as Fundamental Theology (q.v.). The need of A. has been apparent from the beginning, since from the start Christianity was the subject of misrepresentation, abuse, and persecution. It was also faced by a developed culture and philosophy to which its beliefs had to be commended and made intelligible. A. has passed roughly through three main stages or eras. (1) From AD 30 to the fall of the Rom. Empire A. were addressed to the Jewish and Pagan worlds. Some of the N.T. writings have an apologetic (i.e. defensive, and commendatory) character—e.g. St Luke's Gospel, and Romans xiii. But the *Apologetics of the Fathers* were the first systematic works of the kind. They had as their objects to uphold Christianity against heathenism, to refute the false accusations made against Christians, and to show emperors the injustice of persecution. Among the Gk apologetics of the 2nd cent. were Justin Martyr, who wrote *Apologia Prima pro Christianis* and *Apologia Secunda*, usually referred to as one *Apologia*, c. 150; Athenagoras, who defended the Christians against the charges of atheism, incest, and infanticide; Tatianus; Theophilus of Antioch; and Hermas. Among the Lat. apologetics of the 2nd cent. were Tertullian, with his *Apologeticus*; Minucius Felix, who wrote the dialogue *Octavius*; and Cyprian. *On the Absurdity of Idolatry*. In the 2nd and 3rd cents. Origen, a Greek, and Arnobius, a Latin, wrote against the

attacks of Celsus, Porphyrius, Hierocles, and Julian, who attacked the hist. and doctrines as well as the morals of the Christians. The greatest of these Apologists was Eusebius, whose *Evangelical Preparation* (15 vols.) and *Evangelical Demonstration* (20 vols.) explain the harmony between the O.T. and N.T., uphold the teachings of Christ and of His disciples, and examine the *Life of Apollonius of Tyana* by Philostratus. Other apologists were Athanasius, Chrysostom, Cyril of Alexandria, and Theodoret, who proves Christianity from the writings of the heathens; Lactantius (*Divinae Institutiones*); St Augustine (*On the City of God*); and St Jerome. (2) From c. 652 (the death of Mohammed) to c. 1500 (the Reformation) A. were chiefly concerned with the defence of Christianity against the Muslim religion and philosophy. The first great apology of this kind was that of St John of Damascus (c. 750) in the form of a discussion between a Christian and a Saracen. During the Middle Ages Jewish and Moslem enemies took up new lines of attack. Among them were Avicenna, Averroes, Maimonides, and Jehuda Halevi, who were opposed by St Anselm, Abelard, St Albert the Great, and St Thomas Aquinas. The Christian fruit of these controversies was the 'Thomist compromise,' which declares that certain doctrines are beyond the sphere of reason. The 'nominalists,' Wm of Occam, Buridan, and others, going further, declared all matters of faith to be above reason. (3) From 1500 to the present, A. fall into two compartments: (a) the Catholic and Protestant controversy, producing its apologists on both sides; (b) the defence of Christianity by Catholic and Protestant alike against Deism, Pantheism, Materialism, Agnosticism, and Rationalism (q.v.) of all kinds. A. have also had to deal with the alleged conflict between Science and Religion. Searching Biblical criticism produced scepticism in some of its early and tentative stages, but has tended more and more strikingly to confirm Christian belief, so that it may be regarded now as a valuable branch of Christian A. As for the chief apologies of this period, that of the Huguenot P. de Mornay (1574) was the first in a modern language. Butler's *Analogy of Religion*, 1726, is outstanding, and so is Paley's *Evidences of Christianity*, 1794. Charles Gore's *Reconstruction of Belief*, 1926, is a notable work of this cent. The work of the Society for the Promotion of Christian Knowledge (q.v.) and of the Catholic Truth Society, is chiefly Apologetic. See also R. Mackintosh, *Primer of Apologetics*. **Apologia pro Vita sua** (defence of his career), autobiographical sketch of his position in the Oxford Movement, issued by Cardinal Newman in 1864. It contains his reasons for joining the Rom. Catholic Church, and refutes Charles Kingsley's accusations, which were the immediate cause of the *Apologia*. See *Everyman's Library* ed. and recent biographies by Robert Sencourt and Maisie Ward, 1948.

Apologue, fabulous story, in which a worldly-wise or moral lesson is conveyed in a lively, dramatic, and often satiric manner, the characters employed being generally of a lower order than man. See Jotham's so-called parable (Judges ix), also the fables of Aesop and others, and the Ger. *Reineke Fuchs*. A true 'parable' is more spiritual in its teaching than an A.

Apology (Gk *apologia*), originally signified a defence made in a court of justice by or for a person accused, e.g. Plato's *Apology of Socrates*. The word was also used for a work in defence or justification of what might be considered wrong, or be opposed, e.g. Tertullian's *Apology for Christianity*, Bishop Watson's *Apology for the Bible*, and Barclay's *Apology for the Quakers*. In ordinary language it is used in the sense of asking pardon for an offence.

Apomorphine (C₁₇H₁₇O₂N), artificial alkaloid, derived from morphine by the abstraction of a molecule of water. It is administered hypodermically or by the mouth to produce vomiting, and is therefore an emetic. It is also used in small doses as an expectorant. In small, non-emetic doses it has a sedative and hypnotic action and is sometimes used in cases of hysteria and delirium.

Aponi Fons, see ABANO TERME.

Aponogeton, only genus of family Aponogetonaceae, of which *A. distachyos*, Cape pondweed, or Water Hawthorn, and its varieties, are favourite water plants from S. Africa; and *A.* (synonym *Ouvirandra*) *fenestralis* is the Lace-leaf, or Lattice-leaf of Madagascar, and sometimes grown in indoor aquariums. *A. krauseanus* is hardy.

Apophthegm, or **Apophthegm** (Gk *apophthegma*, a thing spoken out), short, pithy, and instructive saying, intended to convey an important truth to the hearers. Plutarch made a collection entitled *The Apophthegms of Kings and Generals*, and also of the A.s of the Lacedaemonians entitled *Laconica*. Cicero called them *salinae*, salt pits. An example is: 'We ask advice, but we mean approbation.' Bacon made a collection entitled *Apophthegms New and Old*.

Apophyllite, mineral consisting chiefly of calcium silicates, and corresponding to the formula 4H₂CaSi₂O₆ + KF + 4H₂O. It occurs in association with the zeolites (q.v.), and large crystals have been found in India, Mexico, and the Harz Mts.

Apophysis, in physiology, protuberance or process on a bone, having no independent centre of ossification, and so forming a continuous part of the bone. Especially applied to the spinal vertebrae. In botany, a swelling of the seta below the theca or spore case in certain mosses, or on the scales on the cones of certain pines.

Apoplexy, medical term meaning a sudden loss of brain function due to a vascular catastrophe. The usual causes of A. are (1) bursting of a cerebral blood vessel and haemorrhage from it; (2) blockage of a cerebral blood vessel either from thrombosis, i.e. clotting of the blood within the vessel, or from embolus

(q.v.). The signs of A. vary, from the slight and transient to the severe, according to the extent and position of the vascular accident. The effect of A. is to cut off the circulation to that part of the brain supplied by the affected vessel, with consequent death of brain tissue unless the circulation is speedily restored. In cases of persisting haemorrhage or spreading thrombosis the area of brain damage is extended, and in haemorrhage parts of the brain distant from the haemorrhage itself also become affected as a result of increasing intracranial pressure. The skull is a rigid box and the volume of its contents cannot increase beyond a certain amount without exerting constrictive pressure on the compressible tissues of the brain. Predisposing causes of A. are arteriosclerosis (q.v.), hypertension (see BLOOD PRESSURE), aneurysms (q.v.) of the cerebral arteries, cerebral tumours, diseases of the heart valves giving rise to emboli and any condition in which the circulation is enfeebled, as in old age. The precipitating cause may be anything which increases the intracranial pressure such as straining, spasms of coughing, sudden exertion, etc. The usual immediate signs of A. are unconsciousness, stertorous breathing and paralysis of one or both sides of the body depending upon the extent of the cerebral damage. In very mild cases the paralysis may be limited and transient and without loss of consciousness. It is probable that these mild cases are due to a passing vascular spasm and not to true A. Nevertheless the predisposing cause is similar and cases of vascular spasm may be regarded as warnings of a possible future A. In cases of extensive haemorrhage or thrombosis the patient does not recover consciousness, coma deepens and death ensues. The after effects of A. in those who survive the immediate crisis depend on the amount of cerebral damage. In some the paralysis remains permanent, in others it recovers partly or wholly. Mental confusion may persist due to destruction of cortical brain cells. Treatment consists in trying to lessen the extent of the immediate catastrophe. The patient should be laid flat and turned to one side to prevent swallowing of the tongue and the inhalation of vomit and other secretions. False teeth should be removed. The clothing should be loosened and cold applications placed on the head. As soon as recovery from the immediate effects of A. has occurred, treatment consists in the rehabilitation of the patient to as near normal life as possible, re-educating him to use paralysed muscles, preventing chronic contractures in those irreversibly paralysed, and encouraging the use of the mental faculties.

Aposiopsis (Gk *apo*, from; *σιόπειν*, to be silent), sudden breaking off of a sentence before its conclusion, for rhetorical effect, as in the quotation from Scott, 'Bertrand is—what I dare not name.' See also FIGURE OF SPEECH.

Apostasia, herbaceous plants belonging

to the family of the *Apostasiaceae*; they originally came from the mountainous forests of Java and the Penang Is.

Apostasy, Gk word which originally meant defection from the military standard, but later more generally a lapse from Christianity, especially if from unworthy motives. In the Rom. Church it was also used for the renouncing of monastic or clerical vows. Julian the Apostate, Rom. Emperor 331–63, attempted to restore paganism for Christianity as the Rom. religion.

Apostle (Gk *apostolos*, messenger or envoy. A title now specially applied to representatives sent out by Jesus Christ (Luke vi. 13). The name was not at first confined to the twelve, for in 1 Cor. xv Paul says of our Lord, 'He was seen of Cephas, then of the twelve, after that he was seen of James, then of all the apostles.' Evidently while the twelve were pre-eminent, others also were recognised as A.s, and even among the twelve there was a differentiation. 'The Pillars' stood out above the rest, and 'the Lord's brethren' were specially honoured. In Acts xiv Paul and Barnabas are both spoken of as A.s, though neither of them belonged to the twelve. The title thus bestowed on many leading ambas. of Christ was claimed by some who were not entitled to it (Rev. ii. 2). The qualifications for an A., at any rate in the full sense, are indicated in Acts i. 21f.: personal eye-witness to the truth of the Resurrection of Christ, they must have seen the Risen Lord (cf. 1 Cor. ix. 1). They had also to have received a commission either direct from Christ or mediately through the others. During the 2nd cent. a traditional restriction grew up; after this we seldom find any but the original twelve, Matthias, and Paul entitled A.s, their chief followers being spoken of as 'evangelists' and 'apostolic missionaries.'

Apostle Islands, U.S.A., group of 27 is. in SW. part of Lake Superior, 10 m. off the Wisconsin shore. The largest is Madeline Is., 13 m. long, 3 m. wide. They are scenic, with abundant game.

Apostle Jug, form of stoneware vessel much used in the 16th and 17th cents. It was made both with and without a lid, and was so called on account of its ornamentation with the figures of the 12 apostles in relief.

Apostle Spoons, common as christening presents during the 15th and 16th cents. Each handle bears the figure of an apostle. A complete set of 12 spoons is now rare and commands a high price.

Apostles, Acts of the, see ACTS.

Apostles, Teaching of the, or the *Didaché* (Gk for teaching), early Christian work discovered at Constantinople and pub. in 1883. It contains 16 chapters, and is divided into 2 parts, the first of which gives an account of the 2 ways of life and death. Harnack, Taylor, and others believed that the first part of the *Didaché* (Chs. i–vi) was originally a Jewish work entitled *The Two Ways*. These chapters substantially appear also in the *Epistle of Barnabas*, and (c. 3rd or

4th cent.) in the *Apostolic Constitutions*. The second gives the rules governing the service, the sacraments, and the ministry in the church; it is a document of great importance for the study of liturgical development. The exact date of the work is not known; the dates assigned to it vary from the latter part of the 1st cent. to the second half of the 2nd cent. It is of E. origin. See H. Bettenson, *Documents of the Christian Church*, 1943, and G. Dix, *The Shape of the Liturgy*, 1945.

Apostles' Creed, see CREED.

Apostles' Days, feasts of commemoration of the apostles. In the Roman and Anglican churches these are: Matthew, 21 Sept.; John, 27 Dec.; Peter, 29 June (and in the Rom. Catholic Church, Paul, who is commemorated in the Church of England only on the feast of his conversion, 25 Jan.); Thomas, 21 Dec.; Philip and James, 1 May; Simon the Canaanite and Jude, 28 Oct.; Bartholomew, 24 Aug.; Andrew, 30 Nov.; Matthias, 24 Feb.; James the son of Zebedee, 25 July. In the Gk Church the following dates are different: Matthew, 16 Nov.; John, 26 Sept.; Thomas, 6 Oct.; Philip and James, 9 Oct.; Bartholomew, 25 Aug.; Matthias, 9 Aug.; James the son of Zebedee, 30 April.

Apostolic Constitutions, 8 books of what claim to be Church customs and rules laid down by the Apostles and recorded by St Clement of Rome. Actually this longest and best known of the Church Orders is a compilation from earlier works of the kind, freely adapted and enlarged, namely *The Didascalia* (Bks 1-6), *The Didache* (Bk 7), and the *Apostolic Tradition* of Hippolytus (Bk 8). The writer was a pious Arian of Antioch in the 4th cent., probably the interpolator of the epistles of St Ignatius the martyr (q.v.). The liturgy of the eighth book, and indeed the whole work, throws light on Antiochene practice in his time. See F. X. Funk, *Didascaliae et Constitutiones Apostolorum* (2 vols.), 1905; C. H. Turner, article in *Journal of Theological Studies*, xv. 53; G. Dix, *The Apostolic Tradition*, 1936.

Apostolic Fathers, Christian writers intermediate between the Apostles and the later apologists. The name belongs strictly only to those believed to have had actual contact with the Apostles, as Sts Clement, Ignatius, and Polycarp; but in common usage it includes others who, in the 2nd cent., carried on the traditional teaching of the primitive church, e.g. Hermas, Papias, and the writer to Diognetus.

Apostolic Majesty, title of the kings of Hungary conferred by Pope Sylvester II upon St Stephen, King of Hungary, in 1001. It was renewed by Pope Clement XIII in 1758 in favour of Maria Theresa, and subsequently was used by all the Hapsburg rulers of Hungary until the monarchy ended in 1918.

Apostolic Succession, doctrine that the power of ministering in the Christian and Catholic Church can be derived only from a validly consecrated bishop, i.e.

one who had himself been validly consecrated, and so on back to the time of the apostles. As first appealed to, against heretics like the Gnostics, who claimed their own secret apostolic tradition and teaching, the A. S. denoted the fact that every diocese of the true Church of Christ was ruled by a bishop who had received his office from his predecessors in an unbroken line of succession from the apostles, and so was the authentic possessor of the apostolic tradition in all its completeness. (Cf. Irenaeus, *Contra haereses*, III, iii. 1; Tertullian, *De praescript.*, 20, 21; Hippolytus, *Philosophumena*, I proem.) The natural extension of the term to describe the parallel fact of a continuous chain of consecrators and ordainers, passing on the ministerial commission and its powers from the apostles to the present day, and of the fact that this was a vital fact for the validity of the ministry and sacraments in any age, was first made by St Augustine in his great controversy with the Donatists. This doctrine has been explicitly maintained in the Catholic Church and the Orthodox Church of the E. ever since. The Protestant Churches, however, rejected the doctrine at the Reformation, and formed new ministries of their own, on what appeared to be N.T. lines which had no claim to an A. S. The Church of England continued the ancient threefold form of ministry, and claims to possess the A. S., but leaves it an open question whether the ancient Catholic teaching on the A. S. is true or not, whether a ministry in the A. S. is of the *esse* of the Church, or only of its *bene esse*. See H. B. Swete, *Early History of the Church and Ministry*, 1918.

Apostolici, imitators of the apostolic life mentioned by Epiphanius (*Haeres.*, 67). In the middle of the 12th cent. there existed a sect called Apostolic Brothers on the banks of the Lower Rhine; they rejected oaths, infant baptism, fasts, ceremonies, worship of saints, purgatory, masses, second marriages, and the authority of the Pope. Some of them were brought before the eccles. court of the Archbishop of Cologne, and were afterwards burned to death. About 1260 Gerhard Segarelli of Parma founded another apostolic brotherhood which rejected the authority of the Pope, oaths, and capital punishments.

Apostolius, Michael (d. c. 1480), Gk theologian and native of Constantinople. When the Turks conquered the city he fled to Italy, and so zealously upheld Plato against Aristotle that he lost the protection of his patron Cardinal Bessarion, and retired to Crete. His *Paroemiae*, a collection of Gk proverbs, was pub. in 1619, ed. by Heinsius. See also *Oratio panegyrica ad Fredericum IV.*

Apostrophe (Gk *apo*, from: *strephein*, to turn): 1. A figure of speech in which the speaker turns from his main subject to address some absent person or quality, as in 'O Death, where is thy sting?' or, in one of Hamlet's speeches, 'Frailty, thy name is woman.' See also FIGURE OF SPEECH.

2. A comma (') denoting elision, as in e'er. In the genitive singular it represents the *e* of the A.-S. ending *es*, as man's for *mannes*. The incorrect use of the (') is a very common error.

Apothecaries, Society of, see APOTHECARY.

Apothecaries' Measure, see METROLOGY.

Apothecary, originally one who prepared and traded in drugs. In medieval England the A.s engaged in a flourishing trade in drugs and spices from the E. In the 14th cent. they became merged in the Grocers' Co., but, under a charter from James I early in the 17th cent., they separated again to form their own company: they then had the monopoly of buying and selling drugs within the city of London. In this way the A.s were the pharmacists of the time, and one of their functions was to dispense the prescriptions of the physicians. Not long remaining content with compounding drugs to the physicians' orders, and no doubt urged on by public demand, the A.s started invading the prov. of the physicians by treating the sick—much to the annoyance of the Royal College of Physicians (q.v.), which had failed in its attempt to have a clause inserted in the A.s' charter forbidding them to practise medicine. In the great plague of London in 1665 most of the physicians left the city but the A.s stayed and attended the sick. In 1704 the House of Lords pronounced judgment in favour of the Society of A.s and against the Royal College of Physicians to the effect that an A. could without the advice of a physician prescribe for a sick patient. Although this judgment estab. the legal right of A.s to treat patients in addition to making up and selling drugs, they were not allowed to charge a fee for the advice they gave but only for the medicines they made up. This limitation, which persisted for a long time, was undoubtedly the foundation of the 'bottle of medicine' habit so deeply ingrained in the mind of the Brit. people. The origin of the general practitioner or family doctor as he is known to-day may be said to have sprung from the time when the A. was permitted to give advice and medicine to patients. A further step in this direction was taken in 1774 when the Society of A.s passed a resolution limiting its membership to those who were practising A.s—i.e. medical practitioners. Apprenticeship, as before, remained the mode of entry to the livery of the society. An Act of Parliament of 1815 gave the Society of Apothecaries of London the power to examine all A.s in England and Wales and grant them licences to practise. This gave a great stimulus to medical education, which before that time had followed no prescribed course. The regular teaching of students was started at many of the prin. hospitals. To this day the medical student may qualify to practise medicine by passing the society's licensing examination, which is recognised by the General Medical Council (q.v.) for purposes of registration. To the Society of Apothecaries must go

much of the credit for raising the standard of medical practice and the status of medical practitioners during the 18th cent. and for paving the way for the modern general practitioner, in favour of whose title that of A. has now given way in common usage. The address of the Apothecaries' Hall is Blackfriars Lane, Queen Victoria St, London, E.C.4.

See Sir Zachary Cope, 'Influence of the Society of Apothecaries upon Medical Education in *British Medical Journal*, 1. 1956.

Apothecia (Gk *apothēkē*, storehouse) are open, shield-like fruits or ascocarps of certain fungi of the class Discomycetes, e.g. *Phydia parietina*. Here they may be seen attached to the surface of the leaf-shaped thallus, of a darker orange colour than the rest of the plant.

Apotheosis, deification, the recognising of a mortal as a god—not uncommon in polytheistic religions. (See Froude's *Short Studies*, vol. III.) Alexander the Great accepted divine honours, as did the Seleucid Antiochus Epiphanes. Julius Caesar was deified by Augustus, and this precedent was followed by other Caesars who were worshipped in their lifetimes. Even their relatives and favourites were often thus honoured, e.g. Antinous by Hadrian. See also GENIUS.

Apotome: 1. In anc. Gk music, the remainder of a whole tone when diminished by a limma or smaller semitone, the ratios being 2187 and 2048.

2. The difference in quantities which are commensurable (q.v.) only in power, i.e. in square, cube, etc., as between $\sqrt{2}$ and 1, which is the difference between the diagonal and side of a square.

Appalachian Mountains. These mts form an important feature in the physical geography of the U.S.A., separating the plain of the Mississippi-Missouri from the Atlantic slope. Their total length, about 1500 m., extends from the St Lawrence to Alabama, and their width in some parts reaches 300 m. They are longitudinally divided into a number of ranges and valleys, the latter forming a chain known as the Great Appalachian Valley. The chief ranges in the N. are the White Mts and the Green Mts (Vermont), the Catskill Mts, New York, and some smaller hills N. of the St Lawrence; in the centre, the Blue Ridges of Pennsylvania and Virginia; in the S., the Black and the Great Smoky Mts. The highest of the N. peaks rise to 5000 or 6000 ft., many in the S. reach nearly 7000 ft. On the W. the Allegheny plateau slopes to the Central Plain. The E. ranges are pierced laterally by the Hudson, Delaware, and other valleys, but the W. plateau is almost unbroken. This had a notable effect on early colonisation; Eng. settlers, with great labour and hardship, worked their way along the rvs. to the Appalachian Valley, but there they were stopped for many years by the difficult country, and also by the enmity of the red men, encouraged by the French from Canada and the Spaniards from Louisiana. This check helped to fill up and solidify the Atlantic states, and hardened them

for their later contests with France and England.

The chief rivs. of the Appalachian system are the St John (N. Brunswick), Hudson, Delaware, Susquehanna, Potomac, and James on the E.; the Alabama flowing S., and the Tennessee, Cumberland, and Kanawha into the Ohio. The ranges are largely covered with forests, and wild animals are numerous, including the bear, lynx, and deer.

Appalachicola, see APALACHICOLA.

Appanage, or **Apanage**, in Fr. law, was the provision of lands or feudal superiorities assigned by the kings of France for the maintenance of their younger sons, and was in practice from the time of the Capets until 1832. Towards the close of the 13th cent. the rights of the *apanagiste* were further circumscribed, and in 1790 it was enacted that the younger branches of the royal family of France should be provided for out of the civil list until they married or attained the age of 25, and that then a certain income called *rentes apanagères* was to be granted them. In 1832 the word A. was substituted for that of *dotation*. The term A. is now given to the allowance made to the princes of a reigning house out of the public funds. In Scotland A. is the patrimony of the prince and steward, and in England the Duchy of Cornwall is the A. of the sovereign's eldest son.

Apparatus Sculptoris, or the **Sculptor's Workshop**, constellation distinguished by Lacaille. It is situated in the region of the heavens immediately to the E. of the large star Fomalhaut or a Piscis Australis, and hardly rises above the horizon in the lat. of the Brit. Isles. It is bounded by Cetus, Aquarius, Fornax, Piscis Australis, and Phoenix.

Apparent. In astronomy corrections have to be made for vitiating factors, i.e. the effects of atmospheric refraction, aberration, precession, etc. The positions of heavenly bodies before such corrections are applied are the *apparent positions*.

Apparent Magnitude, in optics, the angle formed by two visual rays drawn from the centre of the pupil to the extremities of the object. Also used in astronomy to denote the brightness of celestial objects. See MAGNITUDE.

Apparent Motion, speed and direction in which a body appears to move, relative to a moving observer.

Apparition, immaterial appearance as of a real being; a spectre or ghost. From the earliest ages amongst all peoples a belief in A.s was prevalent, and it only ceases to exist with a more enlightened knowledge of the circumstances which affect the minds of men. Amongst savages there is often a belief that when a man is asleep his soul leaves his body and wanders in the night, and that the adventures which happen to the soul in its wanderings are real circumstances. The soul is supposed to visit friends, relations, or enemies, and these visitations are called dreams by the person visited. There is another belief among many people that when a man dies his spirit still lives and is seen by other people as a dream or a

phantasm. In the early religions the worship of the dead played a great part, for sacrifices were made to members of the family who had died, who although dead were still aware of the actions of the living and could affect them with sickness as a punishment for offences and impiety. Closely allied to this belief in A.s is the belief in ghosts, who were supposed to be the souls of deceased persons, appearing in a visible form, or otherwise manifesting their presence, to the living. The spirit of a murdered man is said to visit the murderer in the night. Ghosts have been alleged to appear in the same dress they wore when living; they are often pale and cloudy in appearance, and the ghosts seen in churchyards are often clothed in white. A mind which is deranged by fear, by disease, or even by excitement, has a tendency to form images of those objects which have caused the derangement. Fear of a certain object has often caused that object to appear to the mind. A.s have in all ages formed the subjects of pictures and of writings. The Society for Psychical Research conducts investigations in this field. Amongst the works written on A.s and kindred phenomena may be mentioned: R. Baxter, *Certainty of the World of Spirits*, 1691; S. Hibbert, *Sketches of the Philosophy of Apparitions*, 1824; C. Crowe, *Night Side of Nature*, 1852; Andrew Lang, *The Book of Dreams and Ghosts*, 1897; C. Richet, *Thirty Years of Psychical Research*, 1923; E. Bennett, *Apparitions and Haunted Houses: A Survey of Evidence*, 1939; H. Price, *The Most Haunted House in England*, 1940, and *The End of Borley Rectory*, 1946; and the pubs. of the Society for Psychical Research. See also ANCESTOR WORSHIP; ANIMISM; HALLUCINATION; PSYCHICS.

Apparitor, in Rom. times, an attendant on magistrates who saw to the execution of their orders. The term extended to a great variety of officers (see Justinian's Code, 12, tit. 52, etc.). In the Eng. eccles. courts the A. served processes of the court and causes defendants to appear by summons.

Appeal. In law, to remove a cause from an inferior to a superior court for the purpose of re-examination or for decision. In it the party appealing, called the appellant, tries to show that the decision of the lower court on a matter of fact or of law was erroneous, that the verdict was against the weight of evidence, or the sentence excessive. By this means judicial abuses are reduced to a minimum and something approaching uniformity in judgment is secured by the fact that the judges or magistrates in the lower courts have the precedents and dicta of the higher courts to guide them. The party appealed against is called the respondent or appellee. The idea underlying the system of A. would appear to be that a prin. does not divest himself of responsibility when delegating his authority to an agent. Judges being but the agents of the king, and through the king of the community, the responsibility for their decisions should, in grave cases at any rate, be brought home to its source.

It is this idea which enabled St Paul, brought before Festus, to say, 'I appeal to Caesar' (Acts xxv), and to have his A. allowed, and it is this idea which gives to every Brit. citizen the right of appealing in the last resource to the 'King (or Queen) in Parliament,' in other words, to the House of Lords. At the present time A.s can be made from certain dominion and colonial courts to the 'King (or Queen) in Council,' i.e., the Privy Council functioning through its judicial committee. In theory the entire House of Lords, or entire Privy Council, hears the A. In practice the House of Lords in its legal capacity consists of certain Law Lords whose functions are regulated by the Appellate Jurisdiction Acts, 1876 and 1887. The law lords consist of the lord chancellor, 4 lords of appeal in ordinary, and other peers of Parliament who hold, or have held important judicial office, 3 forming a quorum. No peer is excluded, but by custom peers other than those mentioned neither attend nor vote. In the case of *Bradlaugh v. Clarke*, in 1882, an eccentric and non-legal peer successfully asserted his right to sit and did so, voting with the minority. A.s lie from the courts of A. in England, and from the court of session in Scotland, but there is no A. from the Scottish high court of justiciary. A.s from the Eng. courts must be brought within 12 months. A.s from the court of session must be brought within 2 years. Each of the lords may make a speech in the form of a judgment giving his views, and the decision is by majority. If their lordships should be equally divided in opinion the decision of the lower court stands and each side must pay its own costs. The law lords may sit independent of the fact that Parliament is prorogued or dissolved. The Privy Council's jurisdiction as an appellate court has been subjected to many modifying statutes, the Act which constituted its judicial committee being passed in 1833. This committee consists of the president of the council and the lord keeper and other councillors who hold or have held high judicial rank in the colonies or at home. Two other privy councillors may be added by the sovereign and assessors in the persons of colonial judges, and in eccles. cases, of which the Privy Council is the final arbiter, bishops are sometimes added. The court of A. in England as constituted by the Judicature Acts, 1873-5, consists of the lord chancellor, ex-lord chancellor, the lord chief justice, the master of the rolls, the president of the Probate Div., and 5 lord justices. The quorum is 3, unless both parties agree to have the case tried by 2, and no judge may hear in the A. court an A. against his decision in the lower court. The court of A. has 2 divs.: the master of the rolls presides in one, and a senior lord justice in the second. If possible, Queen's Bench cases are heard by 2 common law and 1 equity (Chancery) justice, and in Chancery cases the proportions are reversed. The court must hear motions for a new trial or to

set aside verdicts given by a jury. A.s are heard from both divs. of the high court, from the palatine courts of Lancaster and Durham, the Liverpool court of passage, bankruptcy, etc., and the question of registration and parl. election petitions under the Corrupt Practices Act. A.s from recorders' and magistrates' courts are heard in the first instance by the high court, and any further A. from that court would go to the court of A. and from there to the House of Lords. The A. court may, but in practice seldom does, hear fresh evidence on A., and it may reverse the findings of the lower court, but may content itself with ordering a new trial. In interlocutory matters appeal must be made within 14 days, in final cases within 6 weeks, of judgment. A.s in eccles. cases are heard by the Judicial Committee of the Privy Council. Until the Criminal Appeal Act, 1907, the practice of the criminal law in this country was almost unique in the fact that no A. was allowed from the assizes (other than on a question of law reserved by the trial judge for the opinion of the old court for crown cases reserved (q.v.)), though clemency might be exercised by the sovereign on the advice of the Home Secretary. While, of course, the royal prerogative of mercy remains, the court of criminal A. (England), with carefully defined and somewhat restricted jurisdiction, offers to the convicted criminal another chance. The court consists of the lord chief justice and 8 judges of the Queen's Bench Div. appointed by him in consultation with the lord chancellor. They do not, of course, all sit at the same time, but there must be not less than 3 and always an uneven number of judges. An A. lies to the court on any ground which involves a question of law alone, but it is only by leave of the court or upon the certificate of the trial judge that an A. lies on any ground involving a question of fact alone, or mixed law and fact. There is also a right of A., by leave of the court, against sentence. In a few specified cases there is a further A. to the House of Lords. What are known as divisional courts, that is, courts consisting of 2 high court judges, hear nearly all the A.s from quarter sessions and magistrates' courts, but the consent of the inferior court must in some cases first be obtained. Similarly, the consent of the divisional court is necessary before an A. from it to the A. court can be heard. The quarter sessions hear A.s from courts of summary jurisdiction (police courts) when sentences of imprisonment have been imposed 'without the option.' In the Scottish courts there is an A. from the outer to the inner house of the court of session: from the sheriff court to the court of session, when more than £50 is involved; from the sheriff-substitute to the sheriff-prin.; to the high court of justiciary, on points of law; from inferior courts in criminal cases; and to the quarter sessions from the petty sessions. For A. in the old criminal law of England involving trial by combat, see article under that head.

Appeals in U.S.A. Appellate jurisdiction in the U.S.A. may be considered under (1) A. from state courts to federal courts; (2) A. to the circuit courts of appeal; (3) A. to the Federal Supreme Court; and (4) A. in jury cases. (1) *A. from State to Federal Courts.* Such A. are authorised by statute where the interpretation of the Constitution, laws, or treaties of the U.S.A. is involved, or some right, privilege, or immunity is claimed thereunder. Such an appeal can only be taken after the unsuccessful party has carried the case through the state courts to the court of last resort and is still unsuccessful. (2) *A. to the Circuit Courts of Appeal.* The dist. courts and circuit courts exercise only original and not appellate jurisdiction. The courts of these 2 classes, together with the Supreme Court, formed the judicial dept of the Federal Gov. until the year 1891. In that year a new court was created, called the circuit court of appeal, to be held at one or more places in each circuit, presided over by the 3 judges authorised to hold the circuit courts throughout the circuit, or, in other words, the justice of the Supreme Court assigned to the circuit and the 2 circuit judges appointed for the circuit. By Acts in Congress the number of circuit judges of many cases has been increased to 3. In practice, however, the Justices of the Supreme Court only in rare instances serve in this capacity. When the circuit courts of appeal were estab., the appellate jurisdiction of the circuit courts was transferred to them, and they were given also a considerable part of the appellate jurisdiction previously exercised by the Supreme Court, the object of establishing the circuit courts of appeal being to relieve the Supreme Court of too great a burden. The circuit courts of appeal in the exercise of their general jurisdiction hear appeal cases from the dist. and circuit courts in suits between citizens of different states or between citizens of a state and aliens; also in Admiralty cases and cases under the patent, copyright, revenue, or postal laws, and in criminal cases unless the crime is capital or otherwise infamous, in which event the appeal is to the Supreme Court. With but few exceptions the decision of a circuit court of appeal is final and conclusive, and no further appeal to the Supreme Court is allowed. These courts do not hear A. from state courts. (3) *A. to the Federal Supreme Court.* The appellate jurisdiction of the Supreme Court embraces (i) A. from the dist. or circuit courts in convictions for a capital or otherwise infamous crime; in prize cases; in cases involving the interpretation or application of the Amer. Constitution and cases in which the constitutionality of any law of the U.S.A. or the validity or interpretation of a treaty made under its authority is in question; and in cases in which the constitution or a law of a state is claimed to be in contravention of the Amer. Constitution; (ii) A. from the circuit courts of appeal in any case certified by those courts to the Supreme Court or removed from them to the Supreme Court by direction of the

latter, and in some other cases in which A. to the circuit courts of appeal are not final; (iii) A. from state courts of last resort, but only in cases involving a Federal question. Such is the case when there is involved (a) the validity of a treaty or statute of the U.S.A., (b) the repugnancy of a state statute to the Federal Constitution, or (c) some decision made against any title right, privilege, or immunity claimed to be under the Constitution, statutes, treaties, or authority of the U.S.A.; (iv) A. from the Supreme Court of the Dist. of Columbia or the Supreme Courts of the states; (v) A. from the court of claims or from dist. or circuit courts in cases against the U.S.A. (4) *A. in Jury Cases.* The Constitution provides that 'no fact tried by jury be otherwise re-examined in any court of the U.S.A. than according to the rules of the common law.' But this article merely prohibits a review by a court sitting without a jury of the conclusions of fact reached by a jury, and there is an appellate jurisdiction in jury cases which allows the court to review the rulings of the trial judge and to reverse the decision of the judge entered on the verdict for errors of law.

Congress passed an Act in 1916 to give finality to the decisions of state courts and circuit courts of appeal in certain types of litigation, leaving to a discretionary review by the Supreme Court the question whether a national interest might be involved. This Act has diminished the number of cases of writs of error to state courts, but appears to have had very little effect on A. from the courts of error to the circuit courts of appeal. After the Act had begun to make itself felt in reducing the cases on error to the state courts, the most prolific source of the courts' business was the direct review of dist. court decisions. An Act was passed in 1925 by which it was hoped to assemble in a single statute the whole law defining the appeal power of the U.S. courts and to gather up the scattered provisions defining the jurisdiction of the circuit courts of appeal. The aim of the Supreme Court is to be allowed to confine its adjudications to issues of constitutionality and other matters of essentially national importance. It is open to doubt whether the Act has achieved this purpose to any appreciable extent, but in theory cases now come to Washington only from 3 sources: the dist. court, the circuit court of appeal, and the state court. A decision adverse to the constitutionality of Federal legislation cannot be taken from the circuit court of appeal except on *certiorari* (q.v.); but a declaration by the circuit court of appeal of the unconstitutionality of state legislation is subject to review as of right by the Supreme Court. See Felix Frankfurter and James M. Landis, *The Business of the Supreme Court: a Study in the Federal Judicial System*, 1928.

Appearance. In law, within 8 days from the service of a writ or summons, the defendant must 'enter an A.' by delivering to the proper officer of the court a memorandum stating his intention

either to defend the case himself or to employ a solicitor on his behalf. Notice of this is given to the plaintiff. This procedure obviates the need of a personal A. In civil cases special provision is made for the representation of infants, lunatics, etc., by responsible persons.

Appellants, or Lords Appellant, title given to Thomas, Duke of Gloucester, and the earls of Derby, Arundel, Nottingham, and Warwick, who in 1387 'appealed,' i.e. accused of treason, De Vere and De la Pole, the advisers of Richard II during his minority. The Lords Appellant were responsible for the actions of the 'Merciless Parliament' of 1388. In 1397 Richard imprisoned Warwick and Gloucester, and had Arundel executed.

Appendant, legal term applied to incorporeal hereditaments. Thus advowsons may be A. to a manor; lands to an office; and various rights, as of fishing, to a freehold. A.S. as being originally annexed to the principal, are distinguished from appurtenances, which may be created by grant or prescription at any time.

Appendicitis, see APPENDIX and PERITONITIS.

Appendicularia, see LARVACEA.

APPENDIX

A, large intestine; B, entry of small intestine (showing valve) into D, caecum; C, appendix.

Appendix, in anatomy, an appendage; the term is applied particularly to the A. vermiformis, the small blind gut projecting from the caecum (see INTESTINE). The average length of the A. is $4\frac{1}{2}$ in. and the diameter about a quarter of an inch. The size, however, varies greatly, and

cases have been recorded of the congenital absence of the A. It has no known function in the human body, and probably represents an organ which is gradually being evolved out of existence. It is peculiarly susceptible to the inflammation known as appendicitis.

Appendicitis, or inflammation of the A. is favoured by any structural defects of the organ, such as unnatural length, location, and arrangement. The presence of faecal concretions and foreign bodies, such as seeds, gall-stones, bristles, worms, etc., may act as a predisposing cause, but the essential cause of appendicitis cannot be discovered in many cases. Females are less often attacked than men, because there is often a lymphatic connection between the A. and the right ovary, so that it is not so completely shut off. The onset may be gradual, but frequently is quite sudden. There are abdominal pains, fever, constipation, vomiting, and constant tenderness on pressure over a limited area midway in a line between the anterior superior iliac spine and the umbilicus. An attack of appendicitis may be slight and subside in a day or two with little disturbance to the patient. On the other hand suppuration of the organ may ensue leading to gangrene and rupture, and allowing the faecal contents of the bowel to escape into the peritoneal cavity. A general peritonitis (q.v.) results and the condition is serious. Sometimes the suppuration is so shut in by peritoneal adhesions that the abscess is localised and general peritonitis is prevented. The treatment of choice for appendicitis, when it is diagnosed within 48 hours, is surgical removal of the A. (appendicectomy). After 48 hours, provided that the peritonitis is not becoming generalised and abscess formation is remaining localised, the case is better kept under observation until the abscess has absorbed, when appendicectomy is performed. Done early in the disease appendicectomy is a safe and quick operation. On no account should any purgative be given to a patient suspected of having appendicitis.

Appenzell: 1. Canton of NE. Switzerland, enclosed within the canton of St. Gallen. It is divided, as a result of the religious differences during the Reformation, into Ausser-Rhoden, mainly Protestant and industrial, and Inner-Rhoden, Rom. Catholic and pastoral. The latter area, in the S. of the canton, is more mountainous, the culminating point being Säntis (8215 ft), famous for an extensive view over NE. Switzerland. A remarkable feature of A. is the yearly *Lands-gemeinde*, or general assembly, held in the open air in each Rhoden, at which every adult male citizen *must* appear, girt with a sword. Here the local gov. and the representatives to the Swiss Federal Assembly are elected. From the 11th to the 14th cent. A. was under the abbots of St. Gallen but after a hard struggle for independence it became a member of the Swiss Confederation in 1513. Its old code of laws (the Silver Book) is still used in swearing in the executive at the

Landsgemeinde in Inner-Rhoden. Ausser-Rhoden (pop. (1955) 48,500), cap. Herisau, manufs. cotton, muslin, and embroidery. Inner-Rhoden (pop. (1955) 13,400) is especially conservative in the retention of old-world dress and traditions.

2. Cap. of the Inner-Rhoden half of the above canton, Switzerland. It is a picturesque vil., situated on the R. Sitter, which is formed by the union of torrents from the mt Sântis, S. of the vil. The *Landsgemeinde* (see above) is held at A. on the last Sunday in April. The cap. is known for its embroidery work.

Swiss National Tourist Office

STREET IN APPENZELL, SWITZERLAND

Apperception, metaphysical term first introduced by Leibnitz (1646-1716), to denote the spontaneous transformation by the mind of the 'perceptions' of sense into the elements of conscious knowledge. This idea was taken up by Kant (1724-1804), who laid special stress upon the spontaneity of the mental action involved, and introduced the theory of the 'synthetic unity of A.', i.e., the principle that all incomplete knowledge must be capable of falling into place in one complete system. The psychological side of A. has been worked out by Herbart (1776-1841), who emphasised the practical significance of the process, and made the realisation of this the basis of educational theory. The subject received still further attention from Wundt and Stout. See G. W. von Leibnitz, *Nouveaux Essais*, 1765; J. F. Herbart, *Psychologie als Wissenschaft*, 1824-5; G. F. Stout, *Analytical Psychology*, 1896; W. Wundt, *Principles of Physiological Psychology*, trans. 1904.

Apperley, Charles James (1779-1843), Brit. sporting writer who used the

pseudonym Nimrod. Educ. at Rugby, he was a cornet in the dragoons, but later took to writing and joined the staff of the *Sporting Review*. His best-known works are *Nimrod's Hunting Tours*, 1835, *The Chase, the Turf, and the Road*, 1837, *Memoirs of the Life of the Late John Mytton*, 1837, and *The Life of a Sportsman*, 1842.

Appian Way, anct Rom. road, built in 312 BC by the censor Appius Claudius Caecus to consolidate the conquest of Samnite ter. It ran from the Porta Capena at Rome to Capua (132 m.), and the skill with which it was taken through difficult country is remarkable. By 244 BC it had been extended to Brundisium via Beneventum (234 m.). Much of the old work remains, and the first few miles are lined with pagan and early Christian tombs. Horace, in his first satire, described a journey along the A. W., which was also followed by St Paul (Acts xxviii. 15). Trajan varied its last stage with a new road, the Via Traiana, from Beneventum to Canusium. The 19 m. from Forum Appii across the Pomptine marshes was improved by Nerva, Trajan, and Theodorici, as also by Pope Pius VI who built a new A. W. from Rome to Albano.

Appiani, Andrea, the Elder (1754-1817), fresco painter of Milan. He modelled himself on Correggio, and was thought in his frescoes 'Amor and Psyche' at Monza, and others in the royal palace at Milan, to have almost equalled his master. His prosperity ended with that of his great patron, Napoleon I.

Appiani, Francesco (1702-92), distinguished fresco painter of the 18th cent. b. Ancona. He was employed by Benedict XIII at Rome, but he lived chiefly at Perugia, where he continued to paint with unusual vigour in extreme old age. He painted, according to Lanzi, many pictures for Eng. commissions.

Appiano, It. family who fl. in the Middle Ages. Jacopo d'A. was secretary to Pietro Gambacorta, who made him Chancellor of Pisa. He killed Gambacorta and his 2 sons, 1392, and acquired Pisa, which was retained until his son sold it to the Visconti of Milan about 1400. Piombino, however, was retained by the family until 1589, when Alessandro, the last possessor, was killed, and it fell into the hands of Spain.

Appianus (c. AD 90-140), Rom. historian, b. Alexandria. Here he attained high office, but settled in Rome c. AD 100, and practised as an advocate. At the same time he compiled in Greek a list, in 24 books, only 11 of which have survived to form a most valuable source for the period. Entitled *Rōmaika*, it was really a series of monographs narrating the hist. of various peoples and countries down to their incorporation in the empire. See the text and trans. by H. White (4 vols., Loeb Library), 1912-13.

Appin, mountainous dist. of Argyll, Scotland, between Loch Leven, Linnhe, and Creran. This beautiful dist. plays an important part in Stevenson's *Kidnapped*.

Appius Claudius, see **CLAUDIUS**.

Apple, spurious fruit, or pseudocarp, of the species *Malus pumila* of the Rosaceae. It has been cultivated for many ages and in many lands; Homer speaks of its presence in the gardens of Alcinoüs and Laertes, while, according to the phrase of Horace, a Rom. banquet lasted 'ab ovo usque ad mala,' from the egg to the A. It is a spurious fruit because the calyx-tube swells up to form the fleshy part. The *pips* are the seeds, and the pseudocarp is called a *pome*.

Apple, Love, see **TOMATO**.

Apple of Sodom, or **Dead Sea Apple**, the fruit of a tree said to grow on the shores of the Dead Sea. The legend avers that it looks like a tempting fruit, but when plucked is found full of ashes. Thus 'like an apple of Sodom' has come to signify disillusion.

Appleberry, see **BILLARDIERA**.

Appleby, bor. and market tn. cup. of Westmorland, England, on the R. Eden. Though an important stronghold in Norman times, it suffered greatly from attacks by the Scots (1174 and 1388) and never regained its former status. During the Civil war A. Castle was held for the king by Anne, Countess of Pembroke. Pop. 1704.

Appleton, Sir Edward Victor (1892-), physicist, b. Bradford, Yorks, studied at Cambridge and was prof. at King's College, London (1924-36), and at Cambridge, (1936-9). Secretary of the Dept of Scientific and Industrial Research (1939-49). Principal and Vice-Chancellor of Edinburgh Univ. from 1949. In 1924, together with S. J. Barnett, A. devised and made the experiment which proved the existence of the Kennelly-Heaviside reflecting layer in the upper atmosphere. They located the position of this layer in the upper atmosphere by radio-waves. The experiment was, therefore the first example of the location of an 'object' by radio waves—or, in other words, by radio-location. The technique was subsequently developed and used for the location of aircraft. In further experiments A. in 1926 showed that there was an additional reflecting layer, now known as the A. layer, at a height of 150 m. above the ground, which was electrically stronger than the Kennelly-Heaviside layer, and was the reflecting agent which enabled short radio waves to pass round the world. He was elected F.R.S. in 1927, created K.C.B. in 1941, and awarded the Nobel prize for physics in 1947.

Appleton, city, co. seat of Outagamie co., Wisconsin, U.S.A., on the Fox R. N. of Lake Winnebago, in dairying, livestock area. It manufs. paper, machinery, and woollen goods, and is the seat of the Lawrence College (opened 1853) and the Institute of Paper Chem. (1929). Pop. 34,000.

Applied Biology, term limited to those agric., veterinary, and medical practices which have arisen either through the application of some general principle of the science of biology, or as a result of specific research; it does not normally

include human or domestic animals as main objects of study, except where their relation to other living forms, such as parasites, vectors of disease, etc., is concerned. Thus the rotation of crops—a practice found empirically to improve yields, and in general use since the 18th cent. is not A. B., for the causes of improvement were not recognised until later; the much more recent practice of specific choice of crop succession, either to cause periodic deprivation of the sole food of a pest and thus, its demise, or because of particular mineral constituents of the soil, is A. B., for the method has been devised from scientific knowledge of the requirements of the animals and plants involved. Unlike the physical sciences, where industrial needs, and indeed, industrial research, have provided scientific information for many decades, and where pure and applied sciences are inextricably interwoven, the hist. of biology (q.v.) and the nature of the subject, have been such that only recently have generalisations emerged which could form the basis of applied method; yet A. B. is now a rapidly expanding industry, chief of its activities being pest control—the design of methods for removing, decreasing, or preventing popa. of unwanted animals and plants. Three types of method are in regular use: (1) chemical control, by weed-killers, insecticides, fungicides, etc., in which A. B. provides information on optimal conditions, and dosages, etc., and on the differential application of pesticides as between useful, and unwanted or harmful, organisms, though it must be appreciated that the discovery of such chemicals is still essentially from trial and error methods—not from prediction; (2) biological control, by the introduction or encouragement of predators, parasites, or diseases of the pest, as, for example, the use of viruses against the cabbage white butterfly, or the encouragement of capsid bugs which live on the fruit-tree spider mites; (3) cultural control, as exemplified by crop selection, or by burning corn stubble, to destroy over-wintering resting stages of pests before ploughing.

Special branches of A. B. are concerned with the protection of stored products (foodstuffs, timber, leather, etc.), with disease vectors, such as mosquitoes, tsetse flies, with riv. pollution and the effects of industrial and domestic waste on sewage processes, with fisheries (q.v.) and with the breeding of strains of plant and animal with specific properties or disease resistance, or for special climatic conditions (see **GENETICS** and **HEREDITY**, etc.).

The particularly important problems in A. B. to-day are the emergence of strains of insect resistant to insecticides, which is severely affecting the work of the World Health Organisation; the incidental effects of chemical control, such as killing pollinating insects, and the unforeseen changes in the balance of pops. through the killing of a few component members; the introduction of pests and diseases to new terr., especially through the agency of air transport, where the time for journeys can be shorter than the ephemeral life of the

organism or vector; the artificial control of seed dormancy and germination by light or other climatic treatment; the artificial culture of plants, particularly algae, as a most efficient method of using sunlight energy for additional food supplies (see HYDROPONICS). See also BIOLOGY and EUGENICS.

Appoggiatura (It. *appoggiare*, to lean on), short musical note used as an embellishment, and having no time-value. The time of the long A. is taken from the note which follows it; it is given its marked value, and the succeeding note takes what remains of its own face value. It originated in the desire of old composers to hide a suspended note and soften its appearance of dissonance to the eye, but became obsolete about the time of Beethoven. The short A. is a grace-note written with an oblique stroke through the stem.

Appointment, Power of, see POWER.

Appomattox Courthouse, vil. in Appomattox co., Virginia, U.S.A., where the Confederate army under Lee surrendered to the Federals under Grant on Sunday, 9 April 1865, and ended the Civil war.

Apponyi, Count Albert (1848-1933), Hungarian statesman. He became a Liberal in 1899, but left the party 4 years later and became leader of the National party. In 1906, as Minister of Education, his work had a profound effect on Hungarian culture. After the Communist revolution he was commissioned by the Entente to form a gov. in Hungary, but failed to secure agreement between the different parties. A. was chairman of the Hungarian peace delegation, 1919. See *The Memoirs of Count Apponyi*, 1935.

Apportionment signifies generally a sharing in due proportion, as in the allocation of benefits, damages, liabilities, etc. In law the regulations concerning A. are so numerous and complicated that special Acts to systematise them have repeatedly been passed in Great Britain, the colonies, and the U.S.A. They fall under 2 main heads: (1) A. in respect to estate; (2) A. in respect to time. Property bequeathed on trust under certain conditions is governed by what is called *equitable A.*

A. Bills are passed in the U.S.A., one after every census, to determine the ratio of representation for each state in the coming decade; the states themselves also make similar regulations for their own legislatures. This system has often been greatly abused for party purposes.

Apposition. In grammar, when a noun or noun-clause is used to explain a noun or pronoun in the same case, they are said to be in A.; thus 'John the Baptist was beheaded,' 'He, the chief culprit, escaped.' Here 'the Baptist' and 'the chief culprit' are nominatives in A. to 'John' and 'he' respectively. Again, 'Alexander killed Clitus, his friend'; here 'friend' is objective in A. to 'Clitus.' In the possessive case the apostrophe is added to the second noun, as 'William the Conqueror's army.'

Appraisalment, legal term meaning valuation, such as may be required for purposes of sale, distress, mortgage,

assessment, compensation, or probate. Any person undertaking the work, unless he is a licensed auctioneer or house agent, must take out an appraiser's licence, the penalty for default being £50. He is liable to the person employing him for any loss arising through negligence or want of skill on his part.

Apprehension, in psychology, term which serves to point the distinction between the act of thinking and the object of the thought. The object of thought can only be described by means of propositions capable of being asserted, denied, or assumed. If, for instance, the thought takes the form of believing, it is clear that we cannot 'believe' the event as such, but we must believe some proposition concerning that event. Again, when we are said to 'know' something, this expresses the fact that we know that something is or is not the case. From this it is evident that the object of thought holds an identity in our consciousness which is independent of both time and change. Events begin and cease; but what the mind *apprehends* is not the mere event as it occurs, but the 'fact' that it does occur. Thus, the Great Fire of London began and ended in 1666, but the fact of its occurrence in that year is not limited by temporal conditions; that it happened in that year is a *fact at the present moment*. In the language of psychology, the distinction is between the act of thinking, which is an event in our own mental hist., and the object which has the same meaning whenever it is apprehended. The acts of thinking and apprehending are distinct occurrences in the time order of our conscious life. I can apprehend the Great Fire repeatedly on different occasions; but on each separate occasion my act of A. is a separate one. As a corollary of this position, it is evident that the object itself can never be identified with the present modifications of the individual consciousness by which it is 'cognised.' Again, there is said to be 'implicit A.' when anything is apprehended in the act of apprehending a whole of which it forms a part, without being separately distinguished as a constituent of this whole. Thus, in glancing at a clock, I am distinctly conscious of the clock face as a whole, but not separately of the shape of each individual numeral which it contains; or again, in listening to a band, I may clearly apprehend the combined sound as a confused mass without differentiating the sev. tones produced by the various instruments. Such implicit awareness has been called subconscientiousness as distinguished from clear conscientiousness. Consult James Rowland Angell, *Psychology*, 1905, and G. F. Stout, *A Manual of Psychology* (4th ed.), 1929.

Apprentice, one who is contracted to a master for a period to be taught a trade or profession; in return he gives his services, and usually a premium is paid. The system is traced back to the 13th cent. when it applied to *all* trades and professions, even students being indentured to study for their degrees. Barristers were technically A.s for 16 years, but for

most arts and crafts the term was 7 years, this period being made universal and compulsory in the reign of Elizabeth. Difficulties and anomalies arising later led many to question the value of this arrangement, and after much argument, in which Adam Smith in his *Wealth of Nations* took a leading part, Parliament decreed in 1814 that trades and handicrafts should be thrown open to non-A.s also. Of late years, owing to many causes, such as the increased subdivision of labour, trade union restrictions, etc., the number of apprenticeships has so decreased as seriously to affect the supply of thoroughly trained workmen.

Since an A. is generally a minor, the contract is signed on his behalf by a parent or guardian. It must always be stamped, except in the cases of parish and ships' A.s. The A. must work on any day his master requires, except Sunday, and must not enter upon any engagement which might interfere with his duties without the employer's consent. The master must supply proper training and indoor A.s must be provided with food and medical attendance. He cannot discharge an A. without grave cause, such as serious misconduct or permanent disablement. The agreement is at an end if the master dies or becomes bankrupt, and it may be concluded by mutual consent.

Approaches, in warfare, trenches dug by besiegers to protect them in gradually working their way nearer to the line of fortification. Introduced into Europe by the Turks in the 15th cent.

Approbate and Reprobate, Scottish theological term corresponding to the Eng. 'doctrine of election,' i.e. predestination to heaven or to hell.

Appropriation (from Lat. *appropriare*), setting aside of money or other property to be applied exclusively to one use.

In civil law, a debtor who owes separate amounts to the same creditor is entitled when making a payment on account to allocate the money as he likes in respect of the different debts. If he pays it in without making any such stipulation the creditor can appropriate it as he chooses, even to the payment of a debt which has been allowed to lapse. If there has been no selection by either, the law generally gives the preference to earlier rather than later debts.

In constitutional finance, both in Parliament and, in the U.S.A., Congress, special Appropriation Acts are passed every session to authorise payments by the Treasury of sums required for the public service, as set forth in estimates presented to and passed by the House.

Approved Schools, Reformatories, and Industrial Schools. A. S. provide places of training for children and young persons who appear before the courts and who need to be removed from home for a long period. They have developed from the old Reformatory and Industrial Schools. The first Reformatory was estab. in 1788 by the Philanthropic Society, but it was not until 1854 that young offenders could be committed to the Reformatories by the courts. Even then a term of imprison-

ment of at least 14 days had to be served first. Under the Reformatory School Act, 1893, the passing of a preliminary prison sentence was made optional and in 1899 was prohibited. Industrial Schools were estab. in 1857 for children who were found homeless or begging or beyond control. In 1861 they were allowed to accept children under 12 who were delinquent. In 1908 the supervision of both Reformatories and Industrial Schools became the responsibility of the Children's Branch (now the Children's Dept.) of the Home Office.

Until the Children and Young Persons Act, 1933, became law, the Industrial Schools took delinquents under 12 and children up to 14 in need of care or protection. Delinquents over 12 were sent to Reformatories. There was no power to commit young persons over 14 in need of care or protection or beyond control. Under the 1933 Act both types of institution were replaced by A. S. and the courts were empowered to commit care and protection and beyond control cases whether children or young persons were involved. The schools are divided into senior, intermediate, and junior and according to the sex and in some cases the religion of those committed.

Though the schools are inspected and have to be approved by the Home Office, and are almost entirely financed by grants from public funds, most are still controlled by philanthropic and religious organisations, though some come under the local education authorities. Since 1948 the appointment of the headmaster or mistress has to be confirmed by the Home Office.

The period of committal is in general for 3 years, except that none can be kept after 19 years of age and that children under 12 plus 4 months can be kept until they are 15 plus 4 months. Children or young persons committed to an Approved School can be released on licence at any time after 1 year, but until the expiration of the full term of their committal the school can direct where they shall live and has considerable powers of control, and they can be recalled at any time if their behaviour warrants it. The period of licence is followed by a period under supervision during which they are under the care of the school, though less subject to control. This lasts for a further 3 years except that it cannot be continued after the age of 21. Absconders who are over 16 can be committed by a court of summary jurisdiction to Borstal (q.v.).

The aim of the Approved School is definitely educational and not punitive, and the general atmosphere is very different from that of the earlier repressive Reformatory. All are in open buildings, though closed blocks have recently been added to 2 A. S. for persistent absconders.

Since they are controlled by organisations of varying points of view, there are inevitably considerable variations in the character of the individual schools, and the type of technical education given also varies. Selection of the most suitable

Approved School therefore becomes important. To meet this a system of classifying schools for the boys and senior girls has been built up and now covers the whole country outside of London. Except in London and with the younger girls, the courts can only commit directly to a school run by the local education authority for that area. All other cases go first to a classifying school.

At the end of 1954 there were 127 schools of which 26 were under the local education authority. There were 88 for boys and 39 for girls. Owing to the reduction in the extent of juvenile delinquency 28 schools were closed between the beginning of 1950 and the spring of 1954. In 1955, 2598 boys and 243 girls were committed for offences, and a further 156 boys and 357 girls as being in need of care or protection or beyond control. It will be noted that with the girls this latter group exceeds the numbers of delinquents. This applies particularly to the senior girls and includes those who are in need of care because they have shown themselves to be sexually promiscuous. See J. Watson, *The Child and the Magistrate*, 1950; M. M. Simmons (Home Office), *Making Citizens*, 1954; W. A. Elkin, *English Penal System*, 1957.

Approved Society: 1. A friendly society approved by law for the purposes of the National Health Insurance Acts prior to that of 1946. See NATIONAL INSURANCE.

2. A society registered under the Industrial and Provident Societies Acts (1893-1923), or the Friendly Societies Acts (1896-1924), one of whose chief objects is the provision of allotments, and which is restricted by its constitution as to the rate of interest on its share and loan capital and the distribution of profits among its members.

3. A registered company the constitution of which prohibits the issue of any share or loan capital with interest or dividend exceeding the rate laid down by Treasury regulations.

Approver. By the old Eng. law, when a person who had been arrested, imprisoned, and indicted for treason or felony confessed the crime charged in the indictment, and was admitted by the court to reveal on oath the accomplices of his guilt, he was called an A.

Approximation, see FINITE DIFFERENCES.

Apricot, well-known fruit, a drupe, of the *Prunus armeniaca*, a species of Rosaceae. It is related to the cherry, almond, peach, and plum, and is largely cultivated in Europe.

Apries, Egyptian king, the son of Psamtik II and 4th king of the 26th dynasty. In Heb. hist. he is known as Pharaoh Hophra (Jer. xlv. 30). He succeeded his father in 588 bc and reigned 21 years. He occupied Phoenicia, but failed to save Jerusalem when besieged by Babylonians. His army, sent against the Greeks of Cyrene, was defeated, and this circumstance caused a nationalist revolt under Amasis, whom they asked to be king. A. was defeated and slain 568 bc

and was buried at Sais. See Herodotus, ii. 161-3 and 169; iv. 159.

April, fourth month of the year, consists of 30 days, which was the number said to have been assigned to it by Romulus. Numa Pompilius gave it 29; but Julius Caesar gave it 30, which number it has since retained. In the original Alban or Lat. calendar A. consisted of 36 days and was the first month. The Rom. name was Aprillis, from *aperire*, to open; either from the opening of the buds, or of the bosom of the earth in producing vegetation. The A.-S. name was *Eostre*- or *Eastre-monath*.

Apron. Original meaning of a protective outer garment has been extended to cover various engineering devices used to shelter certain parts of a mechanism. Thus it is used of a rectangular piece of lead which covers the vents of cannon; of a piece of curved timber above the forward end of the keel of a ship; of a protective platform at the base of machines, etc.

Apsaras, in Hindu mythology race of female water-sprites, somewhat resembling the Germanic swan-maidens, who appear in the Gandharvas legends.

Apse, semicircular or polygonal termination to or prolongation of a church or other building, more common on the Continent than in England. Besides the A. at the E. (or W.) end, others have sometimes been added, e.g. at the ends of transepts. A.s are frequent in Byzantine and Romanesque churches, and in ancient Rom. basilicas.

APRICOT

Apscheron, peninsula in the Caspian Sea at the E. end of the Caucasus Mts. The large Baku oilfields and Baku city are situated here.

Apsides. Many heavenly bodies, such as planets, comets, and meteors, move round their primaries in elliptical orbits, and the 2 points in that orbit which are at the greatest and least distance from the central body are known as A. The point most distant is called aphelion, that

least distant perihelion (the corresponding terms in relation to the moon are apogee and perigee). This 'line of A.' is the major axis of the ellipse. This line, owing to the attraction of other bodies, is always shifting forward (in the case of the earth and all the planets except Venus, where the motion is retrograde), gives rise to what is known as the anomalistic year, i.e. it takes the earth 4 min. 43 sec. longer than the sidereal year to return to its perihelion. Perihelion and Aphelion are shown at P and A respectively in the diagram. See APOGEE; PERIGEE; PERIHELION.

APSIDES

Apsley House, mansion at the SE. corner of Hyde Park, London, originally built in 1771-8 for Baron Apsley, 2nd Earl Bathurst, from designs by the Adam brothers. It was bought in 1820 by the Duke of Wellington from his brother the Marquis Wellesley, and in it he held the commemorative Waterloo dinner annually until his death. The house was enlarged about 1828 by Benjamin Wyatt, and has a remarkable interior. It used to be known as 'No. 1, London.' The house and its contents were presented to the nation by the 7th Duke of Wellington in 1947, and after restoration due to severe damage in the Second World War it was opened to the public as the Wellington Museum. It contains art treasures and many memorials of Wellington.

Apsyrus, see ABSYRTUS and ARGO-NAUTS.

Apt (anot **Apta Julia**), Fr. fn, cap. of an arroyo, in the dept of Vaucluse, on the Calavon. It has a fine church (partly 12th cent.), and is the centre of a region in which ochre quarries are found. Pop. 6300.

Apta Julia, see **APT**.

Apertal (Gk *a*, without; *pteron*, wing), type of temple which has prostyles, but not columns along its flanks. Few Gk temples followed this fashion, but most Rom. rectangular temples were A. prostyles.

Apterygota, or **Aptera**, wingless insects. They differ from such insects as wingless ants, which have winged relations and ancestors. In this group there are only 3 orders, the Collembola, Protura, and Thysanura. The best-known species in Britain belongs to the last order, and is *Lepisma saccharina*, the silver-fish, found in kitchens.

Apteryx (Gk *a*, without; *pteryx*, wing), or **Kiwi**, bird found only in New Zealand, is a ratite bird of the family

Apterygidae. The tail and wings are minute and useless, the feathers are hair-like, the beak is long and weak. It is about the size of a hen, is nocturnal, insectivorous, and lays a single large-sized egg.

Apuan Alps, branch of the Etruscan Apennines (q.v.) in NW Tuscany (q.v.). They are 30 m. long, and fall steeply to the coastal plain of the Ligurian Sea (q.v.). The highest point is Mt Pisanino (6382 ft.). They are noted for beautiful white marbles (see CARRARA and MASSA).

Apuleius, Lucius (b. c. AD 125), Rom. satirist and rhetorician, b. Madaura, N. Africa, was the son of a wealthy magistrate. He studied at Carthage and Athens, and showed a preference for the philosophy of Plato. After the death of his father he used the great riches left him to travel, and went to Italy and Asia. The outcome of this journey was a satire *Metamorphoses* (*The Golden Ass*), a prose romance purporting to narrate the experiences of one Lucius, whom an enchantress had changed into an ass. Justly described as the 'parent of modern romantic literature,' it is veritably 'a gallimaufry of intrigue, sorceries, bickerings, and ravishments, savoured with gaiety and humour, told at the topmost pitch of skyscraping spirits.' The finest part is the graceful tale of Cupid and Psyche, which has been pub. separately more than once. In 155 A. married a wealthy widow, and was accused by some of having gained her by witchcraft. His *Apologia sive Oratio de Magia* is a fine piece of work. He also wrote two philosophical essays, *De Deo Socratis* and *De Mundo*. The best ed. of *Metamorphoses* is that of R. Helm, 1907, brilliantly trans. by Robert Graves (Penguin Books, 1952). Helm's ed. of the *Apologia* has been trans. by H. E. Butler, 1910, and there is an ed. of the *De Mundo* by P. Thomas, 1908.

Apulia (It. *Puglie*), region (*compartimento*) of SE. Italy, comprising the provs. of Bari, Foggia, Lecce, Brindisi, and Taranto (q.v.). It is bounded N. and E. by the Adriatic, NW. by Abruzzi e Molise. W. by Campania and Basilicata, and S. by the Gulf of Taranto (q.v.). In ant. times A. was inhabited by sev. peoples, as the Apuli, the Messapii (see IAPYGTIA), and the Daunii (q.v.). It was conquered by the Romans in 317 BC; the extreme SE. was the Rom. Calabria (q.v.). The Second Punic War (see CARTHAGE) was partly fought here, and the battle of Cannae (q.v.) took place within its borders. Subsequently it came under the power of the Byzantine Empire (q.v.), the Longobards (q.v.), the Byzantines again, the Normans (q.v.), and finally the crown of the Two Sicilies (see SICILY). The N. and the S. (the 'heel' of Italy) are plains, the N. plain containing the isolated mt mass of Gargano (q.v.). The centre has ranges of the S. Apennines (q.v.). There are mineral deposits (bauxite, salt), and tobacco, wine, olives, almonds, and figs are produced. The chief tn is Bari. Area 7462 sq. m.; pop. 3,340,000.

Apulum, see ALBA IULIA.

Apure, riv. in Venezuela which rises in

the E. Cordillera of Colombia and flows into the Orinoco. The chief towns on its banks are San Fernando and Nutrias (port). Its course is about 500 m., and it is navigable for just over half that distance.

Apurimac, riv. in Peru which rises in the Andes in the prov. of Arequipa. After a N. course of about 600 m. it joins the R. Urubamba to form the Ucayali, and finally the Amazon. It also lends its name to the dept., which has an area of nearly 8200 sq. m. (pop. 333,900). The cap. is Abancay, and it yields rubber, rice, and cotton, having also excellent grazing land for cattle-breeding.

Apus, or the **Bird of Paradise**, constellation in the S. hemisphere. Its three brightest stars are of 4th magnitude and orange coloured, and its most westerly one is due S. of Alpha Centauri.

Aqabah: 1. Tn on the E. side of the Gulf of A., which has been identified with the biblical Elath. It is on the pilgrim route from Egypt to Mecca. It is now the port of Israel.

2. A gulf formed by a branch of the Red Sea between the peninsula of Sinai and the N.W. of Arabia. It is the ant. Sinus Aclanticus.

Aqua Regia, mixture of concentrated nitric acid with 4 times its vol. of concentrated hydrochloric acid. It derives its name from its capacity for dissolving the so-called 'noble' metals, such as gold and platinum, which are unaffected by most solvents.

Aqua Tofana, liquid poison invented by a woman named Tofana in the 17th cent. It was tasteless, colourless, and very deadly, even in small quantities. It was sold in Rome and Naples by her daughter. The ingredients have never really been discovered, but it is supposed to have been composed largely of arsenic and lead.

Aqua-vitæ (Lat., 'water of life'), the elixir of life of the alchemists who discovered distillation. They identified it with the distilled quintessence of wine, but in Fr. *eau-de-vie* applies to spirits distilled from other substances than wine. In Gaelic its equivalent *uisge beatha* provides the derivation of whisky.

Aquæ Bignororum, see BAGNERES-DE-BIGNORRE.

Aquæ Bilbilianæ, see BILBILIS.

Aquæ Calidæ, see VICHY-LES-BAINS.

Aquæ Coloniæ, see CALDAS DE REYES.

Aquæ Mortuæ, see AIGUES MORTES.

Aquæ Pannoniæ, see BADEN-BEI-WIEN.

Aquæ Patavianiæ, see ARANO TERME.

Aquæ Perennæ, see ÉPERNAY.

Aquæ Sextiæ, see AIX-EN-PROVENCE.

Aquæ Statiellæ, see ACQUI.

Aquæ Urentæ, see ORENSE.

Aquafortis, old name for nitric acid (q.v.).

Aqualung, used in free-diving for exploration of under-sea archaeological sites, salvage work, etc., consists of one to three bottles of compressed air connected with a mouthpiece and fitted on the diver's back by harness equipment. Goggles cover the eyes and nose; rubber fin-paddles are fitted to the feet to aid

propulsion, while rubber suits may be worn as a protection against cold. See ARCHAEOLOGY, *Undersea Archaeology*.

Aquamarine (Lat. *aqua*, water, *marinus*, pertaining to the sea), a sea-green or bluish-green variety of beryl which is used as a precious stone. It is found in N. and S. America and in Australia.

Aquarium (Lat. *aqua*, water), small reservoir of fresh or salt water in which aquatic animals and plants are kept for scientific purposes, or for amusement. Large aquaria are to be found in places such as zoological or botanical gardens and laboratories in which biology is studied.

Owing to the placidity of the water and air, an A. is difficult of aeration; artificial fountains, the presence of green plants, and the action of pouring water from a height are all beneficial. In a salt-water A. the green alga of the genus *Ulva* grows readily, while duckweed will flourish in fresh water. The amateur natural historian will find sticklebacks, minnows, newts, tadpoles, axolotls, and water-snails thrive under his care, but generally fish are difficult to preserve alive. Goldfish, sun-fish, thunder-fish, and catfish frequently are denizens of aquaria, but they are liable to be attacked by a fungus disease which usually proves fatal. Insufficient aeration and decaying food will cause a white, film-like substance to cover their bodies, hamper their movements, infect their neighbours, and work speedy havoc among them. It may sometimes be removed by placing them in water in which salt has been dissolved, or by gentle application of a soft paint-brush when the patient is under running water. The *Triton cristatus*, a large newt, is a hardy, carnivorous amphibian which requires a large receptacle, and at certain periods of the year prefers to live on land. See E. G. Boulenger, *The Aquarium Book*, 1925, and G. C. Bateman, *Fresh Water Aquaria*, 1936.

Aquarius, or the **Waterbearer**, group of stars forming the eleventh sign of the zodiac (q.v.). This constellation is supposed to bear a resemblance to a water-bearer, hence its name and its hieroglyph . The sun enters the sign of A. on 21 Jan. The origin of the name has been traced by some to the fact that the Nile rises during the month of A., whilst others attribute it to the rainy season in India. No star in A. is brighter than the third magnitude, but it includes some interesting double stars, a fine star-cluster, and the 'Saturn' nebula.

Aquatic Animals is a vague and wide term applied to animals which cannot exist without water, to amphibians which take to it on occasions, and to animals which are also perfectly at home on land; it includes those which respire air by means of lungs, or water by means of gills, vibratile cilia, or any other apparatus. They are distributed over the whole world.

Most of the lower invertebrates are truly aquatic; sea anemones, jelly-fish, many of the annelids, even earthworms, and crustacea, such as crabs and lobsters, cuttle-fish, molluscs, such as mussels

and cockles, with the exception of some gastropods, would perish if exposed to the sun and deprived of water. Among vertebrates fish are exclusively formed for inhabiting a fluid medium; they breathe by gills, are covered with scales, their form is elongated and compressed, the eye is suited to the dense medium of the water, they balance themselves on fins, and the laterally compressed tail serves as a paddle. Among reptiles, crocodiles and turtles may be regarded as truly aquatic; they breathe air, however, and come on land to lay their eggs. Nearly all aquatic birds (except, e.g., the water-ouzel) have webbed, oared, or lobated feet, as grebes, auks, puffins, razorbills, geese, ducks, pelicans, gannets, and gulls; the penguin is as awkward on land as a seal, and as much at home in the sea. Among mammals the whales and porpoises are most truly aquatic, having a smooth and oily skin, a layer of blubber covering the internal viscera, and they are constructed to permit a long cessation of respiration while submerged; walrus and seals obtain their food in the sea, but breed and repose on rocks; their forelimbs are formed into paddles, the hind limbs are placed far back and are also paddles or oars, and every part of their internal structure is saturated with oil. Other aquatic mammalia are usually only web-footed and visit the water for prey (e.g. the otter).

Aquatic Plants are known in botany as *Hydrophytes* (Gk *hudōr*, water; *phuton*, plant). The *Hydrophytes* form a large group of flowering plants, and differ from *Geophytes*, which are rooted in the soil, and *Epiphytes*, which use other plants for support, chiefly because they dwell in the water. There are, however, many incidental peculiarities of structure and pollination in *Hydrophytes* which are not present in their *geophyte* relations, and when transplanted to soil become extinct. They are not influenced by changes of temp. to such a degree as their earth-grown neighbours, hence many of them are perennial. They frequently form winter-buds, which hibernate at the bottom of the water and develop in the early spring (e.g. *Utricularia*, or bladder-wort, and *Potamogeton*, or pond-weed). Besides this asexual reproduction there is the ordinary sexual reproduction common to flowering plants, many of the flowers being above the water and pollinated by insects or the wind; sev., e.g. *Zostera*, or eel-grass, have submerged flowers, of which the pollen grains are thread-like, and float at any depth of water until finally they reach a large stigma and so come to rest.

An interesting feature of these plants is their heterophyllous condition, for there are no fewer than 4 types of leaves observable in them. Those which live beneath the surface are not cuticularised, and are devoid of stomata, the latter confined to the upper surface, whereas in mesophytes they are usually more numerous on the lower surface, while those which float on the surface have both cuticle (generally of a waxy nature)

and stomata. The 4 types are: (a) ribbon leaves, (b) much-divided leaves; (c) awl-shaped leaves; and (d) entire, rounded or lobed surface leaves. The ribbon leaves are found in plants which grow in running water, e.g. *Zostera*; the much divided leaves occur in still-water plants, e.g. *Ranunculus aquatilis* or water crowfoot; the awl-shaped leaves are also submerged, and are found on plants which usually can also grow on land, e.g. *Subularia*, or awl-wort; the floating leaves have large and conspicuous air-spaces, as exemplified in such plants as *Nymphaea*, or white water-lily, *Nuphar*, or yellow water-lily, and also *Ranunculus aquatilis*. Air spaces are also common in the stem. The slimy nature of the hydrophytes is caused by a mucilaginous secretion from surface glands or hairs; the fibrous and vascular tissues are developed to a very slight extent.

Among other interesting A. P. may be mentioned *Elodea*, or Canadian water-weed; *Typha*, or bulrush (also known as cat-tail); *Nelumbium*, or sacred lotus; *Ceratophyllum*, or hornwort; *Sagittaria*, or arrow-head; *Nasturtium officinale*, or water-cress; *Iris pseudacorus*, or yellow flag; *Lemna*, or duckweed; *Stratiotes*, or water soldier. Among these are included a few plants which have their roots in water and the shoots in the air, e.g. the bulrush, and these are often classified as marsh plants. The algae are treated of in a separate article. See J. C. Willis, *Flowering Plants*, 1908; Agnes Arber, *Water Plants*, 1920; Frances Perry, *Water Gardening*, 1939.

Aquatint, means of etching on copper or steel to produce pictures in imitation of sepia and Indian ink drawings. The effects are obtained by the action through a porous ground of sand or some thin resinous solutions, on copper sheets. It was invented in the 18th cent., and sometimes used for colour (see COLOUR PRINTING), as well as black-and-white prints, but is little used to-day, though interesting efforts to revive it have recently been made in France. M. Roger Lacouëre has employed an old trade technique (the 'sugar process') and by this means has reproduced drawings by Clouet (in colour) for the Bibliothèque Nationale, as well as paintings by Picasso and Poussin. Picasso used this process in his illustrations to Buffon's *Histoire Naturelle*, 1942. John Piper's series of *Brighton Aquatints*, pub. in 1940, is an Eng. example.

Aqueduct, artificial conduit or channel for the conveyance of water, the term being usually applied to an open channel rather than pipes. A.s were made on a large scale by the Egyptians and Babylonians, while some of the anc. Gk and Rom. A.s are used to this day. Most of the former are subterranean, and wonders of engineering skill, but perhaps this mode of getting water from the hills to the towns was most extensively employed by the Romans. Rome itself was supplied by 9 A.s, which brought the water over 60 m., and in some places were built nearly 200 ft. in height. These were formed either by erecting one or more rows of arcades

across a valley and making them support 1 or 2 more level canals, or by boring through mt sides which would have interrupted the watercourse. In AD 741 an A.

AQUEDUCT AT SEGOVIA

having 10 pointed arches of 70-ft span was built at Spoleto by Theodoric, King of the Goths.

Ruins of A.s can be found in many parts of Europe, among which may be mentioned the famous one at Pont du Gard at Nîmes. At Metz in France, and at Mainz in Germany, there are also ruins of the same sort. Spain has one at Segovia, and Portugal at Evora, while in Italy these ruins are very numerous.

The Maintenon A., which was begun in 1684 but never finished, is one of the finest structures of this nature in the world, despite its incomplete state. Other A.s of modern times and still in use are the Bridgewater Canal (q.v.) over the R.

Irwell (the first in England), the Croton A., which supplies New York, the Mar-selles A., over 60 m. in length, and also those at Manchester, Glasgow, Birmingham, Bombay, and Vienna. In certain parts of the U.S.A., especially California, there are timber A.s termed flumes, which are frequently carried along steep mt slopes and across valleys, supported on trestles. They are used to convey water for hydraulic mining, for irrigation, and timber transportation. The 3 largest A.s in the U.S.A. are (1) the Catskill, supplying New York, (2) the Owens R., supplying Los Angeles, and (3) the 'Hetch Hetchy' A., completed in 1932, which serves San Francisco. The Catskill has a length of 92 m. (of which 14 m. are tunnel and 23 m. pressure pipes) and a capacity of 500 million gallons per day. The Los Angeles A., which cost about 23 million dollars to construct, has a capacity of 280 million gallons per day and a length of 223 m. The San Francisco A. is 156 m. long, with a capacity of 400 million gallons per day. See also CANAL.

Aqueous Humour, water fluid between the cornea and crystalline lens of the eye. See EYE.

Aqueous Rocks, term applied to rocks which have been deposited under water by the chemical and mechanical action of the water or by organic depositions. They may be made respectively of chemical precipitates, of mineral and rock fragments, or of decayed vegetable and animal matter.

Aquiba (Aqiba), or Akibah, Ben Joseph, called Barakiba by Epiphanius and Hieronymus, lived during the end of the 1st cent. and the early part of the 2nd (c. AD 50-132). He was a disciple and successor of the Rabbi Gamaliel. He joined the standard of the pseudo-Messiah Bar-cochba (q.v.) in Judaea, and when the Emperor Hadrian took Bethara, he ordered that A. should have his skin taken off by an iron comb. He was buried in Tiberias. The authorship of the *Jerirah*, the chief book on cabbalistic doctrines, has by some been ascribed to A.

Aquifer, geological name given to a series of beds from which water can be obtained. The water-bearing properties of rocks vary considerably. A good A. is

GROUND
WATER LEVELS

SOIL

SHALE

UNDERGROUND WATERS

Water and rain and melting snow sink into the soil until arrested by some impermeable bed, such as clay or shale. The level of ground water rises after a wet season and sinks after a dry one, leaving shallow wells without a water supply. Springs occur along the sides of slopes where the top of the impermeable layer is exposed.

both porous, that is, has a high proportion of voids, and permeable. The permeability of a rock is a function of the size of the spaces within the rock. Thus water penetrates but slowly through a clay in which the voids are small, but more readily through a sandstone or gravel where the spaces between the solid particles are larger. Limestone and chalk when fissured are good A.s as the water passes through the cavities so produced. In S. England much water is obtained from underground resources within the Chalk and the Greensand. Farther N. the New Red Sandstone forms an excellent A. Overseas, gravels provide good supplies in many countries, but they are not used for large supplies in Britain.

Aquifoliaceae, family of dicotyledon evergreen shrubs and trees, about 500 species; with leathery, alternate leaves, small, 4-parted, dioecious flowers, and drupe fruits. Chief genera are *Ilex* and *Nemopanthus*.

Aquila, see L'AQUILA.

Aquila (Lat., 'eagle'), constellation situated above and resting on the zodiacal constellations of Capricornus and Aquarius, and to be found due S. at 8 p.m. in the middle of Sept., its brightest star Altair being then about 50° above the horizon in the lat. of London. In the Gk mythology this constellation represented the eagle of Jupiter, and according to some the bird which was the tormentor of Prometheus. A group of stars, now treated as part of A., were named Antinous by order of the Rom. Emperor Hadrian.

Aquila and Priscilla, Jew of Pontus and his wife, who settled in Rome, but left when the Jews were driven out by Claudius (Acts xviii. 2). They were in Corinth when St Paul met them and, as they were of the same trade, lived with them. A. and P. went from Corinth with Paul as far as Ephesus, where they settled down and their house became a Christian meeting place (1 Cor. xvi. 19). Apollos was instructed by A. and P. In Rom. xvi St Paul sends his greetings to them, which indicates that they had returned to Rome and had again made their house a place of Christian worship. The church of St Prisca on the Aventine in Rome is supposed to indicate the site. 2 Tim. iv. 19, however, shows them again in Ephesus. We do not know enough about them to explain or to criticise these movements. Rom. xvi. 4, with its reference to all the churches of the Gentiles as indebted to them, suggests that they were peripatetic in their habits.

Aquila degli Abruzzi, see L'AQUILA.

Aquila Ponticus, relative of Emperor Hadrian, lived c. AD 140, and trans. the O.T. into Greek, aiming, according to Jerome, at a word for word rendering. Part of this version was found in fragments of Origen's *Hexapla*, in two palimpsests, at the beginning of this cent.

Aquilegia, genus of hardy perennials, family Ranunculaceae, of which *A. caerulea*, *A. chrysantha*, *A. formosa*, and *A. vulgaris*, the Columbine (q.v.), and their varieties are popular.

Aquileia, anct tn of Gallia Transpadana,

at the head of the Adriatic, founded by the Romans in 181 BC. A place of great strategic importance, it was also a commercial centre; and in Imperial times its military associations made it one of the prin. seats of Mithraism. In AD 452 A. was taken and destroyed by Attila after a 3-month siege. Many of its inhab. fled to the lagoons where Venice now stands. A new tn was built, but it never regained its former glory. The cathedral dates from the 11th cent. Pop. 2900.

Aquin, tn on S. coast of Haiti, W. Indies, 72 m. SW. of Port-au-Prince. Pop. 1800.

Aquinas, Thomas, St (c. 1226-74) (Thomas of Aquino), one of the most famous of scholastic theologians, known as *Doctor Angelicus*. He was of noble descent, and was b. at the castle of Roccasecca, the property of his father, the Count of Aquino, in the ter. of Naples. He began his education at the monastery of Monte Cassino, after which he studied in the univ. of Naples. While there he came under the influence of the Dominicans, and in spite of violent family opposition was at last permitted to enter their ranks. At the Dominican school of Cologne, whither he was sent, he came under the influence of the greatest teacher in Europe, Albertus Magnus. Later he followed his master to Paris, and was there granted the degree of bachelor of theology. About the year 1248 he returned to Cologne still with Albertus, in the official position of second lecturer. Already the controversy between the univ. of Paris and the teaching friars had broken out, and Thomas had thrown himself with great zeal into the defence of his own order. So great was his zeal that later he was chosen to defend the attitude of the Dominicans before the Pope himself. The hostility of the univ. to the mendicant orders prevented his taking his doctor's degree until 1257, when, together with the Franciscan Bonaventura, he received that degree. Eccles. honours were his practically for the asking, but he refused them all. The popes themselves were beholden to him for advice, and he was held in high regard by Urban IV and Clement III; so great was his love of the religious life that he refused the archbishopric of Naples. In 1263 he visited London to take part in the general chapter of his order. The greater part of his later life was taken up in visits to various potentates and in the duties of his state. He was called again in 1272 to his professional chair at Naples, and 2 years later was summoned by Pope Gregory X to the General Council of Lyons. (I) though he was, he set out, but d. at the Cistercian monastery of Fossa-Nuova on 7 Mar. 1274. He was canonised by Pope John XXII in 1323, and was declared a Doctor of the Church by Pope Pius V in 1567. He is regarded as the patron saint of all Catholic educational establs., and is still upheld as the teacher of the orthodox Catholic faith.

His teachings are equally important from the point of view of the theologian and that of the philosopher, and substantially his writings are regarded as

authoritative by the Rom. Catholic Church. His style is definite, clear, and concise, and the basis of his system seems to have been mainly that the 2 sources of knowledge were the mysteries of Christian faith and the truths of human reason. The mysteries of Christian faith are to be believed because they help even when they cannot be understood. His greatest works are the *Summa contra Gentiles* and *Summa Theologica*.

Bibliography. WORKS: *Opera Omnia*, 25 vols. (Parma), 1862-75; 34 vols., ed. Vivès (Paris), 1871-80. TRANSLATIONS: *Summa Theologica*, 1912-22, and *Summa contra Gentiles*, 1924-9, trans. by members of the Dominican Order; the latter also trans. by J. Rickaby, 1905, under the title of *God and His Creatures*; M. C. D'Arcy (ed.), *Thomas Aquinas: Selected Writings* (Everyman's Library), 1939. LIVES: R. B. Vaughan, *Life and Labours of St Thomas of Aquino*, 1871-2; A. E. Taylor, *St Thomas Aquinas as a Philosopher*, 1924; G. K. Chesterton, *St Thomas Aquinas*, 1933; W. R. O'Connor, *The Eternal Quest*, New York, 1947.

Aquincum, anct Rom. tn, situated near the present city of Budapest (q.v.). The name is said to be a corruption either of 'Aquae quinquæ' (five springs), or of the Celtic *Ak-Ink* (abundant waters). By c. ad 200, A. had become the cap. of Lower Pannonia (q.v.), and Valentinian II (q.v.) was proclaimed emperor in the tn in 375. The extensive ruins of A., standing beside the Budapest-Vienna road, have been excavated, and there is a museum on the site.

Aquino, see AQUINUM.

Aquinum (modern Aquino), anct tn of Latium on the Via Latina, 6 m. W. of Casinum (modern San Germano). Strabo describes it as a Rom. colony and a populous city. It is the probable bp. of Juvenal. Pescennius Niger, one of the competitors for the empire after the death of Commodus (ad 193), was b. at A. The church of Santa Maria della Libera suffered greatly in the Second World War, the roofs of the nave and one aisle being destroyed; the church of San Tommaso was damaged beyond repair. Pop. 2833.

Aquitaine (Rom. Aquitania), a Rom. prov. of Gaul, stretching from the Pyrenees to the Garonne. Augustus added to this the dist. between the Garonne and the Loire. It was conquered by the Goths in the early 5th cent., by the Franks in the 6th cent., and was an independent duchy under the Merovingians (q.v.). The name was corrupted to Guyenne (q.v.) by the 10th cent. Gascony (q.v.), which had become separated, was regained in 1052. A. was united to the Fr. crown in 1137, but passed to England in 1152 through the marriage of Henry II with Eleanor of Aquitaine (q.v.). It was lost to England again in 1452. See also TOULOUSE.

Aquitania, see AQUITAINE.

Aquitanus Sinus, see HISCAY, BAY OF.

Ara (Lat., 'altar'), constellation situated to the S. of the zodiacal sign Scorpio, and so low in the heavens as not to be visible

in Great Britain. In it are 1 or 2 variable stars.

Ara (dimin. of *araraca*, native name), genus of tropical birds, the macaws, of the family Psittacidae, or parrots, and order Psittaciformes. It has a curved and powerful beak, a long tail, and vivid plumage, and can live in captivity. *A. macao* is found in Brazil, *A. militaris* in Mexico.

Arab (Horse). The original home of the A. is unknown. Some think that, like the Barb (q.v.), the A. breed are descended from the 'Libyan' horse; but they were certainly to be found ultimately in the Nejd, Central Arabia, and in the 5th cent. AD were a special breed belonging to the Bedouins. By the 6th cent. the A. tribes were carefully breeding (or in-breeding) from them, and the purest breeds are still to be found in the Nejd. They were a decisive factor in the conquests of the Mohammedan Saracens, and in the course of centuries these A. horses developed into the superb strains which eventually improved the standard of light horses throughout Europe. Only a small proportion of horses bred in Arabia are pure A.s, and these are known as the Kohl (antimony) on account of the bluish-black tint of their skin. Legend has it that the 5 chief families of the A. are descended from a mare known as Kehalet Ajuz (the mare of the old woman); but the Bedouins recognise 5 Kohlani strains, the first and most numerous strain being the Kehallan, which are largely bays, with a white 'star' and 1 or 2 white feet, and are reputed the fastest though not the hardest of the 5. These are the most like the Eng. thoroughbreds, being more nearly related to them than the others. The Darley Arabian—the most famous of all E. horses ever brought to England, bought in Aleppo by Mr Darley, H.M. consul, in 1704—was a pure bred Kehallan. The Abeyan strain, a smaller if handsomer horse, does not so strongly resemble the Eng. thoroughbred. A characteristic of the A. is the peculiar way he carries his well-elevated tail—very still and without the usual sideways swing—while at the gallop his dock is carried almost vertically. The A.'s weak points are a tendency to 'ewe-neck' and excessive thickness of shoulder, the latter being one of the reasons why the A. is not a fast horse judged by modern standards. A height of 14.2 hands is the proper height for the A., whence we may infer that the size and strength of our modern Eng. horses are not solely due to A. blood. Pure-bred A.s are of most colours, but the bay and grey predominate; there are also many chestnuts, and sometimes browns and blacks. A feature of the A. is his endurance; but, as regards speed, the A., owing to careful crossing, is quite out-matched by modern Eng. racehorses. Nor, again, are A.s much used as jumpers, steeplechasers, or hunters. The A., however, makes an excellent polo pony and (for what little this is worth nowadays) light cavalry horse. The Anglo-A., a first cross of thoroughbred A.s, or

descended wholly through ancestors so bred, is, despite its name, a Fr. speciality, and many international show-jumping trophies have been won by Fr. teams mounted on Anglo-A.s. The best-known use of A.s in horse-breeding to-day is in the upgrading of pony stock by the use of A. stallions on selected mares of Brit. native breeds, e.g. Welsh, Connemara, New Forest, Highland. In the Nejd itself the A. is threatened with extinction owing to motorisation, oil royalties, and the fact that Islamic law condemns horse-meat as food. *Consult* W. Ridgeway, *The Origin and Influence of the Thoroughbred Horse*, 1905; Prof. J. C. Ewart, *The Multiple Origin of Horses and Ponies*, 1908; A. J. R. Lamb, *The Story of the Horse*, 1938; Lady Wentworth, *The Authentic Arabian Horse*, 1941, and *The Swift Runner*, 1957.

Arab League, most recent expression of the Pan-Arabic movement (q.v.), was founded at Cairo in Mar. 1945 at a conference of Arab states, with the encouragement of the Brit. Gov. The objects of the league as stated in the covenant are to protect the independence and integrity of the member-states and to encourage economic and cultural co-operation. To the latter end a cultural treaty was approved in Nov. 1946. The original parties to the covenant were Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Jordan, Yemen, and representatives of the Palestine Arabs. Libya acceded in 1953 and the Sudan in 1955. Each member-state is represented on the council, which meets in Cairo, and the secretariat is also situated in Cairo.

The main concern of the A. L. has been the Palestine problem and it undertook the presentation of the Arab case between 1946 and 1948 at London and in the U.N. All members went to the aid of the Palestine Arabs in May 1948, but only Egypt, Syria, and Jordan (Transjordan) provided effective forces. Subsequently they have enforced an economic and political boycott of Israel.

This appearance of Arab unity cannot disguise the serious divergencies of the interests and policies of the member-states, which were apparent even during the Palestine war. Among these differences may be singled out the Egyptian attempt at gaining hegemony over the Arab world, the dynastic enmity between Saudi Arabia on the one hand and Iraq and Jordan on the other, and the varying attitudes adopted by the Arab states towards Great Britain, the U.S.A., and the U.S.S.R. In 1955 Iraq joined the Baghdad Pact. This, together with the Syro-Egyptian alliance of the same year seems to mark the end of the A. L. as an effective force. Subsequent events have done little to alter this situation, and when Israel attacked Egypt in Oct. 1956 there was no military response from the other members of the league. *See* C. Hourani, 'The Arab League in Perspective' in *Middle East Journal*, 1947.

Arabah (arid, desert region), the geographical name of that great depression of the land in which are found the

sea of Galilee, the Jordan, and the Dead Sea (Joshua xi, xii). In the A.V. of the Bible the word is trans., being generally rendered by plain, but also by wilderness or desert. The hollow known to-day as El-'Arabah stretches southwards from the line of cliffs (the Ghôr) which crosses the Jordan Valley from NW. to SE. In its S. reaches it forms 'the wilderness of Zin' (Num. xxxiv), and its undulating surface is formed of loose gravel, stones, sand, and stretches of mud. It is torn by watercourses from either side, converging on Wadij et Jaib. It is bounded on the W. by the limestone uplands of Et-Tib and the wilderness of Paran, and on the E. by the fantastically shaped and naked crags of Edom (q.v.).

Arabesque, carved or painted panel in the Rom., Hellenistic, or Renaissance style, introducing human, animal, grotesque, symbolical, or other elements in conjunction with delicate conventional foliage. The term A., though used since the 17th cent., is quite incorrect as a description, because all representations of human, animal, or other natural forms were forbidden in Arab art. There are many examples of A.s in Rome and Pompeii.

Arabi Pasha (1840-1911), leader of the insurrectionary party in Egypt, 1882, b. of fellah parents in Lower Egypt; began life as a labourer, and served in the Egyptian Army as a private soldier for 12 years. He organised a national party in opposition to the Anglo-Fr. control, obtained the deposition of the ministry, 1881, and became minister of war in the new Cabinet, 1882. He set up as an autocrat, withdrawing the budgets from the Eng. and Fr. controllers. This act resulted in war with England, whose fleet bombarded Alexandria, 11-12 July. On 13 Sept. 1882 A. P. was defeated at Tel-el-Kebir, taken prisoner at Cairo, and expelled to Ceylon. The result of his revolt was the estab. of Brit. supervision in Egypt. Pardoned by the Brit. Gov. in 1900, he returned in 1901.

Arabia (Arabic *Jazirat al-Arab*, the 'peninsula of the Arabs'; Persian and Turkish *Arabistan*), peninsula forming the extreme SW. of Asia; it is bounded on two and a half sides by the sea but on the N. and NE. it passes imperceptibly into Syria (q.v.) and Iraq (q.v.). It lies between 12° 45' and 34° 50' N. and 30° 30' and 60° E. The area is about 1,200,000 sq. m., nearly half of it desert; the length from N. to S. is about 1500 m. and the greatest width about 1250 m. Behind a narrow coastal plain ranges of mts run along the W. and S. sides of the country, and the land slopes down from these to the Persian Gulf and the Euphrates in a plain broken by a few hills. No one description applies to the whole land. In the SW. the mts reach 8000 ft and cause plentiful rainfall during the summer, though snow never falls; along the S. rain falls during the summer on the hills and in places the vegetation is semitropical. In Oman, where the mts reach 9000 ft, water is fairly plentiful and agriculture prospers in parts. In the N.,

where the hills are not so high, rain seldom falls and water is only to be found under the old drainage channels where rivs. once ran. A sudden storm may cause a flood. Where water is near the surface oases occur. An exception is the Shammar hills, the highest point of which is over 5500 ft. This is high enough to produce precipitation and even snow; and, as the ground water is near the surface, agriculture is easy, so there are as many husbandmen among the inhabs. as nomads. In places sand dunes cover vast areas, but the sand absorbs what moisture there is and in the spring produces grazing for the herds. The animals do not need to be watered and the humans drink nothing but the milk. Most of the N. Arabs are nomads, each tribe having its own area for its seasonal wandering, it may be from the centre of the peninsula in winter to the N. of Syria in summer. For details see ADEN; ASIR; BAHREIN; HADRAMAUT; HASA; HEDJAZ; JEBEL SHAMMAR; KOWEIT; MECCA; MEDINA; NEJD; OMAN; QASIM; QATAR; YEMEN.

Classical authors divided A. into A. Felix, A. Petraea, and A. Deserta, a political div. based on conditions in the 1st cent. AD; the first was independent, the second subject to Rome, and the third to Persia. The Arabs divided the people into two branches, a N. and a S., both being the offspring of Abraham, a fantasy derived from the O.T. By the time of Mohammed many S. tribes had moved from their original homes and lived among the northerners. To-day the pop. of S. A. is very mixed and many of them are quite unlike the N. Arabs; it is claimed that the core of the southerners belongs to the Mediterranean race which stretches from Spain to India. In the N. are tribes which are nomad but are not regarded as equals by the others, who will not intermarry with them. The lowest in the social scale are the Solubba, who are expert hunters; they are also smiths (they have been called kettle-menders) and ride donkeys, a thing which no Arab would do. The language of most of the land is now Arabic, one of the Semitic group. Although the latest member to become known to hist. it has preserved more primitive features than any other. The language spoken to-day has changed much from the standard classical one so that a man from Nejd would have the greatest difficulty in understanding one from the Aden protectorate. Formerly another tongue in sev. dialects was spoken in all S. A., and some dialects of the S. coast may be derived from it.

Fauna. In the N. the usual desert animals are found, gazelles of various kinds, foxes, jackals, and perhaps the ostrich and wild ass. (Hunting from a motor-car rapidly destroys all game.) In or near mts ibex, wolves, hyenas, wild-cats, and badgers exist. Eagles, vultures, ravens, kites, and hawks are found. In places snakes are common, and A. is now important to the world as a breeding ground for locusts.

History. Assyrian inscriptions mention Arabs. The last King of Babylon lived for

some years in Teima, N. of Medina. Augustus sent an army to conquer Yemen (to control the Red Sea trade), but it failed. A Nabataean state centred on Petra till it became a prov. of the Rom. Empire, and Zenobia at Palmyra tried to oppose Rome and was crushed. A tombstone from Hauran dated AD 328 bears the name of one who called himself 'king of all the Arabs.' Then buffer states came into being on the borders of Syria and Iraq, in alliance respectively with Byzantium and Persia; the Syrian princeling was given the title of phylarch. Inscriptions show that in the S. highly civilised states existed from about 1200 BC; in Yemen the Minaeans, Sabaeans, and later Himyarites ruled. In the 4th cent. AD the Abyssinians conquered part of the country but were driven out again to return in 525, only to be expelled once more. In 575 the Persians captured the land, but the natives rebelled and estab. their own gov. which was soon overthrown by the Muslims. For two and a half centuries all Arabia was subject to the caliphs; but in 897 a Zaidi sect estab. a state in Yemen which, with many vicissitudes, has lasted to the present day. Hadramaut has always led an existence apart; little is known of medieval hist., and in modern times the quarrels of princelings have no interest for others. In Oman other sectaries ruled; at one time they ruled both Oman and Zanzibar, but in 1832 the sultan went to Zanzibar and in 1856 the two ters. were divided. Nearly all that is known about the early hist. of the N. comes from outside A., as Arab tradition does not go farther back than a few generations before Mohammed. Many tribes occupied the land; a strong leader might collect a confederation which lasted two or three generations, but his doings lived only in story or poetry and no connected hist. is possible till the advent of Islam.

In 899 the Karmathians founded a state in al-Hasa and the bedouin of the centre returned to the bad ways of the 'Time of Ignorance,' fighting each other and raiding caravans. A series of orthodox sultanates divided Yemen with the Zaidi sect. Oman paid no attention to the caliph and the Hedjaz was practically independent under the sheerefs of Mecca unless Egypt interfered. When the Ottoman Turks conquered Egypt the Hedjaz submitted to them in 1517; the Turks appointed a Turkish governor beside the sheeref and exercised a loose suzerainty over the N. of A. In 1546 they got a footing in Yemen but could not destroy the Zaidi state, though in 1871 they captured Sanaa and estab. themselves more firmly. From 1792 onwards Turks and Wahhabis strove to get possession of al-Hasa, opposite Bahrein is., till in 1871 the Turks became the masters there. So in 1900 the Turks held the flanks of the peninsula and in addition had a faithful ally in Rashid of Hail, Jebel Shammar.

In 1747 Mohammed ibn Abd al-wahhab of the family of Sa'ud estab. that family's authority over Nejd. The cry

of every reformer is 'Back to the Koran' and the common name for heresy is 'innovation.' Ibn Abd al-wahhab was no exception; anything remotely resembling the worship of saints was condemned, and coffee and tobacco were forbidden. The Sa'ud family grew so strong and the Turks so helpless that Mehemet Ali, the Viceroy of Egypt, interfered and sent an army against them. After some reverses his son Ibrahim defeated the Wahhabis completely; but after his departure their power was restored in 1818, and by 1833 it was as strong as ever. The rest of the century was filled with the strife between the family of Sa'ud in Riyadh and that of Rashid in Hail. In 1891 the Wahhabi power was broken and the ruling family driven in exile. In 1904 Abdullah ibn Sa'ud recaptured Riyadh, in 1913 he took al-Hasa from the Turks, and in 1923 he put an end to the dynasty of Rashid.

There was another factor in Arab politics. By virtue of descent from Mohammed Husein, the shereef of Mecca claimed a high place in Islam, and he and his sons through residence in Stamboul knew something of world politics. In 1916 the shereef with Brit. help rebelled against the Turks and seized Mecca and Jedda, though he could not take Medina. He kept up a series of attacks on the pilgrim railway, again with Brit. help, and protected the flank of Allenby's advance on Damascus. The shereef proclaimed himself King of the Hedjaz, and in 1924 caliph when the Turks dethroned the last Ottoman sultan. This last claim annoyed Ibn Sa'ud, whose policy could not be reconciled with that of the shereef. Britain played a sorry part here, for London favoured the shereef while the gov. of India backed Ibn Sa'ud who proved the better statesman and soldier. In 1919 the Wahhabis defeated the shereef's army; and in 1924 they conquered the Hedjaz, and first the shereef and then his son abdicated. Ibn Sa'ud was now sultan of Nejd and King of the Hedjaz, and in 1927 he was hailed as King of Nejd and the combined kingdom was soon after called Sa'udi A.

He had instituted the Brethren (Ikhwan, not to be confused with the Muslim Brotherhood in Egypt), bedouin whom he settled on the land and made enthusiasts for the Wahhabi teaching. We may assume that he thought first of religion, but he created in them a body of determined fighters. Later he found it hard to control them, and their raids on Iraq and Jordan, pillaging and killing, caused much trouble. Finally one of their chief leaders, Feisal al-Duwish, rebelled, and Ibn Sa'ud had to use his army against the spirit which he had aroused.

The sacred law of Islam is the law of the country, though neighbouring Muslim countries, Egypt, Iraq, and Turkey, have introduced civil, commercial, and criminal codes; the sacred law also governs questions of personal status.

The Turks evacuated Yemen in 1918, so the Zaldi imam became the sole ruler. He quarrelled with Ibn Sa'ud, was defeated and had to surrender to him Asir

and Nejran, but was allowed to remain independent. In spite of a treaty with Britain there has been a long series of 'incidents' along the border of the Aden protectorate. The old imam was murdered in 1948 but after a short interlude a son succeeded him.

Ibn Sa'ud organised his kingdom in two parts, each under one of his sons as viceroy, though Asir had a separate administration. There were three ministers, for foreign affairs, defence, and finance, and under this last were directorates of health, education, public works, and combined posts, telegraphs, and wireless. In Riyadh and Mecca were councils of notables, and also in other places. In 1952 the Sa'udi A. Monetary Agency, a modified form of state bank, was set up in an attempt to keep the country solvent, because the extravagant demands of members of the royal family outstripped the revenue. Ibn Sa'ud d. in 1953 and the son whom he had nominated succeeded without any opposition. Any lessons which Arab hist. might teach are vitiated by the new factor, oil, and the £50 millions it brings into the land every year. There are many questions but few answers. Are the bedouin willing to become labourers? Has the tribal society broken down? Has the individualism of the tribes been overcome? Should there be strife, is the present king the man to crush it?

A railway from Damman near Bahrein to Riyadh was opened in 1951, a road runs from Jedda to Mecca and Riyadh, and another from Mecca to Medina has been begun; there is air traffic between Jedda, Taif, Riyadh, Hofuf, and Dahrhan. In 1952 a gold coin, equal to a sovereign and divided into 40 riyal, was introduced. Gold is mined profitably at Mahd between Medina and Mecca.

Exploration. Ptolemy's geography shows that the Romans were well acquainted with the coasts of A. and with the interior of the N., but this knowledge was lost. The first known Englishman to visit the holy cities of A. was Joseph Pitts, c. 1690, and a renegade Scot was Governor of Medina early in the 19th cent.; but these were hardly explorers. In 1761 a Danish expedition set out on a long tour of discovery, and the report by Carsten Niebuhr, the only survivor, contains a full and accurate description of Yemen. Domingo Radia y Leblich visited Mecca but could not reach Medina. J. L. Burckhardt travelled widely in the Hedjaz but was more interested in life than in geography. G. A. Wallin explored Nejd, while Burton travelled with the pilgrims from Syria to Mecca and later explored Midian. Doughty travelled with the pilgrims as far as Medain Saleh and then wandered in the desert as far E. as Hail and as far S. as Taif. The Blunts followed the road of the Persian pilgrims to Bagdad. H. St B. Philby has travelled over most of A. and has recorded his journeys. In the S. Wellsted visited Oman in 1835, Miles crossed the mts of Oman in 1876, Haines explored the S. coast and the Hadramaut 1834-6, and von

Wrede went from the coast to the edge of the desert in 1843. In 1935 the Ingrams travelled the length of Hadramaut to the sea. One cannot name all the adventurous spirits, some of whom lost their lives in A. See also ISLAM.

Bibliography. HISTORY: R. A. Nicholson, *Literary History of the Arabs*, 1907 and 1930; C. Huart, *Histoire des Arabes*, 1912-13; De L. O'Leary, *Arabia before Muhammad*, 1927; G. Antonius, *The Arab Awakening*, 1938; P. Hitti, *History of the Arabs*, 1940, etc. **EXPLORATION:** R. F. Burton, *Personal Narrative of*

One Nights, is the name of a very well-known collection of tales, long current in the E. They are supposed to have been derived by the Arabians from India through the medium of Persia. The tales themselves are connected with all subjects, but the connecting link, the thread on which they were strung, is as follows: The Sultan Shahriyar, enraged by the discovery that his bride was unfaithful, made a law that in future all his wives should be executed on the morning after the marriage. This law was duly carried out, until the sultan wedded Shahrazad,

Houses on the ramparts of the old town at Seyun.

a Pilgrimage to Al-Medina and Mecca, 1855, etc.; C. M. Doughty, *Travels in Arabia Deserta*, 1888, etc.; D. G. Hogarth, *The Penetration of Arabia*, 1904; A. Jaussen, *Coutumes des Arabes au Pays de Moab*, 1907; H. St. B. Philby, *The Heart of Arabia*, 1922, *Arabia of the Wahhabis*, 1928, *The Empty Quarter*, 1933, *Sheba's Daughters*, 1939, and *Arabian Highlands*, 1952; R. E. Cheesman, in *Unknown Arabia*, 1926; T. E. Lawrence (afterwards Shaw), *Seven Pillars of Wisdom*, 1927; A. Musil, *In the Arabian Desert*, 1930; H. E. P. Dickson, *The Arab of the Desert*, 1948.

Arabia, name of famous porcelain and earthenware art producers in Helsinki. Their contemporary designs are known all over the world.

Arabian Architecture, see MUSLIM ARCHITECTURE.

Arabian Gulf, see RED SEA.

Arabian Nights, or *The Thousand and*

the daughter of his grand vizier. This lady was a matchless *raconteuse*, and by the expedient of leaving off every night in the midst of a fresh tale of surpassing interest, she induced the sultan to defer her execution until the day after, for a thousand and one nights, when her doom was postponed *sine die*. The tales were first introduced into Europe at the beginning of the 18th cent., by means of the Fr. translation of Antoine Galland. Of some of them no MS. is known, and Galland took them down from the mouth of a Syrian friend. Lane was the first Englishman to translate them worthily, and his opinion is that in their present form they date back to about 1500.

'**Arabic**, The, White Star liner sunk without warning by Ger. submarine on 19 Aug. 1915, off co. Cork. The ship was carrying sev. Amer. citizens, some of whom perished. America protested, and the Ger. Gov. offered full satisfaction and undertook not to sink liners without

warning and without providing for the safety of the lives of non-combatants, but the undertaking was soon broken.

Arabic Numerals, see NUMERALS.

Arabil, **Arabil**, or **Arabians**, small sect of Christians which existed in the 3rd cent., chiefly in Arabia. They held that the soul would perish with the body, but that both would be restored at the Resurrection. At the council of Arabia, c. 247, Origen confuted this opinion. See Eusebius, *Historia Ecclesiastica*, vi. 37; St Augustine, *De Haeresibus liber*, c. 83; J. F. Buddeus, *De Arabicorum Haeresi*, 1713.

Arabin, **Arabic Acid**, or **Gummie Acid**, constituent of gum arabic. Gum arabic consists of the potassium and calcium salts of A. The A. may be set free by adding hydrochloric acid to the mucilage, and may be separated by dialysis, or passing through parchment paper, as the gum passes through with great difficulty. Alcohol added to the solution precipitates the acid as a white amorphous mass.

Arabis, genus of over 100 species of ann. or perennial herba, family Cruciferae, chiefly of N. hemisphere. *A. albida* and vars., white flowering Rock Cress, are popular rock garden plants.

Arabistan: 1. A general oriental name for Arabia and other dists. inhabited by Arabs. See ARABIA.

2. A prov. of Persia, now known as Khuzistan.

Arabona, see GYÖR.

Aracajá, city and port of Brazil, and cap. of Sergipe. Six m. from mouth of Cotiguba R., 175 m. NE. of Salvador. Exports sugar, timber, hides. Pop. 78,364.

Aracari, the native name of *Pteroglossus aracari*, one of the toucans. It belongs to the Rhamphastidae, is allied to the woodpeckers, and is found in tropical America.

Aracati, tn and port of Ceará, Brazil. Exports include cotton and carnaúba wax. Pop. 6700.

Araceae, family of over 1000 monocotyledonous, chiefly tropical, plants. The flowers are usually monoecious, the perianth is absent or has from 4 to 6 leaves, there are 1 to 8 stamens, often united into a *syndrium*, the ovary often consists of 1 carpel; the fruit is a berry, and the seeds are sometimes exalbuminous. Genera include *Acorus*, *Anthurium*, *Caladium*, *Calla*, *Dieffenbachia*, *Monstera*, *Philodendron*, *Scindapsis*, *Zantedeschia*, etc.

Arachis, family Leguminosae; genus of Brazilian annuals, of which *A. hypogaea*, earth-nut, monkey-nut, pea-nut, ground-nut, is grown in tropical countries, for its oily edible seeds. After flowering, the flower stalks bend and elongate, forcing the pods into the soil where they ripen.

Arachne, legendary daughter of Idmon of Colophon, a dyer in purple, excelled in weaving, and challenged Athena in the art. She produced a piece of cloth in which the amours of the gods were woven, and unable to find a fault in it Athena tore the work to pieces. A., in despair, hanged herself; Athena saved her life,

but the rope was changed into a cobweb and A. herself into a spider (Gk *arachnē*).

Arachnida (Gk *arachnē*, spider), class of arthropods, including spiders, scorpions, and mites, differing from insects in having no antennae, a fused head and thorax, and simple eyes varying in number from 2 to 12. They are mostly carnivorous; the scorpion has poison-glands leading to the sting. There are 9 orders: the *Scorpionidae* or scorpions;

ARACINIDS

Pedipalpi, or whip-scorpions; *Araneida*, or spiders; *Palpigradi*; *Solitugae*, or wind-scorpions; *Pseudoscorpionidae*, or book-scorpions; *Podogona*; *Phalangidae*, or harvestmen; *Acarina*, or mites. Two other orders also exist: the *Xiphosura*, or king-crabs, and the *Eurypterida*. For further information see under individual heads.

Arachnoid Membrane, thin, web-like membrane of the brain which lies between the pia mater and the dura mater. It surrounds the nerve centres, and contains no blood-vessels; it can be separated from the dura mater, to which it adheres by its parietal layer, only by dissection. See BRAIN.

Arachosia, prov. of the auct Persian Empire, lying in the basin of the Helmand R., and corresponding to the SE. part of modern Afghanistan.

Arad, tn in Rumania, cap. of the prov. of Arad; on the bank of the R. Mures. It is an important railway centre, and has a large trade in spirits, wine, corn, and tobacco. It was the scene of much fighting in the 17th cent. in the wars between the Turks and the Hungarians, and in the revolutionary war of 1849 was once captured by the Austrians. Pop. (1948) 87,300. The suburb New A. is on the opposite bank of the riv.

Aradus, see ARVAD.

Araf. It is assumed that this word is the plural of *urf* (mane of a horse), so it is explained as a high place from which both heaven and hell can be seen. It is not certain whether, in Islamic religion, those on A. are candidates for heaven or hell, or

are prophets or men of that rank. It is not a purgatory.

Arafat, hill and plain about 15 m. E. and a little S. of Mecca. The hill is granite and may be 200 ft high; it is also called Jebel-al-Rahma. On this hill occurs the most important ceremony of the pilgrimage. See HADJ.

Arafura Sea, div. of the Pacific Ocean, lying between the N. coast of Australia and the W. part of New Guinea. It merges with the Timor Sea (W.) and Torres Strait (E.), and contains the Aru Is. (q.v.).

Arago, Dominique François Jean (1786-1853), Fr. physicist and astronomer, b. Estagel and d. Paris. He was appointed secretary to the Bureau des Longitudes, and in 1806 helped Biot to measure an arc of the meridian. At the age of 23 he became a member of the Academy of Sciences, and afterwards director of the Observatory. In collaboration with Fresnel he showed that experimental evidence on diffraction confirmed the wave theory of light. In 1830 he was appointed perpetual secretary to the Academy of Sciences, Paris, and in 1848 was a member of the provisional gov. His complete works were pub. in 1854-62. He was held in great esteem and reputation throughout Europe; he opposed Louis Napoleon, and refused to take the oath of allegiance, 1852. See Audiganne. *Arago* (2nd ed.), 1869.

Aragon, Catherine of, see CATHERINE OF ARAGON.

Aragon, Louis (1897-), Fr. poet and novelist, b. Paris. At first a surrealist, he became an ardent Communist in 1930. His novels, *Le Paysan de Paris*, 1925, and *Les Cloches de Bâle*, 1934, deal with the decay of the bourgeoisie. His verse, written during the Second World War, is essentially nationalistic: *Cruc-Cruc*, 1941, *Les Yeux d'Elsa*, 1942, and *La Diane française*, 1945.

Aragon, Tullia d', see D'ARAGON.

Aragón: 1. (Eng. *Aragon* or *Arragon*) Former kingdom of Spain, in the N.E. of the peninsula, comprising the modern provs. of Huesca, Teruel, and Zaragoza (qq.v.). It was recovered from the Moors in 1131. Catalonia (q.v.) was united with it in 1137 and Valencia (q.v.) in 1238. The kings of A. secured also the Balearic Is., Naples, Sicily, and Sardinia (qq.v.). The succession to the throne of Ferdinand II (q.v.) in 1479 united A. with Castile, and was the foundation of the kingdom of Spain (see CASTILE and SPAIN, *History*). The prin. riv. of A. is the Ebro (q.v.), which receives numerous tribs. both from the mts of the S. and from the Pyrenees in the N. The central plain, except for the Ebro valley, is sterile. The highlands, however, are known for their magnificent scenery, are well forested, and are very fertile. Cereals, rice, and oil are produced, and a prin. export is merino wool. Area 17,935 sq. m.; pop. 1,102,912.

2. Sp. riv. which rises in the Pyrenees, and flows SW. through the provs. of Huesca, Zaragoza, and Navarra to join the Ebro (q.v.). Length 80 m.

Aragón Canal, see IMPERIAL CANAL.

Aragona, tn in Sicily (q.v.), 7 m. NNE. of Agrigento (q.v.). It has an old castle of the Aragonese princes, and there are sulphur mines. Pop. 17,000.

Aragonite, mineral consisting of calcium carbonate, CaCO₃. It has a sp. gr. of from 2.92 to 3.28 and a hardness of from 3½ to 4. It crystallises in rhombic prisms, and twinning on the prism planes is a frequent phenomenon. A. is found in Aragon, Hungary, Sicily, Cumberland, and in the neighbourhood of hot springs, as at Carlsbad. It is distinguished from the other variety of calcium carbonate, calcite (q.v.), by its greater sp. gr. and its different form of crystallisation.

Arago's Disk, see INDUCTION, ELECTROMAGNETIC.

Aragua, state in NW. Venezuela, area 2160 sq. m., constituted under the re-division of 1904, and lying mainly within the parallel ranges of the Venezuelan Cordillera. Products: textiles, coffee, cacao, sugar. Chief tns: Maracay (cap.) and Carlsbad. The pop. is about 190,000.

Araguaia, riv. (formerly spelt *Araguaya*) in central Brazil, which has a length of about 1100 m. and flows into the Tocantins, close to São João. It forms the W. border of the state of Goiás.

Arak, dist. and tn of Persia, SW. of Qom, and situated on the trans-Iranian railway. Has trade in carpets. It was formerly called Sultanabad. Pop. of tn 55,000.

Arakan, div. of Lower Burma, on the Bay of Bengal between Pegu and Chittagong, having an area of about 14,500 sq. m.; pop. (div.) 1,186,800. A. div. consists of 3 dists., Aleyah, Kyaukpaya, and Sandoway. The old cap. bears the same name, but is generally called Myohoung to-day; formerly a large tn, but now dwindled to little over 2000 people. The div. exports rice, timber, tobacco, and cotton. The majority of the inhab. are Buddhists. For the military operations in A. in the Second World War see BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

Arakcheyev, Aleksey Andreyevich, Count (1769-1834), favourite of Emperor Alexander I of Russia. He became War Minister in 1808. A. greatly influenced internal policy in the spirit of extreme reaction. His name has become in Russia a symbol of intolerable one-man despotism.

Aral, Sea of, brackish lake in Asia, and, after the Caspian Sea, the largest inland sheet of water in this continent. It is in Soviet ter., and is about 270 m. long by 165 broad. It is shallow, and nowhere has a greater depth than 220 ft. Two great rivs. drain themselves into this lake, the Syr Daria (the Jaxartes of old) and the Amu Darya (Oxus). At one time it is thought to have formed part of the Caspian Sea. It has no outlet, but much water is drawn off by evaporation. A number of small is. are dotted about over it, mainly towards the E. shore. By references of anc't writers it is probable that its shape has altered considerably, and part of its area was once dry land.

Aralia, family Araliaceae, genus of hardy shrubs, trees, and herbaceous plants, native to N. America, Asia, and Australia. *A. elata*, the Jap. Angelica Tree, is ornamental for mild dists. in Britain; *A. spinosa*, Hercules Club, is a rare tree; *A. cachemirica*, Kashmir, *A. cordata*, Japan, and *A. nudicaulis*, N. America, are herbaceous perennials, grown for their effective foliage.

Aram, Eugene (1704-59), erudite Eng. schoolmaster who gained notoriety by the murder attributed to him. The story of the crime is the theme of Hood's poem, *Dream of Eugene Aram*, and of Lytton's romance, *Eugene Aram*, 1832; *b.* Rams-gill, Yorks. A. married early and settled as a schoolmaster or usher at King's Lynn. The murder was committed at Knaresborough in 1745, the victim being a certain Daniel Clark, a man who had swindled tradesmen and disappeared. A. hid the body in a cave on the banks of the Nidd. The crime remained undiscovered for 13 years, and it was not until 1759 that he was brought to trial at York and, after he had defended himself with great eloquence, sentenced to death. He was a scholar and philologist of some eminence and had gathered much material for a projected *Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic Languages*. See E. R. Watson, *Eugene Aram, his Life and Trial*, 1912.

Aram (Aramea), probably the name of a people, was applied to the country N. and NE. of Palestine from the Mediterranean to the middle of Mesopotamia. In the O.T. A. occurs in sev. combinations and Damascus was the most important state. From A. is derived Aramaic, the name for a group of dialects. One became the *lingua franca* of the near E. about 600 BC; it was used for dockets on cuneiform tablets in Babylon, for correspondence by Persian officials in Egypt, and an Aramaic inscription was found in Taxila in India. The Arab Nabataeans used it in their inscriptions. It belonged to the Semitic family of languages and was very like Hebrew. The so-called square character used for printing Hebrew was borrowed from Aramaic, replacing the original Phoenician script. Hebrew died out as a spoken tongue and some form of Aramaic was spoken in Palestine at the time of Christ, as quotations in the Gospels show. The chief literary languages are the Targums (used in translations of the O.T. for use in the synagogue), the Babylonian Talmud, and the form used by Christians which split into two branches, W. and E. Syriac. Modern derivatives of Syriac are still spoken in some vils. near Damascus and in Mt Sinjar in W. Iraq. See HEBREW and SEMITIC LANGUAGES.

Aramaean, Aramaic, see ARAM.

Aran Islands, group of is. situated in Galway Bay, 30 m. from Galway, on the W. coast of Ireland. They form a natural breakwater. In order, from the N., their names are Inishmore (7635 ac.), Inishmaan (2252 ac.), and Inisher (1400 ac.). Kilronan is the cap. of the is. They contain architectural remains of early origin, among which are the ruins of the

Abbey of Killenda. For a time Aran was a famous seat of religion and learning. The chief industries are fishing and agriculture. The islanders are immortalised in J. M. Synge's *Riders to the Sea* and *The Aran Islands*, and were portrayed in the famous film *Man of Aran*. Total pop. 2600. Another is. of the same name is situated off the co. of Donegal.

Arando, Pedro Pablo Abarca de Bolea, Count (1718-98), Sp. politician and general, b. Siétamo in Aragon. In 1740 he entered the army and took part in the war of the Austrian succession. He copied Frederick the Great in his methods of military discipline. In 1766 he was called on by Charles III to restore order in Madrid, and, having done so, became most important minister in Spain. He d. at Epila after his fall (1792), due largely to his attitude of sympathy with the Fr. Revolution.

Aranjuez, Sp. tn in the prov. of Madrid, on the Tagus. It has a palace with beautiful gardens, which was, until 1890, the summer residence of the Sp. court. The tn has many fine mansions, is a tourist resort and mkt tn, and is noted for its strawberries and asparagus. Pop. 25,000.

Arany, János (1817-82), Hungarian poet, b. of poor Calvinist parents at Nagyszalonta, where he became teacher and later notary. In 1840 he married Juliana Ercesey. His greatest work, *Toldi*, 1847; *Toldi's Evening*, 1854; and *Toldi's Love*, 1879, an epic trilogy, relates the exploits of the great Hungarian hero Miklós Toldi. Other epics are *The Gipsies of Nagyida*, 1852, a savage satire on the revolution, and *The Death of King Buda*, 1864. A.'s ballads (e.g. *The Bards of Wales*) show his absolute mastery of language and metre. He also trans. Shakespeare and Aristophanes. He d. in Budapest. In English the only extensive trans. so far is *The Death of King Buda*, by Watson Kirkconnell, 1936.

Arapahois, Algonquian tribe of N. Amer. Indians, and one of the most famous raiding tribes of the plains. To-day there are about 4000 A., mainly in Wyoming. See Krober, *The Arapahoe*, 1904, and F. Eggan, *Social Anthropology of North American Tribes*, 1951.

Arapaima (native Brazilian name), genus of fishes of the family of Osteoglossidae, related to the salmon and herring. *A. gigas* is the largest freshwater fish in the world, attaining 15 ft in length. It is captured by spearing in S. America for exportation.

Arapiles, Los, Sp. vil. near Salamanca (q.v.), the site of the battle of Salamanca in 1812 during the Peninsular war (q.v.).

Arara, common S. Amer. name for the macaw (q.v.).

Ararat, city (since 1950) of Victoria, Australia. Its pop. is about 5000. It is situated towards the W. extremity of the Great Dividing Range. It is the centre of the trade in grain and wool of the NW.

Ararat, highest point of Armenia. It rises to a level of 17,000 ft. It is situated in the plain of Aras. The mt mass of A., rising from the Armenian plateau, con-

sists of 2 portions, the Great and Little Ararat. Tradition makes it the resting-place of Noah's ark. The mt. is of volcanic composition, though no recent outbreak has occurred. The name also applies to the country of Urardhas, where the ark rested after the flood. The name is unknown to Armenians of the present day.

Aras, the **Araxes** of Xenophon, riv. rising S. of Erzerum and flowing through the Erzerum prov. into the Persian plateau. It has a length of 600 m. Its trib. is the Zanga. From 180 BC to AD 50 Aratanata was the cap. of Armenia and stood on an is. in the A.

Arason, Jón (1484-1550), bishop of the N. diocese in Iceland; introduced printing into that country (c. 1530), and vigorously opposed the Lutheran reformation which the Dan. kings were forcing upon the people of Iceland. For that opposition the bishop, together with two of his sons, was beheaded by Dan. officials without trial, after which all resistance broke down and the Lutherans triumphed. A. is one of the most heroic and imposing figures in Icelandic hist., and tyrannic though he could be he had many lovable qualities. He was the foremost poet of his time, and other poets, including Matthias Jochumsson (q.v.) and the Norwegian poet Kristoffer Janson, have found in him a proper subject for the exercise of their genius. Biographies by Páll E. Olason and Guðbrandur Jónsson.

Aratus (315-240 BC), Gk poet contemporary with Theocritus. While residing at the court of Antigonus Gonatas he wrote his celebrated astronomical poem *Phaenomena* (ed. by E. Maass, 1893), which was very popular in ant. times and was trans. into Latin by Cicero. He d. in Macedonia. St Paul's quotation in his speech to the Athenians (Acts xvii. 28) is from the *Phaenomena*.

Aratus (271-213 BC), Gk statesman, b. Sicyon. His father was put to death by the tyrant Abantidas in 266, and A. was brought up at Argos. At the age of 20 he freed Sicyon and brought that city into the Achaean League, whose general he became in 245. A. was eventually poisoned by order of Philip III of Macedon.

Araucanians, Indian natives of Arauco in Chile. The most important divs. are the Mapuche and Huilliche. Formerly gov. rested in 4 *toquis* or princes, the chief of whom was the Great Tarqui. Rank was derived from martial prowess, wealth, generosity, and eloquence in speech. They number about 200,000. The A. vigorously resisted the Sp. occupation, and made desperate but futile opposition to it. They were formerly cannibals, eating war captives. They have a belief in a Supreme Being, who is ambisexual, addressed as either 'Father' or 'Mother.' See J. M. Cooper, 'The Araucanians,' in J. H. Steward's *Handbook of South American Indians*, vol. ii, 1946.

Araucaria, genus of gigantic pines (Pinaceae) found scattered over the S. hemisphere. Its leaves are stiff and broad; the scales of the cones bear a leafy

appendage, and the anthers are many-celled. *A. excelsa*, the Norfolk Is. pine, abounds in turpentine, and provides a heavy timber; *A. bidwilli*, the bunya-bunya pine, grows in Australia; *A. araucana*, Chile pine, or Monkey Puzzle, yields much resin. *A. angustifolia*, Parana pine, or Candilabra tree, of Brazil, and *A. cunninghamii*, Moreton Bay pine, or Hoop pine, of Australia, are valued timber trees.

ARAU-CARIA

Arauco, maritime prov. of N. Chile. Its area is 2222 sq. m. and its pop. 72,282. Its nature is agric. but in modern times important coal-mines have been developed. Cap. Lebu.

Araunah (in Chron. Ornan). Jebusite owner of a threshing floor on Mt Moriah, which David purchased as the site of an altar to halt a plague (2 Sam. xxiv; 1 Chron. xxi). This afterwards became the site of Solomon's Temple.

Arauré, tn of Portuguese state, Venezuela. An agric. and cotton-growing centre. Pop. about 2000.

Arawak, Amer. Indian tribe formerly inhabiting the Caribbean is. and coastlines, only a few scattered remnants now being left. Their chief was treated with great ceremony, being carried in a golden litter; at death he was desiccated and kept as an idol. The A.s were treated with great cruelty by the Spanish, who killed them in war or forced them to labour in the mines. See J. H. Steward, *Handbook of South American Indians*, vol. iv, 1948.

Arazá, spa in Minas-Geraes, Brazil, on the Rio das Velhas. Pop. 10,000.

Araxes, name of sev. rivs.: (1) In Armenia, the modern Aras (q.v.). (2) In Persia, which flowed into a salt lake not far below Persepolis, which it stood on its banks. (3) The A. or Chaboras in Mesopotamia, which flowed into the Euphrates. (4) The A. mentioned by Herodotus (i. 20), which cannot be certainly identified.

Arba, see RAB.

Arbaces, general of Sardanapallus (q.v.). He founded the Median Empire

about 830 BC. This is according to the very doubtful hist. by Ctesias. However, there are inscriptions of Sargon II of Assyria, where mention is made of one Arbaku, a Median chief in 713 BC.

Arbalest, or Arblast, see CROSS-BOW.

Arbela, anct. tn of Adiabene, mod. Erbil, 48 m. SE. of Mosul. Assyrian Arbailu was a religious centre (goddess Ishtar) controlling the country between the Greater and Lesser Zab rvs., on behalf of the capital cities of Nineveh, Assur, and Calah. The citadel has been continuously inhabited from prehistoric to modern times. See also GAUGAMELA.

Arber, Edward (1836-1921), scholar, b. London, son of an architect. He worked as a clerk in the Admiralty, but studied English and became Prof. of English at the Mason College, Birmingham. He ed. and pub. sev. valuable series of reprints, including *Arber's English Reprints*, 1868-1871, *English Scholar's Library*, 1878-1884, and *An English Garner*, 1877-96, as well as sev. important bibliographical works.

Arbitrage, commercial term applied to the process of equalising prices in different business centres by buying in the cheaper market and selling out in the dearer. It is mainly carried on between London, other European caps., and New York, and deals for the most part with stocks and shares, foreign exchange, and bullion. The profits of A. are small except in stocks, in which case the operation is attended with considerable risk.

Arbitration, in civil law (Lat. *arbitrari*, to judge), term which has come to us from Rom. law, and which is applied to a judgment given by a selected person or persons in some disputed affair. In Rom. law we find in existence 2 forms of A., one compulsory and the other purely voluntary. As is the case in Eng. law, the arbitrators must come to a decision on all points submitted to them. A. as a method of judgment may be said to apply roughly to 3 different sets of circumstances: in civil law, in international law, and in the settlement of labour disputes.

The mode of proceeding to A. is by 'a submission' or 'reference' to 'arbitrators' or 'referees', who then proceed with due consideration of 'equity' to give their 'award.' This manner of the settlements of disputes has been supported and encouraged in England for a considerable time, and many Acts of the last cent. provided for the use of A. in cases of dispute which would otherwise have come under the jurisdiction of the civil courts. Almost all civil cases can be submitted to A., and seldom when an award has been given by A. has it been set aside on a technical point. Breach of contract, breach of promise cases, property disputes, slander actions, trespass actions can all be submitted to A. In 1889 the A. laws of England, so far as procedure is concerned, can be said to have been practically codified. A matter which is clearly illegal and contrary to the public weal cannot be referred

to A., since it is obvious that from motives of public policy and safety such matters must be punished for the public good. Anyone who is capable of making a contract may be said to be capable of making a reference to A., and persons incapable of making a contract cannot make reference to A. It has also been held that reference to A. made by a lawyer for his client must stand good. In the choice of an arbitrator the parties at difference are absolutely free, and provided that the person chosen is not incapable of making sane judgments, the choice will be upheld by law. It is customary to choose as an arbitrator a person capable by training of examining evidence, or a person who is familiar with the subject under A., e.g. in naval matters a seafaring arbitrator. In most cases of A. a lawyer is chosen. All these rules apply to voluntary A. A court or judge may put any point arising in any case to compulsory A., when the award of the arbitrators may be enforced as the judgment of the court.

Arbitration Act of 1930. This Act is a corollary to the Arbitration Act of 1889, in that it carries further the constantly increasing desire of Parliament to aid and encourage private A. Its enactment resulted from the requirements of international trade and it was passed in consequence of resolutions discussed under the auspices of the League of Nations. In 1923 the League Assembly promulgated a Protocol on Arbitration (Clauses, recognising submissions to A., and effect was given to that protocol by the Brit. Gov. in the Arbitration (Clauses (Protocol)) Act, 1924. The next step in the raising of the status of private A.s was the Geneva Convention on the Execution of Foreign Arbitral Awards which the Brit. Gov. accepted in 1927. The Act of 1930 was passed to give effect to that convention. The vital provision of the Act is the second section, which declares that a foreign award may be enforced in England either by an ordinary action at law or as a judgment or order under the Act of 1889, thus placing foreign awards on as sure a foundation as Eng. awards, so far as recognition and enforcement by Eng. courts are concerned. But the aid of our courts can be invoked only if one at least of the parties concerned is a subject of a power which has made reciprocal provisions to enforce foreign awards, as declared by Order in Council, or if the award was given in a ter., e.g. a colony or protectorate, which has received similar recognition by Order in Council. The statute law of A. has now been consolidated in the Arbitration Act, 1950.

Arbitration, Industrial, or A. in labour disputes, usually takes place between representatives of the employers and of the employed, although frequently an independent arbitrator is appointed. A. was purely voluntary until 1896, when legislation placed it on a legal footing. Previous to this, however, A. and A. boards had been estab. in almost every trade in the country.

The Conciliation Act of 1896 repealed all previous legislation, and, supported by the fact that a coal dispute had been settled by Lord Rosebury in 1893 and a cab drivers' dispute by the Home Secretary in 1895, stated that in cases of dispute between employer and employed meetings might be held with an independent chairman, or a chairman appointed, on application, by the Board of Trade. The formation of conciliation boards by the president of the Board of Trade (Lloyd George) temporarily averted the railway strike which was to break out in 1910. In 1912 compulsory conciliation boards were set up by the Conciliation Bill which helped to end the coal strike of that year. These boards were to have independent chairmen elected by a given date, failing which they were to be appointed by the gov., or they could, on application, be appointed straight away by the Board of Trade. These conciliation boards were to fix the wages which had been in dispute during the coal strike. In the U.S.A. about 30 states have made constitutional or statutory provision for mediation in trade disputes. Federal legislation may not touch the question of A. and conciliation save as regards disputes affecting inter-state commerce.

The Industrial Courts Act, 1919. The Conciliation Act of 1896, combined with the Industrial Courts Act, 1919, represents the characteristic Brit. form of the system of settlement of industrial disputes by conciliation and A., with its emphasis on voluntary or optional resort to investigation, conciliation, and A. by competent tribunals. Voluntary recourse to these methods, with or without encouragement or assistance from the gov., has now been a long-established practice in all the well-organised Brit. industries; while trade boards supply the need in the less well-organised and unorganised industries. In some Brit. dominions, however, the principle of compulsory A. has been adopted, and the legislation of most of the Australian states has been modelled upon it. Italy, too, under the Fascist gov. of Mussolini, adopted a compulsory A. law which absolutely forbade stoppages of work. The tendency towards compulsion is not otherwise very pronounced. In the First World War compulsory A. was adopted by the Munitions of War Acts, 1915-17, which provided for settlement of wage disputes by a committee of production, a court of A., or a single arbitrator. This system was continued for a time after the war by the Interim Wages Act, but in 1919 compulsion in the United Kingdom was abolished by the Industrial Courts Act, which estab. a standing industrial court of independent persons and representatives of employers and work-people to deal with such disputes as might be referred to it, with the consent of both parties, or to investigate the circumstances surrounding a dispute if the Minister of Labour, with or without the consent of the parties, deemed inquiry to be desirable. In its original form this measure contemplated

compulsory A., and went so far as to make trade union funds liable for strikes against the decisions of the arbitrators, but in its accepted form neither the awards of the court nor the findings of an inquiry are made binding upon the parties. Thus the tradition of voluntary resort to A. is perpetuated, the only significant departure being the extension of the power to order an inquiry into the circumstances of a dispute at the minister's discretion. The Act lies on the border line between A. and conciliation in that it partakes of the nature of both. But the statutory power given to the Minister of Labour with respect to investigation is not adequate, in that it is left entirely to his discretion to order an inquiry, and the court has no power to compel production of documents and witnesses. Elsewhere important changes in the machinery of conciliation and A. have been introduced by all the larger countries of the world since 1920.

In some countries the arbitral body itself exercises the initiative, e.g. in Canada, under the Industrial Conditions Act, 1919, of Manitoba, a joint council of industry was set up of 5 persons, 2 each representing employers and employees, with an impartial chairman, with the assistance of technical advisers appointed by the lieutenant-governor. This body can take the initiative in investigation of conditions affecting wages, including cases of alleged unfair profits through low wages, cost-of-living inquiries, and so forth.

While experience on the whole seems to strengthen the traditional Brit. method of voluntary conciliation and A., it also tends to confirm the view that in some authority should be vested the power ultimately to compel inquiry, and that the investigating tribunal should be such as to guarantee the permanence of the settlement. These inferences are suggested by the settlements of trade disputes in Australia. Underlying the whole problem is that of ensuring that the spokesmen of both sides properly represent their members. This is largely true on the employers' side, but often much less true on the workers' side; and this in turn raises the further question of the working of the democratic process in the trade unions. In the period after the Second World War full employment greatly increased the bargaining power of the unions, and a series of strikes, some seemingly for frivolous reasons, provoked discussion of the possibility that A. and/or conciliation, at least in 'public service' industries such as transport, fuel, and power, should be compulsory. See TRADES DISPUTES ACT and CONCILIATION IN INDUSTRY.

Arbitration, International, act by which 2 nations agree to submit their differences to 1 or more persons, and to agree to their award after both the parties at difference have had an opportunity of being heard. If the arbitrator is an emperor, a king, or president of a republic, he is not expected to act in person, but to delegate his authority to a chosen board of arbitrators. Further,

the award of a board of arbitrators is not enforceable, as is the award of an enforced A. of civil law, but rests entirely upon the faith and honour of the parties submitting their case to A. It is usual also to appoint an odd number of arbitrators, and to abide by the decision of the majority in case a unanimous agreement is not arrived at.

I. A. has to deal not only with questions of law, but also with questions of fact. Usually, however, when a point of law has to be decided, the case is referred to a court of A., which gives an 'award' as in the case of civil law. But frequently cases of frontier questions and pecuniary liability have to be decided, and in that case a 'mixed commission' usually hears the case, i.e. a commission composed of representatives from both or all sides. In the 2 decades immediately preceding the First World War I. A. was used frequently by many nations. Great Britain figured in the greatest number of cases, being followed by the U.S.A. and France. The subjects in dispute may be roughly described as differences over the ownership of land or of fishing rights, and pecuniary losses caused by the wrong action of another state. Among the most important cases submitted to A. in the earlier years were the Alabama case, the Bering Sea controversy, and the long-drawn-out case of the fishing rights of the French off the coast of Newfoundland, which was settled in 1904, and which had dragged its slow length along since 1711. A permanent court was estab. at The Hague in 1900 to which many important cases have been referred. The Hague Court of A. was the realisation of an old ideal dating back to the 18th cent., and was the immediate outcome of a peace conference called by the Tsar of Russia in 1899. Sixteen of the powers agreed to the appointment of a court which should be open for the settlement of all disputes amongst nations. The court was to be composed of men learned in international law and appointed by the signatory powers. The aim of the court was obviously the furtherance of the peace movement by the submission to this permanent court of all disputes from which war might arise. Probably its most important decision was given in the case of Great Britain, Germany, and Italy versus Venezuela. On that occasion it may have prevented war, and it certainly allayed the spirit of hostility which had arisen from the Venezuelan question.

Arbitration between Great Britain and the U.S.A. It is to be observed that long before there was any world court of justice or a Hague court, Great Britain and the U.S.A. were distinguished among all the nations for their readiness to submit differences to A. rather than resort to arms. One of the most famous cases between the 2 nations was that known as the Alabama case (see ALABAMA, THE). The most serious difference between America and Great Britain in modern times occurred during the second administration of President Cleveland. In 1895 there was a dispute between

Venezuela and Great Britain over the boundary between Venezuela and Brit. Guiana. Secretary of State Richard Olney of the U.S.A. intervened in a dispatch to the Brit. Gov. which brought relations between the 2 countries almost to the breaking point. The crisis was allayed by the judicious policy of Lord Salisbury, then Brit. Prime Minister, and the matter was submitted to A. and settled in 1899. Other prominent cases in which the U.S.A. and Great Britain were involved, and which were settled by A., were the boundary dispute between Alaska and Canada in 1903, and the N. Atlantic coast fisheries dispute which was settled in 1910 after causing difficulty for over 60 years. Not only did the 2 countries thus set an example to the world, but they emphasised it by signing a treaty of A. 3 Aug. 1911, and again on 15 Sept. 1914, when they signed an Anglo-Amor. Peace Commission treaty. The 2 great Eng.-speaking nations have thus solemnly rejected war in favour of I. A. as a means of settling disputes between them.

Arbitration and the First World War. Although I. A. resolved such important disputes as the Venezuelan boundary question, it played little part in the First World War. The terrible allied losses in 1917 encouraged a 'negotiated peace' movement which was supported by such diverse elements as pacifists, socialists, international financiers, and some of the old diplomatists. A conference of this movement at Stockholm completely failed. On 1 Aug. 1917 Pope Benedict XV (q.v.) in an appeal for peace proposed 'the settlement of all international disputes by A.' Three successive Ger. chancellors paid lip service to A., and the 'central powers' advocated the 'moral force of right,' but said nothing of the restoration of conquered ter. President Wilson replied for the Allies that the actions of the existing Ger. Gov. made any negotiations with them useless.

The experience of the First World War showed that A. is unlikely to succeed after war has begun. The Covenant of the League of Nations unsuccessfully attempted to strengthen A. as a means of settling international differences. The members of the League agreed that if there should arise between us any dispute likely to lead to a rupture they would submit the matter either to A. or to inquiry by the council of the League, and that they would in no case resort to war until 3 months after the award of the arbitrators on the council's report. An award had to be made within a reasonable time and a report by the council within 6 months of submission. The League members also agreed that whenever any dispute arose between them 'which we recognise to be suitable to A. and which cannot be satisfactorily settled by diplomacy,' they would submit the whole subject-matter to A. Matters considered suitable for submission to A. included disputes about treaty interpretation, questions of international law, allegations of breaches of international

obligations, and reparation for such breaches. The court of A. to which a case would be referred would be the court agreed on by the disputants or stipulated in any convention existing between them. Finally, the members agreed that they would carry out in good faith any award made, and would not resort to war against a member which complied with the award; and in the event of any failure to carry out an award, the council would propose what steps should be taken to give effect to it. Experience was to show, however, that in any really serious contingency the covenant was nugatory. See further COVENANT OF THE LEAGUE OF NATIONS and LEAGUE OF NATIONS.

Arbitration since 1922. In the five years following the estab. of the Court of International Justice in 1922, the work of the court itself and the conclusion of special A. treaties by individual govs. reflected a growing belief in A. The court's intervention in a dispute between 2 or more govs. might be secured either for the interpretation of treaties, where specific provision for such reference to the court had been made in advance by the parties; or for the settlement of all justiciable disputes referred to it by both parties; or by one party only if both had accepted the optional clause of the statute of the court (see OPTIONAL CLAUSE); or for an 'advisory opinion' upon any dispute referred to it by the council or assembly. 'Opinions' have been given on a dispute between France and Great Britain as to the nationality (and consequently liability to military service) of Brit. subjects in the Fr. protectorate of Tunis; in disputes between Poland and Germany in 1923, as to the nationality and the rights of Ger. residents in dists. ceded to Poland under the treaty of Versailles; and on the interpretation of the treaty of Lausanne (q.v.) regarding the sovereignty of the dist. of Mosul—a most important question (see IRAQ). The court's jurisdiction has sometimes also been invoked in other ways, e.g. in the case of the *Wimbledon*, which raised certain questions of interpretation of the transport clauses of the treaty of Versailles arising out of the closure by Germany of the Kiel Canal to a Brit. vessel chartered by a Fr. firm to carry munitions to help Poland against Russia. An instance of a case of reference by the consent of both parties or by one party relying on the optional clause is afforded by the agreement in 1924 by Greece and Bulgaria to invite the court's interpretation of the treaty of Neuilly relative to a frontier dispute, and in the same year Belgium invited the 'compulsory' jurisdiction of the court against China in the matter of the denunciation of the Sino-Belgian treaty of 1865, relying on the optional clause, which both had accepted; and also by the *Lotus* case, submitted by France and Turkey in 1926, an important case raising a pure question of customary international law arising out of a collision between a Fr. and a Turkish vessel with resultant loss of life. The readiness of both France and Turkey to submit so important a decision

to the court was some indication of increasing confidence in that tribunal, and the great increase in the number of A. treaties—at least 90 were negotiated between the end of the First World War and 1926, a number much larger than all the treaties concluded during the 19th cent.—was another tribute. Thus far the progress of A. was good, but when the sessions of the eighth assembly of the League began, it was appreciated that the leading govs. of Europe were not prepared to pledge themselves further in regard to A. until more substantial advances had been made in the sphere of security, while the Brit. Gov. showed so little sign of changing its attitude towards the optional clause that the Imperial Conference of that year declared the time premature to accept the obligations of that famous clause. In the Brit. case against Albania on the mining of the Corfu Channel, the majority of the United Nations Security Council upheld (Mar. 1947) the Brit. charges against Albania of laying mines in the channel, but the Russian delegate used the veto and there was no decision. Britain therefore applied to the International Court of Justice which tribunal (Mar. 1948) rejected by 15 to 1 Albania's preliminary objection that in view of Britain's application being unilateral the court had no competence in the matter. The Brit. and Norwegian Govs. have in recent years submitted fishery disputes to A. and abided by the award. See further ARMEMENTS, LIMITATION OF.

See Fred Alexander, *From Paris to Locarno and After*, 1928.

Arboeala, see TORO.

Arboga, auct. tn of Sweden, in the former lan. of Västergötland, situated on the R. Arboga and canal which connect Lakes Hjälmaren and Mälaren. Formerly a place of considerable trade, especially in woollen and iron wares, its prosperity has greatly declined. Once important, too, as the seat of many councils and diets, particularly the parliaments of 1434, 1440, 1471, and 1561. Pop. 10,391.

Arbogast, barbarian officer of the Rom. army at the end of the 4th cent. AD. His nationality is obscure, but the authorities, among them Zosimus and Sulpicius Alexander, say that he was a Frank. He served with distinction against the Goths, and was sent against Maximus, whom he totally defeated in AD 388. He then became the chief minister to Valentinian II, whose murder he contrived in 392, and appointed as his successor one Eugenius, a rhetorician. Defeated by Theodosius, A. committed suicide (394).

Arbois, Fr. tn in the dept. of Jura, on the Quince. It produces good red and white wines, as well as the remarkable *vin jaune* Chateau Chalon which is the only wine other than sherry (q.v.) to profit by the *flowering* of a secondary fermentation. Pop. 3500.

Arbon, industrial tn in the canton of Thurgau, Switzerland, situated on Lake Constance. Originally it was a Rom. settlement, called Arbor Felix. Pop. 9000.

Arbor Day is a day set apart for the public planting of trees in America. The custom originated in Nebraska in 1872 and gradually spread throughout the U.S.A. With few exceptions it is regarded as a legal and public holiday. The date is movable and fixed by proclamation. The same custom is observed in New Zealand.

Arbor Low, megalithic structure near Bakewell, Derbyshire. A circle of 30 stones, now overturned, enclosing a megalithic ruin, is surrounded by a fosse and rampart 250 ft. across. It dates from the late Neolithic period.

Arbor-Vitae (Lat. 'tree of life'). see THUJA.

Arboriculture (Lat. *arbor*, tree; *cultura*, cultivation), scientific cultivation of trees, whether ornamental or useful. In the cultivation of fruit trees such processes as grafting, pruning, and binding are employed; viticulture, or vine-growing, is common to France and S. Europe. For silviculture, or the growing of forest trees for timber, see FORESTRY.

Arbroath, or **Aberbrothock**, royal burgh and seaport of the co. of Angus, Scotland, 16 m. E.N.E. of Dundee at the mouth of Brothock Water. The chief industries are engineering, flax-spinning, sail-making, knitwear manuf., fishing, and farming. A. is noted for its 'smokies' or smoked haddock. It is the Fairport of Scott's *The Antiquary*. Pop. 19,505.

Arbroath Sandstone, geological name of series of sandstones and flags of Lower Old Red Sandstone age exposed in the neighbourhood of Arbroath, Scotland.

Arbuthnot, Alexander (1538-83), minister and poet, b. Kincardineshire. Educ. St Andrews and Bruges, he became Principal of King's College, Aberdeen, in 1569, and was Moderator of the General Assemblies of 1573 and 1577. He wrote three poems, 'On Love,' 'The Praises of Women,' and 'Miseries of a Poor Scholar'; they are printed in Plunkerton's *Ancient Scottish Poems*, 1789.

Arbuthnot, John (1667-1735), physician and satirist, b. Arbuthnot, Kincardineshire, studied at Aberdeen, Oxford, and St Andrews, where he obtained the first recorded M.D. (1696). Appointed regular physician to Prince George and, in 1705, to Queen Anne. Became the cherished friend of Swift and Pope and himself gained a reputation as a wit. A. was the chief contributor to *Memoirs of Martinus Scriblerus*, 1741, in which Pope had a hand. His other prin. works are (1712) *The History of John Bull*, an allegory on the conduct of the Fr. war; *A Treatise concerning the Altercation or Scolding of the Ancients*; and *The Art of Political Lying*, the style of which is modelled on Swift, but without the latter's ferocity. A. was an honourable and amiable man, one of the few who retained the sincere regard of Swift. See G. A. Aitken, *Life and Works of John Arbuthnot*, 1892.

Arbutus, genus of evergreen shrubs of the order Ericaceae, occurring in Europe, the E., and N. America. *A. unedo*, the strawberry-tree, mentioned by Virgil, bears a berry which resembles the

strawberry. *A. andrachne* is native to SE. Europe and Asia Minor.

Arc, **Joan of**, see JOAN OF ARC.

Arc (Lat. *arcus*, a bow), in geometry, a portion of a curved line. The straight line joining its extremities is called a chord (q.v.). If the A. of a circle subtends an angle α at the centre of the circle then the length of the A. is $\alpha/360$ of the circumference. See also ARC, ELECTRIC, and CIRCULAR MEASURE.

Arc, Electric, luminous discharge of appreciable duration. If 2 carbon rods are fixed end to end about $\frac{1}{4}$ in. apart and a direct current voltage of 50-70 volts is applied to them, the voltage is insufficient to break down the gap. But if the rods are made to touch, or touched with another carbon, and then drawn slowly

apart, an A. develops between them, persisting as long as the distance does not exceed a certain limit. As the carbons are separated the voltage across the A. rises and the current decreases. The A. does not follow Ohm's Law; it has a falling volt/ampere characteristic and is unstable. It is therefore always connected in series with a resistance such that the combined characteristic has its minimum at the operating voltage. In alternating current circuit the A. is momentarily extinguished when the current passes zero value. If the voltage passes zero at the same moment (voltage and current in phase, non-inductive circuit) it may not reach a sufficiently high value to maintain the A. before the A. space has cooled (or become de-ionised). To maintain a steady A. an inductance is inserted so that when the current reaches zero the (leading) voltage is near its peak. When a power circuit is opened an A. develops between the separating contacts of the switch or circuit-breaker (q.v.). The A. may be extinguished by air blast or by immersing the switch in oil. In direct current controllers magnetic blow-out is used: the A. path is deviated by magnetic action. See DISCHARGE; ELECTRIC LAMPS; OSCILLATORS; RECTIFIERS (mercury A.); TRANSFORMERS.

Arc Furnace, see FURNACES.

Arc Lamps, see ELECTRIC LAMPS.

Arc-suppression Coil, or Petersen coil, a reactor connected from the neutral point of a 3-phase alternator or transformer to earth. In case of a fault (arc) to earth on the transmission line, the arc burns in parallel with the capacitance to earth of the line. In the circuit formed by the alternator - line - capacitance/arc - earth - reactor, the latter takes a lagging current,

the capacitance a leading current, and if the reactor is correctly dimensioned the two cancel out and the arc is quenched.

Arcs, anct tn of Phoenicia, bp. of Alexander Severus, from whom it took the name of Caesarea A.

Arcachon, Fr. coastal tn. in the dept of Gironde, at the entrance to the A. basin—a lagoon of 60 sq. m. It is a health resort near magnificent pine woods, and with a very mild climate. The chief industries are oyster-breeding and fishing. Pop. 14,000.

Arcade, range of arches carried on piers or columns. The earliest examples are found in Rome, 1st cent. bc. Rows of arches were frequently used as decoration.

Arcadius (378–408), Rom. emperor, elder son of Theodosius the Great, created Augustus in 383. On his father's death in 395, A. received the E. prefectures of the Orient and Illyricum. Throughout his reign he was the tool of successive ministers, and was greatly influenced by his wife Eudoxia (d. 404).

Arcagnuolo, L', or Cione, see ORCAGNA.

Arcani *Disciplina*, see DISCIPLINA ARCANI.

Arcanum is the neuter of the Lat. adjective *arcanus*, used as a substantive. It had the significance of a profound mystery, or, in a more particular sense, one of the alchemist's secrets of nature, such as the elixir of life, the philosopher's

PARTS OF AN ARCH. AA, Voussoirs. B, Keystone. C, Extrados. D, Intrados or soffit. E, Abutment. F, Crown. G, Springing line. H, Centre. R, Radius.

internally or externally, in Early Christian, Lombard, and other forms of Romanesque architecture, and less commonly in Gothic. They are described as 'arcading.' In modern building, a covered gallery with shops on either side is called an A.: e.g. the Burlington A. in London.

Arcadelt, Jacob (c. 1505–c. 1567), Netherlands composer, who went to Italy in his early thirties and entered the Papal Chapel in Rome in 1540. From about 1555 to his death he lived in Paris. He wrote masses and motets, but is particularly famous for his lt. madrigals.

Arcadia, central plateau of Peloponnesus, surrounded by mts and therefore relatively backward in ant times, owing to difficulties of communication. The inhab. were principally engaged in hunting and the rearing of goats; hence their worship of Pan (q.v.), originally an Arcadian god. The prin. tns were Mantinea, Tegen, and (after 371 bc) Megalopolis. The Arcadians subsequently joined the Achaean league, and became subject to Rome in 146 bc. Popular fancy has attributed to A. a life of idyllic happiness.

Arcadius, Gk grammarian of the 2nd cent., a native of Antioch. An epitome of the works of Herodian has been attributed to him, but without sufficient proof.

stone, etc. The plural form *arcana* is also used, sometimes as though it were a singular noun.

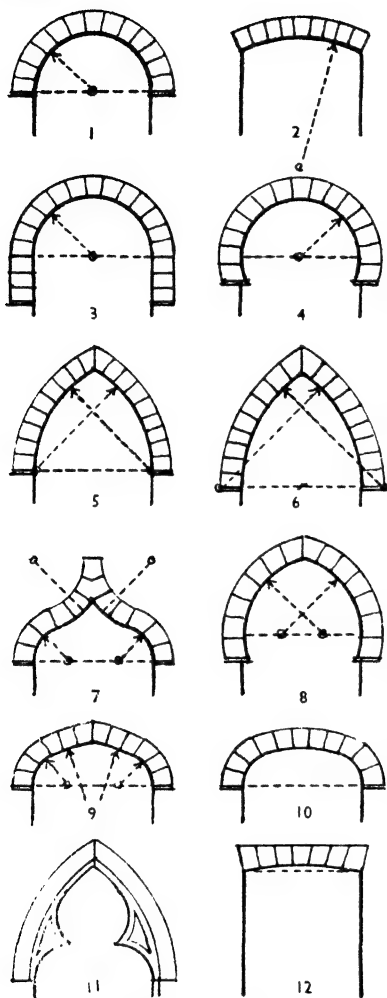

Arcesilaus (316–241 bc), Gk philosopher, and founder of the Middle Academy, b. at Pitane in Aetolis. His doctrine, which is known only through the writings of others, was a form of agnosticism based on the conviction that intellectual certainty is impossible.

Arcevia, lt. tn in the Marches (q.v.), 29 m. SW. of Ancona (q.v.). Pop. 16,500.

Arch, Joseph (1826–1919), Eng. politician and founder of the National Agric. Labourers' Union, b. Barford, Warwickshire. Justin McCarthy calls him the 'emancipator of the agric. labourer.' He represented the NW. div. of Norfolk as a Liberal in the Parliaments of 1885 and 1886; and he was returned again in 1892 and 1895.

Arch, self-supporting structure composed of blocks of brick or stone, and capable of carrying a superimposed load over an opening. As are usually curved in various forms, but may be flat or nearly flat. The component blocks are generally wedge-shaped; but, in rough work, are occasionally rectangular with the joints between them increasing in width from the underside outwards.

The principle of the A. was known to the

TYPES OF ARCHES

1. Semicircular. 2. Segmental. 3. Stilted.
4. Round Horseshoe. 5. Equilateral.
6. Lancet. 7. Ogee. 8. Pointed Horseshoe.
9. Four-centred. 10. Elliptical. 11.
Cusped. 12. Flat (cambered).

and Egyptians, Assyrians, and Greeks; but A.s were seldom used until Rom. times, when the semicircular A. was universally adopted. This form continued in fashion during the phases of architecture known as Romanesque (q.v.) in W. Europe, and Byzantine (q.v.) in E. Europe.

Pointed A.s, first used in the Middle E. about the 7th cent. AD, were employed in Mesopotamia and Egypt from the 9th-10th cents. onwards, and were introduced into England and France, probably by returning crusaders, at the end of the 11th cent. (see ARCHITECTURE, *Gothic*). In Muslim countries (see ARCHITECTURE, *Muslim*), mainly S. of the Mediterranean, the 'horseshoe' A., sometimes round and sometimes pointed, was popular. In Renaissance architecture, throughout W. Europe, round A.s replaced the pointed type.

The prin. terms connected with any form of A. are the span, rise, and springing line; and the various parts: abutment, archivolt, crown, extrados, impost, intrados, keystone, spandrel, springer, voussoir (see fig., p. 415, and separate definitions). The prin. types of A., according to their shape, are semicircular or 'round,' segmental, stilted, round horseshoe, equilateral (pointed), lancet (pointed), four-centred (pointed), pointed horseshoe, three-centred, cusped, elliptical, and Venetian (see illustration).

To support the component blocks of an A. during its construction a framework of centering (q.v.) is required.

Arch, Triumphal. In order to celebrate the victorious return of Rom. generals, an A. was erected either across roads or at the entrance to cities. The first known T. A.s were those erected by L. Stertinius in Rome in 196 bc. He erected 2, in the Circus Maximus and the Forum Boarium. During the reigns of the Rom. emperors money was lavished on them. Frequently they were decorated with bas-relief designs and adorned with laudatory inscriptions. The total number of T. A.s that were built by the emperors is about 40, of which number 3 remain standing in Rome. These were built by Titus in AD 82, Septimius Severus in AD 203, and Constantine AD c. 315. Other examples exist in other parts of the old Rom. Empire: e.g. at Rimini, Susa, Verona, Ancona, and Orange (France).

Inspired by a similar motive, Napoleon resolved to adorn Paris with 4 of these structures. In 1806 he caused to be erected the Arc de Triomphe du Carrousel. It is situated between the Louvre and the Tuilleries, and follows the pattern of the A. erected by Septimius Severus. In the same year another A. was commenced beyond the Champs-Élysées. This is the Arc de Triomphe de l'Étoile. Its erection, however, was not completed till 30 years later. The 'Marble A.' in London, 1825 (modelled on the A. of Constantine at Rome), originally stood in front of Buckingham Palace, but was transferred to its present site in 1851. The A. now at the top of Constitution Hill, 1828, originally the N. entrance to Buckingham Palace, was moved to its present position in 1888. This A. is based on the A. of Titus at Rome.

Archaean (Gk *archaios*, anct), geological name for the oldest crystalline rocks in any region. A. rocks formed during Pre-Cambrian (q.v.) times, which extended for about 3,000,000,000 years,

ending when the Cambrian Period began 500,000,000 years ago. Fossil remains of stratigraphical value are absent from A. rocks, and until it became possible to date the formation of a rock from the radioactive decay of certain of its minerals it was impossible to determine the ages of A. rocks. It is now clear that A. rocks were formed over this immense span of time, and the term A. System should be dropped in favour of names describing each div. of the A. The A. includes unaltered sedimentary and igneous rocks, together with metamorphic schists and gneisses. It underlies much of Africa, Canada, Siberia, Scandinavia, W. Australia, and Antarctica. Isolated outcrops of A. rocks occur in W. Britain (for details see PRE-CAMBRIAN).

Archaeology. The standard definition of A. as the scientific study of antiquities has the merit of being wide in application and easily understood. The word itself combines Gk *archaios*, anct., with a suffix *-logia*, denoting a branch or system of knowledge, and was first used by an Eng. author in the early years of the 17th cent. Any systematic description and orderly study of antiquities must necessarily cover a very wide field, extensive not only in time but equally in geographical space. It may be said to embrace the whole hist. of races and things from the earliest times until yesterday. Whether this study is an art or a science has never been settled; the point does not really matter, and A. may well be regarded as the art which deals scientifically with the study of all remains of human activity. Its function is interpretation as well as record.

A. is very commonly studied on a selective territorial, regional, or subject basis. Thus at the present time there is active interest in the field and comparative A. of America, Egypt, India, the Near E., the Far E., the U.S.S.R., Scandinavia, and Yugoslavia, as well as of Europe generally and of Greece and Rome. The basis is sometimes more local, as in the A. of a natural region, dept., or co., and there are frequent studies of particular sites as of Stonehenge, Hadrian's Wall, the Köln-Lindenthal Neolithic farmsteads in Germany, or the Swedish ship-burials of Valsgarde. There is also the A. of particular problems, e.g. deserted medieval vills. In Britain, the spread of the Wessex Bronze Age culture, the Rom. settlement of N. Africa, the use of radio-active carbon in dating remains. Again, A. is often considered in a period or chronological context; thus in Britain there is prehistoric, Rom., Dark Ages, and medieval A., while the archaeological aspect of special subjects, e.g. church fittings, castles, heraldry, monastic remains, numismatics, and place-names, forms yet another large and important branch of the study.

The difference between the archaeologist and the antiquary is nowadays one of academic and literary rather than practical interest. In circumscribed thought, perhaps, the archaeologist is the excavator who works in the field, exemplified often by the prehistorian, while the

antiquary, the medievalist, reads, carpet-slipped, in his study which he leaves only to visit churches. In modern practice they are one and the same, and the aims and often the methods of the one are those of the other. There is no difference between the technique of excavation on prehistoric, Rom., or medieval sites.

It would be difficult to say when man was not interested in his past. There has been such an interest in Britain and on the Continent at least since the 5th cent. AD. The professed antiquary was recognised in Britain in 1533 when Henry VIII conferred the title of 'King's Antiquary' on John Leland, authorising him to travel in search of antiquities and anct documents. The Brit. topographer-antiquaries, Leland (15061-52), John Stow (1525-1605), John Speed (1552-1629), and Wm Camden (1551-1623) (qq.v.), were much occupied with documentary hist., but sometimes found space for mention of antiquities. In the 17th and 18th cents. studies in O.E. flourished; beside them grew an interest in objects as antiquities. It was largely a collector's interest, enhanced by a topical vogue for classical gems and sculpture, fossils, and curiosities brought home by travellers from abroad. This acquisitive interest did focus attention on the worthy aspects of some notable Brit. field monuments, and Stonehenge in particular came in for a good deal of speculation. The thin thread of fact which ran through many speculative theories, put forward by men moved more by diligent curiosity than by learning, paved the way for the acceptance of objective A. When first-hand inquiry took the place of unsupported theory, A. could build on the foundations laid by the antiquarians. Many country gentlemen, chiefly parsons and doctors, gave their time and more to practical research, frequently enriched their cabinets by disembowelling the graves of their local ancestors, and often pub. in a satisfactory way the results of their pursuits. See PREHISTORY.

It was only natural that in the marshalling and exhibition of these growing private and public collections of relics some sort of grouping and order should make itself felt. On a broad basis of material there were objects of stone and metal, but the most obvious grouping was that of function. It was perhaps a classical scholar who recalled that the Graeco-Rom. world had some knowledge of the early use of materials; that man shaped tools of stone before he had discovered the properties of metals, and that he used bronze before iron. A practical div. of prehistoric antiquities according to these ages of stone, bronze, and iron was made about 1836 by C. J. Thomsen, Curator of the National Museum of Antiquities in Copenhagen, and his colleague Worsae was able to prove the soundness of the div. by field work. In Britain A. gained much support from Lord Avebury who in 1865 pub. the first ed. of his *Prehistoric Times*, and from the new and sustained interest in the process of evolution.

A variety of circumstances combined to secure the growth of the new idea of A. National or local societies were formed for the study of its sev. branches. The examination of churches became an accepted genteel occupation. There was an impelling interest in oversea expeditions to the classical lands. Austin Layard was at Nineveh, the cap. of the anct Assyrian Empire, in 1845; by 1870 Schliemann had begun his spectacular work at Troy; and in 1881, under Brit. auspices, the Egypt Exploration Fund had been inaugurated. In Britain the gov. had recently purchased from the Earl of Elgin his collection of marble works from the Parthenon, and even the Great Exhibition played its part. Above all, the work of Darwin and Wallace gave an extraordinary stimulus to the scientific world at large; it created a new epoch in general thought, and in particular gave a new meaning to the study of our early ancestors. The acknowledgment that humanly flaked flint tools were contemporary with the gravels of the R. Somme near Abbeville in which they were found completely disqualified the hitherto widely accepted theological story of the descent of man. With the principles of scientific excavation and the study of stratigraphy laid down and practised in Britain by Lt.-Gen. A. H. Pitt-Rivers (q.v.) (A. H. Lane-Fox, 1827-1900) A. was at last an exact discipline. In the present cent. the scientific method of archaeological excavation has been fully developed. It is with the use of techniques drawn from the well-estab. sciences of geology, geography, physics, botany, biology, and chem., and with a proper application of a background of hist., economics, and sociology, that the archaeologist now considers the environment of his ancestors. His is before everything a social study. The bones, the jewellery, and the pots, vitally interesting and important though they are in themselves, are above all pointers and guides to a social system. We want to know about food and shelter, and indeed the whole technique of living. It is not simply a question of digging up the past, but of what man has done in the past; under what conditions he has made good and where and why he has failed.

The discipline of modern A. in all its branches may be considered under the following headings:

Discovery. Relics of interest are very often obtained by chance from pits and quarries made for industrial materials, and from excavations undertaken for new buildings and public utility services. Farmers, gardeners, burrowing animals, and deep-sea fishermen are also potential discoverers of objects of archaeological interest. Even a modern sexton may disinter in an age-old burial ground the handwork of his predecessors. Casual discoveries are sometimes revealed by the natural processes of weathering and erosion along the sea coast and by the side of rvs. It sometimes happens that anct material, re-used for other than its original purpose, is recognised by an observant eye; at Steyning in Sussex, for example, a

Saxon sculptured slab placed face downwards had for cents. served as a door-step. Industrial requirements have sometimes been responsible for the wanton destruction of known anct sites, but conditions both in Britain and abroad are now generally improved. There are sev. other indications which may point the way to archaeological discovery, among them the conformation of the ground itself (burial-mounds, camps, dikes, and conspicuous earthworks); the provenance of museum objects; and literary evidence, including that of legends and place-names. Many archaeological sites of importance have been revealed for the first time on photographs taken from the air. Outstanding recent examples have been a series of Rom. forts and camps in Scotland, which will necessitate a complete revision of the currently accepted thought about the Rom. occupation of that country; the detection of Rom. viticulture systems in S. Italy; and the recovery of the plans of sev. medieval monastic sites in Britain.

Certain features such as low mounds, the low banks of fields, and shallow ditches which might well escape examination on the ground are often emphasised by shadow in photographs taken from the air under suitable conditions of oblique light. Long filled-in ditches, and the holes made for the posts and beams of anct timber structures, are revealed by the more luxuriant growth of the crops above them, while the lines of buried walls and roads are often shown by sparse vegetation limited in growth by the shallow soil covering the masonry and metalling. Much depends on the vegetation or crop; grass is of no help except in drought conditions, but oats, barley, and lucerne all develop satisfactory crop-marks.

Excavation is the controlled scientific examination and investigation of a site or object of known archaeological importance. Its aim is to recover and record, to trace development and purpose, and to place the resulting knowledge in a human and living background.

In the present practice of A., excavation is undertaken only for the sake of obtaining new knowledge or for the solution of a particular problem. Uncontrolled treasure-seeking and digging for mere pleasure are not encouraged.

The condition and state of preservation of archaeological remains vary not only with the climate and soil but also with the nature of the material. In general, organic remains, apart from bone and ivory, tend to disintegrate, though in favourable conditions of moisture and temp., as in the peat-bogs of N. Europe, human bodies themselves with hair and skin, and objects of wood and bone, are all well preserved. Vegetable remains persist as seeds and pollen. Very dry climates exercise a preservative effect, and nowhere is this more apparent than in the famous tombs of the Pharaohs in Egypt and in the civilisations of Arizona. Equally the conditions found in the subarctic regions of N. Europe, particularly in N. Russia, Greenland, and Alaska, preserve anct remains at a constant low temp.

Emergency or rescue excavation is undertaken where the site is in danger of destruction; in a selective excavation, perhaps the most usual, the archaeologist obtains leading information about a site, its form and chronology; a complete excavation in which a site is investigated right down to the natural bed-rock should reveal its whole story in detail. The remarkable modern advances in the technique of excavation developed in Britain, Holland, and Germany are now being applied to the A. of the E. and Near E.

In the interpretation of his discoveries, the archaeologist is much concerned with function and chronology.

Function in its broadest aspect is a study of social behaviour and organisation. The archaeologist is interested in pots and brooches, tools and weapons, the form of houses, temples, and tombs, for the light they throw upon the lives and environment of the people who made and used them. Food, shelter, art, material, culture, and trade are all a measure of man's success or failure. There is much more in the evolution of the bronze age, for example, than a mere transition from a flat casting to a sharp-edged cast socket with a loop for the haft.

The estab. of a *chronology* or the dating of his discoveries is the archaeologist's constant task, and to the layman the frequent use and classification of stage or period, culture, and phase, with their sub-divs. and local variations, is indeed confusing. The stage names (see PREHISTORY AND STONE AGE) are convenient main divs., while culture and phases denote groups and variations which existed within the period. Cultures are usually named from the place (the type station) where they were first recognised, but may be named serially or alphabetically.

Chronology may be considered as relative to a known man-made background, or more broadly in an absolute sense by reference to a natural time scale dependent upon solar and geological phenomena. The consideration is one of degree; it is obviously not possible to measure the events of the half a million years old Palaeolithic period with the same precision as those of the Roman occupation of Gaul or Britain.

The typological development of objects and their arrangement in an evolutionary sequence sometimes provides a form of relative chronology. It does so in the case of the axes of the European Bronze Age, and with much primitive pottery. But certain objects, and coins particularly, show a marked degeneration, and older forms not infrequently exhibit a version of early states. The repeated association of forms at the same stage of development, e.g. in hoards of metal objects, often strengthens belief in a chronological sequence, but the comparative study of types against a relative time scale is always fraught with difficulties.

The most reliable criterion of relative age comes from the proper interpretation of the stratigraphy of an ancient site. The principle is a simple one: that any given

layer with the objects contained in it (provided that there has been no subsequent disturbance) is relatively older than the one covering it and not as old as the one upon which it itself lies. It is a principle very well known in geology. The human occupation of a site, be it represented by cave, house, temple, fort, or burial mound, results in the cumulative collection by purpose or by accident of a variety of objects. Buildings fall down, burn, or are demolished, and new ones are erected on the site. New floors cover the levelled debris of a former occupation. Forts are strengthened against new assaults. A riv. bursting its bank may flood the area; the relative level of land and sea may alter by reason of land movement; and war or plague may obliterate every trace of human habitation. In all such cases the proper interpretation of the stratigraphy will elucidate the hist. of the place and its inhab.

The various layers can be dated by the objects found in them (provided again that there has been no later intrusion), but it must be remembered that any particular layer must have been formed after the date of the latest object which it contains. In all excavation work a primary object is to reveal the sequence in which stratified material was formed or laid down, and from this foundation knowledge the hist. of the site is built up. For this reason stratigraphy is always examined in a horizontal as well as a vertical plane. It may be mentioned that much of our knowledge of the Pleistocene period, with its various ice sheets and pluvial phases, has resulted from detailed studies of stratigraphy in Europe and N. America, studies by geologists and archaeologists in association. The brilliant and convincing speculations of Sir Cyril Fox in his consideration of Bronze Age funeral ceremonies are based entirely on a proper appreciation of the stratification found in the excavation of burial mounds.

Yet further light is thrown on chronology by the geographical distribution of man's relics, which are distributed through space as well as through time. Migration, colonisation, and trade routes explain the spread and development of various cultures. Distribution seen in a worldwide geographical setting, and the adequate use of maps, is a relatively new branch of A. in which O. G. S. Crawford (q.v.) and Sir Cyril Fox have, in Britain, played a leading part. By its use such diverse problems as the effect of the Asian and African culture streams on the Upper Palaeolithic of W. Europe, the course of the gold and amber trade in the prehistoric world, and the outcome of the travels of medieval Gothic masons and sculptors have all been placed in a proper perspective.

Absolute dating expresses man's earliest activities in terms of years, and in this way there is made possible an accurate comparison of cultures of widely separated regions. The time expressed by human records covers, perhaps, some 5 millennia. In Egypt and Babylonia, lands with ancient

written hist., it is possible to correlate to some extent the evidence of written King Lists with astronomical data and thus to form a calendar. With some reservations Egyptian hist., which is the most anct known, can be carried back to the end of the 4th millennium BC. By cross-dating and noting the synchronisation of various developments in such objects as pottery and metal goods, it is possible to link Egypt reliably with the civilisation of Crete and only a little less authoritatively with that of Greece. There are, however, many difficulties, some unsurmountable, in the extended application of this form of absolute chronology to the periphery of the prehistoric world. For convenient tables of archaeological dating down to AD 1000 see PREHISTORY.

The modern archaeologist, and especially the prehistorian, is much indebted to the science of geochronology, which is concerned with the establ. of absolute time scales for the very remote past. Its main methods deal with tree-ring dating, varve analysis, and radio-carbon dating.

Dendrochronology, or 'tree-ring' analysis, has for its purpose the dating of timber by a study of its ann. growth-rings in conjunction with astronomical phenomena. It is used to date timber itself, and may date the structure of which the timber forms a part, or with which it is associated, and also to obtain information about regional climatic changes, and the relative growth of trees on various sites at different periods, as well as to examine the effects of biological conditions on tree growth. There is an obvious difficulty in dating timber structures by this method, as the timber may have been re-used or cut some time before use. Very successful results have been obtained, however, particularly in the prehistoric and historic Indian vils. in Arizona, and active research is now being undertaken in America, Scandinavia, Britain, and Germany. The matter is discussed fully by Prof. Zeuner in his book noted below.

Varve analysis consists of the detailed examination and plotting of laminated geological deposits known to have been laid down annually. Much research has been undertaken in the late Ice Age deposits of Scandinavia and N. America, where successive bands or varves of silt and clay were left each year by the retreating ice sheets.

By linking the observations with conditions present in a Swedish lake known to have been drained in 1796, de Geer produced a time scale in years; in the Baltic region it covers a period of approximately 10,000 years, and according to de Geer's scheme it is thought the ice lake of the Baltic may have ceased to exist in 1912 BC, though this date is not insisted upon. Much work still remains to be done in correlating and cross-dating the results obtained in various centres of observation. Radio-carbon dating, a side-line of atomic research first pub. in 1949 by Prof. W. F. Libby of Chicago Univ., is a method of determining the age of organic material by reference to its content of radioactive

carbon. The reliability and applicability of the method are still undergoing test, but it has been applied in America and the Near E. with satisfactory results, and work is now proceeding on prehistoric material from Europe. If certain practical difficulties can be overcome, radio-carbon dating is likely to be the most remarkable advance in modern A. For the theory of the method see Willard F. Libby, *Radio-carbon Dating*, 1952, and *Antiquity*, xxiii (1949), pp. 113-14; xxv (1951), pp. 145-9.

Undersea Archaeology. The development of the 'aqualung,' and the recent exploitation of free-diving and the use of powerful suction hoses, have given rise to much interest in the examination and recovery of archaeological relics from the sea bed. Expeditions in the Mediterranean, especially along the coasts of France, Italy, N. Africa, and Spain, have located the sites of many wrecked ships from which have been salvaged remains of the cargoes—amphorae with corks and wax seals still in place, marble statuary, bronze figures, many architectural fragments of carved and moulded Gk marble—as well as coins and occasionally anchors of the ships themselves. One of the earliest exploits was the examination in 1907-13 of a sunken galley off Mahdia, a small Tunisian port and the recovery of many of the works of art which formed part of its cargo; this wreck has recently been explored once again. At Saint-Tropez, in 1951, were recovered a large number of blocks of Carrara marble, the remains perhaps of a temple which were being carried by sea in the 2nd cent. AD and were lost in a wreck at the harbour mouth. The lay-out of the Rom. port at Cherchel on the coast of Algiers has been explored by free-divers, and the Rom. harbour installations at Tyre and Sidon have also been investigated in very recent times. In Gk waters notable undersea discoveries have been made at Artemision, Anticythera, Marathon, and the Piraeus. This branch of A. is still in its infancy, though it grows lustily; it is limited more by the great cost of the apparatus it requires than by lack of interest. In Britain the conditions of the sea are not generally favourable for such research, though in 1912 the Society of Antiquaries employed a diver to investigate a Rom. vessel carrying a cargo of Samian pottery from Gaul to London which was wrecked off the Pudding Pan Rock near Whitstable in the estuary of the Thames. Much of the material recovered from undersea investigations is in the Museum of Maritime Hist. in Marseilles, where also may be seen archaeological relics brought up by the use of suction apparatus. See AQUALUNG. See also Philippe Dole, *Promenades d'Archéologie Sous-Marine*, Paris, 1952; pub. as *4000 Years under the Sea*, London, 1954. This book contains a detailed bibliography.

Some recent research and discovery in Britain. Expert scientific examination has proved Piltdown Man (q.v.) to be a hoax. Excavation of a mesolithic habitation site at Star Carr, Seamer, Scarborough, has yielded much information

about the environment of these people who used flint awls, burins, and scrapers to fashion barbed fishing-points of red deer antler and to work birch-bark which was stored in carefully made rolls. Much research has been done on the petrological determination of stone axes. At Stonehenge (q.v.) 3 structural periods have been demonstrated by excavation, and carvings on certain of the monoliths were noticed for the first time. A native settlement dating from the earliest years of the Christian era has been excavated at Jarlishof in the Shetland Is., and an auct settlement at Skara Brae, Orkney. Deep ploughing in E. Anglia has resulted in the discovery of many relics, especially fine quality metal-work, of the Early Iron Age. A descriptive survey of the Rom. roads of Britain has been made, and important discoveries of Rom. material have been made during excavations in the war-damaged areas of London, Canterbury, Exeter, and Dover, and in a carefully planned long-term study of Hadrian's Wall. Two important portrait busts were found in a Rom. villa at Lullingstone, Kent, in 1949. The Sutton Hoo ship-burial, excavated in 1939, has received much attention since, as has the pagan Saxon period in general. In 1954 excavations on the site of the bombed Mercers' Chapel in Cheapside in the City of London revealed an early figure of Christ of outstanding beauty. It is described as one of the major archaeological finds of the cent. A special group of scholars has been formed to study the problem of deserted medieval vills., and there is very wide interest in the adequate preservation of auct monuments and historic buildings of all periods. For details reference should be made to the annual reports and bulletins of the Council for British A., the national representative of archaeological opinion.

The literature of A. is widespread and somewhat unwieldy; the following authoritative and up-to-date books, most of which contain good bibliographies, are outstanding in their respective spheres: R. J. C. Atkinson, *Field Archaeology*, 1946; Grahame Clark, *Archaeology and Society* (2nd ed.), 1947; V. G. Childe, *Man Makes Himself*, new ed. 1948; G. E. Daniel, *A Hundred Years of Archaeology*, 1950; F. E. Zeuner, *Dating the Past*, 1950; K. M. Kenyon, *Beginning in Archaeology*, 1952; O. G. S. Crawford, *Archaeology in the Field*, 1953; R. E. M. Wheeler, *Archaeology from the Earth*, 1954; M. B. Cookson, *Photography for Archaeologists*, 1954; R. L. S. Bruce-Mitford (ed.), *Recent Archaeological Excavations in Britain*, 1956; I. W. Cornwall, *Bones for the Archaeologist*, 1956.

Of equal value for general interest and as a basis of fieldwork are the second and third eds. of the illustrated *Regional Guides* of sites and buildings in the care of the Ministry of Works; the Ordnance Survey maps of the major visible antiquities of Great Britain older than AD 1066; the National Period Maps (Monastic, Roman, Dark Ages, the Trent Basin, Salisbury Plain, etc.) pub. by the Ordnance

Survey; *Notes on Archaeological Technique* (Ashmolean Museum, Oxford, 1950 ed.); and J. Hawkes, *Guide to Prehistoric and Roman Monuments in England and Wales*, 1951. See also ALIGNMENT; BARROWS; BEAKER FOLK; BROCH; BRONZE AGE; CAIRN; CAVE ART; CRANNOG; EARTHWORKS; FLINT IMPLEMENTS; HILL-FORTS; IRON AGE; MEGALITH CULTURE; MONUMENTS, ANCIENT; PREHISTORY; ROMAN REMAINS IN BRITAIN; SAXONS; STONE AGE; STONEHENGE; WHITE HORSES AND HILL FIGURES.

ARCHAEOPTERYX

The earliest known bird, *Archaeopteryx*, as it was found.

Reprinted with permission from E. H. Colbert: 'Evolution of the Vertebrates.' Copyright 1955, John Wiley & Sons, Inc., New York.

Archaeopteryx (Gk *archaios*, auct; *pteryx*, wing), Jurassic fossil bird found in the Solenhofen lithographic stone of Bavaria, and which presents characteristics of birds and reptiles. It is the oldest known bird. Its size was that of a crow, it had teeth in both jaws, a feathered tail, and 3 claw-like digits at the end of each wing. Two specimens only are extant.

Archaism (Gk *archaios*, old), the retention, or imitation, of what is old or

obsolete, especially in language and art. *Archaic* means primitive, antiquated, no longer in common use.

Archangel (Russian *Arkhangel'sk*): 1. Oblast in the N. of European Russia, adjacent to the Arctic Ocean. It is predominantly lowland covered by coniferous forests. Area 229,400 sq. mi.; pop. (1956) 1,205,000, mostly Russian (since 11th cent.), some Nenets (q.v.). It has lumbering and wood-processing industries, fishing, and dairy cattle breeding (Kholmogory breed). The prin. tns are A., Kotlas. The famous Solovetskiy Monastery is situated here. A. belonged to Novgorod until 1478, then to Moscow. It is an area of banishment and labour camps.

2. Cap., economic and cultural centre of the above, at the head of the N. Dvina delta. The largest saw-milling centre and prin. lumber port of the U.S.S.R., it is open to navigation from May to Oct. Pop. (1956) 238,000 (1897, 20,000; 1917, 48,000; 1939, 281,000). Founded in 1583, after the estab. of Anglo-Muscovite trade, A. enjoyed the monopoly of Muscovite foreign trade until the construction of St Petersburg. Since 1702 it has been the administrative centre of the Russian N. During both world wars it was a major supply port for Allied goods. A. was occupied in 1918-19 by Allied troops under Brit. leadership and was the seat of an anti-Bolshevik gov. which held out until Feb. 1920.

Archangel, chief or leading angel. Both Jewish and Christian tradition venerate seven of them (see Tobit xii. 12, 15), of whom 3 only are named in the Bible—Michael, Gabriel, and Raphael. The others are known as Uriel, Raguel, Sariel, and Jeramel. It has been suggested that the conception of 7 A.s is borrowed from the Zoroastrian belief in the Amshaspands. There are radical differences, however, in the 2 beliefs apart from the fact that there were thought to be only six Amshaspands. The notion of Persian influence on Judaism especially in angelology is disputed. Any influence that existed may have been in the reverse direction. See *ANGEL*, also in Jewish Encyclopedia.

Archangel, name given chiefly to *Galceadalon luteum*, a perennial wild herb.

Archbishop, bishop of superior rank, or one who has jurisdiction over other bishops. The title when it first came into existence did not imply that the holder had metropolitan power. An A. is usually a metropolitan, presiding over a prov. or group of dioceses. The terms, however, are not interchangeable. The title seems to have been first used in the early Church, being used by Athanasius and by Gregory to imply respect to their predecessors. In the E. Church the title was much more common than in the W., but gradually, with the right to summon prov. councils, the metropolitans began to assume the title of A. A.s, however, were not allowed to assume authority independently of the papacy, since they were compelled to receive

the pallium from Rome. In the Rom. Church the right to wear the pallium is only granted to such A.s as have metropolitan jurisdiction, since there are a number who have merely titular archbishoprics. Until the pallium is received and the oaths of fidelity and obedience are taken to the papacy, the A. is only recognised as the A. elect, and cannot use his full powers. In England the Anglican Church is governed by 2 A.s, the A. of Canterbury, who is also 'Primate of all England,' and the A. of York, who is 'Primate of England.' At the time of St Augustine the plan was to divide England into 2 provs. with 2 A.s, 1 at London and 1 at York, who were to take precedence according to seniority, but during the pre-Reformation period the metropolitan of Canterbury exercised the functions of papal legate throughout all England. At the present day he possesses powers over both provs., e.g. he can grant licences for marriage which are valid in both provs. Amongst his other powers he can grant Lambeth degrees in music, law, and theology. As the metropolitan of the S. prov. he is the guardian of all vacant sees, and appoints to benefices during such vacancy. He has also jurisdiction over all bishops within his prov., and has the privilege of visitation and deprivation which is not exercised by the A. of York. It is his privilege to crown the kings and queens of England, and to consecrate all bishops within his prov. He is also an eccles. commissioner for England. He takes precedence immediately after the princes of royal blood. The powers of the A. of York are very similar to those of the A. of Canterbury, with the above exceptions. The A. of York has the privilege of crowning the queen consort, and of being her perpetual chaplain. He is one of the eccles. commissioners of England, takes precedence after princes of the royal blood, and the lord chancellor. A.s have the title of His Grace, and Reverend Father in God.

Archdeacon, high officer of the Christian Church whose rank is directly subordinate to that of bishop. He is the bishop's vicar, viceroy, or representative (*oculus episcopi*), attached to the cathedral, having jurisdiction over the clergy and authority to manage the affairs of part of the diocese (his archdeaconry). He presides over a court where certain eccles. causes are heard. Originally he was the chief of the deacons who assisted the bishop in eccles. affairs. The distribution of the dioceses into archdeaconries cannot be assigned to any certain time. In the 5th cent. A.s rose from mere bishops' assistants, and took upon themselves some of a bishop's powers and privileges. Gradually they acquired a recognised position apart from the bishop, and claimed a jurisdiction to themselves. In the 13th cent. protests from sev. synods were successful in securing a curtailment of their powers by episcopal courts. It is their special duty to inspect the buildings within their range of supervision, and to undertake the repair of

eccles. property. A.s are obsolete in the Rom. Catholic Church in England.

Archduke, title borne by members of the former Austrian royal family. It denoted a rank above all other dukes, bearing superior powers and rights.

Archegoniata, botanical term applied to the div. of the vegetable kingdom which contains plants having an archegonium (q.v.). It includes the Bryophyta (liverworts and mosses), and the Vascular Cryptogams (ferns and scaglinellas).

Archegonium (Gk *archē*, origin; *gonos*, offspring), the female sexual organ of the prothallus of such plants as the mosses and ferns. It is flask-shaped with a slender *neck* and a swollen *center*, in which is the ovum (oosphere or egg-cell). Fertilisation takes place by means of spermatozooids which pass down the neck.

Archelaus, King of Macedonia (413-399 BC), obtained the throne by the murder of his uncle, cousin, and half-brother. He ruled wisely, and attempted to inculcate the refinements of Gk civilisation among his subjects.

Archelaus of Cappadocia (1st cent. BC), general of Mithridates the Great. In 87 BC he was sent to Greece with a large army, and was besieged by Sulla and defeated. Later he deserted to the Romans.

Archelaus, son of A. of Cappadocia; King of Egypt. In 56 BC he married Berenice IV. He reigned only 6 months, being defeated and slain by Aulus Gabinus in 55 BC.

Archelaus (d. AD 17), grandson of A., King of Egypt. In 41 or 34 BC he received the kingdom of Cappadocia from Mark Antony, on whose side he fought at Actium. He then deserted to Augustus, by whom his dominions were enlarged. A. d. in captivity at Rome, whither he had been summoned by Tiberius, and Cappadocia was made a Rom. prov.

Archelaus, ruler of Judaea, son of Herod the Great (q.v.). He refused to accept the throne before obtaining the consent of Augustus. His request, though strongly opposed by influential Jews at Rome, was granted by the emperor; but his title was limited to that of ethnarch. A violation of the Mosaic law caused his deposition and banishment.

Archelaus, Bishop of Carrhae in Mesopotamia, had a controversy with the heretic Manes, c. AD 278. He pub. 2 books of the *Acta Disputationis*, etc., in Syriac, later trans. into Greek by Hegemonius. A fragment of this work is preserved by Valesius, in the notes to his *Socrates*, pp. 197, 203, lib. i, c. 22; and in a more complete form by Zaccagnius in his *Collectanea Monumentorum Veterum Ecclesiae Graecae*, 1698 (Fabricius, *Bibliotheca Graeca*).

Archelaus of Miletus (5th cent. BC), b. probably at Athens. He was a pupil of Anaxagoras (q.v.), and Ion of Chios (quoted by Diogenes Laërtius, II. 23) states that he was a teacher of Socrates. A. taught that primary matter combined with mind to produce fire and water, from which sprang animal life. Nothing of his work remains; but his doctrine may

be inferred from the writings of Diogenes Laërtius, Simplicius, Plutarch, and Hippolytus.

Archer, Frederick (1857-86), jockey, b. Cheltenham. Rode his first race, 1870. Won the Derby 5 times, Oaks 4, St Leger 6, Two Thousand Guineas 5.

Archer, Frederick Scott (1813-57), b. Bishop's Stortford. Inventor of the collodion process in photography and sev. improvements to the camera.

Archer, Thomas (11668-1743), architect, one of the practitioners of Baroque architecture in England; studied abroad after leaving Oxford. Designed Heythrop House, Oxon; the N. front of Chatsworth; and the churches of St Philip, Birmingham (now the cathedral), 1710-25, and St John, Westminster, 1714-28.

Archer, William (1856-1924), dramatic critic, b. Perth, Scotland, son of Thos A., C.M.G., of Queensland. Educ. at Edinburgh Univ. he travelled in Australia, 1876-7; and, after returning to Edinburgh, went to London, where he soon took a prominent position in the literary world. He was dramatic critic on the *World*, 1881, and, later, on the *Tribune* and *Nation*. He did much to popularise Ibsen in England. He trans. (either alone or in collaboration with his brother, Charles Archer) a number of Ibsen's plays, as well as editing Ibsen's prose dramas in 5 vols., 1890-1. His works include *English Dramatists of To-day*, 1882, *Masks or Faces*, 1888, *The Theatrical World*, 1893-7, *Study and Stage*, 1899, *Poets of the Younger Generation*, 1901, *Real Conversations*, 1904, *The Thirteen Days*, 1915, *India and the Future*, 1917, and *The Old Drama and the New*, 1923. His plays include *War is War*, 1919, *The Green Goddess*, 1923, which was a great success, and 3 pub. posthumously: *Mother Washington*, *Beatrice Juana*, and *Lidia*. He d. in London.

Archer, see SAGITTARIUS.

ARCHER-FISH

Archer-fish, *Toxotes*, a spiny-finned fish of the family Toxotidae, found off the Australian and E. Indian coasts. It

casts a drop of water from its mouth on to an insect playing near the surface of the sea, causing it to fall in, when it is devoured.

Archery, use of the bow and arrow, both for hunting and warfare, is widespread and dates from very early times. The foremost archers of antiquity were the Egyptians, who used bows a little shorter than a man, and arrows headed with bronze or flint, 2 to 3 ft long. On the authority of the Bible and other

ARROW

writers, the Jews were deadly with the bow, which seems with them to have been made of reed, wood, or horn. All Asiatic nations were bowmen, notably the Babylonians, Persians, and Scythians. In medieval times the Arabs and Turks were famous archers, as were the Japanese till recent times. Exploration has revealed the use of the bow among the natives of the E. and W. Indies, S. America, the Arctic circle, and Central Africa. The Germanic nations and the Welsh appear to have been most proficient in A. in early European hist. The Greeks and Romans in anct times, despite the legends of Teucer, Ulysses, etc., seem to have been indifferent archers, and recruited their bowmen from Crete and Asia Minor. After the 4th cent. AD the Rom. armies consisted very largely

ARCHERS AT AGINCOURT

of mounted archers. Scandinavian legend has many references to famous bowmen, and by the 10th cent. the short bow was the chief weapon of the poorest military classes in England, France, and Germany. Both the English and Normans employed mounted archers at Hastings in 1066. The cross-bow, or arbalest, for the shooting of bolts, which was mounted on a stock and discharged by a catch or trigger, was also much in use, especially in sieges and naval battles, though it was condemned by the Lateran Council of 1139. It made its reputation in the crusades, proving much superior to the bow used by the mounted Asiatic archers. In Europe the best exponents

of its use were the Genoese, Pisans, and Venetians. Its use in England was forbidden by Henry VII. The famous English long-bow, at least 6 ft long with a shaft a cloth-yard long, seems to have been introduced from Wales. Its long range and speed were proved at Falkirk in 1298, and the Eng. archers played an important part at Crécy, Poitiers, and Agincourt. A. was supported by all the kings, who encouraged its practice for sport, as is witnessed by the many ballads on the skill of Eng. marksmen. The introduction of gunpowder, which began early in the 15th cent., naturally meant the gradual decay of A., but its disappearance in England was slow. In the reign of Elizabeth treatises on the art were still being written; notably the *Toxophilus* of Roger Ascham, 1545, a detailed and practical work. The long-bow died out at the end of the 16th cent., and the cross-bow early in the 17th. In 1807 horse archers were used in Poland against Napoleon, and in 1860 the Chinese used bows at Taku. In the mid 18th cent. there was a great revival of A. for purposes of health and exercise, which resulted in 1781 in the formation of the Royal Toxophilite Society. Other societies for the practice and encouragement of the art are the Woodmen of Arden, 1785, having H.Q. at Meriden in Warwickshire; John o' Gaunt's Bowmen, 1785; and the Royal Company of Archers (Scotland), dating from 1676. The main legislative and managing body of Brit. A. at the present day is the Grand National A. Society, founded 1861, which holds championship meetings and to which regional and county associations of clubs are affiliated. Best bows were made of yew, but owing to scarcity of that wood (and for greater efficiency) most are now made of steel or combinations of wood and 'plastics.' The length of the bow varies from 5 to 6 ft, according to that of the arrows used (25-30 in.), and it has a drawing power of 40-60 lb. for men, and 24-32 for ladies. The string is made of 3 strands of hemp, dressed with glue, or of flax dressed with wax. The arrow is made of red deal or aluminium alloy and has a 'pile,' or point, a 'nock' for string, and 3 turkey feathers.

Arches, Court of, eccles. court of the Archbishop of Canterbury, so called because it was anciently held at the church of St Mary of the Arches, now St Mary-le-Bow. It has power to deal with suits sent up from the consistorial courts of the provs. of Canterbury. The presiding judge is described in his letters patent as the official principal of the C. of A. of Canterbury, but is usually called the Dean of the A. Since 1874 he has also been chief judge of the chancery court of York.

Archias, A. Licinius, (Gk poet, b. Antioch in Syria 120 BC. Coming to Rome in 102, he was patronised by the Luculli, whose gentile name he assumed, and Cicero was later among his pupils. In 61, while engaged on a poem commemorating Cicero's consulship, A. was charged with having unlawfully assumed Rom. citizenship some 30 years earlier.

He was successfully defended by Cicero in the speech *Pro Archia*, which is our prin. source of information on his career. See also T. Reinach, *De Archia Poeta*, 1890.

Archibald, Raymond Clare (1875-), Amer. mathematician, b. Colchester co., Nova Scotia, and educ. at Mount Allison Univ., Sackville, New Brunswick, Harvard, Berlin, etc. He gained some distinction in violin-playing, but it is as a student of mathematics that he is best known. After occupying a mathematical professorship at Acadia Univ., Nova Scotia, and an instructorship at Brown Univ., he became associate prof. at Brown Univ. 1917-23. Publications: *The Cardoid and Some of its Related Curves*, 1900; *Mathematical Instruction in France, 1910*; *Bibliography of Life and Works of Simon Newcomb*, 1905, 1924; *Euclid's Book on Divisions of Figures with a Restoration*, 1915; *Bibliography of Egyptian and Babylonian Mathematics*, 1927-9; and numerous contributions to European and Amer. journals and reviews.

Archidamus, name of 5 kings of Sparta from the 7th to the end of the 3rd cent. bc. The most famous was A. II (q.v.).

Archidamus II, son of Zeuxidamus, became king when his grandfather, Leotychides, was banished from Sparta. A. reigned from 469 to 427 bc. Prudence and foresight, steadiness of purpose and gravity of deportment were his prominent qualities. In the fourth year of his reign Sparta was nearly annihilated by an earthquake, an opportunity of which the Messenians took advantage to attempt the recovery of their independence. A., by his presence of mind, saved what remained of the city from the hands of an exasperated foe; but it was not till the end of 10 years that this third Messenian war was brought to a close, when the Messenians evacuated their citadel, Ithome (Diod. Sic. xi. 64; Thucyd. i. 103). A. is not mentioned again till we find him speaking on the peace side in the council held by the Lacedaemonians before they resolved on the Peloponnesian war. Though a declaration of war was the result of their deliberation (431 bc), the Lacedaemonians gave him the command of the troops against the Athenians. He was their general also in their second expedition (426 bc) and third expedition (428 bc). He was succeeded by his son, Agis II (Thucyd. i. 79; ii. 10-20, 71; iii. 1).

Archidamus III (d. 338 bc), son of Agasilaus, succeeded his father 361 bc. He commanded the Spartan troops during his father's lifetime, 367 bc, and gained the 'tearless battle' against the Arcadians and Argolians: not one of the Spartans fell, but a great many of the enemy were slaughtered. He was sent (338 bc) to Italy to assist the inhab. of Tarentum, who were at war with the Lucanians. He fell bravely at the head of his troops, and a statue was erected to his honour at Olympia by his countrymen. He was succeeded by his son, Agis III (Diodorus Sic. xvi. 24, 63; Pausanias, iii. 10).

Archidamus IV, grandson of A. III, King of Sparta in 294 bc.

Archidamus V, grandson of A. IV, King of Sparta in 240 bc.

Archidoria, see DORIS.

Archigenes of Apamea (fl. AD 98-117) was a medical author and practitioner at Rome during the reign of the Emperor Trajan (see Juvenal, *Satires*, vi. 236; xiii. 98; xiv. 252). He followed the principles of the Pneumatic sect, founded by Athenaeus of Attalia, and wrote treatises on pathology and the practice of medicine and surgery. His fragments are in the works of Galen, Aetius, and Oribasius.

Archil, or **Orechil**, violet dye which is obtained from sev. species of lichens, notably from the *Roccella tinctoria*. As materials dyed solely with it fade readily in the sunlight, another dye is usually employed at first and the A. is used to give an added brilliance.

Archilochus (early 7th cent. bc), Gk lyric poet, b. Paros, which he left to join the colony of Thasos. Killed in battle between the Parians and Naxians. He enjoyed a very high repute among the ancients, especially for his iambic satiric poems. A. was the first writer in the metre which was afterwards that of Gk drama. For the few surviving fragments of his work see E. Diehl, *Anthologia Lyrica Graeca*, 1949.

Archimagus, or the Anglicised form **Archmage**, was used to denote a chief magician, a mighty worker of things 'mystic, wonderful.' In Spenser's *Faerie Queene* it is applied to the personification of hypocrisy.

Archimandrite, title of the highest order of monastic superiors in the Oriental Church, almost corresponding to that of abbot in the Lat. Church. Russian bishops are chosen from the A.s.

Archimedes (287-212 bc), Gk mathematician and engineer, b. Syracuse in Sicily. His mathematical studies were chiefly concerned with the relation of spherical and rectilinear surfaces and bodies. But he is most famous for his discoveries in hydrostatics and mechanics. He estab. the principles of the lever, and of the equilibrium between a floating body and the hydrostatic pressure of the liquid in which it floats. According to tradition, A. was invited by Hieron II to determine whether a golden crown made for him did not in fact contain a proportion of silver. A. was at a loss to decide the question until one day, as he stepped into a bath, he noticed the water running over. He then realised that the excess of bulk caused by the presence of alloy could be measured by putting the crown and equal weights of gold and silver separately into a vessel of water, and noting the differences of overflow. Whereupon he ran home naked, shouting: 'Heureka! heureka!' (I have found it, I have found it.)

A. also invented a number of military engines which postponed the fall of Syracuse, and was killed when the city was taken by the Romans. Amongst his extant works on three-dimensional geometry are *The Sphere and the Cylinder*

Conoids and Spheroids, and Semi-regular Polyhedrons. Other works are his *Mechanics, Levers, Floating Bodies, and the Method* (discovered in 1906). The definitive text of A.'s writings is that of J. L. Heiberg (2nd ed. 1910-15). Sir T. Heath ed. *The Works of Archimedes* in modern notation (1897), and also, as a supplement, the *Method* (1912). See Sir T. Heath, *Archimedes*, 1920, and *History of Greek Mathematics*, vol. II, 1921.

Archimedes' Screw, machine for raising water. It may consist of a tube wound spirally round a cylindrical axis or a cylinder enclosing a screw so as to form a spiral chamber from end to end. The lowest portion of the screw just dips into the water, and as the cylinder is turned a small quantity of water is scooped up.

ARCHIMIDES' SCREW

A, Opening for entry of water.

The inclination of the cylinder is such that at the next revolution the water is raised above the next thread, whilst the lowest thread scoops up another quantity. The successive revolutions, therefore, raise the water thread by thread to emerge at the top of the cylinder. The machine is used in Holland for draining purposes, and the same principle is sometimes used for raising grain to a higher level in a continuous stream.

Archinto, name of a celebrated family of Milan whose prin. members were:

1. Filippo (1500-58), Bishop of Saluzzo, theologian and diplomatist.
2. Count Filippo A., b. 1649, Governor of Cremona 1692-4.
3. Giuseppe A. (1649-1712), Cardinal and Archbishop of Milan.
4. Carlo A. (1669-1732), son of Giuseppe A. He pub. Muratori's *Scriptores rerum Italicarum*, and founded the Palatine Society.

Archinus, an Athenian who lived during the latter part of the 5th and the beginning of the 4th cent. BC, was the companion of Thrasylbulus. He helped to overthrow the 30 tyrants of Athens, and was mainly instrumental in bringing about the famous amnesty when the democracy was restored in 403. It was owing to him that public documents were written in Ionian instead of in Attic characters.

Archipelago, Gk term (= chief sea)

originally applied to the Aegean Sea, and now to any sea thickly scattered with is.

Architect (from Gk *architekton*, chief craftsman; hence Lat. *architectus*), in modern practice a person qualified to design buildings and to supervise their erection. In Gk and Rom. times his status was fully recognised, and an A.'s duties are fully described by Vitruvius (q.v.). The title was seldom used during the Middle Ages, the A. then being commonly called 'Master' in English (or *magister* in Latin, *maitre* in French, *maestro* in Italian and Spanish, *Baumeister* in German). The Victorian idea that most medieval buildings were designed by monks and bishops rather than by lay A.s has long ago been disproved by many competent authorities, documents having established the fact that the services of lay-designers were utilised by ecclesiastical as well as royal and lay employers.

The title A. was revived during the 16th cent. and was used by Inigo Jones (q.v.) in the early 17th cent. The status of the A. became more definite during the 17th-18th cents.; and in 1834 the foundation of the Royal Institute of Brit. Architects estab. a precise standard of qualification. This Institute, which has its H.Q. at 66 Portland Place, London, conducts examinations for candidates from Britain and overseas, and awards diplomas: F.R.I.B.A., A.R.I.B.A., L.R.I.B.A. In 1925 it absorbed the Society of Architects. The Architectural Association was founded in London in 1847 to provide facilities for social intercourse among A.s and for the education of the younger men; it conducts a large architectural school in Bedford Square.

Since the enactment of the Architects' Registration Act (1938) architectural practice in Britain has been restricted to persons qualified and registered, as in certain other countries abroad. In the U.S.A. the premier architectural body is the Amer. Institute of Architects, with headquarters in Washington. See M. S. Briggs, *The Architect in History*, 1927.

Architecture. *Definition.* The word 'architecture' was first used c. 1563, so is not very old as Eng. words go; but is derived from Lat. *architectura*, and that in turn from Gk *architekton*, literally 'chief craftsman' or 'master-builder.' Hence A. means building designed by a competent person (see ARCHITECT) as distinct from building not so designed. This is not a very clear distinction, and is so difficult to explain that most of the attempts made for three or four cents. past are all unsatisfactory. An Eng. writer in 1581 defined A. as 'the science of building'; Ruskin in the 19th cent. wrote that it is 'nothing but ornament applied to buildings,' a dictum that is universally rejected to-day, when many stark and austere buildings devoid of ornament are accepted as excellent A. It is something more than 'good building' in the sense of sound construction with good materials. An often quoted definition by Sir Henry Wotton, an amateur

critic, in his book, *The Elements of Architecture*, 1624, comes very near the truth. He says that it must fulfil three conditions, 'Commoditie, Firminesse, and Delight,' meaning that, to constitute A., a building must not only be conveniently planned for its purpose ('commodity'), and be soundly built of good materials ('firmness'), but must also give pleasure to the eye of a discriminating beholder ('delight'). It is this third quality, added to the other two essentials, that differentiates 'architecture' from mere 'building.'

Some very primitive buildings, such as rude huts or wigwags in all ages, cannot be counted as A.; and to these may be added primitive stone circles (such as Stonehenge), megaliths, and barrows; also, perhaps, the Egyptian pyramids, and, in modern times, bridges and other structures which are now commonly regarded as 'civil engineering' rather than A. or even building.

Fletcher, *History of Architecture* (16th ed.), 1954.

Periods

The following paragraphs describe the various 'periods' or stages in the hist. of A. up to modern times, but are concerned with general world development. For the distinctive characteristics of each important country, with its buildings and the names of their architects where known, see the various articles on each, e.g. ENGLISH, FRENCH, RUSSIAN ARCHITECTURE.

1. *Pre-Classical Architecture*, up to c. 700 BC (i.e. older than the classical or Hellenic A. of Greece, the first classical period in Europe). Before 700 BC buildings of some pretensions had been erected in W. Asia—including Mesopotamia, Persia, and parts of India—and in Egypt, Greece, and the Aegean Is.

(1a) In *Ancient Egypt*, because life on earth was regarded as no more than a

preliminary to the future life, dwelling-houses of all classes were constructed of relatively impermanent materials, and hardly any have survived to-day; whereas temples and tombs were built to last, as indeed they have done, for thousands of years. In the limited space here available, only temples can be mentioned, though it may be remarked that the numerous and imposing pyramids (q.v.) had their origin in a primitive form of tomb called a *mastaba* (q.v.). *Ancient Egyptian A.* dates from at least 4000 BC to c. 30 BC, when Egypt became a Rom. prov. (See EGYPTIAN ARCHITECTURE; after 7th cent. AD, see MUSLIM ARCHITECTURE.) Although Egypt was occupied for cents. by Assyrians, Persians, and Greeks before its conquest by the Romans, its A. retained distinctive national features throughout. The temples were mostly built of granite (see also OBELISK), with walls which were 'battered' (i.e. tapered slightly as they rose), squat and clumsy columns, and flat roofs. Arches were hardly ever used, though the principle of the arch was known. The chief temples in Egypt are the temple of the Sphinx at Giza, at least fourth millennium BC; the group of temples at Karnak, c. 2466 BC onwards; and the single temples at Abydos, 1350-1330 BC; Abu Simbel, 1330 BC; Edfu, 237 BC; Philae; and Dendera. See E. Bell, *The Architecture of Ancient Egypt*, 1915; Sir W. F. Petrie, *Egyptian Architecture*, 1938; H. Plummer, *Ancient and Classical Architecture*, 1956.

(1b) In *W. Asia* the hist. of early A. is complicated by changes of dynasty (see BABYLONIA, ASSYRIA, PERSIA). The 3 stages are generally described as Babylonian (c. 2630-1275 BC), Assyrian (1275-538 BC), and Persian (538-331 BC). From the 7th cent. AD all these countries of the Middle E., as well as the neighbouring portions of Asia Minor previously forming the Hittite Empire (q.v.), were occupied by the Muslim Arabs (see MUSLIM ARCHITECTURE).

The large walled city of Babylon (q.v.), which became the cap. c. 2000 BC, contained many fine palaces of brick, faced with glazed bricks; also numerous temples; but hardly anything now survives. The chief buildings of the Assyrian era were huge palaces in diminishing stages. Arches, but not columns, were used in these buildings. The chief palaces, now all in ruins, are at Nimrud, 9th cent. BC; Khorsabad, 722-705 BC; and Nineveh, 7th cent. BC. In the Persian period, and therefore contemporary with classical Gk A., the chief surviving buildings are the ruined palaces of Cyrus at Pasargadae, of Darius and Xerxes at Persepolis, of Xerxes and Artaxerxes at Susa. They had flat roofs of timber, carried on tall slender stone columns. See E. Bell, *Early Architecture in Western Asia*, 1921, and Plummer, op. cit., 1956.

(1c) In the *Aegean* (including Crete and parts of Greece) there was an advanced civilisation long before the classical or Hellenic period began c. 700 BC. It is commonly described as the *Aegean*

period, and includes the famous Palace of Minos at Knossos in Crete (q.v.) as well as the important fortified palaces at Tiryns (q.v.) and Mycenae (q.v.) on the mainland. Although there is evidence of civilisation in the Aegean area as early as 3000 BC, the first palaces at Knossos and Phaestos in Crete were built c. 2000 BC, and restored or rebuilt after damage by earthquake and fire a few cents. later. About 1400 BC Mycenae, which had long been prosperous and strong, attacked Crete and became the chief power in the Aegean, until the Dorians invaded Greece from the N. c. 1100–1000 BC. It is impossible to assign accurate dates for the palaces at Knossos, Mycenae, and Tiryns; for in each case their construction lasted over cents., and at Knossos perhaps a thousand years. There the chief interest lies in the impressive sequence of rooms and staircases, the elaborate drainage system, and the coloured mural decorations. At Mycenae the fortified palace contains the wonderful domed tomb, 50 ft in diameter, commonly but incorrectly called the 'Treasury of Atreus' (c. 1185 BC), and the 'Lion Gate' (c. 1200 BC). Here, as in the colossal walls of Tiryns, the huge blocks of 'cyclopean' masonry are astounding. It is now confirmed that there was frequent contact between these 'sea people' of the Aegean and the ancient Egyptians. See E. Bell, *Pre-Hellenic Architecture of the Aegean*, 1926, and J. D. S. Pendlebury, *A Handbook to the Palace of Minos, Knossos*, 1955.

2. *Greece*. Classical or Hellenic GK A. began c. 700 BC, and lasted until the Rom. occupation of Greece in 146 BC; but its later stages, from the death of Alexander the Great in 323 BC until 146 BC, are now generally described as 'Hellenistic' or 'Graeco-Roman.' The so-called 'Golden Age' of Greece occurred in the 5th cent. BC, and all the finest buildings were erected between 480 BC and 323 BC. These buildings comprised temples, theatres, sepulchral and other monuments, formal colonnades (*stoa*), and dwelling-houses, but hardly any palaces. Theatres and houses are dealt with under those headings, leaving temples as the chief buildings to be described here.

GK temples are classified in sev. different ways: (i) according to the type of column or 'order' used (see *ORDERS OF ARCHITECTURE*). There were three orders—Doric, Ionic, and Corinthian—of which the third was seldom used in Greece; (ii) according to the number of columns in a row at the end of the temple, i.e. distyle (2), tetrastyle (4), hexastyle (6), octastyle (8), occasionally nonastyle (9), and decastyle (10 columns); (iii) according to the arrangements of columns around the buildings: peripteral if one range of columns, dipteral if two ranges, and a few other variations. The temples varied greatly in size, from a very small one at Rhamnus measuring only 21 by 35 ft overall, to the temple of Apollo at Miletos measuring 388 by 194 ft, including its surrounding columns and platform. At Epidauros is an unusual circular

temple or *tholos*. Whatever the arrangement of surrounding columns, the temple proper included a chamber or shrine (*naos*) containing a statue of the god or goddess to whom it was dedicated; and usually a *posticum* or *epinaos* (often serving as the *opisthodomos* or treasury) behind the *naos*, and a portico or *pronaos* in front of it. There were no windows in the walls, and it is unknown whether, in any temple, light was admitted through transparent tiles in the roofs. These roofs were low in pitch, made of timber, and covered with tiles of clay or marble. The walls, columns, and lintels were either of the beautiful Pentelic or other marbles easily obtainable in Greece, or of limestone or sandstone; but the design of these stone buildings is derived from much earlier buildings of timber-framing.

Especially in the Parthenon (q.v.) at Athens—the most beautiful and highly finished temple of all—great ingenuity was shown in correcting optical illusions by means of subtle refinements, e.g. in providing a delicate convex curvature (*entasis*) to the tapered columns so that their tapering should not appear concave, and a similar subtle curvature to the platform of steps upon which the columns rested. Besides the numerous temples in Greece itself, there were many others in Sicily and S. Italy, where the various GK colonies were collectively known as *Magna Graecia*. These are mentioned in the article *ITALIAN ARCHITECTURE*. Following are the prin. temples in Greece and Asia Minor, with their dates:

Doric

Olympia, the Heraion	c. 640 BC
Eleusis, Temple of the Mysteries	7th–6th cents. BC
Corinth, Temple of Apollo	c. 625 BC
Rhamnus, Temple of Themis	c. 510 BC
Aegina, Temple of Aphaia	c. 490 BC
Olympia, Temple of Zeus	c. 460 BC
Delos, Temple of Apollo	c. 450 BC
Athens, the Parthenon	447–432 BC
Athens, the Thesion	c. 428 BC
Sunium, Temple of Poseidon	c. 425 BC
Bassae, Temple of Apollo	
Epauris	c. 420 BC
Epidauros, the Tholos	360–330 BC
(¹ Also Ionic and Corinthian)	

Ionic

Ephesus, older Temple of Artemis	c. 560 BC
Samos, Temple of Hera	c. 500 BC
Athens, Temple on the Ilissus	c. 450 BC
Athens, Temple of Nike	
Apteros	c. 425 BC
Athens, the Erechtheion	? 421 BC
Ephesus, later Temple of Artemis	c. 356 BC
Priene, Temple of Athena	
Polias	c. 335 BC
Miletus, Temple of Apollo	
Didymaeus	c. 330 BC

Corinthian

Athens, the Olympieion	c. 170 BC
------------------------	-----------

Besides temples, mention must be made of the prin. theatres, especially that at

Epidauros (c. 330 BC) and the theatre of Dionysos at Athens (c. 340 BC); of the enormous stadium at Athens, holding 70,000 persons and in 1896 restored from ruin to its former grandeur; of the Propylaea or formal entrance gateway to the Acropolis at Athens (437-432 BC); of the dainty little monument of Lysikrates (335 BC) and the Tower of the Winds (c. 50 BC), both in Athens; and also of the magnificent Stoa of Attalus (c. 150 BC), recently restored, in Athens.

(For the names and works of Gk architects see CALLICRATES; DINOGRATES; ICTINUS; MNEKLES.) During the Middle Ages and until the early 19th cent. the only notable buildings erected in Greece were Byzantine churches and monasteries in and around Athens, and at Daphni, Mistra, and Stiris (see '4' below). See E. Bell, *Hellenic Architecture*, 1920; D. S. Robertson, *Greek and Roman Architecture*, 1929; W. B. Dinsmoor, *The Architecture of Ancient Greece* (3rd ed.), 1950; H. Mommer, *Ancient and Classical Architecture*, 1956.

3. *Etruscan and Roman*. The earliest It. A. is commonly called 'Etruscan' after the Etruscan tribes which occupied the dist. of Etruria, approximately between the rivs. Arno and Tiber on the SW. side of the Apennines and between the cities of Rome and Florence. The fragmentary remains of Etruscan A. are, however, distributed over a wider area extending N. of the Arno; and their dates are uncertain. Although the Etruscans may have entered Italy as early as 1000 BC, possibly from Asia Minor, most of their scanty A. must be attributed to a much later date, and the end of the Etruscan period in A. is generally dated at c. 100 BC, centuries after the legendary but probable foundation of Rome in 753 BC. 'Etruscan A. is therefore synonymous with 'early Rom.' or 'early It. A. (see ITALIAN ARCHITECTURE).

As remarked above, Gk colonies were estab. around the coasts of Sicily and S. Italy during the 8th-6th cents. BC, and the influence of Greece is very apparent in Etruscan buildings. The invention of the arch, once ascribed to the Etruscans, is now known to be much older than any Etruscan examples yet discovered. Some of the early tombs, hewn out of solid rock, represent the interiors of timber houses; and from these it is possible to infer the appearance and construction of Etruscan dwellings (e.g. in a tomb at Corneto), while in another tomb at Cerveteri there is a primitive representation of the Gk Doric Order.

It is only in their temples that the Etruscans seem to have reached any tolerable standard of A., but even of these no examples survive. In some respects they resembled Gk Doric temples, but they were usually square on plan, and were mainly constructed of wooden posts, beams, and rafters, covered with elaborate but crude casings of terra-cotta. From surviving portions of these casings, and the descriptions in the books of Vitruvius (q.v.), it has been possible to reconstruct, full-size, an Etruscan temple of the 3rd

cent. BC, formerly at Alatri and now in the garden of the Etruscan Museum in the Villa Giulia, Rome, which also contains an anct terra-cotta model of the temple at Lanuvium, 5th cent. BC. The Alatri temple is square, with a portico of only two columns at each end, richly modelled terra-cotta friezes and cornices, no windows, and a pedimented roof of low pitch. The columns are a rustic form of Doric, without flutings: the type which Vitruvius christened the 'Tuscan Order.'

The transition from 'Etruscan' to 'Roman' A. is imperceptible, but may be dated at c. 100 BC, by which time Greece had become a Rom. prov. (146 BC). Thus Rom. A. is largely a product of the Gk tradition, grafted on to a native Etruscan tradition which was itself mainly Gk; but, in the vigorous hands of later Romans, a distinctive Rom. style of A. was created, and soon it spread all over the empire.

In contrast with the 'trabeated' A. of the Greeks (Lat. *trabs*, a beam), where all the weight of a building was carried over openings by lintels or horizontal beams, the Romans, from the outset, favoured 'arcuated' construction, where arches took the place of beams over openings whenever possible. The Romans, however, did not entirely discard the Gk 'orders'—consisting of standardised columns supporting a standard arrangement of beams (the 'entablature')—but used them mainly as ornamental rather than structural features, e.g. not only in imposing porticos at the entrance to temples, but even as unnecessary surface decorations on the exterior or interior of buildings. A notable example is the Colosseum at Rome, where the vast structure consists of tiers of massive arches, to which the tiers of added orders give no additional strength. Though the Romans used all three Gk orders—Doric, Ionic, and Corinthian—in modified form, they favoured the richest of all, the Corinthian, which had been least popular with the Greeks.

Arches were invariably semicircular, whether of stone or of brick. Much daring, novel, and imposing construction was effected by the use of concrete, of which pozzolana (a volcanic ash) was an important ingredient. With this new material great vaults and domes were erected; but travertine stone was also largely used in Rome, and marble was imported in later years for the prin. public buildings. A unique and comprehensive account of Rom. architectural design and construction in the early years of the empire is given by Vitruvius (q.v.).

Besides erecting temples, theatres, and certain other types of building already developed by the Greeks, the Romans introduced many new types: e.g. amphitheatres (q.v.), public bathing establs. (*thermae* (q.v.)), basilicas (q.v.), apartment houses or 'flats,' especially in Rome and Ostia (see HOUSE), enormous palaces for the emperors (especially on the Palatine in Rome and at Spalato in Dalmatia), triumphal arches, and—in later years—Christian churches.

No less than 400 temples are said to have existed in Rome itself in the 4th cent. AD, when the pop. is computed to have reached a million. Some of them were surrounded by a peristyle of free-standing columns, as in Gk temples. Some others had the surrounding columns partly built into the side-walls (as at the *Maison Carrée* at Nîmes). The prin. examples in the city of Rome are the temples of Fortuna Virilis (c. 40 BC); Mars Ultor (2 BC); Concord (7 BC-AD 10); Castor and Pollux (AD 6); Vespasian (c. AD 80); Venus and Rome (AD 135); Antoninus and Faustina (AD 141); and Saturn (c. AD 320). In Rome are also the circular temples of Vesta (AD 205)

mausoleum of Augustus (c. 25 BC, 270 ft diameter) is in a ruinous condition.

The secular basilicas are described elsewhere (see *BASILICA*); and the basilican churches, erected after Constantine granted toleration to Christianity in AD 313, are dealt with below.

All the buildings mentioned (except the temple of Tivoli) are in Rome itself, and were erected before Constantine's removal of the cap. of the Rom. Empire to Byzantium (Constantinople, now Istanbul) in AD 324. For Rom. buildings elsewhere see *ENGLISH*, *FRENCH*, *GERMAN*, *ITALIAN*, *SPANISH ARCHITECTURE*; also *ATHENS*; *BAALBEK*; *PALMYRA*; *TEMPLE (at Jerusalem)*; *TIMGAD*. For

ST CLEMENT'S, ROME

Anderson

and the huge Pantheon (27 BC-AD 124). At Tivoli, near Rome, is the circular temple of Vesta (c. 80 BC).

The enormous *thermae* or bathing estab. served as popular clubs or recreation centres, including gymnasia and libraries as well as baths. The chief examples, all in Rome itself, are the baths of Caracalla (AD 212-35) and Diocletian (AD 302). The only anct theatre in Rome is that of Marcellus (23-13 BC); and the only amphitheatre is the magnificent Colosseum or Flavian Amphitheatre (AD 70-82), which had seating accommodation for 80,000 spectators. Of seven great circuses in the city none remain; but the site of the Circus Maximus is open, and enables one to realise the vast size of a building that held 250,000 persons. The surviving triumphal arches in Rome are those of Titus, AD 82; Septimius Severus, AD 203; and Constantine, c. AD 315. Trajan's famous column was erected in AD 112. The best preserved tombs are the great circular mausolea of Hadrian (c. AD 135, 240 ft diameter, now called the 'Castle of S. Angelo'); and of Caecilia Metella (c. 20 BC, 94 ft diameter); but the

Rom. architects see *APOLLODORUS*; *ARCHITECT*; *VITRUVIUS*. See W. J. Anderson, R. P. Spiers, T. Ashby, *Architecture of Ancient Rome*, 1927; D. S. Robertson, *Greek and Roman Architecture*, 1929; H. Plommer, *Ancient and Classical Architecture*, 1956.

4. *Early Christian and Byzantine*. Although the Rom. Empire maintained some sort of an existence long after Constantine transferred the cap. from Rome to Byzantium in AD 324, that date really marks the end of Rom. A. Constantine having officially recognised Christianity by the Edict of Milan in 313, a number of basilican churches were erected—mainly in Rome—between c. 330 and 340; and very little other building took place in the city. It is for that reason that the name 'Early Christian' is given to the period from c. 330 to the estab. of the Lombard kingdom of Italy in 568. Then the 'Lombard style' of A. was created, afterwards becoming the first phase of 'Romanesque' A.

The reason why no notable churches older than Constantine's day survive is that the first Christians had to worship in secret because of persecution. Their meetings

were held either in private houses or in catacombs (q.v.) outside Rome.

The basilican churches founded in and around Rome in Constantine's day and shortly afterwards include some of the most famous shrines of W. Christendom. Among sev. which have been entirely rebuilt was the great original basilica of St. Peter's, 330. Most of the others have been much altered; so that the typical example of Early Christian A. in Rome is now St. Paul's-without-the-Walls, destroyed by fire in 1823 and then completely rebuilt in its original form. Most of these churches are mentioned

examples of Early Christian churches in England, France, and Spain are mentioned in the articles ENGLISH, FRENCH, SPANISH ARCHITECTURE.

Ravenna possesses two interesting basilicas of rather later date than most of those in Rome: S. Apollinare Nuovo, 493-525, and S. Apollinare in Classe, 534-9; both containing fine mosaics and both erected by Theodoric, the Gothic king of Italy. At the same time were erected, by Justinian the Byzantine emperor, the remarkable group of churches which are the chief masterpieces of the Byzantine style. The largest and most

W. F. Mansell

BYZANTINE: INTERIOR OF ST SOPHIA, CONSTANTINOPLE

under ITALIAN ARCHITECTURE (q.v.). They usually comprise an aisled nave, separated from each of its flanking aisles by a row of columns, generally Corinthian and often rifled from older buildings; round-headed windows in the wall above them, to light the interior; an apse at the E. end; and a narthex or vestibule at the W. end (*see* CHURCH). Thus, except for the general plan, they present no new structural or architectural features; but the plan is important, for it was the ancestor of the great medieval churches all over Europe. Abreast of these basilican churches some round churches were also erected: in Rome S. Costanza, 330; the Baptistery of Constantine, 430-440; S. Stefano Rotondo, c. 470; and, at Nocera, the Baptistery, 350.

Meanwhile Constantinople had built some churches in his new cap. at Byzantium ('Constantinople'), one of which was S. Sophia, destined to be rebuilt on a grand scale two cents. later; also the Church of the Nativity at Bethlehem, 330, on the basilican plan. The few

famous is St Sophia at Constantinople which he rebuilt in 532-7. It was designed by Anthemius of Tralles (q.v.) and Isidorus of Miletus (q.v.); and became a mosque after Constantinople was captured by the Turks in 1453, when the tall minarets were added (*see* MUSLIM ARCHITECTURE). In the same city are the domed Byzantine churches of St Sergius and St Bacchus, 527; St Irene, 740; St Saviour-in-the-Chora, c. 1050; and St Theodore, c. 1100. At Ravenna Justinian built the small but wonderful octagonal domed church of St Vitale, 526-47. Much later is St Mark's at Venice, 1042-71, which as seen from the W. side appears Gothic rather than Byzantine, because of florid later additions, but internally is a noble example of Byzantine domed roofing, clothed with rich mosaics. Not far from Venice are the beautiful cathedrals at Parenzo in Istria (535-43) and Grado in Venetia (571-86), but these are mainly basilican in form.

The Byzantine style was adopted

throughout the countries of E. Europe and the Near E., whose religion was ruled by the Orthodox or Gk Church; so that Byzantine churches are found in Greece and Syria, and Byzantine domes spread into Russia (see RUSSIAN ARCHITECTURE). In Greece there are sev. tiny but interesting domed Byzantine churches of the 9th-13th cents. at Athens; and larger examples at Daphni, Mistra, Salonica, and Stiris.

The outstanding feature of Byzantine A. in all its phases is the prominence given to the dome in contrast to the simple sloping wooden roof of the Early Christian

was placed a new feature, the 'dosseret' (q.v.), a block from which rose the arches, which, as in Rom. work, were always semicircular. Columns, usually of marble, were strengthened against earthquakes by bronze annulets. See C. Diehl, *Manuel d'art Byzantin*, 1910; O. M. Dalton, *Byzantine Art*, 1911, and *East Christian Art*, 1926; T. G. Jackson, *Byzantine and Romanesque Architecture* (2 vols.), 1920; J. A. Hamilton, *Byzantine Architecture*, 2nd ed., 1956.

5. *Romanesque*. The term 'Romanesque' has been applied for more than a cent. to the style of A. which, in most

W. F. Mansell

ENGLISH ROMANESQUE: THE GALILEE CHAPEL, DURHAM CATHEDRAL

basilica. At St Sophia, Constantinople, the great central dome is buttressed by semi-domes. The dome was used, in Rom. A., on circular buildings; but Byzantine domes generally rise from square bases, the transition from square to circle being effected by means of 'pendentives' (see DOME, PENDENTIVE). Hence the typical plan of a Byzantine or 'Gk Orthodox' church is a 'Gk cross,' i.e. a central (domed) space with four short arms; whereas the typical plan of a large Rom. Catholic church is a 'Lat. cross,' i.e. a long nave with shorter arms for the chancel and the two transepts, arising from the plan of the Early Christian basilica, with transepts added. Brickwork and concrete were the materials chiefly used, covered internally with mosaics. The Rom. Corinthian capital was modified into a convex shape, and the foliage carved on it was either 'wind-blown' in character or was decorated with new forms of ornament. Above it

European countries, followed the collapse of the auct Rom. Empire and preceded the introduction of the Gothic style, c. 1200. Nowadays it is held to include the so-called 'Lombardic' and 'Rhenish' styles as well as the familiar labels of 'Saxon' and 'Norman' applied to Eng. Romanesque buildings (see ENGLISH ARCHITECTURE). It is important to define its historical and geographical limits. These were not confined to 'Romanised Europe,' as one famous dictionary asserts, for one finds a few Romanesque buildings in Scandinavia (see SCANDINAVIAN ARCHITECTURE) and Poland, which were never Romanised; whereas in SE. Europe, which was Romanised, the Byzantine style was followed (see BYZANTINE ARCHITECTURE).

It is more correct to state that Romanesque was used in the countries of Europe where the Rom. Catholic Church prevailed, while Byzantine was adopted in countries where the Orthodox or Gk

Church was supreme. The latter group included modern Turkey (in part), Greece, Bulgaria, Rumania, and Russia. The Catholic countries included all W. and central Europe, Scandinavia, Hungary, and Poland; but the S. part of Spain, as well as much of Turkey, was under Muslim rule for most of the Romanesque period (see MUSLIM ARCHITECTURE).

A description of the prin. Romanesque buildings and their distinctive national characteristics will be found under the

Anderson

MUSLIM ARCHITECTURE:
THE ALHAMBRA, GRANADA

articles on the A. of the various countries concerned (see BELGIAN, ENGLISH, FRENCH, GERMAN, IRISH, ITALIAN, SCANDINAVIAN, SCOTTISH, SPANISH ARCHITECTURE); and here it is only necessary to describe the general characteristics of the style.

While it is true that all Romanesque A. is a natural development from anct Rom. or classical A., there was a period, commonly called the 'Dark Ages'—between the collapse of the Rom. Empire in the 5th cent. and the reign of Charlemagne in the 9th—when a form of Rom. A. still persisted but when Romanesque had hardly matured. In Italy this was the 'Early Christian' period (see 4); in England and France there are a few churches which could be similarly classified; in Spain there was a 'Visigothic' style (see SPANISH ARCHITECTURE). The oldest buildings that can properly be called Romanesque are found in Italy:

e.g. St Pietro, Toscanella; St Maria in Cosmedin, and St Giorgio in Velabro, both in Rome; parts of St Ambrogio, Milan; and Torcello Cathedral. All these are of the 8th–9th cents., and have been called 'Lombardic' because Lombard kings ruled Italy from 568 to 774, their cap. being at Milan. Charlemagne became Holy Rom. Emperor in 800; and his cathedral (796–804) at Aachen in Germany is the first important Romanesque building in N. Europe. Thus the historical limits of Romanesque A. may be set from c. 800 to the beginning of Gothic A. c. 1200.

This period of four cents. was the great age of European monasticism. The Benedictine Order was founded in Italy in the 6th cent., but its chief buildings were of later date and of Romanesque character. During the period 900–1100 the Benedictines were followed in due course by the Cluniac, Cistercian, Augustinian, Premonstratensian, and Carthusian Orders (see MONASTERY). The 11th and 12th cents. also saw great activity in castle-building, and the science of military A. developed rapidly as the result of warlike contacts with the 'Saracens' during the Crusades (see CASTLE). The architectural work of the Romanesque period therefore consists almost exclusively of monasteries, cathedrals, parish churches, and castles. Very few domestic buildings have survived, for there was hardly any middle class between the feudal lord in his castle and the common people in their wretched hovels. In England the so-called 'Jews' Houses' at Lincoln are a rare exception (see HOUSE).

From the anct Rom. tradition the Romanesque architects adopted certain features: the semicircular arch, the groined cross-vault (see VAULT), and even a modified and debased form of the Corinthian column with its capital of acanthus leaves. Occasionally, in early days, they used carved fragments of antique buildings. They made one important advance upon Rom. structural methods, in balancing the thrust of heavy vaults and domes by means of buttresses, and in substituting, for the thick vaults used by the Romans, a much thinner web supported on curved stone ribs.

Romanesque churches generally followed the basilican plan, with aisles and an apse; but transepts were often added, and sometimes the aisles were continued around the apse to form an ambulatory. Towers were now popular, the campanile (q.v.) having been invented cents. earlier, and Rome contains sev. graceful examples while the churches of the Rhineland bristle with gabled towers, and at Sompting in Sussex is a small tower of the same remarkable type (11th cent.). Numerous circular churches, too, were built during this period: based upon the precedent of the Early Christian baptistery, and thus ultimately derived from anct Rom. temples and tombs. The Knights Templars built four circular churches in England, taking as their model the Church of the Holy Sepulchre in Jerusalem, originally founded by Constantine.

Arcading (i.e. rows of semicircular arches, sometimes interlacing) was freely used as decoration on the towers, the walls, and even the interiors of churches. Windows were comparatively narrow, and round-headed. Doors also had round arches over them, the tympanum (i.e. the space between the lintel of the doorway and the arch) being usually carved. The jambs or sides of the doorway were decorated with crude and often grotesque carved mouldings (see **MOULDINGS**), and small shafts were recessed in them. The roofs of Romanesque churches were steep in N. Europe, whether the building was vaulted or not; but of much lower pitch in Italy, where the simple tiled roof of the Early Christian basilica was followed as an example. A certain amount of didactic religious wall-painting has survived; also some examples of Romanesque stained glass, e.g. at Canterbury. Perhaps the finest works of Romanesque craftsmen are the bronze doors of Hildesheim Cathedral in Germany, wrought in 1015-22. See A. K. Porter, *Medieval Architecture* (2 vols.), 1909; W. R. Lethaby, *Medieval Art* (2nd ed.), 1912; T. G. Jackson, *Byzantine and Romanesque Architecture* (2 vols.), 1920; G. T. Rivoira, *Lombardic Architecture* (2nd Eng. ed., 2 vols.), 1933; A. W. Clapham, *Romanesque Architecture in Western Europe*, 1936. (See also bibliography at end of **ENGLISH ARCHITECTURE**.)

6. *Gothic*. Gothic was the architectural style used in certain countries of Europe from the end of the Romanesque period, c. 1200, to the advent of the Renaissance movement—in the 15th cent. in Italy, in the 16th cent. elsewhere. Although the term 'Gothic' is used to-day, as it has been for a hundred years, to describe a style which is universally regarded as splendid and beautiful, one must remember that it was originally applied simply as a term of contempt or a nickname, like 'Quaker' or 'Tory'; and was so used in the time of Wren (late 17th and early 18th cent.). At that date it was erroneously believed that the destruction of the classical monuments of Rome was due to the savage and barbarous Goths who sacked the city on five occasions during the 5th and 6th cents. A similar meaning is attached to the term 'Vandals'—the Vandals being another savage race who sacked Rome in 455.

Yet, as Gibbon (q.v.) pointed out nearly two hundred years ago, marauders of this type could not possibly have destroyed such massive structures, their opportunities being limited to portable loot; and the state of ruin into which these great buildings fell was due to the ravages of the weather, to cents. of neglect, and to their use as a convenient quarry throughout the Middle Ages and even in later times. Moreover the Goths never produced any definite A. of their own; so that to describe medieval A. as 'Gothic' was, in fact, absurd. See M. S. Briggs, *Goths and Vandals*, 1952.

In the 17th cent., when the term was first used, medieval A. was considered by connoisseurs to be uncouth and barbarous;

hence it was christened 'Gothic' because the Goths were regarded, quite rightly, as barbarous.

Gothic A. was essentially the style of the Catholic countries of Europe listed above, including Hungary and Poland; but it was also carried to Cyprus, Malta, and Palestine by the Crusaders and their successors in the Mediterranean. It was used for all secular buildings, and even for a few synagogues, as well as for cathedrals, churches, and monasteries.

W. F. Mansell

BURGOS CATHEDRAL.

An example of florid Gothic architecture in Spain.

The date of its beginnings may be safely placed at c. 1200 in all countries; but the date of its end varies according to the length of time that the new ideas of the Renaissance took to influence architectural fashions—as early as c. 1420 in Italy, the cradle of the movement; as late as c. 1540 or c. 1550 in England and NW. Europe. Gothic A. attained its highest excellence in France and England. In Germany, Belgium, Holland, Spain, and Switzerland it was largely borrowed from one of those two countries, especially from France. In Italy, because of the strength of the classical Rom. tradition, it never reached so high a level; and, for the same reason, it quickly succumbed to the Renaissance, which was itself a return to that tradition. For a description of the national characteristics of Gothic in various countries see **BELGIAN AND**

DUTCH, ENGLISH, FRENCH, GERMAN, IRISH, ITALIAN, SCANDINAVIAN, SCOTTISH, SPANISH ARCHITECTURE.

In the article AMERICAN ARCHITECTURE is mentioned a Gothic church in Virginia, U.S.A., built in 1632. This is a very belated example of Gothic, but is nearly contemporary with two Eng. examples—the church of St John at Leeds, 1624, and the magnificent fan-vaulted staircase at Christ Church, Oxford, 1640. The dominating feature of Gothic A. at all its stages and in all the countries mentioned is the pointed arch, which was first used in England at Fountains Abbey, Yorks, c. 1135, but had been used in France some years earlier. Up to comparatively recent times some scholars attributed the origin of this feature to the shape produced by interlacing of semicircular arches in an arcade; but now the invention of the pointed arch is universally ascribed to the Middle E., where it was used on a large scale in the great mosques of Samarra in Iraq (mid 9th cent.) and Ibn Tulun at Cairo (876-9, *see* MUSLIM ARCHITECTURE); but even that is not the beginning of the story, for pointed arches of the 6th cent. have been found in Syria. The idea may well have been brought to France and England by the Crusaders.

The pointed arch is, however, important as something more than a shape: its introduction enabled Gothic builders to solve many problems, and thus to develop the elaborate and highly scientific system of vaulting and buttressing which is the real basis of Gothic A., differentiating it from the heavier Romanesque (*see* VAULTING). This process of change lasted, in all, over a period of about half a cent., from c. 1150 to c. 1200, and is called the 'Transitional' period: thereafter mature and fully fledged Gothic came into being, c. 1200.

One result of the improved system of vaulting and buttressing was an increase of window area in the walls between buttresses, because these walls no longer had to carry the main weight of the roof, so could be thinner and could be pierced with impunity. The pointed arch was now used over windows, and these 'lancet' windows were grouped in twos or threes under an enclosing arch, the remaining enclosed space being pierced with small circular openings. Then the stonework between all the various windows and openings ('lights') in the group was reduced to slender stone bars ('mullions'), and the whole enclosed group of 'lights' became a single window, the upper portion within the arch being filled with 'tracery,' consisting at first of geometrical patterns, then of flowing patterns, and finally of quasi-rectangular openings forming a grid (*see* TRACERY). The effect of a grid was mainly due, however, to the introduction of horizontal transoms in the larger windows.

It is these phases of window design, rather than any vital principle of construction, which led Eng. writers of a cent. ago to divide Eng. Gothic A. into three main stages, viz. (i) Early Eng., c. 1200-1300; (ii) Decorated, c. 1300-70;

(iii) Perpendicular or Rectilinear, c. 1370-1540. (*See* ENGLISH ARCHITECTURE.)

The process of development in other European countries differed in many respects from that in England: reference is made to such differences in the various articles on national A. already mentioned. Thus France never had a 'Perpendicular' phase but produced a 'Flamboyant' phase unknown in England, though occasionally found in Scotland. It. Gothic is completely different from Eng. and Fr., and some It. cathedrals have striped exteriors of black and white

W. F. Mansell

ENGLISH GOTHIC: SALISBURY CATHEDRAL

marble. Many great Ger. churches were built of brick, not of stone. Flying buttresses, perhaps the most dramatic features of Fr. Gothic cathedrals, are only occasionally found in England, e.g. at Westminster Abbey, which is the most Fr. in character of our greater Gothic churches. Fan-vaulting, on the other hand, is a distinctly Eng. invention. Open timber roofs are seen at their best in Eng. Gothic churches and secular halls, the enormous oak roof of Westminster Hall (1397-9) being the finest example. This is a hammer-beam roof (q.v.), a type peculiar to England. The so-called 'Tudor Arch' (*see* ARCH) is also distinctively English, though something similar was used in Muslim buildings cents. before and is called the 'Persian arch.'

In the larger Romanesque churches, as already stated above, towers were numerous and conspicuous; but their roofs were generally finished with gables

or in pyramidal form. It was left to Gothic architects to develop lofty spires, of which there are numerous fine examples in most countries of W. Europe except Italy.

The differences between Fr. and Eng. church plans are noted in the articles on FRENCH and ENGLISH ARCHITECTURE. Gothic was not confined, however, to churches; and, in the various articles on the A. of individual countries, the chief Gothic secular buildings are mentioned. For the function, titles, and status of medieval architects see ARCHITECT. Stained glass (q.v.) had come into use during the Romanesque period; but its full development occurred in Gothic times; and all other branches of craftsmanship made great advances. Colour was freely used in the interior of the greater churches: not only in the form of stained glass, but also in wall-paintings of religious subjects, and in costly hangings and vestments.

The numerous details of Gothic A. (e.g. *Chevet*, *Crocket*, *Sedilia*) are described as separate items, alphabetically arranged. See E. Corroyer, *L'Architecture Gothique*, 1891; A. K. Porter, *Medieval Architecture* (2 vols.), 1909; G. H. West, *Gothic Architecture in England and France*, 1911; W. R. Lethaby, *Medieval Art* (2nd ed.), 1912; T. G. Jackson, *Gothic Architecture in France, England, and Italy* (2 vols.), 1915; J. Harvey, *The Gothic World*, 1950. (See also bibliography at end of each article on the national A. of various countries.)

7. Renaissance to c. 1800. As explained elsewhere (see RENAISSANCE) the Renaissance in general was a revival of interest in the classical culture of Greece and Rome, including A. and the other arts as well as literature. No specific dates can be given for its beginning or its end. It certainly began in Italy, but it took a cent. or more to reach other countries; and when it had taken root its progress continued until the Gothic Revival began in the first quarter of the 19th cent. In A. the cultural centre where it had its birth was Florence, the most enlightened and important of the numerous civic reps. in Italy, which at that time (c. 1420) was a mosaic of independent states, the largest being the kingdom of Naples in the S. and the papal dominions in the centre. Rome, which contained the classical ruins from which the first Renaissance architects drew their inspiration, had no more than 20,000 to 30,000 inhab. at the end of the 13th cent., and probably less after the Black Death had taken its toll in the next cent. Poggio (1380-1459) wrote thus of the condition of its great monuments: 'The public and private edifices, that were founded for eternity, lie prostrate, naked and broken, like the limbs of a mighty giant; and the ruin is the more visible from the stupendous relics that have survived the injuries of time and fortune.'

It was at this moment that Filippo Brunelleschi (q.v.), a young goldsmith of Florence, having been unsuccessful in the

competition for bronze gates to the baptistery there in 1401, decided to turn to A., and visited Rome in order to make a first-hand study of the ancient buildings. He returned to his native city in 1407, and had his reward when his designs for completing the unfinished cupola of the cathedral were successful in 1420. In the same year, or thereabouts, he built the Pazzi Chapel adjoining St Croce in Florence; and this work may be regarded as the first church copied closely from Rom. A. During the next 30 years or so Renaissance A. was confined to Florence and its neighbourhood, the chief exponents being Brunelleschi himself and Michelozzi. By the middle of the 15th cent. the movement had spread a little further under the leadership of Alberti (q.v.), a many-sided man who had obtained a doctorate in law, and was talented as a poet and musician. Turning to A. in middle age, he designed his first building in 1446; and wrote a book on A., *De Re Aedificatoria*, which was pub. in 1485, after his death. The importance of Alberti is partly that he was the first architect since ancient Rom. days to formulate the rules of architectural design, and that he based these upon Rom. tradition. In due course he was followed by other It. writers who all adopted the same procedure. They included Serlio (q.v., 1475-1554), Vignola (q.v., 1507-73), Palladio (q.v., 1508-80), and Scamozzi (1552-1616). They all were able to quote the famous book on A. written by the ancient Rom. architect Vitruvius, the MS. of which seems to have been discovered in 1414 and was pub. in Rome in 1486. Thus architectural design in Italy, and ultimately in the rest of Europe, became a matter of Rom. precedent: that is why Renaissance A. has been called 'the Architecture of the Book.' The effect of all this scholarship varied in the different countries. In Italy the impatient genius of Michelangelo (q.v.), a sculptor-painter turned architect late in life, rebelled against so much pedantic dictation; and his deviations from orthodoxy led to the Baroque style, which was enthusiastically welcomed by the promoters of the Counter-Reformation, especially the Jesuits, and swept through the Catholic countries of Europe during the 17th cent. Baroque may be defined as a picturesque and unconventional form of Renaissance A.: sometimes wayward to the point of eccentricity, but often brilliantly effective in its treatment of masses and spaces, and in its relating of buildings to their surroundings. In France, England, the Netherlands, and Scandinavia its influence was less pronounced; but in all of them there are many important buildings which are more or less Baroque in character. Examples are noted in the various articles on the A. of individual countries. See also ARCHER, THOMAS; BERNINI; BIBIENA; BORROMINI; HAWKSMORE; VANBRUGH.

The stages by which the new Renaissance doctrines of architectural design gradually overcame the prevailing Gothic

tradition are briefly described in the articles on individual countries (*see* list in Section 6), where also the chief Renaissance buildings and their architects are named. The three channels through which the new gospel was communicated were: (i) It. craftsmen and architects working in other countries; (ii) It. books on A., already mentioned; (iii) visits of architects and wealthy aristocrats to Italy in order to study the Rom. ruins. In the first category are craftsmen such as Torrigiano who executed the monument of Henry VII in Westminster Abbey (1512); and the group of Italians

pub. *The Elements of Architecture*, an amusing little book based almost entirely upon Vitruvius but reinforced by personal study in Italy.

Far more important than either of these was Inigo Jones (q.v.), who, although a poor man, managed to spend years of study in Italy, concentrating mainly on the works of Palladio; and after returning to England was commissioned to design, for the king, the Queen's House at Greenwich (1617-35) and the Banqueting House at Whitehall (1619-22). These two remarkable buildings introduced into England the genuine Renaissance A. of

Jacobean house (1620), essentially in the English tradition.

who worked in France at Fontainebleau, Amboise, etc., for François I., among them Serlio the architect. The books mentioned were all trans. from the Italian sooner or later, and sold throughout Europe; but other less authentic works on the Orders (q.v.) and on classical design began to appear from the printing presses of Antwerp and Amsterdam. Some of them were produced by engravers with little knowledge of A., and resulted in mere caricatures of classical buildings. Their effect on architectural design was naturally unorthodox, hence the highly picturesque A. of the late 16th and early 17th cents. in the châteaux of the Loire, our own 'Elizabethan' and 'Jacobean' buildings, and the delightful gabled bn halls of so many quaint old Ger., Dutch, and Flem. cities. Some Fr. architects of the late 16th cent.—among them Delorme (q.v.) and Du Cerceau—had studied auct Rom. A. first hand in Italy, as had the Eng. architect, John Shute, who pub. in 1563 *The Chief Groundes of Architecture*. In 1624 a cultured diplomatist, Sir Henry Wotton,

Italy. Sir Christopher Wren (q.v.) never visited Italy personally, and his A. was never so wholeheartedly Italian as that of Jones. He himself, and still more some of his followers—Archer, Hawksmoor, and Vanbrugh (qq.v.)—showed some sympathy with Baroque. In the early 18th cent., however, there was another swing of the pendulum, back to the orthodox scholarship of Inigo Jones. Hence its practitioners were called the 'Palladian School' of architects. They included Burlington, Gibbs, Kent (qq.v.), and Colin Campbell.

Thus, in c. 1750, Eng. A. was definitely Palladian; while the Baroque style had petered out in Italy, Spain, Austria, Bavaria, Switzerland, and the other countries in which it had chiefly fl.; and Fr. A. stood midway between the two. The second half of the 18th cent. saw the beginning of the last phases of Renaissance A. In England two famous architects, Sir Wm Chambers and Robert Adam (qq.v.), were keen rivals for court patronage. Chambers continued the Palladian tradition, and wrote an excellent

text-book of architectural design on orthodox classical lines. His taste is exemplified in his greatest building, Somerset House, London. Adam, another student of the antique, favoured the delicate Hellenistic A. and decoration of Pompeii and Herculaneum, then recently discovered, rather than the more massive style of Palladio and Chambers. His influence was felt in America, where the simple building fashions of the New England and Virginia colonists had already given place to the more academic designs of the Renaissance (see AMERICAN ARCHITECTURE). France experienced no counterpart of the 'Adam' style; but, instead, produced a dainty frolicsome variant of Renaissance A. known as 'Rococo'—lighter and more feminine than Baroque, but equally unconventional. It soon spread into Germany and Switzerland; and one of its most attractive examples is the palace of Sans Souci at Potsdam (1745-7). See L. Palustre, *L'Architecture de la Renaissance*, 1892; M. S. Briggs, *Baroque Architecture*, 1913 (also in German, 1914); T. G. Jackson, *The Renaissance of Roman Architecture* (3 vols.), 1921-3; Geoffrey Scott, *The Architecture of Humanism*, 1924. (See also bibliography in each article on the A. of individual countries.)

S. *The Nineteenth Century*. The hist. of European A. in general, and of Eng. A. in particular, is more complicated during the 19th cent. than in any cent. that preceded it, because it includes more than one 'revival' of earlier styles. There was an upheaval in the 16th cent. when Renaissance fashions from Italy interrupted the long-established Gothic tradition; but the 19th cent. witnessed a lengthy competition between the Classic and Gothic schools in nearly every European country and particularly in Britain. As already mentioned, there was keen rivalry during the second half of the 18th cent. between two architects—Chambers, the upholder of 'Palladianism,' and Adam, the practitioner of a more original style on Pompeian lines; but both schools of thought traced their inspiration back to Italy. The next star in the architectural firmament was John Nash (q.v.), 1752-1835, who introduced the style known as 'Regency' because it was so warmly encouraged by the Prince of Wales, afterwards George IV, during the years 1810-20 when he was Prince Regent. This decorous and refined style, which owes much to both Chambers and Adam, is associated with an extensive use of stucco, and may be seen to advantage at Hove, Brighton, Weymouth, Cheltenham, Clifton, and Tunbridge Wells, as well as in the terraces and mansions in 'the Regent's Park' in London. It constituted the last phase of that 'Georgian' A. which had been in vogue since 1725 or so. In much of Nash's work, however, the influence of Greece as well as that of Rome is apparent, and this may be traced, once more, to books. Greece, long inaccessible hitherto, had been visited by many architects and connoisseurs during the second half of the

18th cent.; Stuart and Revett pub. their vol. on *The Antiquities of Athens* in 1762; and the 'Elgin Marbles' arrived in London from Athens in 1801.

Thus was born the 'Greek Revival,' which lasted for a few years abreast of the 'Regency' style. Typical examples are the Athenaeum Club (1827-30) by D. Burton (q.v.) and St Pancras Church (1819-22) by H. W. Inwood, both in London; Downing College, Cambridge (1820), by W. Wilkins; and sev. buildings in Edinburgh by W. H. Playfair (see SCOTTISH ARCHITECTURE). Simultaneously there was in Germany a Gk Revival, which produced a number of important buildings in Munich by L. von Klenze and in Berlin by Schinkel (q.v., see also GERMAN ARCHITECTURE). In France, thanks to learned antiquarian books written by Percier and Fontaine, the so-called 'Empire' style was launched, and lasted c. 1805-30; but the position was complicated by the fact that Napoleon's campaigns in Egypt (1798-1801) had also created a short-lived vogue for Egyptian A. Even Russia and Spain had their Gk Revivals; and the movement fl. in the United States, where typical examples are the Capitol at Columbus, Ohio (1839-58); and Girard College and the Bank of Pennsylvania, both in Philadelphia.

Abreast of all this classical revivalism another very different movement was growing, especially in England. As long ago as 1753 the famous diarist and connoisseur Horace Walpole (q.v.) had built near Twickenham an ornate and picturesque villa in the Gothic style (which he called 'Strawberry Hill'), at a time when everything Gothic was despised by men of taste. A passion for romance and the brave days of chivalry arose about the same time, and rich noblemen erected sham ruins—'Gothic' as well as 'Roman'—as ornamental features in their parks. Here and there a belated specimen of Gothic church A. was built; but it was not until 1818, when Parliament voted a million pounds for building new Anglican churches, that the real Gothic boom began. Out of 214 churches provided under that Act, no less than 174 were in a Gothic or near-Gothic style. One of the best specimens is St Luke's, Chelsea, London (1820-4). The causes of this sudden change are too complex for explanation here; but it may be said that one of them was the romantic movement in literature. Once started, the Gothic Revival spread like wildfire; and from that date onwards, for nearly a cent., most churches in England were in the Gothic style.

For public buildings, however, some variety of It. Renaissance or Rom. A. continued to be favoured. St George's Hall at Liverpool (1815) by H. L. Elmes (q.v.), Leeds Town Hall (1853-8) by C. Brodric, and Birmingham Town Hall (1832-50) by J. Hansom are characteristic specimens; as is C. Barry's Reform Club (1837) in London. When, however, it became necessary in 1834 to rebuild the Houses of Parliament, the

proximity of Westminster Abbey induced the authorities to prescribe a Gothic or Elizabethan style; and a Gothic design by Barry won the competition, with the result that we now see. From that moment the 'Battle of the Styles' began between the advocates of Gothic and Classic, reaching its climax during the fierce debates in Parliament over the competition for a new India Office and Foreign Office, 1855-72. Sir George Gilbert Scott (q.v.), the most eminent architect of the day, was then instructed to convert his Gothic design into the It.

historical styles, and the use of 'traditional' materials such as brick, stone, and timber. True, Alfred Waterhouse (q.v.) introduced terra-cotta on a large scale, and many of his buildings presented a comparatively original but Romanesque effect, as did those of H. H. Richardson (q.v.) in the United States; and something similar occurred in Canada.

It is fair to say that, in 1900, the Gothic Revival had expired for public buildings, but that Gothic was still favoured for churches; that 'Free Classic' was universally adopted for public buildings; and

Renaissance form in which it was finally approved. (See the article ENGLISH ARCHITECTURE for a list of leading architects of the Victorian period, 1837-1901; also the separate biographies of those mentioned, naming their prin. buildings. It is impossible to label them 'Gothic' or 'Classic,' because many of them were prepared to make the best of both worlds by working in either style as the occasion seemed to demand.)

Almost up to 1901 there was this duality of expression, though few Continental countries were so powerfully affected by it as England, Canada, and the United States. Even in India there are examples of both Gk and Gothic revivalism, erected under Brit. rule. Confused as was this rivalry between the two schools of design, it was further complicated in the last quarter of the cent. by revivals of Jacobean and finally of 'Queen Anne' A. (see SHAW, R. N.). The only feature common to all these movements was the revival of bygone

either 'Elizabethan' or 'Georgian' for the larger houses. The great mass of small dwellings (see HOUSE) was provided by speculative builders, and the services of an architect were seldom utilised. Meanwhile structural ironwork had come into use everywhere, but was invariably concealed by a 'period' facing of stone or brick, or else by terra-cotta. A similar state of affairs prevailed in Amer. and Continental countries. See K. Clark, *The Gothic Revival* (2nd ed.), 1950; R. Turner, *Nineteenth Century Architecture in Britain*, 1950; H. S. Goodhart-Rendel, *English Architecture since the Regency*, 1953. (See also bibliographies at end of each article on the A. of individual countries.)

9. *The Twentieth Century.* The early years of the 20th cent., before the First World War began, witnessed the birth of what has been termed the 'Modern Movement' in A.—rather foolishly, because every movement eventually becomes obsolete, and therefore 'modern'

no longer. 'Contemporary' is another relative term, constantly becoming out of date. Yet undoubtedly there was a significant change in architectural design just before the war occurred to interrupt it throughout Europe; and perhaps the word 'Functional' best describes it. In the 19th cent. Sir George Gilbert Scott (q.v.) designed St Pancras station and the Leeds Infirmary in his favourite form of Continental Gothic. The hospital had pointed windows filled with tracery—obviously obstructing the light and ventilation, and impeding cleanliness in a smoky city. (Another architect in Leeds designed a brick factory chimney

and 'period' features, and for its construction with simple, honest materials. Very different are the delightful houses erected between c. 1890 and c. 1914 by C. F. A. Voysey (q.v.), so refreshingly free from Victorian pretentiousness and Edwardian ostentation, so English, and so original. Rather more striking in design is the Glasgow School of Art (1896–1906) by C. R. Mackintosh (q.v.), where all revived historical features are cast aside and the building is most definitely planned for its modern purpose. Both these architects had their idiosyncrasies of design; but neither of them adopted fully the somewhat eccentric style which,

Wates Ltd

L.C.C. FLATS AT WANDSWORTH

as a direct copy of Giotto's sparkling marble *campanile* in Florence!) Both those designs were unfunctional.

St Pancras station is more difficult to condemn, because its picturesque grouping may have had a publicity value which perhaps counted for something before the railways were nationalised. Since it was built, however, a more distinctive and sensible type of station A. has been evolved, notably at Rome and in many Fr. and Ger. cities, as well as in the smaller London Transport stations. Most of the Continental Gothic—Flem. and Venetian—which was so lamentably popular in the third quarter of the 19th cent. was the direct outcome of the books and lectures of John Ruskin (q.v.), then regarded as an inspired prophet. His disciple, Wm Morris (q.v.), brought these fancies down to practicality by demanding honest workmanship before ornament, and in 1854 built himself the Red House at Bexley, Kent, from the designs of Philip Webb. This building, though widely acclaimed to-day, is in fact a mediocre design, noteworthy only for the absence of superfluous ornament

under the title 'L'Art Nouveau,' had been evolved in Vienna in the nineties and had made some impression on Continental countries. Long before Mackintosh and Voysey appeared on the scene, however, the Crystal Palace had been designed for the Great Exhibition of 1851 in Hyde Park by Joseph Paxton (q.v.), who was not an architect at all, but a talented working gardener who had previously designed some large hothouses. This gigantic structure, whether it be regarded as 'architecture' or not, was notable for its frank acceptance of iron as a building material, and as such is a landmark in hist. Nevertheless it had no immediate influence on contemporary architectural design. Structural ironwork was increasingly used in buildings, but, to render it fireproof, had to be cased; and the mood of the day chose to make iron (and later, steel) the core of classical columns of apparently solid stone. At the turn of the cent. the invention of reinforced concrete (q.v.) revolutionised building construction, and A. had to yield to its demands and its potentialities. Invented in France, its use was slowly

adopted in England and soon had its effect upon architectural forms.

Since 1900 the pioneers of the 'Modern Movement' have come from France (see 'LE CORBUSIER'; PERRET), Finland (see AALTO; SAARINEN), Germany (see BEHRENS; GROPIUS; MENDELSSOHN; VAN DER ROHE), Holland (see BERLAGE; DUDOK), and, since 1940 or so, the United States (see NEUTRA; F. L. WRIGHT), Brazil, Italy, Mexico, and Switzerland, with the Scandinavian

Wates Ltd

LABOUR BOARD, LONDON

countries contributing their quota; but Britain too has supplied its share (see EASTON; E. M. FRY; F. GIBBERD; H. M. ROBERTSON; B. SPENCE; see also articles on AMERICAN, DUTCH, ENGLISH, FRENCH, GERMAN, ITALIAN, RUSSIAN, SCANDINAVIAN, SPANISH ARCHITECTURE). The writings of Gropius and of Le Corbusier have played a large part in explaining and popularising the movement.

The outstanding and distinctive features of 20th-cent. A. in Europe and elsewhere are planning strictly for the functional purpose for which the building is required; the elimination of all load-bearing walls, and the substitution for them of thin weather-proof panels between columns and beams; flat roofs; a structural frame of reinforced concrete in which floors, roofs, and vertical supports form a homogeneous whole;

extensive use of cantilever construction, and of balconies where required; a generous and sometimes excessive provision of window area; some form of central heating by which only one central flue and chimney is required; elimination of all arches and vaults, and of the classic orders, Gothic tracery, leaded windows, picturesque chimneys, and all other traditional and historical forms; omission of all superfluous ornament; use of plastic instead of wood flooring; and an extensive reliance upon prefabrication of structural units and equipment, based upon systematic standardisation. This tendency was accelerated after the Second World War, when the acute housing situation in all countries called for new methods. It was realised that one way of speeding erection was to reduce work on building sites to a minimum by having all possible components made beforehand in factories, where delays caused by inclement weather do not occur. (For other distinctive features of contemporary domestic A. see HOUSE.) In conclusion, it must be added that only a proportion of the total building work carried out in the 20th cent. entirely follows the 'Modern Movement': a large amount continues to utilise traditional design, materials, and methods of construction. See C. Marriott, *Modern English Architecture*, 1924; 'Le Corbusier,' *Towards a New Architecture*, 1927; (A. A. Platz, *Die Baukunst der Neuesten Zeit*, 1930; Sir R. Blomfield, *Modernismus*, 1934 (an amusing but bitter attack on the 'Modern Movement'); W. Gropius, *The New Architecture and the Bauhaus*, 1935; N. Pevsner, *Makers of the Modern Movement*, 1936; F. R. S. Yorke and C. Penn, *A Key to Modern Architecture*, 1939; J. M. Richards, *An Introduction to Modern Architecture*, 1940; M. S. Briggs, *Building To-day* (2nd ed.), 1948.

Architrave, in architecture, either (i) in any of the Gk or Rom. 'Orders,' the lowest member of the entablature (q.v.); or (ii) a moulding around a doorway or a window-opening.

Archives, collection of documents, now usually refers to gov. records. For further details see HISTORICAL MANUSCRIPTS COMMISSION and PUBLIC RECORD OFFICE.

Archivolt, in architecture, a moulding around an arch.

Archlute, large lute of the theorbo type with 2 sets of strings, the pegs of which were set at different distances in the double neck; the longer bass strings had no fingerboard and could therefore not be altered in pitch during performance.

Archons, ann. magistrates in the Athenian democracy. According to tradition, the last King of Athens, Codrus, was succeeded by his son Medon as A. instead of king. The historical development of the office can probably be traced to the reduction of the power of the original basileus (king), who was left with religious functions only by the military and civil powers being handed over to other officials. There were 9 A.; the

chief, or A. eponymous, who gave his name to the year and dealt with domestic cases; the basileus, with religious powers; the polemarch, who had jurisdiction in military and foreign matters; and 6 thesmothetae. For a detailed account of their functions, see Aristotle, *Athenian Constitution*.

Archpriest, an eccles. term dating from the 4th cent., and originally applied to a senior priest attached to a cathedral as assistant to the bishop and overseer of the subordinate clergy. The modern representative of the office is a dean. The term had a special application in the early 17th cent. to the superiors appointed by the Pope to govern secular priests sent into England. These had been left without a head at the death of Cardinal Allen in 1594. The archpriest had 12 assistants, but was subordinate to the superior of the Jesuits in England. The office, which was much opposed, lapsed in 1621.

Archytas (c. 428-347 BC), of Tarentum, Gk philosopher of the Pythagorean school, scientist, and general. He was an intimate friend of Plato. A. was the founder of scientific mechanics, and did much to advance the study of music and acoustics. Besides evolving an ingenious method of doubling the cube, he is said by Aulus Gellius (*Noctes Atticae*, x. 12, 9) to have invented a kind of flying machine. Some fragments of his ethical and metaphysical writings have survived.

Arceis-sur-Aube, Fr. tn in the dept of Aube, on the R. Aube, 16 m. NE. of Troyes. It was the bp. of Danton, and the scene of an Allied success against Napoleon, 20-21 Mar. 1814. Pop. 2200.

Arceograph, see CYCLOGRAPH.

Areole, It. tn, in Veneto (q.v.). 15 m. ESE. of Verona (q.v.), on the Alpone, a trib. of the Adige. The victory of Napoleon (q.v.) here in Nov. 1796 forced the Austrians to abandon the attempt to relieve Mantua. Pop. 4500.

Aroos, Don Rodrigue Ponce de Leon, Duke of (fl. 1646), Sp. Viceroy of Naples 1646-8, whose crushing taxation caused the revolt of the people of Naples under Aniello. After 1648 the Duke of A. retired from political life.

Arcoot: 1. Name of 2 contiguous dists. of Madras, India. N. A. is bounded on the N. by Chittoor and Mysore, on the E. by Chingleput, on the S. by S. A., on the W. by Salem, and on the NW. by the SE. Ghats. The products are mainly agric.: rice, peanuts, sesame, sugarcane, cotton, and tobacco; there are also mango and orange groves. Industries include rice- and sugar- milling and the extraction of peanut- and sesame-oil. Area 4671 sq. m.; pop. 2,577,540 (93 per cent Hindu). S. A. is bounded on the N. by N. A. and Chingleput, on the E. by the Coleroon R., on the S. by Tanjore and Trichinopoly, on the SW. by the Kalrayan Hills, and on the W. by Salem. Products include rice, peanuts, sugarcane, sesame, and cotton; there are extensive cashewnut and casuarina plantations along the coast. Industries include rice- and sugar-milling, peanut- and sesame-oil extraction,

and hand-loom cotton and silk weaving. There is widespread quarrying of granite and other building stone. Area 4205 sq. m.; pop. 2,608,753. Both dists. are flat on the coast; hilly, with jungles, inland. A. was the scene of the 18th-cent. struggle for supremacy between the French and English in India, and was ceded to the English in 1801.

2. City of N. A. dist., Madras State, India, on Palar R., 65 m. SW. of Madras and 13 m. E. of Vellore. Here Clive withstood a famous siege in 1731. Not many relics of the time survive, but Clive's Room is still shown in the Delhi Gate. Rice, sugarcane, and peanuts are produced, and there is cotton weaving.

Arctic Animals do not present great variety. Molluscs, annelids, and jelly-fish are common to all the N. seas, while such fish as the salmon, cod, and halibut are plentiful, and provide employment for European sailors. Insects are found far N., such as bees, flies, and butterflies, but as the flora is scanty they do not occur in great abundance. The birds are chiefly sea birds, as petrels, elder ducks, cormorants, auks, gulls, puffins, and guillemots, and all are migratory. The mammals include the walrus, seals, and sev. varieties of whale—the white whale and narwhal, grampus, and bottle-nosed whale, but the whalebone whale (*Balaena mystecetis*) is becoming rare; the polar bear, reindeer, elk, fox, wolf, ermine, and musk-ox are the prin. terrestrial mammals. Insectivorous and herbivorous habits are naturally almost absent in A. A., which are piscivorous or carnivorous as they dwell chiefly in the sea or on land. Many of them exhibit the curious phenomenon of becoming snowy-white in winter, and among these are birds, as the ptarmigan, and mammals, as the hares and lemmings, which are brown in summer, and the Arctic fox, which is salty-blue in summer; the polar bear is, of course, white all the year round. See *Manual of Natural History of Greenland*, by T. Jones, pub. by the Admiralty, 1875; A. Hellprin, *Geographical and Geological Distribution of Animals*, 1887; S. P. Gordon, *Amid Snowy Wastes: Wild Life*, 1922; V. Stefánsson, *Hunters of the Great North*, 1923.

Arctic Circle, The, is an imaginary circle drawn round the N. Pole at a distance of 23½ degrees therefrom, this angle being equal to the angle between the plane of the equator and the plane of the ecliptic. Within these limits the sun disappears entirely from view for a certain period in the year, and for another period is always visible. The length of these periods varies with the nearness to the Pole, the nearer the Pole the longer the period during which the sun is continually above (or below) the horizon.

Arctic Exploration. The first Arctic voyagers were the Vikings who discovered Iceland and Greenland and colonised them. After the time of Harald Hardraade the Northmen gave up adventure in the N. seas, and it was only in the 15th cent., when the English and Dutch led the van of seafaring nations, that

A. E. was revived in the search for a supposititious N.E. or N.W. passage to China or India. The first of the navigators stimulated by the success of Columbus in the field of exploration to renewed efforts to discover a W. route to Cathay was Sebastian Cabot, who in 1496 sailed from England towards the N.W. Little is known of Cabot's voyage, though it seems, according to a contemporary account, that he must, before turning eastward in despair, have sailed into the Gulf of St. Lawrence and partly through the straits of Belle Isle from the N. opening, from which the coast of Labrador sweeps to the W., and so on to Shekatika Bay, where that coast trends eastward (51° N.). In 1553 the Muscovy Company of London Merchants, formed to promote commerce with Russia and the E., prepared an expedition 'for the discovery of Cathay, and divers other regions, dominions, islands, and places unknown,' by the exploration of the seas eastward of the N. Cape. The expedition, consisting of 3 ships, set out from Ratcliffe under the command of Sir Hugh Willoughby. The record of Willoughby's wanderings, probably along the coast of Novaya Zemlya, was learnt from the explorer's own jour. when, the following year (1554), some Russian fishermen found him and his crew, frozen to death, at the mouth of the riv. called 'Arzina.' in Lapland. Richard Chancellor, who commanded the larger of the other 2 ships, reaching Wardhus (Vardöhus) on Vardö Is. in safety. The narrative of Chancellor's expedition, which was written by Clement Adams and preserved by Hakluyt, shows that Chancellor entered the White Sea, till then unknown to the civilised world, and explored the country round Archangel. After this follow the 3 voyages of Martin Frobisher in quest of a N.W. passage to Asia. None of these or any of the attempts made at this time resulted in the wished-for discovery. In his first voyage Frobisher (q.v.) found a bay which has since been named after him, in 61° N., and landed on an is. since called Gabriel Is., where his party for the first time in the hist. of Englishmen encountered the Eskimo. In 1577 Frobisher made his second journey. He anchored in what was named by him Jackman's Bay, believing, indeed, that he had solved the problem of a N.W. passage to Asia, and landing on what is now known as Foxe Peninsula formally took possession in the name of the queen. Marching into the interior, his party discovered nothing at first but mosses, lichens, and a few juniper bushes and stunted firs. The third expedition sailed from the Thames in May 1578. The only result of the voyage was the finding of what was supposed to be gold, but which in all probability was merely ferruginous or cupreous pyrites, upon an is. in Beare Sound, which they named Countess of Sussex Is. In 1585 John Davis (q.v.) renewed the attempt to discover a N.W. passage to the E., publishing in 1595 a short narrative of his 3 voyages (1585-1587) entitled *The World's Hydrographical*

Description. The net results of Davis's first voyages were a better understanding with the natives of Greenland—the W. coast of which he explored up to 64° N., naming it Desolation—and the discovery that land still hemmed him in as far as 67° N. In his last voyage he sailed through Davis Strait and the bay which was not explored till close upon 30 years later by Baffin and since called Baffin Bay, as far N. as Melville Bay. Ten years later Barents (q.v.), the Dutch navigator, made his celebrated voyage in search of a N.E. route to China, and the narrative of his perils and death forms one of the most interesting and pathetic records of human bravery and endurance. The scene of his wintry sojourning in Novaya Zemlya was not revisited for nearly 300 years, when Capt. Carlsen, in 1871, landed there and found the wooden house, the ashes still upon the hearth, as the explorers had left it, together with an old clock, Barents's flute, and other interesting relics of the expedition, all of which are now in the possession of the Dutch Gov. With Barents seems to end the quest for a short route to the E., or rather that quest is lost sight of in the general exploration of the Arctic. Hudson's first voyage (q.v.) took place in 1607, and resulted in the discovery of one of the most easterly points of the E. coast of Greenland (73° N.), called Hold with Hope. He penetrated as far N. as 80° 23', and on returning discovered Jan Mayen Is. In 1610 he discovered Hudson Strait and the large bay which has left his name to posterity. His voyages opened the way to the Spitzbergen whale fisheries. In 1612-13 Sir Thos. Button, supported by the Merchant Adventurers of London, entered Hudson Bay, and crossing over westward explored Southampton Is. up to 65° N. Baffin as pilot and navigator in the *Discovery* investigated the coasts of Hudson Strait in 1615, and later, with the same ship, circumnavigated the great sound with its numerous trib. channels, which has since received the name of Baffin Bay. There was but little in the way of fresh discovery in the years immediately following the efforts of the 16th- and 17th-cent. explorers, though much was done to reap the benefits of their discoveries. After the formation of the Hudson's Bay Company, the company's servants, towards the latter part of the 18th cent., effected some important journeys to explore the shores of the Amer. polar seas, Samuel Hearne navigating the Coppermine R. to the Polar Sea, and Alexander Mackenzie discovering the mouth of the riv. named after him. Dutch rivalry in A. E. resulted in Marten's visit in 1671 to the Spitzbergen group of is., and the best record of the natural hist. and physical features of that part prior to Scoresby's *Account of the Arctic Regions*; in the discovery by Capt. Gillis in 1707 of 'Gillis Land,' and in the opening up of the Dutch whale fisheries of Davis Strait. In 1806 the intrepid fisher and scientific observer, Scoresby, advanced his ship, the *Resolution*, up to 81° 12' N., and 16

years later, forcing a passage through the ice barring the approach to the E. coast of Greenland, he surveyed that coast for a distance of 400 m. In the course of the 18th cent. Russian explorers penetrated to the most northerly parts of Siberia, Lt. Chelyuskin in 1735 reaching the cape in 77° 25' N. which bears his name; while Hering, a Dane, put by Peter the Great in command of the *St Paul*, set out from Okhotsk to explore the Amer. side of the strait which he had discovered 12 years previously, and which is named after him. After finding Mt St Elias he was wrecked and perished in the vicinity of the Aleutian Is.

A. E. appears to have been dropped in England towards the last quarter of the 18th cent., and it was only with difficulty that the gov. could be induced to support even voyages of scientific research in polar regions. In 1778, however, Capt. Cook was instructed to sail northward from Kamchatka and look for a NE. or NW. passage from the Pacific to the Atlantic. He reached Cape Prince of Wales, the W. extremity of America, and after passing through Bering Strait found his way barred by ice. In 1815 the search for the NW. passage was revived in England by the strenuous advocacy of Sir John Barrow, through whose influence a reward of £20,000 was offered for its accomplishment, and £5000 for reaching 89° N. (1818). The most celebrated names during this period of revival were those of Lts. W. E. Parry and John Franklin, whose chief discoveries between 1819 and 1827 were Lancaster Sound, the continuation of which was called Barrow Strait, an archipelago, now known as Parry Is., Fury and Hecla Strait (a channel leading W. from the head of Hudson Bay), and Prince Regent Inlet, a wide opening observed on the third voyage in 1824 to the S. from Lancaster Sound. In 1827 a new chapter opens in A. E. with Parry's attempt to reach the Pole from Spitsbergen. This attempt was remarkable for the fact that the explorer abandoned his ship and endeavoured to make his way over the northward drift-ice with boats which his party dragged along on sledges. He reached the then highest lat. (82° 45'), but, carried southward by the current, he was forced to return. Prior to Sir John Franklin's ill-starred expedition in 1845, Capt. John Ross, with the financial assistance of Sir Felix Booth, a distiller, set out in a small steamer, the *Victory*, on a private expedition of discovery. The most remarkable feature of this expedition was Ross's sledge journey, after abandoning his ship, across the ice. In the course of his voyage he discovered the Gulf of Boothia (named after his patron) and King William Is., and located the position of the N. Magnetic Pole. In 1845 Franklin, with the *Erebus* and *Terror*, set out on his tragic journey through the channels of that dense ice-packed region called by Sir George Nares the Palaeocrystic Sea to Beechey Is., along the W. shore of Somerset Is. (discovered by Parry

in 1819), through a southward channel called Peel Sound to King William Is., in the effort to reach some channel to Bering Strait. It appears, however, that the great ice floes from the vicinity of Melville Is. rendered all progress impossible save by rounding the E. side of King William Is.; Franklin did not know that this latter was an Is., and so perished with all his party. Numerous expeditions for some years afterwards endeavoured to ascertain Franklin's fate. Sir James Ross, in 1848, was sent with 2 ships, the *Enterprise* and the *Investigator*, by way of Lancaster Sound, and with Lt. M'Clintock made a long sledge journey along the N. and W. coasts of Somerset Is. In 1850 elaborate and extensive plans of search were organised under Capt. Penny, Austin, Ommaney, Lts. M'Clintock, Collinson, and McClure. Austin and Penny went through Barrow Strait and discovered Franklin's winter quarters of 1845-6 at Beechey Is. This party wintered on the S. coast of Cornwallis Is. and arranged sledge travelling excursions for the spring, Penny undertaking the Wellington Channel route, M'Clintock advancing to Melville Is., while Capt. Ommaney went southward, discovering Prince of Wales Is., and Lt. Brown investigated the W. shore of Peel Sound. In 1851 Lady Franklin sent out the schooner *Prince Albert* under Capt. Kennedy and Lt. Bellot of the Fr. Navy, the Frenchman discovering in the course of a long sledge journey Bellot Strait separating Somerset Is. from Boothia Peninsula, thus proving that this part of the Boothia Peninsula was the N. extremity of the continent of America. In May 1851 Collinson, in the *Enterprise*, penetrated the narrow Prince of Wales Strait between Banks Is. and Prince Albert Peninsula, reaching Princess Royal Is., where M'Clure had been the previous year. He then wintered in Victoria Is. and dispatched travelling parties in the spring of 1852 to explore Prince of Wales Strait and the S. portion of Prince Albert Peninsula. When the ship was free Collinson went E. along the coast of N. America, and after wintering a second time in Cambridge Bay, he examined the shores of Victoria Is. up to 70° 26' N. and westward to 100° 45', being within a few m. of Point Victory, where, indeed, he would have learnt the fate of Franklin. This great voyage was only completed in 1854, when Collinson brought back the *Enterprise* safely to England. In the meanwhile M'Clure, in the *Investigator*, had passed the winter of 1850-1 30 m. from Barrow Strait at the Princess Royal Is., and actually saw a NW. passage, which, however, he could not reach on account of a branch of the palaeocrystic ice that had baffled Franklin off King William Is. This ultimately forced him southward round Banks Is., whence he endeavoured to drive a passage to the N. between the W. shore of King William Is. and the cliff-like ice walls. Eventually, after the narrowest escapes, he took refuge on the N. shore of Banks Is., and in the early part of 1853, after preparing

to abandon his ship for the Amer. coast, was fortunately rescued. In 1852 the Brit. Gov. dispatched another expedition via Lancaster Sound, under Sir Edward Belcher, Sherard Osborn, Capt. Kellett, and M'Clintock. M'Clure's record was discovered by Lt. Mecham, one of the sledge travellers of this expedition. This discovery soon led to the succour of M'Clure, who thus partly by ship and partly by travelling over ice had now in fact accomplished the NW. passage, for which long-sought prize he was knighted, and, together with his party, received a grant of £10,000. In 1854 Dr Rae, whose previous work in A. E. was in 1846-7, when he crossed the isthmus joining Melville Peninsula with the mainland and skirted the shores of Committee Bay and the E. coast of Boothia as far as Lord Mayor Bay, joined Sir J. Richardson in a search for Franklin. He brought home tidings of Franklin's expedition from the Eskimo, the immediate consequence of which was that M'Clintock, in the *Fox*, with Capt. Allen Young and Lt. Hobson, prosecuted a thorough search of the W. coast of Boothia, the whole shore of King William Is., and Montreal Is. Eventually this party came upon a paper outlining the voyage of Franklin and telling of his death in June 1847 and the departure of the survivors in an attempt to make the Great Fish R., in which attempt none ever succeeded, though sev. traces of their struggles were subsequently found. M'Clintock's voyage proved that Franklin's expedition did in fact discover a sea route from the Atlantic through the channels S. of Victoria Is. to Bering Strait, and since that time Capt. Hall and Lt. Schwatka, of the U.S. Navy and Army respectively, have discovered other relics of Franklin's expedition. A notable expedition in quest of Franklin was that of Dr Elisha Kent Kane of the U.S. Navy, who, sent out by the U.S. Gov. in 1852 to look for the Eng. explorer, made his winter quarters in Rensselaer Bugt, W. Greenland, and with his boat, the *Advance*, pushed on to Smith Sound, where his further progress was stopped by ice at the entrance. Kane's contributions to A. E. contain a great deal of valuable information as to fauna, flora, magnetic conditions, and climate; the first really authentic and detailed account of the Ethal Eskimo; and, by his sledge journeys, the making known to the world of the marvellous waterways along the W. of Greenland between Smith Sound and the Atlantic Ocean, which afford the acknowledged easiest route to the Pole.

In 1871 Charles Hall, of Cincinnati, took the *Polaris* for 250 m. up the channel which runs N. from Smith Sound. He reached an unprecedented lat. by ship, and explored Ellesmere Is. to within 412 m. of the Pole. In 1875-6 Sir George Nares, with Lts. Aldrich, Markham, and Beaumont, touched 83° 20' N., after pushing along Ellesmere Is. to 85° W. long, and Greenland to Wulff's Land. In 1883 Lt. Greely, of the U.S. Army, made extremely valuable observations round Lady Franklin Bay (81° 44') on the

fauna and flora, climate, tides, and magnetism of this region. During the sojourn of the Greely expedition (1881-4), Lt. Lockwood, by touching 83° 24', gained for the U.S.A. the honour of reaching the then farthest N. The next most important work of this period was the traversing of the great ice sheet forming the interior of Greenland by Nansen (1888-9). Nansen's theory was that a current flowed at some point between the Pole and Zemlya Frantseva-Iosifa from the E. Siberian Sea to the E. coast of Greenland; and his objective was to investigate the great unknown region that surrounded the Pole, and in 1893, in the *Fram*, a ship specially designed to sustain and rise to powerful ice-pressure, he set out on his brilliant expedition to cross the polar ocean by relying on the drift from E. to W. after deliberately forcing the ship into the ice. The *Fram* ultimately emerged from the pack to the N. of Spitsbergen, Nansen's chief discovery being to ascertain the existence of a very deep ocean to the N. of the Franz Josef group, which was found to be a continuation of the water to the N. of Spitsbergen. In April of 1895 Nansen with a single companion, Johansen, left his ship, and by means of kayaks and sledges drawn by dogs reached farthest N. (86° 13'). Nansen's theories are on the whole sound, and the light he threw on what has been called the polar question estab. his fame for all time. Peary in 1892 and 1895 made journeys over the inland ice of N. Greenland, but beyond ascertaining the N. limit of the Greenland ice sheet added little to general information. Then in 1897 the Jackson-Harmsworth expedition in the *Windward* explored the W. part of Zemlya Frantseva-Iosifa, discovered a wide channel opening on a northward sea, and made important magnetic and meteorological observations. In 1897 Andree, with Fraenkel and Strindberg, set out on his unhappy balloon journey. Except for buoys cast overboard, nothing further was heard of this expedition until 1930, when their bodies were found in White Is., Kviteya, near Spitsbergen. The latest of 3 buoys found showed that the balloon reached 82° N. 25° E., but no other traces were discovered until 1930. Then Andree's diary showed that at one time the balloon reached a point a little higher than 83° N. In 1899 Sverdrup, Peary's companion in 1892, led a party in the *Fram* up Smith Sound to explore the N. coast of Greenland, while in the same year Peary, with the help of Eskimo, followed the same route, and the Duke of Abruzzi on the Norwegian whaler *Jason* proceeded to Zemlya Frantseva-Iosifa. In 1900 various sledge parties were sent N., one, under Capt. Cagni, reaching a point 20 m. beyond Nansen's farthest N. The names of prin. note in the early 20th cent., notable for Peary's achievement in reaching the Pole, are those of Peary himself, Amundsen, Einar Mikkelsen, and Mylius-Erichsen. Peary undertook his last voyage in 1903, shortly before the time that Dr Frederick A. Cook claimed

to have reached the Pole. With a few whites, nearly 50 Eskimo, and 200 dogs he crossed the frozen seas, passing his own previous record of 87° 6' N. in 1906, and ultimately, on 6 April 1909, gained for the U.S.A. the honour of first reaching the Pole. The rapidity of Peary's travelling may be gauged from the fact that he traversed nearly 150 m. in 5 days going N., and on his return journey over 400 m. in 16 days. He located the Pole on a deep ice-covered ocean, there being no land in its vicinity, his soundings being 1500 fathoms within 5 m. of the Pole. The chief work of Mylius-Erichsen was the completion of the exploration of the hitherto unknown parts of the coast of Greenland from Kap Farvel, 60° N., for over 1600 m. to 83° N. He d. of cold and starvation after crossing the inland ice between Danmarks Fiord and Lambert Land in an effort to identify Peary's Navy Cliff. Mikkelsen, another Dane, recovered Erichsen's records for Denmark in 1912, and it is worthy of note that these records altered the entire cartography of N.E. Greenland, especially proving that Greenland extends over 20° eastward of Peary's farthest E., the net result being the addition of over 150,000 sq. m. to Greenland, and the discovery that the E. extremity of Greenland is within 23° of Spitzbergen. Other explorations of note are those of O. Sverdrup in Grinnell Land and his discovery of Axel Heiberg and Ringnes Is., the re-location in 1904-5 by the Norwegian Amundsen of the N. Magnetic Pole in 70° N. 97° W., and the investigations of the Eskimo of V. Stefánsson from 1908 to 1912. The great feat of Amundsen was the unquestioned accomplishment of the NW. passage over Franklin's route. Since the war, exploration and mapping of the Canadian Arctic, of the Arctic Ocean, and of Alaska has been organised by the Canadian and U.S. govs. on a large scale. Many scientific expeditions visit the Arctic, e.g. M. M. Miller's Juneau Icefield Research Project, 1944-52. See the *Polar Record* for accounts of expeditions.

A 'NE. passage' was only discovered in the late years of the 19th cent. After Nordenskjöld's journey in the *Vega* (1879), Vilkitzky's expedition in 2 ice-breakers in 1915 and Amundsen in the *Maud* in 1919-20 made the journey. Vilkitzky's boats brought back much valuable information on the Arctic coast of Siberia, and since then the Soviet Republic has sent out survey boats to the same region and has much developed the Northern Sea Route (q.v.). Amundsen's *Maud* tried to follow Nansen's former route across the Arctic Ocean, in the hope of drifting to the Pole; but the effort was not successful though the expedition which later was commanded by Wisting returned with much useful information about the Siberian coast supplementary to that of Vilkitzky. Peary remains the only explorer who has sledged to the Pole, but his reported finding of Croker Land in 85° N. lat. was not confirmed by Amundsen in his polar flight in 1926, nor by the Amer. explorer,

D. B. MacMillan, who explored Ellesmere and other is. during the period 1913-17. One good result of Peary's exploit has been to reconcile explorers to research rather than to spectacular discoveries. The Norwegian, K. Rasmussen, throughout the decade 1920-30 opened up a mine of knowledge on Greenland and the Eskimo, as also have E. Mikkelsen and J. P. and L. Koch.

The aeroplane was not at first an unqualified success for exploration work. Amundsen, however, though he failed to reach the Pole in 1925, showed that with sufficient petrol the feat could be accomplished, and in the following year Commander R. Byrd flew to the Pole from Spitzbergen and back, and Amundsen's dirigible *Norge* also crossed from the same base to Alaska. Amundsen was accompanied by Gen. Nobile, the lt. designer of the airship, but unfortunately the enthusiasm of Amundsen's adventurous spirit caused him to quarrel with Nobile over the allocation of the credit for the flight as between Italy and Norway, and the two parted. Later, however, when it was learned that Nobile was missing on his second flight, Amundsen generously joined in the flights organised for relief. Nobile was eventually rescued, but nothing further was ever heard of Amundsen.

In 1928 Capt. Sir Hubert Wilkins flew from Alaska to 'Dead Man's Is.' Spitzbergen. The flight lasted less than a day, and though no new land was discovered in the waters N. of Canada useful observations were made on meteorological and navigation conditions in that region. Later in the year Gen. Nobile made 3 flights in his dirigible *Italia*, and on the third reached the Pole, only to be wrecked off N.E. Land. Numerous expeditions were organised for relief by many nations, but the Soviet icebreaker *Krassin* was the first to reach the stranded party. Meanwhile Nobile had been taken off the ice by a Swedish aviator. Half the crew, however, perished, no trace of them or of the wrecked airship in which they had been carried away being found. With Amundsen, who, as stated above, joined in the relief expeditions, were 5 other men, who also disappeared.

In 1931 Gino Watkins (Cambridge Univ.) tried to organise an air route from the U.K. to Canada via Greenland, but lost his life while hunting in a kayak in Greenland (see F. Spencer Chapman, *Watkins's Last Expedition*, 1934). Another notable Brit. expedition, the Brit. North Greenland Expedition, 1952-4, was led by Commander C. J. W. Simpson, R.N., and explored Dronning Louise Land. Considerable progress in exploration and mapping has been made by the Dan. authorities since the 1920's. *Expéditions Polaires Françaises Missions P.-E. Victor* (q.v.) have been active in Greenland since 1948, as have Amer. gov. expeditions in the Thule dist. and elsewhere. In 1931-2 Prof. Ushakov, of the Soviet Union, explored Severnaya Zemlya, little-known is. N. of Cape Chelyuskin.

In Sept. 1936 the Fr. polar research ship, *Pourquoi Pas*, foundered off Iceland with the loss of all but 1 of its crew, and of the famous Fr. explorer, J.-B. Charcot (q.v.). In the same year a Soviet hydrographic expedition, on the icebreaker *Sedov*, mastered the new sea route in the region of Novosibirskiye Ostrova, investigated for the first time 40 years before by the Russian explorer, E. Toll. In 1937 the Soviet Gov. estab. a Russian polar station in the vicinity of the N. Pole, on the sea ice. Prof. Otto Schmidt, who headed a Soviet expedition in 1937-8, reported that the N. polar summer climate was considerably milder than was expected and even showed temps. above freezing-point; soundings in the Polar Sea had proved that it was more than 3000 ft. deeper than Nansen's researches had led them to expect. Post-war Soviet exploration has followed this pattern, and drifting stations on the sea ice have made valuable contributions to knowledge of the Arctic Ocean, discovering notably the Lomonosov Range (q.v.). Permanent stations have also been set up on all Soviet arctic is. See Sir John Ross, *A Voyage of Discovery, for exploring Baffin's Bay and a North-west Passage*, 1819; Sir E. Parry, *Journal of a Voyage for the Discovery of the North-west Passage*, 1819-1820 (and subsequent *Journals*, 1824-8); Sir John Franklin, *Narrative of Journey to the Shores of the Polar Sea*, 1819-22, 1823; Sir J. Barrow, *Voyages of Discovery and Research within the Arctic Regions*, 1846; J. Payer, *New Lands within the Arctic Circle*, 1876; A. H. Markham, *The Great Frozen Sea*, 1878; Duke of the Abruzzi, *On the Polar Star*, 1903; Sir M. Conway, *No Man's Land*, 1906; R. Amundsen, *The North-west Passage*, 1909, and *The First Flight Across the Arctic Ocean*, 1927; R. F. Peary, *The North Pole*, 1910; F. Nansen, *Hunting and Adventure in the Arctic*, 1925; K. Rasmussen, *Across Arctic America*, 1927; R. N. Rudmore Brown, *The Polar Regions*, 1927; R. E. Byrd, *Skyward*, 1928; F. Spencer Chapman, *Walkins's Last Expedition*, 1934; L. Brontman, *On the Top of the World: the Soviet Expedition to the North Pole*, 1937; H. P. Smolka, *40,000 against the Arctic*, 1937; A. Croft, *Polar Exploration*, 1939; R. J. Cyriax, *Sir John Franklin's Last Arctic Expedition*, 1939; V. Stefansson, *Ultima Thule: Further Mysteries of the Arctic*, 1942; J. Minsky, *To the Arctic*, 1949. Also the following periodicals: *Arctic* (Montreal); *Polar Record* (Cambridge); publs. of the Hakluyt Society (London) and of the Hudson's Bay Record Society (London).

Arctic Ocean is usually defined as the area of water within the Arctic Circle. It lies to the N. of Europe, Asia, and N. America, and communicates with the Atlantic by means of the wide sea between Norway and Greenland; Denmark Strait, between Greenland and Iceland; and Davis Strait, between Greenland and Brit. N. America. The only communication which it has with the Pacific is by means of Bering Strait. A relatively mild climate is found a long way inside the

Arctic Circle owing to the influence of the Gulf Stream off the coast of Norway, and, on the other hand, Arctic conditions are caused to exist far into the Atlantic by means of the Arctic currents, which flow through Davis Strait and along the E. coast of Greenland. The sea between Norway and Greenland belongs physiographically to the same basin as the A. O., as ridges between Greenland, Iceland, Farøe Is., and the N. of Scotland separate it from the Atlantic region. The region immediately at and around the N. Pole is covered with rough sea ice, whilst Peary found the depth of the water at

New York Times
GREENLANDERS HUNTING AMONG THE
ARCTIC ICEBERGS

the N. Pole itself to be more than 1500 fathoms. The whole ocean, in fact, is covered with sea ice, which varies in depth from 5 to 30 ft. The average depth of the sea ice, however, is about 10 ft. It is frozen together in winter but in the summer it is broken up into floes of varying size. Leads form in the ice pack, and when these leads close up again the floes are piled up on one another, and the well-known 'hummocky' ice results. If hummocky ice is piled up against a shallow shore and so fixed for a great length of time, the appearance is produced which Nares called the palaeocrystic sea. A permanent layer of fresh water is found in many places outside the edge of the ice pack. This layer, which has a depth of 6 ft in some places, is formed partly by the melted ice and partly from the outflow of the rivs. of Siberia. The sea ice as a whole has been found to drift from the middle of the N. coast of Siberia north-westwards towards the NE. extremity of Greenland. Large quantities of ice also pass down each year between Spitsbergen and Greenland. The warm surface waters of the Atlantic flow up into the Arctic regions, passing

between Greenland and Norway. When they arrive there they are chilled by contact with the icy Arctic waters, and gradually sink to the bottom. Finally they return, along the E. side of Greenland and down Davis Strait, as a cold current carrying with them the icebergs which are such a danger to navigation in the Atlantic. The above is only an adumbration of the circulatory system which exists. The winds, the Gulf Stream, and the various submarine ridges and depressions between the continents and is. are all factors which complicate the movements of the waters. The A. O. is bordered by a fairly broad continental shelf; this renders the ocean as a whole shallow. Along the N. of Europe and Siberia, to 135° E. long., the water is very shallow indeed, and proceeding westward from this point the depth does not exceed 80 fathoms. Between Zemlya Frantsa-Iosifa and Novaya Zemlya the depth of the water varies from 100 to 150 fathoms, and between Norway and Bjørnøya it is 240 fathoms. In the Kara Sea a depth of over 400 fathoms is found. The depth of the ocean E. of 135° long. suddenly increases to 2000 fathoms. The *Fram*, in 1893-6, drifted with the ice from 79° N. lat. and 138° E. long. into the neighbourhood of Spitsbergen, and the depth of the sea along her route was ascertained to be more than 1800 fathoms, and frequently over 2000 fathoms. The Nathorst expedition of 1898 found that the greatest depth W. of Spitsbergen was 1720 fathoms. The temp. of the A. O. is found to vary somewhat at different depths. The surface temp. in the polar regions is usually about the freezing-point of salt water, 29.2°. It increases at about 110 fathoms to 33°, and between 120 and 350 fathoms the temp. is higher than at any other depth, ranging between 35° and 39.9°. This warm layer is probably due to the influence of the Gulf Stream. Directly underneath this, down to nearly 1000 fathoms, there is a drop in the temp. to about 31.9°. Lastly, from 1000 fathoms to the bottom the water is slightly warmer, and the temp. is fairly uniform, being between 33.1° and 33.4°. Near the Pole itself there appears to be no wind in the winter, and the air is clear; in lower lat., round Zemlya Frantsa-Iosifa and Greenland, for instance, whilst the temp. is higher, rough winds prevail. These are generally SW. along the coast of Norway, and as far as Zemlya Frantsa-Iosifa, but W. of this region northeasterly winds are general. During the summer fogs and mists are very frequent, and form one of the greatest dangers to explorers. The prin. rvs. which flow into the A. O. are the Onega, the Dvina, and the Petchora in Europe, the Lena, the Yenisei, and the Obi in Asia, and the Mackenzie in America. The lofty Arctic lands are covered in the interior to an enormous depth with snow and ice, and vast glaciers are found in some places—for instance, the Humboldt Glacier on the W. coast of Greenland. The smaller seas and bays contained in the A. O., Baffin Bay, Bering Strait, Davis Strait, the

Greenland Sea, the Kara Sea, the White Sea, etc., are described at length in separate articles. Soviet scientists have contributed much to our knowledge of the hydrography of the A. O. since the estab. in 1937 of a series of drifting stations on the sea ice (see ARCTIC EXPLORATION). Amer. and Canadian gov. depts have also done much charting and oceanographical work in post-war years.

Arctiidae, family of lepidopterous insects; the tiger moths.

Arctinus, of Miletus, anct Gk epic poet, probably of the 8th cent. bc. His life is unknown. His works, which are said to have included the *Aithiopis*, a continuation of the *Iliad* and *The Sack of Troy*, are lost except for a few fragments, collected in Kinkel's *Epicorum Graecorum Fragmenta*, 1877.

Arctium, see BURDOCK.

Arctostaphylos, family Ericaceae, genus of evergreen shrubs. *A. uva-ursi*, the Bearberry, is native to Britain, N. Europe, N. Asia, and N. America; once cultivated for medicinal uses, and in tanning and dyeing. Amer. species of *A.*, grown in gardens, are often known as Manzanita.

Arcturus, or Alpha Boötis, next to Sirius the best-known star, and the brightest in the N. sidereal hemisphere. It is one of the 11 stars brighter than the first magnitude and the sixth brightest in the heavens, its magnitude being 0.3. *A.* derives its name from 2 Gk words, *arktos*, a bear, and *oura*, tail. It is not in the constellation called Ursa Major (Great Bear), but is nearly on a line drawn through the 2 hinder stars of the tail of the Bear. *A.* has been the subject of many literary references in anct and modern times, and perhaps one of the oldest references to it is contained in the book of Job in the Bible (Job ix. 9 and xxxviii. 32), though possibly here, as elsewhere, the name of *A.* is wrongly used for the constellation the Great Bear. Hesiod (q.v.) makes reference to *A.* in his *Works and Days*. The poet Shelley, in *The Question*, uses the word in the plural, singing of 'Daisies, those pearl'd Arcturi of the earth, the constellated flower that never sets.' Astronomically *A.* has many points of interest, not the least being that it is the fastest-moving of the brighter stars, its velocity being 84 m. a sec. Its 'proper motion' is 228" a cent., which is very high. *A.* is approaching the earth at the rate of about 4 m. a second. It will, however, take a long time to arrive, for its light, travelling at the rate of more than 186,000 m. a sec., takes about 40 years to reach us. In type the star resembles our sun, its spectrum being full of metallic lines, but it is 2000 times more luminous.

Arcueil, Fr. tn, a S. Industrial suburb of Paris, in the dept of Seine, on the R. Bièvre. There are remains of a Rom. aqueduct built by the Emperor Julian (*Arcus Iuliani*, hence the name *A.*). The lower part of the modern aqueduct was constructed in 1813 to bring water to the Luxembourg Palace (q.v.). Pop. 18,200.

Arey, Grotto of, cavity in a hill in the

dept of the Yonne, France, about 3 m. S. of Vermenton. It contains various apartments, in some of which are found stalactites and stalagmites. The cathedral of Auxerre is supposed to have been built of stone from this grotto.

Ard, loch in the SW. of Perthshire, Scotland.

Ardagh: 1. Vil. of co. Longford, Rep. of I., formerly the seat of the bishopric of A., which was founded by St. Patrick in the 5th cent. St. Mel was the first bishop. Pop. 1500.

2. Vil. of Limerick. *see* RATHKEALE.

Ardalan, *see* SANANDAJ.

Ardashir I (AD 224-40), King of Persia, founder of the dynasty of the Sasanians, was the son of Babak (Papak) and grandson of Sasan. Having reduced to submission the prov. of Fars, A. then defeated Artabanus IV (q.v.) in 3 successive battles in the last of which Artabanus was killed. A. entered Ctesiphon in triumph. A coalition formed to restore the rule of the Parthians was defeated, and all retired except the King of Armenia who continued the war for some ten years. War with the Romans broke out in 232. It ended after sev. defeats in the reoccupation by the Persians of Nisibis and Carrhae. A. retained the Parthian feudal system but introduced a greater degree of centralisation, and made the army into a powerful instrument for the execution of his policy. He made Zoroastrianism the state religion, and the chief Zoroastrian dignitary, the *mohadnan mobadh*, became one of the chief officials of the state (*see* A. Christensen, *L'Iran sous les Sassanides*, 1936).

Ardabil, dist. and tn of Azarbaijan, Persia, 180 m. NE. of Tabriz. In the 10th cent. A. was the cap. city of Azarbaijan. It was sacked by the Mongols in 1220, and became the cap. of Persia under the Safavids before they removed to Tabriz. Pop. of tn 5000.

Ardèche: 1. Fr. riv. rising in the Cévennes and flowing SE. to the Rhône. Length 70 m.

2. Dept of France, formerly part of the ant. prov. of Languedoc. It is very mountainous, containing part of the Cévennes (the Vivarais mts) in the W., and is watered in the SE. by the R.A. Cereals, vines, chestnuts, mushrooms, and olives are produced, and coal and iron are found. The prin. tns are Privas (the cap.), Largentière, and Tournon (qq.v.). Area 2140 sq. m. Pop. 249,100.

Ardee, tn of Louth, Rep. of I., on R. Dee. It contains a 13th-cent. church, and two 14th-cent. castles. Pop. 2492.

Ardemano, **Teodoro** (1664-1726), Sp. architect, painter, and sculptor, b. Madrid. He studied painting under Claudio Coello, and afterwards gave his time to mathematics and architecture. He painted the frescoes in the church of St. Francis, Madrid, and among his sculptures are the tombs of a dauphin of France and of a queen of Savoy. The cathedral of Granada is partly his work.

Arden, Forest of, dist. in central and W. Warwickshire, England, originally part of a forest which covered a large part of

the midlands. Undulating and still well wooded. It is probably the scene of Shakespeare's *As You Like It*. His mother claimed to belong to the famous Arden family, founded in the 11th cent.

Ardennes: 1. Formerly the name of a large hilly and wooded dist. embracing parts of Belgium, Germany, and France; now applied to the wooded heights which extend from SE. Belgium into France on each side of the Meuse. The highest elevations are about 2000 ft. The industries of the dist. are pasturage and mining. This hill and forest region, watered by the Meuse and Aisne, was the scene of heavy fighting in the early days of the First World War, the Ger. invading armies marching to SE. Belgium through Luxembourg in the S. Ardennes and through Malmédy near the N. part of the dist. The fate of Liège (Aug. 1914) cleared the road for the Germans between A. and Visé when, under the Duke of Württemberg and the crown prince, they resumed their advance by the hills to the Luxembourg railway lines. After the fall of Liège Gen. von Bülow, on the pretext that the inhab. of the tn of A. had attacked Ger. troops, ordered the tn to be burned and 100 inhab. shot. It was in the A. in the Second World War that Gen. von Rundstedt (q.v.) opened his counter-offensive on the Belgian and Luxembourg frontiers on 16 Dec. 1944. In the new year, on 3 Jan., the Americans launched a powerful counter-attack on the N. flank of the A. salient, which eliminated the last hostile threat and reduced the Germans finally to a general defensive. *See* WESTERN FRONT IN SECOND WORLD WAR.

2. Dept of NE. France, bordering on Belgium, formed of parts of the ant. provs. of Lorraine, Hainaut, and Champagne. It is partly wooded and hilly, and is watered by the Aisne and the Meuse. The W. and the riv. valleys are fertile, live-stock raising is important, and there are many iron-mines and quarries. Prin. tns are Mézières (the cap.), Rethel, Sedan, Vouziers (qq.v.). Area 2027 sq. m.; pop. 245,000.

Ardfert, tn in co. Kerry, Rep. of I. 5½ m. NW. of Tralee. It is the see of the Bishop of A. and Aghadoe, and the ruined cathedral is of 13th-cent. construction. A. Friary was founded by the Franciscans in 1253. Pop. of vil. 135.

Ardglass, small seaport, fishing station, and bathing resort in co. Down, N. Ireland. Pop. 500.

Ardil, textile fabric produced from groundnuts in the U.K. in 1944 and used in the manuf. of a cloth with wool-like qualities. *See* MAN-MADE FIBRES.

Ardilaun, **Arthur Edward Guinness**, 1st and only Baron (1840-1915). Educ. at Eton and Trinity College, Dublin. Head of the great brewing firm of Arthur Guinness & Co. Conservative M.P. for Dublin, 1868-9 and 1874-80. Raised to peerage, 1880. Acquired St. Stephen's Green (Dublin) and Muckross estate (Killarney) for the public.

Ardingly, vil. of Sussex, England, 40½ m. from London with a Woodard

public school. Wadehurst Place is a 16th-cent. mansion; St Peter's Church dates from the 14th cent. Pop. 1310.

Arditi, Luigi (1822-1903), It. musician and composer, b. Piedmont, graduated at Milan Conservatory 1842. In 1846 he visited Havana as violinist with Bottesini, the double-bass player, and in 1847 went to New York as conductor of the Havana Opera Company. In 1858 he became conductor of His Majesty's Theatre, London, being Patti's favourite conductor. He wrote some operas but is now remembered only for his light waltz song, *Il Bacio*. Pub. *Reminiscences*, 1896.

Ardluke, Eskimo name for the grampus.
Ardmore: 1. Vil. and watering-place of Waterford, Rep. of I., 6 m. from Youghal. Pop. 200.
2. Co. seat of Carter co., Oklahoma, U.S.A., home of the Chickasaw Indians, 98 m. N.E. of Fort Worth. It is a commercial, shipping, and manuf. centre in a rich agric. region. A state hospital and the Carter Seminary for Indians are here. Pop. 17,890.

Ardnamurchan Point, headland in Argyll, Scotland, the most westerly point of the mainland. The lighthouse on it was built in 1849.

Ardnaree, see BALLINA.

Ardobicum Curonium, see CORUÑA, LA.
Ardoch, vil. of Perthshire, Scotland, 9 m. S.W. of Crieff, containing the best-preserved Rom. camp in Great Britain. Pop. 985.

Ardoye (Flem. *Ardooie*), tn in the prov. of W. Flanders, Belgium. Pop. 7100. It is noted for its cloth-weaving works.

Ardres, Fr. tn in the dept of Pas-de-Calais, on the A. canal. The Field of the Cloth of Gold (q.v.) was at Balinghem, 2½ m. from A. Lace and tapestry are manuf., and a cattle market is held. There are ferruginous springs. Pop. 2900.

Ardrihaig, port of Argyll, Scotland, 19 m. S.W. of Inveraray, on Loch Gilp and the Crinan Canal. Pop. 1300.

Ardrossan, burgh and seaport of Ayrshire, Scotland, 12 m. S. of Largs on the Firth of Clyde. There is an important harbour, the construction of which was begun in 1806. The tn is noted for its shipbuilding and oil refinery, and there are collieries and ironworks in the neighbourhood. A ruined castle with its dungeon, known as Wallace's Larder, may still be seen. Pop. 8800.

Ardreea, par. in Tyrone and Londonderry cos., N. Ireland, containing part of Moneymore. Pop. 5000.

Arduini, Carlo (1815-81), It. author. He became a journalist at Rome, and after the fall of the rep. of Mazzini went to Switzerland and was appointed prof. of It. language and literature at the Polytechnic, Zürich. Among his works are a hist. of Picenum; *L'ultimo dei Romani, ovvero la congiura di Stefano Porcari*, an historical drama, 1849; a work on the philosophy of Dante and on literature and art during the It. Renaissance; and one on the philosophy of the fine arts in Italy.

Ardreck Castle, on the edge of Loch Assynt (q.v.), Scotland, built in the late 16th cent. and now ruined. The Marquess

of Montrose (q.v.) was imprisoned here (1650) before his execution.

Ardwick Series, geological name of series of marls and limestones which form part of the Upper Coal Measures in the S. Lancs coal-field of Britain.

Ardys succeeded his father Gyges as King of Lydia, and reigned 678-629 B.C. He took Priene, and made war on Miletus. The Cimmerians, attacked by the nomads of Scythia, invaded the kingdom of A. See Herodotus, i. 14, 15.

Are, unit of fr. land. A square measure, one side of which is 10 metres long. See METROLOGY.

Area, two-dimensional measurement of surface. The A. of a rectangular surface = length multiplied by breadth. The A. of a parallelogram = length multiplied by perpendicular height; the A. of a triangle = half the product of any side and the perpendicular drawn to it from the opposite angle; the A. of a circle = πr^2 , where $\pi = 3.1416$ (approximately) and r = radius (see CIRCLE and IT). See DIMENSIONS; MEASUREMENT AND SURVEYING; METROLOGY.

Areas of Local Government. Reference is made under local gov. (q.v.) to the fears of co. councils regarding the disintegration of co. areas which led to the appointment of the Onslow Commission in 1923 and the implementation of that commission's recommendations.

The movements of pop. during the Second World War created new problems of areas and boundaries, and the estab. of the Regional Commissioner system during the war gave rise to some apprehension that a regionalisation of local gov. might be adopted after the war. The Local Gov. Boundary Commission, set up in 1945, made widespread investigations and issued reports in 1947, 1948, and 1949, proposing the merger of certain co. councils, the div. of other cos., the constitution of one tier co. councils for certain conurbations, and the loss of the 'all-purpose' type of co. bor. status for some co. bors. The gov. dissolved the commission in 1949 and indicated that they intended to review the whole subject with a view to the introduction of a comprehensive scheme of reorganisation. In the autumn of 1956 the Minister of Housing and Local Gov. issued a white paper on 'Local Government—Areas and Status of Local Authorities in England and Wales,' after consultations with the sev. associations of local authorities. This only dealt with structures. It indicated that 2 commissions would be appointed to make recommendations. More co. bors., the only type of 'all purpose' authority, would be created, but the minimum pop. would be raised from 75,000 to 100,000. Small co. dists. would be absorbed into larger units and some co. councils would be amalgamated. Following a first new general review, the co. councils would review the areas of their co. dists., including, for the first time, the non-co. bors.

A new co. can only be created by the div. of an existing co. The Local Government Act, 1888, made provision for this

to be done by an order of the Minister of Health, now the Minister of Housing and Local Gov., confirmed by Parliament. Only in one instance has it been done, namely in the case of the Isle of Wight in 1889. For the creation of a new co. bor. an Act of Parliament is necessary, and a pop. of 75,000 is required.

Any dist. council may petition Her Majesty for the grant of a charter of incorporation as a bor. for the whole or any part of their area. A bor. council may make proposals for the alteration of the boundary of their bor. to the minister and he may make an order therefor subject to the approval of Parliament.

The creation of a new urb. dist., rural dist., or par., or the alteration of the boundaries thereof, may be effected in 3 ways. The local authority may make a proposal to the co. council and that council will hold a local inquiry and may make an order for the change and submit it to the minister for approval; secondly, the co. council may themselves make representations to the minister for the change; thirdly, the co. council may review the whole of the co. area and make a report to the minister with proposals for changes. If there is opposition to the scheme within 6 weeks of its pub., the minister must hold a local inquiry before deciding whether to make the order with or without modifications or not to make the order. The order must be laid before Parliament and may be annulled. There must be an interval of at least 10 years between these reviews. See also LOCAL GOVERNMENT.

Areca, family Palmaceae; genus of *Palms*, natives of Malacca to New Guinea. The chief species, *A. catechu*, is grown for its seeds, the pinang or betel nuts. See BETEL NUT PALM.

Arecibo, city on the N. coast of Puerto Rico, a processing centre in an agric. region (sugarcane, coffee, tobacco, fruit). It has sugar milling and alcohol and rum distilling, and manufs. needlework, clothing, furniture, and agric. machinery. It was settled in 1556. The harbour is dangerous. Near by are the famous caves of Consejo. Pop. 28,569.

Arena, central part of an amphitheatre where the fights of the gladiators and wild beasts were held. Its name was derived from the Lat. *arena*, sand, and it was so called because it was usually covered with sand.

Arenaceous (Lat. *arena*, sand) Rocks is a term applied to those rocks which are formed largely of sandy material. The fine particles of quartz, of which sand consists, mingle with particles of other material, such as mica or felspar, and when cemented become rocks. When the clayey cement predominates they pass into *argillaceous* rocks.

Arenaria, genus of Caryophyllaceae, about 160 species. *A. serpyllifolia*, Thyme-leaved Sandwort; *A. ciliata*, Irish Sandwort; *A. norvegica*, Norwegian Sandwort; and *A. gothica*, Fries' Sandwort, are found in Britain. *A. graminifolia* and *A. montana* may be grown in gardens.

Arenas, Puntas, see MAGALLANES.

Arenberg, former Ger. duchy, sovereign from 1644 until 1801, situated between Cologne and Jülich (qq.v.).

Arendal, seaport in S. Norway, co. tn of Aust-Agder, situated at the mouth of the R. Nid. Pop. 11,800. In the tn and neighbourhood are paper and wood-pulp factories and engineering and shipbuilding works.

Arendonk, tn in the prov. of Antwerp, Belgium, noted for its manufs. of hosiery. Pop. 8300.

Dr W. R. Waterfield

THE AREND-ROLAND COMET

Photograph taken with an astrographic camera. The straight line across indicates the passage of an aircraft.

Arend-Roland Comet, named after its discoverers, Prof. D. S. Arend and Georges Roland, both of the Belgian Royal Observatory, who first observed it in Nov. 1956. It approached within 53 million m. of the earth on 20 April 1957 and was first seen with the naked eye in Britain in April 1957. It is of the non-recurring type, its orbit being hyperbolic. See COMET.

Arène, Paul-Auguste (1843-96), Fr. writer, b. Sisteron. He helped Alphonse Daudet in his *Lettres de mon moulin*, 1868, and like him describes the life of his native Provence in many of his works. His chief novels are *Jean des Figues*, 1868, *La Guise*

parfumée, 1876, *La Chèvre d'or*, 1889, and *Domnine*, 1894. He also wrote comedies (*Les Comédiens errants*, 1873); short stories (*Contes de Paris et de Provence*, 1887); as well as many critical essays. See H. Provence, *Le Roman d'amour de Paul Arène*, 1945.

Arenenberg, castle on the borders of Lake Constance, canton of Thurgau, Switzerland. It was the residence of the Countess of Saint-Leu, ex-queen of Holland, and of Prince Louis Napoleon, afterwards Napoleon III.

Areng, name of one of the palms that produce sago and palm wine, found in all the is. of the Indian Archipelago. The only species, *A. saccharifera*, has a trunk 20 or 30 ft high covered with coarse black fibres. It yields a large amount of sap, which, when first drawn from the tree, is transparent. It soon becomes turbid and milky, and when fit for drinking is of a yellowish colour, with a large amount of astringency. It is very intoxicating. The coarse fibres are made into cables, and sago is obtained from the trunk.

Arenicola, see LUG-WORM.

Arensky, Anton Stepanovich (1861-1906), Russian composer, *b.* Novgorod. Studied under Zikhe, and, later, under Johansen and Rimsky-Korsakov at St Petersburg Conservatory. In 1890 his first opera, *A Dream on the Volga*, was successfully performed in Moscow. His other chief works are the opera *Nal and Damayanti* (1899), the ballet *A Night in Egypt*, and cantata *The Fountain of Bakheisarai*. He also composed church music, songs, symphonies, a set of variations for strings on a theme of Tchaikovsky, some chamber music, and a large amount of elegant piano music. Much of his output is already forgotten, for, though akin to Tchaikovsky's, his music lacks the dramatic eloquence, to say nothing of the versatile technical equipment, of the latter's.

Areolar Tissue, see CELLULAR.

Areometer, instrument for measuring the sp. gr. of fluids. See HYDROMETER.

Areopagus, 'the hill of Ares' (q.v.) in Athens, which gave its name to the judicial assembly of elders which met there. This was of great antiquity, and was said to have taken its name from the legend of Ares having been tried there by Poseidon for the murder of his son, Halirrhothius. Its powers and functions were greatly increased by Solon, 594 bc. It was formed of ex-archons and other men of high moral character, and exercised the right to inquire into men's incomes, to punish idleness and immorality, and to try persons for homicide, murderous assault, conspiracy, and arson. Its power declined after 487 bc; in 461 its jurisdiction was limited to homicide and certain religious cases; and it was finally abolished c. ad 400. For St Paul's sermon on the A. see Acts xvii.

Arequipa: 1. Coast dept of S. Peru, divided into 7 provs. Area 21,622 sq. m.; pop. 323,000. Mountainous region with fertile valleys. Agric., and rich in mineral resources. Chief exports are borax, textiles, and agric. products.

2. Cap. of A. dept and A. prov., trading and distributive centre. Tn founded by Pizarro on the site of old Inca city, 1539; pop. 130,000. A. stands at 7500 ft in a beautiful valley, but subject to earthquakes. Cathedral founded in 1612. It is a univ. tn with a public library and many fine colonial houses. Important textile centre. It is connected with its ports, Mollendo, 90 m. distant, and Matarani, 110 m., by the A.-Puno Railway. The tn was captured by the Chileans in 1883 during the war between Chile and Peru.

3. Volcano in A. dept, Peru, usually called El Misti; its altitude is 19,166 ft.

Ares, Gk god of war, later identified by the Romans with their god Mars (q.v.); son of Zeus and Hera. He loved Aphrodite, whose husband Hephaestus made the pair the laughing-stock of the gods. According to a late tradition A. slew Halirrhothius for violence to his daughter Alcippe, and was acquitted on the Areopagus by the Olympian gods, whence was derived the name Areopagus on whose W. slope was his temple. In the Trojan war he was wounded by Diomedes. The Aloadae also conquered him, and imprisoned him for 13 months. The worship of A. was not widespread in Greece. It was probably introduced from Thrac., derived perhaps from anet war magic.

Aretaeus (AD 81-1138), Gk physician, *b.* Cappadocia. As a clinician he ranks next in importance to Hippocrates. He left many fine descriptions of disease, including the first clear accounts of diabetes and sprue. His extant works were trans. by F. Adams, 1856.

Areata Cataracts, see ESSEQUIBO.

Arethusa: 1. Nymph; name of sev. fountains, the most famous being in Ortygia, near Syracuse.

2. One of the Hesperides (q.v.).

3. In botany, a genus of orchids.

Arethinian, see GUIDONIAN SYLLABLES.

Aretino, Leonardo, see BRUNI, LEONARDO.

Aretino, Pietro (1492-1556), It. poet and playwright, *b.* Arezzo, Tuscany; pretended to be the natural son of a nobleman. He wrote lyrics, satires, 4 unfinished epics, prose dialogues, and comedies. He also pub. some 3000 of his letters, which reveal much of 16th-cent. life, as well as his own vicious character, which won for him the name Scourge of Princes. After being banished from Arezzo he was patronised by Giovanni de' Medici, who introduced him to Francis I of France. His comedies are now regarded as his best work, but all his writings are tainted with licentiousness.

Aretino, Unico, see ACCOLTI, BERNARDO.

Aretinus, Guido, see GUIDO D'AREZZO. Ares was the son of Acrotatus, and succeeded his grandfather Cleomenes II as King of Sparta in 309 bc. He was attacked by Pyrrhus, King of Epirus, and was killed when engaged in battle in support of the Athenians against Antigonus Gonatas.

Aresu, or **Areas** (1st cent. bc), Gk philosopher of the Pythagorean school, *b.* Alexandria. He was one of the tutors

of the future Emperor Augustus, who, at his instance, spared the city of Alexandria in 31 BC.

Arezzo: 1. Prov. of Italy, in E. Tuscany (q.v.). It is in the Apennines (q.v.), and is mountainous except for the broad valley of the Arno (q.v.) in the W. (see CASENTINO). Cereals and wine are produced, and pigs are reared. The prin. tns include Arezzo, Cortona, and San Sepolcro (qq.v.). Area 1275 sq. m. Pop. 326,000.

2. (anct *Arretium*) It. tn, cap. of the prov. of Arezzo, near the confluence of the Arno and the Chiana, 36 m. SE. of Florence (q.v.). It was originally an Etruscan settlement (see ETRURIA), and in 308 BC it made a 30 years' peace treaty with Rome. In 283 BC it was besieged by the Senones (q.v.), and it was later colonised by Sulla (q.v.). During the Middle Ages it sided with the Ghibellines (see GUELPHS AND Ghibellines), partly out of enmity towards Florence (q.v.), by which A. was, however, defeated in 1289. In 1348 it came completely under Florentine domination. During the Second World War the tn suffered considerable damage. The anct part of A. stands on a hill, with the modern part at its foot. There is a 13th-cent. Gothic cathedral (20th-cent. facade) containing notable paintings. In the 14th-cent. church of S. Francesco there is a famous fresco by Piero della Francesca (q.v.) called the *Legend of the Holy Cross*. There are sev. other beautiful old churches, as well as palaces, museums, and a picture gallery. Twice yearly, in the *Piazza Grande*, there takes place a competition in which horsemen joust with a clockwork 'Saracen king.' The tn has a large trade in agric. produce, wine, and oil, and there are textile, leather, and pottery manufs. Maecenas, Vasari, Petrucci, Aretino, Caesalpino, and, perhaps, Guido d'Arezzo were natives. Pop. (tn) 28,000; (com.) 67,700.

Arlaks Mts. New Guinea (q.v.); highest elevation 9643 ft.

Arfe: 1. Enrique de A., distinguished Sp. silversmith, who lived in the early part of the 16th cent. He made the silver tabernacles of the cathedrals of Leon, Cordova, and Toledo, and also that of the Benedictine monastery of Sahagun.

2. Juan de A. y Villafino (1535-?), b. Leon, grandson of the above, employed by Philip II and Philip III. He was the artist of the tabernacles of Avila, Seville, and Osmas, and he made tabernacles for the cathedrals of Burgos and Valladolid, and for the church of St Martin at Madrid. He wrote *Guilador de Oro, Plata, y Piedras*, Valladolid, 1572, and *Varia Commensuración para la Escultura y Arquitectura*, Seville, 1585.

Arfredsonite, dark green mineral which occurs in igneous rocks such as nepheline-syenite and phonolite. Its formula is $\text{Na}_2(\text{Ca,Mg})_2(\text{Fe,Mn})_4(\text{Al,Fe})_2\text{Si}_5\text{O}_{18}$.

Argaeus, mt in Cappadocia, Asia Minor. Extinct volcano, 13,100 ft high. Now called Arjash-Daghi.

Argali, name of a species of wild sheep found in the steppes of Siberia and the mts of central Asia. It is the *Ovis ammon* of

Pallas. There are many races, which range from the Himalayas to Kamchatka. See SHEEP.

Argall, Sir Samuel (c. 1580-c. 1626), Eng. adventurer, b. Bristol. He went to Virginia in 1609 and obtained the release of sev. Englishmen held captive by Powhatan, a Potomac chief, by abducting his daughter, Pocahontas, in 1612. A. became Deputy-Governor of Virginia in 1617, resigning on account of charges of tyranny and rapacity in 1619. In 1621 he commanded a fleet against the Algerian pirates in the Mediterranean, and was knighted in 1622.

Argand, Aimé (1755-1803), b. Geneva, d. England, a chemist who first invented lamps with a burner which admitted air to the flame.

Argand Burner, burner for an oil lamp, in which the wick is in the form of a hollow cylinder, so that air rises within and without the flame, procuring more complete oxidation and therefore a brighter light. The addition of a cylindrical chimney creates a greater draught, at the same time promoting steadiness of the flame by preventing side draughts. The same principle is used in gas burners where the gas is admitted into the space between 2 hollow cylinders. This space is closed at the bottom and provided at the top with a series of small holes through which the gas issues.

Argao, tn on the E. coast of Cebu, Philippine Is. Founded 1608. Pop. 33,596. Products are rice, corn, and coco-nuts.

Argel, or **Arghel**, the *Solenostemma A.*, species of the family Asclepiadaceae found in Syria, Arabia, and Africa. Its leathery and acrid leaves are sometimes used in the adulteration of senna.

Argelander, Friedrich Wilhelm August (1799-1875), Ger. astronomer, b. Memel; educ. at the univ. of Königsberg. In 1820 became assistant to F. W. Bessel; was director of the observatory of Åbo, 1823, and later of Helsingfors, 1832. Appointed prof. of astronomy in the univ. of Bonn, 1837. In 1822 there appeared his treatise on the path of the great comet of 1811. His *Bonner Durchmusterung* includes all the stars of the N. hemisphere down to the eleventh magnitude.

Argelès-Gazost, Fr. spa, cap. of an arron., in the dept of Hautes-Pyrénées. Pop. 2300.

Argens, Jean Baptiste de Boyer, Marquis d' (1704-71). Fr. writer, b. Aix-en-Provence. He entered the army at the age of 15. Most of his writing was done at Amsterdam. He was invited to Potsdam by Frederick the Great in 1744 (see *Correspondance entre Frédéric II et le marquis d'Argens*, 1798). His chief works are *Lettres juives*, 1738-42; *Lettres chinoises*, 1739-42; *Lettres cabalistiques*, 1741; *Histoire de l'esprit humain* (14 vols.), 1765-8.

Argensola, Bartolomé Leonardo de (1562-1631). Sp. poet and historian. He studied at Saragossa and Salamanca, took holy orders, and was attached to the suite of the Count of Lemos. He pub. in 1609

Conquista de las Islas Molucas; and in 1630 a supplement to Zurita's *Anales de Aragón*; in 1634 his poems, which are highly polished, witty, and satirical, appeared with those of his brother. In 1613 he succeeded his brother Luperco as historiographer of Aragón.

Argensola, Luperco Leonardo de (1559-1613), Sp. dramatist and poet. His tragedy *Filís* is lost; *Isabela* and *Alejandra*, imitations of Seneca, were pub. in 1772. His poems, being trans. from Lat. poets and some original satires, were pub. with those of his brother in 1634. In 1585 he was appointed secretary to the Duke of Villahermosa, in 1599 he became historiographer of Aragón, and in 1610 he accompanied the Count of Lemos to Naples, where he d. 1613. See O. H. Green, *The Life and Works of Luperco Leonardo de Argensola*, 1927.

Argenson, Marc Antoine René de Voyer, Marquis de Paulmy d' (1722-87), Fr. diplomatist and man of letters, b. Valenciennes; son of René Louis de Voyer d'A. He collected the famous *Bibliothèque de l'Arsenal*, containing 150,000 vols., which was sold after his death to the Comte d'Artois. Pub. *Mélanges tirés d'une grande bibliothèque*, 1779-87.

Argenson, Pierre de Voyer, Vicomte d' (1626-70), fifth Governor-General of Canada (1658-61), educ. for the priesthood but forsook the Church for the Army. He came to Quebec in 1658, 1 year after his actual appointment. His tenure was marked by a dangerous attack on the Fr. establs. in Canada by the Iroquois, an attack which was checked by the heroism of the garrison at Long Sault under Dollard. A. returned to France in 1661 and rendered distinguished service in the royal armies. It was during his tenure that de Laval arrived in Quebec as first Bishop of Quebec and Canada.

Argenta, Jacopo Filippo d', It. miniaturist of the 15th cent. He did exquisite work in choir-books, specimens of which are still to be found in the communal library at Ferrara.

Argentan, Fr. tn in the dept of Orne. Horses are bred, and there is a school of lace-making and leather manufs. Mézeray (q.v.) was a native of A., and Charlotte Corday was b. at St Saturnin-des-Lignerets near by. The tn was severely damaged during the fighting in Normandy in 1944 (see FALAISE, *Battle of the 'Falaise Pocket'*). Pop. 6700.

Argentario, or Argentaro, It. mt. in Grosseto, S. Tuscany (q.v.), forming a peninsula jutting into the Tyrrhenian Sea. Orbetello is on the isthmus joining it to the mainland, and at its foot lie the harbours of Port'Ercole and Porto S. Stefano. Height 2082 ft.

Argentera, mt in Italy, near Cuneo (q.v.). It is the highest peak (10,817 ft) in the Maritime Alps (see ALPS).

Argenteuil, Fr. tn in the dept of Seine-et-Oise, on the Seine. It is a residential and industrial suburb of Paris. Héloïse (see ABELARD) was abbess of the convent here, founded in the 7th cent. The modern church preserves a relic, said to be the seamless tunic of Christ, given to the

convent by Charlemagne. There are aircraft, automobile, metallurgical, and textile manufs., and market gardening is important. Pop. 53,500.

Argenteus, Codex, or Silver Book, name of a MS. containing the greater part of the 4 gospels in the Moeso-Gothic language, now in the library at Upsala, Sweden. It was discovered in the Abbey of Werden, Westphalia, and is believed to be a relic of the Gothic Bible trans. by Ulfilas, who lived in the 4th cent. AD. The leaves are of vellum, the initial letters are in gold, and the others in silver. The Gothic gospels of the Silver Book were first printed in types approaching to a facsimile by Junius, 1665; in Stockholm, 1671; by Edward Lye at Oxford, 1750; and by Zahn, Weissensfels, 1855.

Argentières, glacier of Mont Blanc (q.v.).

Argentières Pass, pass in the Maritime Alps (q.v.), leading from Barcelonnette in the dept of Basses-Alpes (q.v.), France, to Dament in the prov. of Cuneo (q.v.), Italy.

Argentières, Fr. vil. in the dept of Haute-Savoie, 6 m. NE. of Chamionix. In the vicinity is the famous glacier of A., the largest in the Mont Blanc group.

Argentina (Lat. *argentum*, silver), deep-sea salmonoid fish with silvery scales, found mainly in the N. Atlantic down to 500 fathoms or so. Artificial pearls are made from the scales.

Argentina, or Argentine Republic, federal rep. of S. America; its name is derived from the Río de la Plata (riv. of silver). It is bounded on the W. by the Andean range of mts, which separates it from Chile; on the N. by Bolivia, and on the E. by Paraguay, Brazil, Uruguay, and the Atlantic Ocean. Area 1,084,359 sq. m. (including water surface).

The country is divided into provs. and ters. There are 19 provs. and 1 federal dist.: (1) In the N., Salta and Jujuy. (2) On the coast, Buenos Aires, Santa Fé, Entre Ríos, Corrientes. (3) The central provs. of Córdoba, San Luis, Santiago del Estero, and Tucumán. (4) The Andean provs. of La Rioja, Catamarca, San Juan, and Mendoza. The ters. were 10 in number: (1) Neuquén, Río Negro, Chubut, Patagonia, and Tierra del Fuego. (2) Pampa. (3) Misiones, Formosa, and Chaco in the N. (4) Military Zone, Comodoro Rivadavia. In 1955 Formosa, Neuquén, Chubut, Río Negro, and Patagonia became provs. There is also the federal dist. of Buenos Aires (71 sq. m.).

Physical features. The Andes form a continuous chain of mountainous highland, with an average height of 13,000 ft. S. of Buenos Aires there is an extensive mountainous range, the Sierra Ventana. The country is well watered, the prin. rivs. being the La Plata, Paraná, Uruguay, Río Negro, Chubut, and Gallegos. In the N. and E. there are fertile valleys, and wide tracts of lands which for agric. and pastoral purposes could hardly be surpassed. In Patagonia and to the centre there are vast plains known as pampas, which are covered with shingle and interspersed with clumps of thorny brushwood and tall thistles.

The climate for the most part is temperate and healthy, though that part of the country which lies N. of the tropic of Capricorn is extremely hot, and the S. ters. are bleak and windy. High, stormy winds, known as pamperos, blow on the coast from the Atlantic.

Products and industries. The main industries are agric., the pasturage of live-stock and forest products being 95 per cent of the whole. Wheat, oats, maize, and linseed are the prin. crops. Alfalfa, for feeding live-stock, is a very successful crop. Cotton, potatoes, sugar, vines,

are borax, salt, and limestone. Oil has now been found and the Argentine State Oilfields at Comodoro Rivadavia produce with private companies 4,200,000 metric tons annually.

Fauna. Numerous species of animals exist, of which may be named the chinchilla, fox, skunk, guanaco, coypu, viscacha, armadillo, deer, and ostrich. Birds of beautiful plumage abound, as, for example, parrots, flamingoes, and humming-birds. The extensive pasturage of live-stock has greatly decreased the numbers of wild cattle and horses.

Canadian Pacific

BUENOS AIRES, LOOKING TOWARDS THE HARBOUR

tobacco, rice, and yerba maté (Paraguayan tea) are also cultivated. Other products are peanuts and sunflower seed. The vine is cultivated in Mendoza and San Juan and the wine export to other S. Amer. states is increasing, being valued at £500,000 yearly. Meat-packing houses have been estab. on a large scale, and meat refrigeration is the chief industry. Flour-milling is next in importance. The A. has commerce with practically all the European countries and with the U.S.A., but the greater part of the trade is with Great Britain and France. The prin. exports are beef and mutton, wheat, maize and linseed, wool, skins and hides, tallow, sugar, spirits, dried fruits, and maté.

The minerals of the country might be much more developed than they have been in the past. Some gold is found in Patagonia and in the sub-Andean regions to the NW. Other minerals are silver, copper, lead, iron, coal, tin, and cement. Tungsten is an important mineral; others

Population (1955) estimated to be 19,111,500. A census taken in 1774 gives the Buenos Aires dist. pop. as 6000. In 1869, the year of the first regular census, it was 315,000. The pop. in 1955 was 3,582,561. The extraordinary increase in the past 60 years is explained by immigration. Of the tens of the Pampa, the ports have grown most rapidly: Rosario 465,000 (1952), Bahia Blanca 93,000 (1952). The areas of greatest density, however, remain the maize area in the Buenos Aires and Santa Fé provs., and the old agric. colonies on the Middle Salado. In 1914 foreigners numbered 30 per cent of the total pop., all being European except a few tens of thousands of Bolivians and a few thousand Brazilians and Chileans. Immigration is now more under control; in 1919 legislation was passed which requires intending immigrants to produce certificates of good character and ability to work. In 1954 immigrants numbered only 80,000; emigrants, 48,000. The general language

spoken is Spanish, but there are so many immigrants of different nationalities that there is a variety of languages spoken.

The national religion is Rom. Catholicism, but toleration is afforded to other religions.

The constitution is modelled on that of the U.S.A. The president, who must be a Rom. Catholic and a born citizen of the republic, is elected for 6 years, and is assisted by a vice-president and a Cabinet of 5 ministers. There is a Congress of 2 houses: the Senate, composed of 30 members elected by compulsory universal suffrage for 9 years, and the Chamber of Deputies, composed of 158 members elected for 4 years, one-half retiring every 2 years. There is also provincial self-gov., which is republican in form.

The army is a national militia, service in which is compulsory for all citizens between 20 and 45 years of age. After 10 years in the 'active' army, the men serve in the National Guard for 10 years and conclude with 5 years in the Territorial Guard, which latter is only mobilised in war. The army is organised in 6 divs. In 1952 the strength was about 105,000 men. The trained reserve numbered 300,000 men. The navy comprises 2 battleships, 5 cruisers, 6 frigates, 1 corvette, 4 coast defence ships, 11 destroyers, 3 submarines, and 14 mine-sweepers; and includes 9 motor torpedo boats, 27 landing craft, 7 oilers, 7 transport ships, 2 survey ships, and auxiliary vessels. Battleships and coastal defence ironclads have been modernised. There are 1500 naval officers and 20,000 men. The air force to-day comprises 9 reconnaissance groups and 3 fighting groups.

Education is compulsory for the ages of 6 to 14. Primary education is free, being subsidised by the General and Prov. Govs., and secular. Secondary education is also free, but not compulsory. It is controlled by the National Gov. in over 50 national colleges. Normal colleges, mining, agric., commercial, industrial, and training schools are also sustained at public cost. There are national univs. at Buenos Aires, and at Córdoba, which latter has an astronomical observatory. There are 5 prov. univs., the prin. being at Corrientes, Santa Fé, Tucumán, and La Plata. The Univ. of Cuyo for the provs. of Mendoza, San Luis, and San Juan was founded in 1921, and one at Bahía Blanca in 1955.

Chief towns. Buenos Aires, the cap. of the country, on the estuary of the La Plata, was founded by Don Pedro de Mendoza in 1535. It was made a bishopric in 1620, and a viceroyalty in 1775. It is an important commercial and educational centre and owns flourishing engineering works. Its pop. in 1905 was about 1 million. The prin. tns are: Buenos Aires, pop. 3,582,561; Rosario, 465,000; Córdoba, 352,000; Avellaneda, 100,000; La Plata, 218,000; Santa Fé, 168,000; Tucumán, 192,000; Bahía Blanca, 93,000; Mendoza, 93,000; Mar del Plata, 105,000; Santiago del Estero, 63,500.

Communications. The R.s Paraná and

Uruguay are important channels of trade. The railways now form part of the Argentine State Transport System, the Brit. company-owned systems having been taken over between 1946 and 1948. The 6 main systems have been renamed after important figures in the nation's hist. There are 26,700 m. of line, much of it on the 5 ft 6 in. gauge. There are now over 30,000 m. of telegraphs and over 50 wireless stations (1939), one of which is reserved for communications with England. Sov. aeroplane services are also in operation. There are tramway lines in all the important tns.

A. has produced a few great names in the realm of literature and science, Gregorio Funes (1749-1830), rector of the university of Córdoba, was an eminent historian. President Sarmiento, during his term of office (1868-74), founded the observatory at Córdoba. The first director of the observatory was Benjamin Apthorp Gould (1824-96), a scientist of the first rank, whose brilliant research work did much to kindle an interest in scientific matters. See further under SPANISH-AMERICAN LITERATURE.

By a law passed in 1899, the paper peso equals .44 of the gold peso. In 1956 the paper peso stood at 85.3 to £1. The revenue of the country is chiefly derived from customs and excise, which are heavy. All banks, national and prov., are now under the direct control of the State.

History. The country was first visited by Spaniards in 1516. A company of adventurers, under the leadership of Juan Díaz de Solís, landed near the Río de la Plata in search of a passage S.-westward to the E. Indies. In 1520 Magellan arrived at the wide estuary of the R. Paraná, and being convinced that there was no passage through to the W. he promptly left the country. In 1526 Sebastian Cabot, once a favourite of Henry VII of England, now the pilot-major of Charles of Spain, went to La Plata to make astronomical observations. On hearing of mineral wealth in the interior, however, he abandoned his primary object and began exploring. He explored up the R.s Paraná and Paraguay, built a fort on the Uruguay, and founded a settlement a little beyond the N. of R. Carcarañal, which he called San Espritu. The Indian ornaments of heavy silver which he sent home to Spain gave the country a reputation of great wealth, and the estuary of the Paraná was called the Río de la Plata, or the Silver R., in consequence. In 1534 a Basque nobleman, Pedro de Mendoza, organised an expedition on a larger scale than had been attempted before. He arrived at La Plata in the following year and laid the foundations of a Sp. settlement at Buenos Aires, but suffered great losses. His company of 2500 men was reduced to 500 in 2 years, partly from the repeated attacks of the Indians, and partly through the ravages of disease. Mendoza himself returned to Spain in 1537. His lieutenant, Domingo Martínez de Irala, remained in the country, and founded the

first permanent Sp. settlement in the interior of S. America at Asunción, which for many years remained H.Q. of the Sp. Gov. In 1538 Iralá was proclaimed by his fellow countrymen the captain-general of the Río de la Plata. The settlement at Buenos Aires had failed through the assaults on the colonists by neighbouring tribes of Indians. An attempt to re-establish the city was made in 1542 by Cabeza de Vaca, but with no success. In 1580 Juan de Garay, who in 1573 had founded the city of Santa Fé, rebuilt Buenos Aires, and endowed it with a corporation and full Sp. municipal rights. He defeated the Indians, and obtained complete mastery over them. By this time the Spaniards had penetrated as far as the Andes. Tucumán was founded 1565, and Córdoba 1573. In 1620 Buenos Aires became separate from the local Sp. Gov. at Asunción, though it remained under the authority of the viceroyalty of Peru. The colonists were very discontented under the yoke of the home gov. Spain jealously forbade all European powers to trade with her colonies or to settle in the country, which meant commercial ruin for the ports. In 1618 Spain allowed Buenos Aires to send out 2 ships, but the tn was prevented from having any internal trade with Peru by the exorbitant customs duty of 50 per cent levied at Córdoba on all goods sent to or from Buenos Aires. This duty was reduced in 1665, but it was not till 1776 that the policy of exclusion was finally abandoned. In 1713, by the treaty of Utrecht, England gained the right to import Negro slaves into Sp.-Amer. colonies. See ASIENTO.

The life of the early settlers, therefore, was not very prosperous. Not only was their trade crippled through the unwise administration of the mother country, but they themselves were continually harassed by attacks from the native Indians. In 1776 Buenos Aires was made the cap. and seat of the viceroyalty, with jurisdiction over the neighbouring ters. now known as the reps. of Paraguay, Uruguay, and Bolivia and the A. Federation. During the period of the Fr. Revolution Spain and France combined against Great Britain, and the Amer. colonies came in for a share of the warfare.

In 1806 Gen. Beresford besieged Buenos Aires, but was repulsed by the inhab., and in the following year Gen. Whitelock assaulted the tn and was also compelled to capitulate. The colonists were so elated at their victories, unaided by the Sp. or Fr. armies, that their thoughts inevitably turned towards independence. In the meantime Napoleon had entered Madrid, and proclaimed his brother, Joseph Bonaparte, King of Spain, and the colonists were not bound by any feelings of loyalty to the Fr. rule. On 25 May 1810 a provisional junta was formed, which marks the beginning of the rep. During the following 4 years the war of independence took place, Manuel Belgrano and José de San Martín being the 2 prominent revolutionary leaders. In 1816 a congress of deputies was held

at Tucumán, when Don Martín Pueyrredón was elected supreme dictator. Spain was defeated by the combined forces of Chile and Buenos Aires at Chacabuco in 1817, and at Maipú in 1818, but it was not till 1842 that Spain formally acknowledged the independence of the A. During the first half-cent. of the repub. the country was disturbed by continual civil war, due to the jealousy of the provs. of Buenos Aires and to the dissatisfaction of the remaining Sp. adherents. In 1826-8 war was waged with Brazil for the possession of Uruguay. The Brazilians were defeated at Utuzaingo, and Uruguay became independent under the name of Monte Video. In 1838-42 there was war with France; and in 1865-70 occurred the Brazilian-A. war against Paraguay, due largely to the arrogance of Francisco Solano Lopez, President of Paraguay, who had invaded A. ters. He was defeated and killed in 1870 by Mitre, the A. president and general, and peace was restored. Up to comparatively recent years the country was harassed by internal revolutions, which frequently involved a general financial crisis. Towards the end of the 19th cent. the relations between Chile and the A. were embarrassed by quarrels over the boundaries. The A. prepared for war by increasing its navy. The boundary protocol was signed with Chile in Dec. 1900. In the following year the 2 countries referred the question of the frontier to the arbitration of Great Britain, and in consequence war was averted. The death of President Manuel Quintana took place in Mar. 1906, when the vice-president José Figueroa Alcorta assumed presidential office. He was succeeded in 1910 by Roque Sáenz Peña, with Victoriano de la Plaza as vice-president.

Throughout the First World War A. remained neutral. One of the most significant events in A. hist. in these years was the election of the Radical leader, Dr Hipólito Irigoyen, to the office of president. Never previously had the Radicals secured control of the gov. in so proudly conservative a country as the A. During 1917 a serious railway strike, probably fomented by Ger. agitators, brought about acute political tension. Irigoyen's democratic sympathies were said to have indirectly encouraged the outbreak. About this time the notorious *spurs versenkt* warning as to Ger. U-boat intentions was sent to the A. Gov. and sev. A. boats were sunk. Feeling ran high in the A., but though numerous volunteers joined the allied armies, neutrality was preserved.

It is considered by most pan-Americans to be an outstanding achievement of the president that in spite of the strongest inducements from outside to join the Allies he kept A. out of the First World War. This abstention enabled the country to make headway in commerce, and in 1938 the foreign trade was valued at 2861 million pesos. Imports and exports were, respectively, 1461 million and 1400 million pesos. In domestic

affairs the chief features of Irigoyen's first administration were the introduction of a minimum wage to save the working classes from the effects of an inflated currency, the raising of the railway tariff, and the unswerving support of national and prov. constitutions. Irigoyen, who had been the chief political force in A. ever since he assumed a commanding position 40 years previously, at first refused to stand for the presidency, partly, perhaps, because he underestimated the chances of his party and partly because his immense estates occupied so much of his attention. He was, however, again inaugurated president in 1928, and but for the revolution of 1930 would in the ordinary course have held office till 1934. The most significant event in the foreign policy of A. in recent times is the unequivocal championship of the complete sovereignty of the S. Amer. reps., untrammelled by any implications or even by the mere existence of the Monroe doctrine. In 1930 a revolution took place, which ended the gov. of President Irigoyen. The *coup d'état* was effected by a combination of all the fighting services directed by a junta under Gen. Uriburu. The course of the revolution was swift and accompanied by relatively small loss of life and damage to property. The new gov., the members of which were all men of marked Conservative tendencies, dissolved Parliament but promised to respect the constitution. The cause of Dr Irigoyen's downfall was, apparently, popular discontent with one-man rule bordering on dictatorship, a discontent aggravated by economic depression, much the same causes as had led to similar forcible changes in the govts. of Bolivia and Peru a few weeks earlier in the same year. The *de facto* gov. estab. after the revolution of 1930 was succeeded by a constitutional régime in Feb. 1932, when Gen. Justo was made president in succession to Gen. Uriburu. In the interest of Brit. trade a Brit. Empire Exhibition was held at Buenos Aires in 1931, and was opened by the Prince of Wales (Edward VIII). President Castillo pursued a neutral policy in the Second World War. His policy was not unpopular in A., though in neighbouring countries it was construed as pro-Nazi. In June 1943 there was a military rising at the Campo de Mayo, the great A. military centre, and Dr Castillo surrendered to the revolutionaries and resigned the presidency. Gen. Ramírez, the insurgent leader, issued a manifesto, calling for 'a loyal Amer. union and collaboration, and the fulfilment of pacts and continental undertakings.' But one of the fundamental causes of the revolution is said to have been the alarm prevailing in A. military circles at the arming of A.'s neighbours, notably Brazil, while owing to Castillo's neutrality policy A. could not buy arms. Towards the end of 1943, however, relations between the Allies and A. greatly deteriorated on account of the openly Fascist character of the Ramírez dictatorship. In Jan. 1944 the A. Gov. announced the ending of diplomatic relations with Germany and

Japan, but despite the fact that the great majority of the people were democratic in sentiment and friendly to the Allies, the A. Gov. continued to tolerate widespread Ger. and Jap. espionage, and probably collaborated with the Germans in fostering unrest throughout S. America. Moreover relations between the Ramírez Gov. and Franco's Gov. in Spain continued to be as close as ever. But throughout most of the period from the revolution of June 1943 the A. Gov., partly under pressure of external events, had veered steadily towards the left—whence the frequent changes of presidents and ministers. The end of 1945 saw the rise of a 'Caudillo' in the person of Col. Juan Domingo Perón, who had been secretary of the War Ministry in June 1943, and since then secretary of labour and welfare, president of the Post-war Council, and finally vice-president of A. He was imprisoned by the dictatorship in the is. of Martín García, but owing to the insistent clamour of the A. workers was brought back to Buenos Aires as the *de facto* leader of the country. In the general election of Feb. 1946, which was held in an atmosphere of turbulence and violence, Perón was, in effect, the official candidate, and stood for the presidency as the self-proclaimed champion both of the masses against the plutocracy and of A. against the U.S.A. He had the support of part of the army and the allegiance of a large and well-trained police force. During the A. election campaign the Amer. Gov. pub. a memorandum, which it had addressed to the Pan-Amer. Union, in which evidence from Germany was adduced indicating a continuing partnership between the military dictatorship and an elaborate Nazi organisation in A., and quoting Perón himself as aiming at a 'thoroughly regimented totalitarian State dedicated to the pursuit of a warlike life and a war economy.' Perón's opponent was Dr Tamborini, a man devoid of Perón's glamour and mystic appeal, who had been minister of the interior from 1925 to 1928. Tamborini was the spokesman for all those who hated Perón, ranging from wealthy landowners and captains of industry to the workmen's leaders and left-wing agitators whom Perón had once imprisoned in the bleak wilds of Patagonia. He also represented his own party, the Radicals, and the democratic union of Socialists, Communists, and progressive democrats, though in A. party and programme count for far less than does a colourful and dynamic personality. The navy was opposed to Perón because it believed that soldiers should not rule, while the Catholic Church veered towards him on account of its disapproval of Socialists and Communists, and because the Radicals had included the principle of lay teaching in their programme. It was against all this strange and troubled background that Col. Perón was now making his bid for power, and in June (1946) he was inaugurated president amidst scenes of remarkable popular enthusiasm, particularly among his working-class supporters. After troubles in

the provs., especially in Catholic and conservative Córdoba, armed revolt broke out in the cap. in June 1955. This was supported by the naval and air forces, and in sufficient part by the army. By Sept. the provisional president Gen. Eduardo Lonardi had taken over from Perón, who had taken refuge on a Paraguayan gunboat. Rear-Adm. Rojas was a powerful aid. In Nov. Lonardi was replaced by Gen. Pedro Aramburu. The newspaper *La Prensa*, which had come under the control of Col. Perón, was restored to its rightful owners, with freedom of editorial action. The famous economist Raúl Prebisch was recalled from exile to advise on fiscal and monetary rehabilitation, and efforts were made to clear up the havoc wrought by years of maladministration.

Argentite, or Silver Glance, mineral of the glauca group, occurring in isometric crystals. Consists of sulphur and silver, and is found in Cornwall, the Urals, and generally in N. European countries.

Argenton (-sur-Creuse), Fr. in the dept of Indre. It manufs. linen goods and shoes, and produces an excellent wine. Pop. 6100.

Arghei, see ARGEL.

Argillaceous (Gk *argillos*, clay) **Rocks**, term applied to those rocks which are formed entirely or partially of clay (q.v.).

Argillite, see PORCELLANITE.

Argo, or the **Ship**, largest of Ptolemy's 15 S. constellations. It is so large that much confusion formerly prevailed as to the names of its different parts. To obviate this difficulty Sir John Herschel suggested its div. into Carina, the Keel; Puppis, the Stern; Vela, the Sails; and Malus, the Mast. A part of Malus was called by Lacaille Pyxis, the Compass. The greater part of the constellation, which lies E. of Columba and Canis Major, is not visible in Britain, and it is this part which contains all the more important stars. Canopus is the only star in A. of the first magnitude, but at least 2 new stars temporarily outshone it. The variable star Eta Carinae was brighter than Canopus in 1843. It rapidly declined in luminosity, and it now fluctuates

slightly around a magnitude of 7.5. The constellation was named after the ship *Argo*, which conveyed Jason and his companions to Colchis, the story of which is told in the article ARGONAUTS. The Hindus regarded it as the ship of the sun, while the Egyptians regarded it as the bark of the moon.

Argol, crude product deposited on the bottom of a cask during alcoholic fermentation. It is used for the preparation of 'cream of tartar' and tartaric acid. The A. is partially purified by recrystallisation from hot water, is dissolved in water and boiled with chalk, when calcium tartrate, $\text{CaC}_4\text{H}_4\text{O}_6$, is precipitated. After washing, the tartrate is treated with sulphuric acid, which sets free the tartaric acid. A. is also a Mongolian term for dried dung used as a fuel.

Argolis, ter. of Peloponnesus (q.v.), of which Argos (q.v.) was the cap.

Argon (Gk 'inactive'), gaseous constituent of the atmosphere. Symbol A, atomic number 18, atomic weight 39.94. Up to 1894 it was generally assumed that the atmosphere contained oxygen and nitrogen, with variable quantities of carbon dioxide, hydrogen, water-vapour, ammonia, etc. It is true that Cavendish had in 1785 suggested the existence of a small proportion of another constituent, but little notice was taken of the suggestion until Lord Rayleigh and Sir Wm Ramsay demonstrated the existence of A. in 1894. Cavendish had added excess of oxygen to air and passed electric sparks through the mixture collected over caustic potash, so that nitrous acid was produced and absorbed. He then absorbed the excess of oxygen with 'liver of sulphur', and found a small bubble of unabsorbable gas remaining. Over 100 years later Lord Rayleigh determined with great care the weight of 1 litre of oxygen, of hydrogen, and of nitrogen. The results obtained in connection with atmospheric nitrogen were consistent one with the other, but when nitrogen prepared from ammonia was used, an unexplainable error of about one-half per cent was encountered. In 1894 Rayleigh and Ramsay in association proved that the difference was due to the presence in the atmosphere of an inert gas heavier than nitrogen.

A. may be prepared from atmospheric nitrogen in 3 ways: (1) by passing it over red-hot turnings of magnesium; (2) by sparking the gas with excess of oxygen in the presence of caustic alkali; or (3) by dissolving the more soluble A. in water. Commercially it is obtained by the practical distillation of liquid air.

As its name implies, A. is an inactive gas. Its density ($H=1$) is 19.82. It has been condensed to a colourless liquid which boils at -187° and freezes at -189.6° . It is largely employed in filling gas-filled electric filament lamps. See INERT GASES.

Argonautidae, family of cephalopodous molluscs of the order Dibranchiata and div. Octopoda. They are cuttle-fish, the males of which are very small, and the females, which are much longer,

bear a thin shell to hold their eggs. *Argonauta argo*, the paper-nautilus, or paper-sailor, is found in the Mediterranean; *A. tuberculata* in the Indian Ocean.

Argonauts (Gk 'sailors of the *Argo*'), heroes who accompanied Jason in his quest of the Golden Fleece. Aeson, King of Iolcus in Thessaly, was deprived of his kingdom by his half-brother Pelias. His son Jason, when grown up, demanded the throne, which Pelias promised to surrender if Jason would bring the Golden Fleece from Colchis, where it was guarded night and day by a dragon, in the oak grove of Ares. Jason ordered Argus to provide him with a ship with 50 oars, the building of which was superintended by Athena. It was called *Argo*, after its maker. Jason embarked with the great heroes of the age, e.g. Castor and Pollux, Hercules, Theseus, and Orpheus. Aesculapius was their physician, Tiphys the pilot. Their number is variously given as 45, 50, and 54.

Landing first at Lemnos, an is. inhabited by women who had murdered their husbands, they remained 2 years, and raised a new race of men called Minyae. They next visited Samothrace and Bebrycia, whence they were driven by a storm to Salmydessus, and delivered the land from the Harpies.

After many adventures they came to Aea, the cap. of Colchis. The king, Aëtes, promised to give up the Golden Fleece if Jason would yoke 2 fire-breathing bulls with brazen feet to a plough and sow the teeth of the dragon which Cadmus had not used at Thebes. This Jason accomplished by the help of Medea, the king's daughter, who loved him. She provided him with the means of resisting fire and steel, and a drug which lulled to sleep the dragon that guarded the Golden Fleece. The A. fled with their spoil, taking Medea with them, and were pursued by Aëtes. To hinder her father in his pursuit, Medea seized her brother Absyrtus and strewed the way with his mangled limbs. Zeus, angry at the murder of Absyrtus, raised a storm which drove the *Argo* to the is. of Circe, who refused to absolve Jason.

The A. continued their journey and were guarded through the straits of Charybdis and Scylla by Tethys, the mistress of Peleus, one of their company. They sailed safely past the Sirens, who sang in vain, for Orpheus surpassed them. At the is. of the Phaeacians they encountered King Aëtes and his fleet. The wife of Alcinous, king of the country, was chosen to arbitrate between the Colchians and the A. Secretly by night she had a marriage consummated between Jason and Medea, and in the morning declared that Aëtes's claim to his daughter was void.

After many disasters the *Argo* arrived in the Peloponnesus, where Jason was purified of the murder of Absyrtus, and finally reached Thessaly in safety.

The belief of many scholars that the legend is founded upon fact has been strengthened by some important excavations at Iolcus in the summer of 1956.

See J. R. Bacon, *Voyage of the Argonauts*, 1925.

Argonne, forest and hilly dist. of France in the anct provs. of Lorraine and Champagne. It is included in the depts of Meuse, Marne, and Ardennes. Its chief tns are Ste. Ménehould (the anct cap.), Clermont, Varennes, Beaumont, and Grandpré.

During the First World War the A. was the scene of bitter fighting against the forces under the Ger. crown prince, whose advance in Sept. 1914 was finally stopped by Gen. Serrail. In July 1915 the crown prince unexpectedly advanced his lines a quarter of a mile against superior odds, but was then halted by the French. During the stalemate that followed, the Germans constructed their Kriemhilde system of trenches as a continuation of the Hindenburg line, and profiting by the terrain built cement 'pill-boxes' for machine-guns over the entire section of the A. which they held. This stalemate was finally broken in the autumn of 1918, and in the battle that followed more Amer. troops were engaged than had ever fought under the Stars and Stripes at one time in any of the nation's previous wars. Twenty-two Amer. divs. were engaged, with a total strength of over 625,000 men. The importance of this battle was that it was calculated to bring the strongest pressure to bear upon the Germans at this point at the moment when Gen. Halg was hammering away successfully at the Hindenburg line. If the Amer. and Fr. troops, who were also engaged in this action, should succeed in piercing the A., they would threaten one of the most important series of railway lines upon which the Ger. armies depended not only for supplies and reinforcements but also for withdrawal in case of defeat.

The objective set the Americans was to pierce the Forest of A. and advance upon the W. bank of the Meuse, at the same time that the French, under Gouraud, advanced W. of the A. The thrust was so dangerous that, hard-pressed as Ludendorff was all along the line, he had to throw in troops sorely needed elsewhere. The Amer. attack opened with great élan on 26 Sept., on a front of 18 m., and, by the second day, Montfaucon, dominating a great stretch of country, had been taken.

On 4 Oct. the advance was once more resumed through what the Germans considered to be an impregnable forest. By 14 Oct. the Americans had captured Romagne, had broken through the Kriemhilde line at various places, and were approaching the partially completed Freya line. Gen. Pershing now divided his forces into 2 armies, the First under Gen. Liggett and the Second under Gen. Bullard (q.v.). In each of these there were Fr. as well as Amer. corps. By 2 Nov. the whole of the A. was cleared, the troops had passed through the Freya line and had reached Buzancy. According to the plan agreed upon between Marshal Foch and Gen. Pershing the troops were to push on to Sedan and cut the important railway network. By 6 Nov. Fr. and Amer. troops had reached the suburbs of

Sedan. Just as in the war of 1870 the Germans had trapped an entire Fr. army there, so now it seemed as if the French and Americans would turn the tables on the Germans. The latter, indeed, were only saved by the Armistice of 11 Nov. The Amer. casualties in this long-fought battle were 115,529, of which number 15,599 were killed.

Argos, anct city of Peloponnesus. In the Homeric age it was overshadowed by Mycenae, but during the reign of Pheidon (q.v.) its supremacy extended over the whole of the E. Peloponnesus. Engaged in frequent wars with Sparta; 461 BC, alliance with Athens; 229 BC, governed by tyrants supported by Macedon; 146 BC, subjugated by Rome; AD 1210, captured by the Franks. During the 18th cent. the scene of many conflicts between the Venetians and Turks. Archaeological excavations have brought to light the Heraeum, or temple of Hera, neolithic pottery, etc.

Argostoli, cap. of Cephalonia, one of the Ionian Is. Pop. 8200. See of the Gk Church. The tn has a fine quay and harbour. There is a curious stream flowing from the sea, which is used to drive mills. Currants, wine, and olive oil are exported. The ruins of the anct Cranii still remain.

Argosy, large ship either for merchandise or war. According to Rycout in *Maxims of Turkish Polity*, chap. xiv, it derived its name from Ragosies, i.e. the ships of Ragusa, but it is more probable that the A. derived its name from the ship *Argo* (q.v.).

Argot, see SLANG.

Argovie, see AARGAU.

Arguin, small Fr. is. off Cape Blanco, Africa. A. Bank is very dangerous for ships, and was the scene of the wreck of the *Medusa*, 1816. A. has been occupied at various times by Portuguese, Dutch, English, and French. Turtle fishing is the main industry, and gum arabic is produced.

Argument: 1. In logic, the middle term in a syllogism.

2. In mathematics, the angle, arc, or other variable quantity upon which the required quantities are made to depend.

3. Term used in astronomy, chiefly to denote the arc measured from the ascending node of a planet, comet, satellite, or any other body in the solar system to its perihelion point. This arc is always measured in the direction in which the body is moving with reference to its primary, i.e. with reference to the sun in the case of a planet or comet and with reference to a planet in the case of its satellite. In these cases it is known as 'the argument of perihelion' and is denoted by the symbol ω .

Argun, riv. in Asia. It rises in the Great Khingan Mts. W. Manchuria, and flows NNE., forming the boundary between Russia and China and joining the Shilka to form the Amur. Length, 440 m.

Argus, mythical son of Arestor, surnamed Pandotes, All-seeing, because he had 100 eyes, of which only 2 slept at a

time. Hera made him guardian of Io (q.v.). Zeus commanded Hermes to lull him to sleep with his flute and kill him. Hera transplanted his eyes to the tail of the peacock.

'Argus,' The, Melbourne, Australian daily morning newspaper estab. 1846, with wide coverage throughout the state of Victoria and Riverina dists. of New South Wales. Politically independent, with staffs in Canberra, Sydney, London, New York, and Paris, and correspondents throughout the world, it brings readers a wide and up-to-the-minute picture of international affairs.

Argus Pheasant, *Argusianus argus*, galliform bird, so called because its long tail-feathers bear ocellated spots. It is a native of the Malay Peninsula and Sumatra.

Argyll, maritime co. in W. Scotland, bounded W. by the Atlantic, N. by Inverness, E. by Perth, Dunbarton, Renfrew, and Ayr, and S. by Bute. A. was the original Scottish kingdom, founded c. AD 500 by the tribe of the Scots who named it Dalriada. The coast is heavily indented, and inland the co. is mountainous. Rainfall is high, ranging from c. 45 in. per annum in the SW. to over 120 in. in the NE. The Inner Hebrides, comprising Mull, Islay, Jura, Tiree, Coll, Colonsay, Iona, and Staffa (qq.v.), and other small islands, are included in the co. The highest peaks are Bidean nam Bian (3766 ft) and Ben Cruachan (3689 ft). The prin. sea-lochs are Sunart, Linnhe, Fyne, and Long, and the fresh-water Loch Awe is the largest inland lake. The Awe and Orchy rivs. are short and rapid. There are many beautiful glens, such as Glens Etive, Strae, Orchy, and Glencoe (notorious for the massacre in 1692). The co. abounds in deer and game; mountaineering, yachting, fishing, ski-ing, deerstalking, and camping are favoured recreations. The prin. industries are agriculture, tourism, forestry, fishing, distilling, and quarrying. Coal is mined near Campbelltown, and there are aluminium works at Kinlochleven. Whisky is distilled in Islay, Campbelltown, and Oban. Oban also manufs. tweed. Boat-building is carried on at Tarbert and Sandbank. In addition there is a seaweed processing industry, and slate, granite, and limestone are quarried. The Forestry Commission holds 384 sq. m. of the co. (116 sq. m. already under forest). A. is the largest sheep-producing co. in Scotland; much stock-rearing is carried on, and there is dairy-farming in Kintyre. Inveraray is the co. tn and seat of the Duke of Argyll who is head of Clan Campbell. The co. returns one member to Parliament. Area 3110 sq. m. (814 sq. m. being island); pop. 63,360.

Argyll, Dukes of. The dukes of A. are descended from the Campbells of Lochaw, who were created barons with the title of Baron Campbell. The earldom was created in 1457 by James I, who conferred it on Lord Campbell (d. 1493), from whom the greatness of the family dates. The 2nd earl was killed at

Flodden, the 3rd earl *d.* in 1530, whilst the 4th earl was the first of the great Scottish nobility to become Protestant. The 5th earl was one of the 'lords of the congregation,' but is later found on the side of Mary Queen of Scots, whose troops he commanded at the battle of Langside. After her defeat he again became friendly with the regent Murray, and ultimately became lord high chancellor of Scotland. He *d.* in 1573. He was succeeded by his half-brother, who *d.* in 1584, and his successor became a Catholic and fought for Philip III.

Archibald Campbell, 8th earl and 1st marquess, *b.* 1598 and succeeded to the control of the estates at an early age. He was thoroughly despotic and was described as the most powerful subject in the kingdom, being at the head of 20,000 retainers. He opposed the church policy of the king (Charles I) in Scotland. He became exceedingly powerful, and in 1640 the king was practically forced to create him a marquess. An attempt was made to kidnap him with 2 other Scottish leaders—the 'Incident' in 1641. He was instrumental in the completion of the alliance between the Parliament and the Scots in 1643. He defeated sev. royalist risings in Scotland; fought a campaign against Montrose in Argyllshire. He was defeated by Montrose at Inverlochy, and also witnessed the victory at Kilsyth. He negotiated with the king after the surrender at Newark, and attempted to moderate the parl. terms. He lost power when the king was beheaded, and although he supported Charles II in his attempt to regain the crown, his power passed to the Hamilton family. For complicity in parl. plots he was executed in 1661. *See* life by J. Willcock, 1903.

Archibald Campbell, 9th earl and 2nd marquess of A., eldest son of the 8th earl and 1st marquess of A., fought at Dunbar on the royalist side. Was omitted from the Act of Grace of 1654, and, although he submitted, was a prisoner from 1657 to 1660. He was raised to favour and high position by Charles II. He refused to sign the new test in 1680, making a special reservation, and was tried for treason and condemned to death 1681. He escaped to Holland, and there agreed to the Monmouth plot, and, crossing to Scotland, tried to raise the Campbells. He failed, and he was captured and beheaded on the old charge of treason 1685.

Archibald Campbell, 1st duke, *d.* 1703, was an active promoter of the revolution of 1688. He organised the massacre of Glencoe, 1692. In 1701 he was created 1st duke.

John Campbell, 2nd duke, one of the great founders of the union of Scotland and England. His services in this respect were recognised by the bestowal of the title of earl of Greenwich. He was a famous soldier, and fought at Oudenarde. Later in the war he took command in Spain. He was deprived of his offices on his return for his outspoken criticism of the ministry. Restored to favour under George I, he was instrumental in putting

down the '15 with so little bloodshed. He *d.* in 1743.

George John Douglas Campbell, 8th duke, *b.* 1823, succeeded his father in 1847. He became a well-known Liberal politician and held sev. ministerial posts. He resigned office (lord privy seal) in 1881 on the question of an Irish Land Bill. He was also an opponent of Irish Home Rule. He *d.* in 1900.

John Douglas Sutherland Campbell, 9th duke, succeeded his father 1900. He married in 1871 H.R.H. the Princess Louise. He was Governor-General of Canada 1878-83. He *d.* in 1914.

Ian Douglas Campbell, 11th duke, succeeded to the title after the death of the 10th duke in 1949.

Argyll and Sutherland Highlanders, The (Princess Louise's). This regiment, which combines the former 91st (Argyll) and 93rd (Sutherland) Foot, raised respectively in 1794 and 1799, was augmented to 27 battalions in the First World War. Its death-roll in the war was 6442. In the heavy fighting round Zonnebeke and Ypres in 1914 the regiment suffered tragic losses near Fromelles (2nd Batt.). It was also conspicuous in the Ypres battles of 1915 (7th Batt.) and at Loos (2nd Batt.). The 1st Batt. was at Salonica in 1916, and in that year the 2nd, 6th, 8th, 10th, and 11th Batts. were all engaged in severe fighting in the Somme battles, notably at Martinpuich and Delville Wood; at Arras in 1917 the 11th Batt. suffered losses, and other battalions were distinguished for their fine resistance at the Hoelx Chemical Works near the Menin Road (May 1917) and especially in the Vaux-Vraumont sector in 1918 (14th Batt.). The battle honours before the First World War included the Cape of Good Hope (1806), sev. battles of the Peninsular war, S. Africa (1846-7, 1851-3), the Crimea, Indian Mutiny, S. Africa (1879), and the Modder R. and Paardeberg. In 1930 H.R.H. Princess Louise became colonel-in-chief of the allied A. & S. H. of Canada. In the Second World War the regiment fought in the Libyan battles, and against the Germans in Greece and NW. Europe. Units of the regiment bore the brunt of some of the heaviest fighting in the Malayan peninsula (1941-2). They entered this battlefield over 800 strong; but after fighting a rearguard action down the entire peninsula they crossed over to Singapore Is. with fewer than 100 men, and these were the last to cross the causeway from Johore to Singapore.

A battalion of the regiment served in Korea.

See Brig.-Gen. A. E. J. Cavendish, *The 93rd Sutherland Highlanders, 1799-1927*, 1928.

Argyrokastro (Albanian *Gjinokastër*), tn in Albania, situated in the valley of the Drino, a branch of the Vjose. It contains a castle, a mosque, and barracks. Taken by Ali Pasha in 1812, it was afterwards surrendered to the Turks. Pop. 11,733. The scene of heavy fighting between the Italians and Greeks in 1941. (*See* WAR, SECOND WORLD, *Fall of Greece*).

Argyropoulos, John (c. 1418-86), Gk

scholar, b. Constantinople. Appointed rector of Padua Univ. about 1435, he returned to his native city in 1441, but died once more to Italy when Constantinople fell to the Turks in 1453. About 1466 he became prof. of Greek in the univ. of Florence and remained there until 1471, when he moved to Rome. Politian and Reuchlin were among his pupils. A. trans. sev. works of Aristotle.

Ari Thorgilsson (1067-1148), commonly called the Learned, Icelandic priest justly described as 'the Father of Icelandic historiography,' being the first to write hist. in the vernacular. His famous *Íslendingabók* (Book of the Icelanders) is a concise survey of the essentials of Icelandic hist. from the beginning down to 1120. The main body of the work is divided into ten chapters: (1) Of the settlement of Iceland. (2) Of the settlers and legislation. (3) Of the estab. of the Althing. (4) Of the calendar (explaining the reform of the Icelandic calendar made in the 10th cent.). (5) Of the div. (of the country) into quarters (for administrative purposes). (6) Of the settlement of Greenland. (7) Of how Christianity came to Iceland. (8) Of foreign bishops. (9 and 10) Of the first native bishops. For almost every statement Ari quotes his source, and such is his accuracy that no statement of his has ever been challenged. Snorri Sturluson (q.v.) pays him a tribute in his preface to *Heimskringla*. In consultation with Sæmundur Sigfusson (q.v.) Ari settled the chronology of the early hist. of Iceland. There are reasons to believe that he may have laid the foundations of the *Landnámabók* (q.v.) and other historical works, but of this we have no absolute proof. Of *Íslendingabók* there is a model Eng. trans. with an introduction by H. Hermannsson (q.v.).

Aria, one of the E. provs. of the ant. Persian empire, forming a part of Ariana (q.v.). It was bounded on the N. by Margiana and Bactriana, on the E. by the Paropamisadae, on the S. by Carmania, and on the W. by Parthia. It was the site of the modern Seistan and the S. part of Khorasan.

Aria, literally 'air,' denoting a rhythmic song as contradistinguished from a recitative, and in the 18th cent. came to imply a vocal piece in 3 sections, of which the third repeats the first, while the second introduces variety of subject-matter, key, and mood, known more exactly as the *da capo* aria. The development of the A. is closely bound up with that of the lt. school of music, as the great medium of vocal display. In principle it existed as early as Monteverdi's *Arianna* (1608) and reaches its more elaborate form in Alessandro Scarlatti and Handel. After Handel's death (1759) and Mozart's youth (1760's) less rigid forms developed, sometimes based on sonata form (Mozart), and later shaped by the dramatic action of an opera (Beethoven, Weber) or oratorio (Mendelssohn). Modern composers using the A. (e.g. Stravinsky) do so as an exercise in archaic formality.

Ariadne, daughter of Minos of Crete by

Pasiphaë, who loved Theseus and gave him the thread by which he escaped from the labyrinth after killing the Minotaur. He married her, but deserted her in Naxos, whence Dionysus carried her off to Zennos and set the crown he gave her among the stars. See J. Pendlebury, *The Archaeology of Crete*, 1939, and L. Cottrell, *The Bull of Minos*, 1955.

Ariana, general name given to the E. provs. of the ant. Persian empire, stretching from Media to the Indus, and bounded on the N. by the Indian Caucasus and on the S. by the Arabian Sea.

Ariana (ant. *Aequum Tuticum*), It. tn in Campania (q.v.), 23 m. NE. of Avellino (q.v.). It was originally a Samnite tn (see SAMNITUM). There is a cathedral. Pop. 10,000.

Arians, see **ARIUS**.

Ariarathes, name of sev. kings of Cappadocia: (1) Son of Ariamnes I, defeated and slain by Perdiccas 322 bc. (2) Son of Heliophanes, and nephew of A. I, became king 315 bc. (3) Son of Ariamnes II, and grandson of No. 2, died 220 bc. (4) Son of No. 3, reigned 220-162 bc; assisted Antiochus the Great against the Romans, and obtained peace in 188. (5) Son of No. 4, surnamed Philopator, reigned 163-130 bc. He was expelled by Demetrius Soter, but was restored by the Romans, whom he helped against Aristonicus of Pergamum. (6) Son of No. 5, reigned 130-96 bc, and was put to death by Mithridates. (7) Son of No. 6, also murdered by Mithridates, who then reigned. (8) Second son of No. 6, was deposed by Mithridates. (9) Son of Ariobarzanes II, reigned 42-36 bc, and was deposed and put to death by Antony, who appointed Archelaus in his stead.

Arias, Montanús (1527-98), Sp. orientalist, b. at Fregenal de la Sierra, in Estremadura; studied at the univs. of Seville and Alcalá, and took orders in 1559. In 1562 he was consulting theologian to the Council of Trent, and in 1571 pub. a commentary on the minor prophets. From 1568 until 1573 he was engaged in editing the Polyglot Bible at Antwerp. In 1575-6 he was acquitted at Rome on a charge of heresy.

Aribert, or **Heribert** (d. 1045), Archbishop of Milan, 1018-45. He was one of the leaders of the Ghibelline party, and in 1026 crowned the Emperor Conrad II, whom he had invited to Italy, as King of Milan.

Arica, seaport tn, cap. of Arica dept, Tarapacá prov., N. Chile, about 40 m. S. of Tacna by rail. A completely rainless district, and seaside resort. It is the prin. port for Bolivia, and exports copper, guano, silver, salt, etc. The tn was the subject of the long dispute between Chile and Peru, which led to mediation by the U.S.A. The settlement, accepted by both countries in May 1929, awarded A. to Chile in return for payment to Peru of a sum of \$1,200,000, and Tacna to Peru. The prosperity of the tn has been diminished by frequent earthquakes, of which the chief occurred in 1868. Pop. 14,000.

Arichat, seaport of Richmond co., Nova Scotia, on Isle Madame. It is the seat

of a Rom. Catholic bishop and possesses a good harbour, from which there is some fishing. Pop. 500.

Aricia, anct. tn of Latium, on the Apian Way, 16 m. SE. of Rome. In 388 BC it was subdued by the Romans, and received the Rom. franchise. In its neighbourhood, beside the Lacus Nemoensis, was a celebrated grove and temple of Diana Aricina, where, until about the 1st cent. AD, there survived a unique relic of barbarian worship. The priest, called *rex nemorensis*, held office until he was slain by a stronger rival. (See Sir J. G. Frazer, *The Golden Bough*, Ch. I.) The Chigi Palace at A. was much damaged by bombs in the Second World War.

Aricina, see ARICIA.

Aricine, see CINCHOVATINE.

Aridaeus, see ARRHIDAEUS.

Ariège, dept. of S. France, formed of parts of the anct. provs. of Languedoc and Gascony, and the co. of Foix. Spurs of the Pyrenees cover a large part of the dept, and there are many fertile valleys. It is watered in the E. by the A., and in the W. by the Salat, both rvs. being tribs. of the Garonne. Grain, vines, vegetables, potatoes, and hemp are produced, and live-stock is raised. Iron, zinc, manganese, and bauxite are mined, and there are chemical, metallurgical, textile, and paper industries. The prin. tns are Foix (the cap.), Pamiers, and St.-Girons (qq.v.). Area 1890 sq. m.; pop. 140,000.

Ariel: 1. Word signifying lion of God or altar of God, is in Isa. xxix. 1 applied to Jerusalem. In later Jewish times the name is given to a water spirit. One of the fallen spirits in *Paradise Lost* bears this name. See also Pope's *Rape of the Lock* and Shakespeare's *Tempest*. In astronomy, one of the satellites (the inmost) of Uranus.

2. Title of internationally influential work by the leading Uruguayan thinker and politician José Enrique Rodó, 1900.

Aries, or the Ram, first sign of the zodiac (q.v.), which the sun enters about 2 Mar. The Gk mythology makes A. the commemoration of the Golden Fleece, in quest of which the Argonautic expedition was undertaken.

Arietta (diminutive of the It. word *aria*), in music, a short air.

Arikara, Caddoan tribe of N. Amer. Indians formerly belonging to the Pawnees. They originally lived on the Missouri, in N. Dakota, existing by hunting, agriculture, and barter with white settlers. They now number a few hundred, and share Fort Berthold Reservation in N. Dakota with the Mandans and Hidatsas. See J. O. Dorsey, *Traditions of the Arikara*, 1904.

Arillus, or Aril, in some plants forms an exterior appendage to the seed. It develops after fertilisation, proceeding from the placenta, and partially invests the seed, after which it falls spontaneously. The mace of the nutmeg and the scarlet covering of the seeds of the climbing bitter-sweet and yew are true A.s.

Arimaspi, mythical Scythians of the E. coast of the Caspian, who were one-eyed,

and waged perpetual war with the griffins for gold washed down by the R. Arimaspius.

Arriobarzanes: 1. The name of kings of Cappadocia: (1) Surnamed Philoromaeus, reigned 93–63 BC, having been chosen by the Romans. During his reign he was sev. times expelled, but was finally restored by Pompey shortly before his death. (2) Surnamed Philopator, succeeded his father, 63 BC, but was assassinated in 51. (3) Surnamed Eusebes and Philoromaeus, succeeded his father in 51 BC, and reigned until 42, when he was slain by Cassius.

2. The name of kings or satraps of Pontus: (1) Who reigned c. 400 BC. (2) Son of Mithridates I, reigned 363–337 BC. He revolted against Artaxerxes in 362. (3) Son of Mithridates III, reigned 266–250 BC.

Arion (c. 625 BC), Gk lyric poet, b. Lesbos, but made his permanent residence at the court of Periander of Corinth. He is said to have given the dithyramb its artistic form. Herodotus tells us that returning to Corinth by sea with much treasure, after a visit to S. Italy and Sicily, the sailors plotted his death. He pleaded permission to play his lute, and then, throwing himself into the sea, escaped on the back of a dolphin whom the melody had attracted. No fragment of his work survives. See A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy*, 1927.

Arioso, vocal or instrumental piece of a recitative character, but of a more melodious kind. Also means the kind of melodic singing suitable for the greater arias.

Ariosti, Attilio (1666–?). It. composer, b. Bologna. He produced operas at Venice and Berlin, and finally in London. He wrote, so far as is known, 22 operas, 5 oratorios, cantatas, and lessons for *viola da gamba*.

Ariosto, Ludovico (1474–1533), described by Hallam as having been, 'after Homer, the favourite poet of Europe,' b. Reggio. For some years he studied law in compliance with his father's will, but his bent from the first was towards literature. His father d. early, and he was forced to enter the household of the Cardinal Ippolito d'Este. His life was busy, for he was perpetually engaged in embassies to Rome and in diplomatic business. Yet he managed in the intervals of business to complete his great work, the *Orlando Furioso*, of which the first ed. in 40 cantos was pub. at Ferrara in 1516. In 1517 he quarrelled with the cardinal, and entered the service of the Duke of Ferrara, Ippolito's brother. His situation was not greatly improved, and in 1521 he was appointed governor of the Garfagnana, where his energies were chiefly devoted to the suppression of bandits and the enforcement of order. He retired some years later, and devoted himself to the final revision of *Orlando*, which appeared in 46 cantos. The delight of the poem is in its harmonious, accurate intricacy, its interrupted climaxes, and surprising confluence of scattered incidents.

The praises of Cardinal Ippolito and the Duke of Ferrara are sung in the comically fulsome asides of the poem, while the cardinal's real meanness and mediocrity are immortalised in the *Epistles*. Next year he d. at Ferrara, where he was buried in the church of San Benedetto. Besides his great work he wrote 5 plays, 7 satires after Horace, some Lat. poems, and a prose dialogue *Erbolale*, on the subject of hygiene, *Rime* (sonnets, etc., and elegies), and a fragment, *Cinque Canti*. His distastes and weaknesses make him the eternal contemporary of Horace and Lamb, for whom, similarly, the stirring events of the times in which they lived were not much more than additional perturbations in the never sufficiently calm tenor of their private life.

The subject of the *Orlando* had already been treated by Pulci in his *Morganle Maggiore*, and by Boiardo in his *Orlando Innamorato*, and of this latter work the *Orlando Furioso* is professedly a continuation. It is the triumph of the half-satiric, fantastic, yet lovely style which Boiardo had hardly attained. What raises A. to the level of the greatest poets is the sustained zest of his execution upon the huge scale he chose for representing his own private world. In A. Croce sees the model It. artist, just as in Cavour he sees the model It. politician. The first complete ed. of *Orlando Furioso* was that pub. in Ferrara in 1532. The ed. of Morali, 1818, follows the text of the 1532 ed. with great correctness. A good modern ed. is that by Papini, pub. in Florence, 1903. The indifferent trans. into English of Sir John Harrington, 1591, and Hoole, 1783, were superseded in 1823 by the spirited rendering of Stewart Rose. See also J. S. Nicholson, *Life and Genius of Ariosto*, 1914; Benedetto Croce, *Ariosto, Shakespeare, and Corneille* (Eng. trans. 1920); W. Binni, *Melodo e poesia di Ludovico Ariosto*, 1947.

Ariovistus, Ger. chieftain who crossed the Rhine in 71 bc at the invitation of the Arverni and Sequani during their struggle with the Aedui for supremacy in Gaul. A., however, tempted by the rich farmlands of Alsace, occupied the country, brought over thousands of his Ger. subjects, and oppressed his former allies. In the summer of 58 bc, after the defeat of the Helvetii, a Gallic council appealed to Julius Caesar, who annihilated the Ger. forces, probably near the R. Fecht. (See *De Bello Gallico*, I.)

Aristaenetus (5th or 6th cent. AD). Gk epistolographer who should be distinguished from A. of Nicaea who perished in the earthquake at Nicomedia in 358. To him are attributed 50 erotic epistles wholly lacking in originality. The text was printed in Hercher's *Epistolographi Graeci*, 1873.

Aristaeus, god worshipped in anct Thessaly, Boeotia, Arcadia, and Thrace. Son of Apollo and the nymph Cyrene, he was educ. by Chiron the centaur. At Thebes he married Autonoe, daughter of Cadmus, and begat Actaeon. A. was the protector of herdsmen and teacher of bee-keeping and olive-tree cultivation.

Aristagoras (d. 497 BC), brother-in-law of Histiaeus, tyrant of Miletus, for whom he acted as regent during the latter's absence at the Persian court. Having fallen in an attack upon Naxos, and thereby fallen into disfavour with the Persians, A. raised the whole of Ionia in revolt (499). He obtained assistance from Athens and burned Sardis; but his troops were driven back to the coast. A. withdrew to Thrace, where he was afterwards killed in an attack on the Edonian city of Ennea Hodoi (later Amphipolis). See G. B. Grundy, *The Great Persian War*, 1901.

Aristarchus, name given to a crater in the NE. quadrant of the moon. It is the brightest object on the moon and is visible as a luminous spot when all the surrounding region is involved in shadow.

Aristarchus of Samos (c. 310–251 BC), Gk astronomer, all of whose works are lost except a short treatise *On the Magnitudes and Distances of the Sun and Moon*. He was the first to assert that the earth revolved about the sun and also rotated on its axis.

Aristarchus of Samothrae (c. 220–143 BC), Gk grammarian and critic. Having settled at Alexandria, he studied under Aristophanes of Byzantium (q.v.), and later succeeded him as keeper of the Alexandrian library. On the accession of Ptolemy Euergetes (145) A. fled to Cyprus where he is said to have d. by voluntary starvation. His enormous output is believed to have included 800 commentaries, chiefly upon the poets; but he is chiefly remembered for his critical ed. of Homer which first divided the *Iliad* and *Odyssey* into 24 books each and was the foundation of all later recensions. See J. E. Sandys, *History of Classical Scholarship*, vol. I, 1921.

Aristaeus, reputed to have been sent by Ptolemy Philadelphus, King of Egypt, to the high priest Eleazar to obtain people to translate the O.T. into Greek. A. is said to have gathered together 72 Jewish translators, who assembled on an is. to carry out the task, which, when finished, was called the Septuagint, i.e. the version of the Seventy. This story is related in the *Epistle of A.*, which is considered spurious and of which the date is uncertain. But see SEPTUAGINT.

Aristias (c. 1798–1884), Gk poet who lived in Wallachia. He is celebrated for his trans. of the *Iliad* into Rumanian verse, and he took an active part in the political movements for the independence of Greece.

Aristides (c. 530–468 BC), surnamed the Just, an Athenian statesman. He was the son of Lysimachus, and came of a well-to-do family. He was one of the 10 *strategoi* at Marathon (490 BC), and persuaded his fellow generals to alter the arrangement that each should lead for 1 day, and to give Miltiades full power. In the next year he was made chief archon, and his zeal for the conservative policy brought him into conflict with Themistocles, the democrat, by whose influence A. was ostracised c. 484 BC. In 480 Xerxes invaded Greece, and Themistocles,

eager to stop dissension, secured the passing of a decree recalling all post-Marathonian exiles. A. profited by this, and did good service at Salamis. In 479 he was re-elected *strategos*, and shared with the Spartan Pausanias the glory of the victory at Plataea. He later took the lead in the formation of the Delian league. A. d. poor, and his family were compelled to accept pensions from the State.

Aristides, Aelius (c. AD 120-89), sur-named Theodorus, Gk sophist and rhetorician. He was the son of Eudaemon, and studied under Polemon of Smyrna and Herodes Atticus. After many travels he settled at Smyrna. Prior to this he had been troubled by illness for 13 years, but this did not hinder him from the pursuit of his studies. In 178, when Smyrna had been destroyed by an earthquake, he secured from the Emperor Marcus Aurelius its rebuilding at the imperial expense. Fifty-five of his speeches are extant, as also certain other works. Prin. ed. W. Dindorf (3 vols.), 1929. See A. Boulanger, *Aelius Aristide*, 1923.

Aristides, Quintilianus (3rd cent. AD), Gk author of an important treatise on music, which was first printed by Meibomius in 1652.

Aristides of Thebes, Gk painter and contemporary of Apelles. According to Pliny, he was the first to try to give expression to his characters. His best-known picture was one of a child approaching his mother, who lay wounded and dying in the midst of a sacked city.

Aristion, see **ATHENION**.

Aristippus (fl. 4th cent. BC), Gk philosopher, founder of the Cyrenaic or Hedonist school (see **CYRENAICS**), b. Cyrene. He was a pupil of Socrates, whose philosophy, however, he debased, making pleasure the final aim of life. He lived, therefore, the life of a philosophic voluptuary, while at the same time retaining restraint over his passions. He passed much of his life at Syracuse at the court of Dionysius, and lived some time at Corinth in intimacy with the famous courtesan, Lais. His doctrines were taught after his death by his daughter Arete, and later by her son, A. the younger.

Aristobulus of Cassandria (4th cent. BC), Gk historian who accompanied Alexander the Great on his campaigns, and later wrote an account of them. Arrian made considerable use of his works.

Aristocracy, theoretically a form of gov. administered by the best citizens (Gk *aristos*, best). In practice gov. by the nobility. See **GOVERNMENT** and **OLIGARCHY**.

Aristodemus (8th cent. BC), King of Messenia, who waged a 20 years' war for independence against the Spartans. He committed suicide in despair of final success, on the receipt of unfavourable oracles.

Aristogiton (6th cent. BC), noble Athenian who, together with Harmodius, plotted the death of the tyrant Hippias and his brother Hipparchus. Hipparchus was murdered at the Panathenaic festival, 514 BC. Harmodius was immediately killed. A. escaped but was afterwards taken and

put to death by Hippias. Four years afterwards Hippias was expelled, and Harmodius and A. were regarded as martyrs, bronze statues being erected to them in Athens. According to Thucydides and Herodotus (vi. 123), the plot arose out of a private quarrel, and was not undertaken in the cause of liberty.

Aristolochia, family *Aristolochiaceae*, genus mostly of shrubs, often climbing, of temperate and warm regions; with pungent aromatic roots, and tubular flowers. *A. clematitis*, Birthwort, is cultivated as a medicinal plant, and is naturalised in Britain. *A. macrophylla* (synonym *sipho*), Dutchman's Pipe, is a popular N. Amer. garden climber.

Aristomenes (7th cent. BC), Messenian general who led his countrymen in the second Messenian war. After a number of daring attempts and brilliant successes he was betrayed by Aristocrates of Arcadia (668), and fled to Rhodes, where he d.

Aristophanes (c. 444-c. 380 BC), the most renowned of the Gk comic dramatists, probably b. at Athens, where he spent his life. His education was of the best, and he favoured throughout the aristocratic and conservative party. His production began early, and altogether 54 comedies are ascribed to him, of which 11 only are extant. These comedies fall into 3 well-defined periods, the first extending from 427 to 421 BC, the second to 405, the last to 388. His early plays show unrestrained political satire, the second period shows more restraint, and in the plays of the third period the satire is chiefly social. His extant plays of the first period are 5. *The Acharnians* (425) seeks to aid the peace party by drawing the contrast between Lamachus the warlike and Dicaeopolis, an honest countryman, who makes peace with Sparta on his own account, and on whom all blessings are showered. *The Knights* (424) is a vigorous attack on Cleon, who for a while beguiles the populace represented under the name of Demos. Demos is finally rescued and his youth restored. *The Clouds* (423) satirises the Sophists and especially Socrates, the proprietor of a 'thinking shop' where all dishonesty is taught. Alcibiades is represented under the name of Pheidippides, the young Athenian. In *The Wasps* (422) A. ridicules the Athenian love of law-suits, and in *The Peace* (421) he continues the theme of the Acharnians, advocating once again a truce with Sparta. To the second period belong 4 plays. In *The Birds* (414) 2 old Athenians leave the town and persuade the birds to build in mid air the city of Cloud-Cuckoo-town. The gods are thus cut off from the sacrifice of men, and the sceptre is regained from Zeus. Some have seen in this play an allusion to the Sicilian expedition. *Lysistrata* (411) shows the women taking the affair into their own hands and making peace. *The Thesmophoriazuses* (411) contains an attack on the tragic poet Euripides. *The Frogs* (405) continues this literary satire. Dionysus is sent to Hades to fetch a poet, Aeschylus and Euripides having just died.

These two contend for the throne of tragedy, which is finally won by Aeschylus. In *The Ecclesiazusae* (392 or 389 bc) the dramatist ridicules the mania for communism, while *Plutus* (388) is merely a moral allegory. The works of A. are characterised by wit and hearty humour, by a perfect agreement of matter and form, and by exquisite lyric quality.

Museum

ARISTOPHANES

The best text is that ed. by V. Coulon and H. van Daele (with Fr. trans., 5 vols., 1923-30). There is an Eng. ed. with commentary and trans. by Benjamin Bickley Rogers (11 vols., 1875-1947). Frere's trans. is pub. in Everyman's Library. See G. Murray, *Aristophanes*, 1933, and V. Ehrenberg, *The People of Aristophanes* (2nd ed.), 1951.

Aristophanes of Byzantium (c. 257-c. 183 bc), Gk scholar. He studied at Alexandria under Zenodotus and Callimachus, and was appointed head of the Museum Library c. 187 bc. His works included eds. of Homer and other poets; his arguments to the plays of Aristophanes and the tragedians are in large part preserved. A. also did valuable work as a lexicographer and grammarian, and introduced critical signs. See A. Nauck, *Aristophanes Byzantii Grammatici Fragmenta*, 1848, and J. E. Sandys, *History of Classical Scholarship*, vol. i, Ch. VIII (3rd ed.), 1921.

Aristotelia, 'those things pertaining to Aristotle.' See ARISTOTELÆ.

Aristotle (384-322 bc), Gk philosopher and scientist, b. Stagira (modern Stavro) in Chalcidice, whence he is often called 'the Stagirite.' His father, Nicomachus, was a member of the Asclepiad guild and physician to Amyntas II of Macedonia.

His mother's name was Phaestis. In his eighteenth year A. entered the school of Plato (the Academy) at Athens, and immediately came under that influence which is manifest in all his writings, even when he disagrees with his master. So outstanding was his ability that Plato spoke of him as 'the reader' and 'the mind of the school.' A. remained at the Academy for 20 years, partly as a pupil, but partly also engaged in independent studies and (probably) in the composition of some of his lost works. Further, in this period some of his extant writings seem to have been begun. When Plato d. in 347 he was succeeded as head of the Academy by his nephew Speusippus, who represented a trend of Platonism which A. could not accept. A. therefore, together with his fellow student Xenocrates, emigrated to the court of Hermias, ruler of Atarneus and Assos in Mysia, where he became the leading figure of a philosophic circle, and married Pythias, niece of Hermias, who bore him a daughter. At the end of 3 years he moved to Mitylene in Lesbos, but in 343-342 accepted an invitation from Philip II of Macedon to undertake the education of Alexander who was then 13 years old. In 335-334, soon after his pupil's accession to the throne, A. returned to Athens, where he rented some buildings and founded his school (the Lyceum) in a grove sacred to Apollo Lyceus and the Muses, between Mt Lycabettus and the Ilissus. Here each morning he walked up and down (hence the name Peripatetic), discussing logic, physics, and metaphysics; and in the afternoon or evening lectured indoors to a larger audience upon less abstract subjects. On the death of Alexander, in 323, the hostility of the anti-Macedonian party resulted in a charge of impiety against A., on the absurd grounds that he had deified Hermias in a hymn and an epitaph. A. thereupon withdrew to Chalcis in Euboea, a stronghold of Macedonian influence, where he d. His will has been preserved by Diogenes Laertius: it affords evidence of a grateful and affectionate nature. Soon after A.'s return to Athens his wife d., and he entered into a permanent union with Herpyllis, a native of Stagira, who bore him a son, Nicomachus.

His writings have unfortunately come down to us in a very confused form. It is certain that many of those attributed to him are not genuine, and the condition of the authentic works is far from satisfactory. The language of most of them is abrupt, and conversational promises are made and then forgotten; there are sudden breaks in the thread of the argument; sometimes they are redundant, sometimes inconsistent. In a word, it is evident that these writings, which have so profoundly affected the thought of all succeeding ages, were neither completed nor arranged by the writer himself. It has, indeed, been suggested that they are nothing more than the notes taken down by his scholars from dictation, and afterwards ed. by them. This hypothesis is refuted both by the extreme compression of parts of the works and by the fact that it is now

generally agreed that the works as we have them are, in the main, the unfinished notes and discourses of A. himself. Much of their disconnectedness may be attributed to the length of time over which their composition was probably spread, and to the development of his theories during this time. Strabo, the geographer, relates that on the death of A. his library, after passing through many hands, came into the possession of Andronicus of Rhodes, and became the basis of his ed. of the works prepared c. 70 BC.

The surviving authentic works are as follows: (1) *Organon*, comprising *Categoriae* (less certain parts), on the 10 classes of predicates; *De Interpretatione*, on language, dealing with the proposition and its parts; *Analytica Priora*, in 2 books, dealing with the syllogism; *Analytica Posteriora*, in 2 books, dealing with the method of scientific demonstration; *Topica*, on dialectical syllogism and reasoning from probabilities; *Sophistici Elenchi*, on the fallacies of which the sophists made use, their refutation and their solution. (2) Physical treatises: *Physics*, *De Caelo*, *De Generatione et Corruptione*, *Meteorologica*. (3) Psychology: *De Anima*, *Parva Naturalia* (*De Sensu et Sensibili*, *De Memoria et Reminiscencia*, *De Somno*, *De Somniis*, *De Divinatione per Somnum*, *De Longitudine et Brevitate Vitae*, *De Vita et Morte*, *De Respiratione*). (4) Biology: *Historia Animalium* (less certain parts), *De Partibus Animalium*, *De Motu Animalium*, *De Incessu Animalium*, *De Generatione Animalium*. (5) *Metaphysics*. (6) *Ethics*: *Ethica Eudemia*, *Ethica Nicomachea*. (7) *Politics*: *Politica*, *Athenaion Politeia*. (8) *Rhetoric*. (9) *Poetics* (a fragment).

Aristotle's Philosophy. Though A. never allows us to forget the great degree in which he differed from his master Plato, yet it is important to remember that he can always in his earlier period speak of the Platonic tenets as those which *we* hold. In fact, A. was probably much more in sympathy with Plato than were his immediate successors at the Academy. Yet their difference as to the attitude of inquiry was fundamental, and may thus be briefly put: Plato takes his departure from the eternal, from the universal form; A. from the actual world of nature, from the individual substance. Plato was a poet and an idealist; A., though possessing a great range of interest, is fundamentally a man of science. Their points of agreement and difference are well shown in the *Metaphysics*, where we see that whereas Plato finds reality only in the universal 'idea,' A. seeks it in the individual things, which he defines as a combination of the universal form and matter. Yet both agree that the reality or essence of the thing lies in the idea. But a more important divergence is in A.'s criticism of the Platonic 'ideas' as being only potential and not actual causes of the phenomena of the world. Hence is elaborated the famous doctrine of the 4 causes which combine to produce any individual object, and which give 4 lines of inquiry when investigating it. These are: (1) the material

cause, or the material conditions of its existence; (2) the essential or formal cause, giving its essential character and realisation; (3) the efficient cause, through the agency of which it comes into being; (4) the final cause, giving the end or result attained by it. But the work deals also with theology, and A. expressly speaks of the prime and unmoved movement of the earthly and heavenly bodies as God. His language on the subject is simple, and perfectly clear. God is the supreme excellence, more excellent than anything that we can attain to. He is perfect, with eternal and continuous life. The philosopher then explains the anthropomorphic mythology of the time as accretions which have been added for the use of the vulgar to the original conception of a single divinity investing the whole of nature. There are many omissions in the scheme of metaphysics, and difficulties are multiplied by the fact that A. had to invent many of his technical terms and that he did not always use them in the same sense. The invention of logic was, perhaps, the prin. work of A. He regarded it as no true part of philosophy, but as its handmaid or instrument, and hence the name *Organon* given to the group of treatises on the subject. Even this name was given it by the later Peripatetics. The founder of logic himself gave it no name, neither subdividing the subject nor combining it into a system. It is noteworthy, too, that in his classification of the sciences he gave no place to this one of his own evolution.

A.'s scientific treatises have long since fulfilled their purpose. His researches show insight, observation, and knowledge; but their intrinsic value was never great, and in later ages they showed signs of becoming a positive hindrance to progress through the reverence felt for his great name.

The metaphysical and physical philosophy, together with the logical treatises, were grouped together by the author as speculative science; while practical philosophy comprised the *Ethics*, *Politics*, and treatises on Art. The *Politics* are the application to the state of the principles which had been applied to the individual in the *Ethics*. Briefly, they consist of the old question: 'What is man's greatest good, and how can it be realised?' There are various degrees of goodness, of which the chief are theoretical wisdom, which is the highest, practical goodness, and goodness of character. The first of these is the contemplation and comprehension of the loftiest principle of the universe. Practical goodness consists in the carrying out of the moral virtues. Goodness of character is the habit of mind which enables a man to choose the mean between extremes of extravagance. These last 2 forms of goodness should not be neglected by the philosopher, but should be developed at the same time as the highest. Since, however, reason is obviously the highest faculty of the soul, being, in fact, the one thing which differentiates man from the other organic bodies and approximates him to God, it should receive the

supreme place. In the *Politics* the subjects dealt with are the good of the individual citizen, which should consist in the happiness of virtuous action, and the good of the state. Right govts., then, are those which aim at the general good, and they may be either: (1) *Monarchies*, the rule of one man excelling in virtue; (2) *Aristocracies*, the rule of a class excelling in virtue; or (3) *Commonwealths*, the rule of the many who excel in virtue. On the other hand, the wrong govts. are perversions of these 3 forms. A wrong gov. may be: (1) a *Democracy*, aiming merely at the good of the majority; (2) an *Oligarchy*, aiming at the good of the few; or (3) a *Tyranny*, aiming at the good of one man. All these last are distinguished by the fact that their aim is the benefit of the ruling body rather than that of the whole community. Last to be considered are the 2 works in which the art of production is dealt with, the *Rhetoric* and the *Poetics*. The first is a treatise on the art of persuasion, and its influence has been almost nil. In the *Poetics* A. shows himself a literary critic of the first order. After a subdivision of the kinds of poetry, he deals at length with tragedy, which, he says, 'by raising pity and fear, purges the mind of these passions.' Perhaps no literary judgment has given rise to more controversy as to its meaning, controversy which is not yet ended. From the commentators on this work, and not from the work itself, is gathered the famous theory of the 3 unities which was so long attributed to A. himself. Misunderstanding though it was, it has influenced the whole course of European drama. Not until the Middle Ages did the period of A.'s greatness begin, and then he was known only in Arabian trans. From the trans. of Avicenna and Averroes his philosophy was taken up by the schoolmen, and made the framework in which to arrange the theology of the Christian Church. His writings were generally received as the summary of sciences, and as such they were taken up and reconciled with Catholic dogmas, which his philosophy was used to express, by the great St Thomas of Aquinas. With the Renaissance came a natural reaction, but even here the philosopher himself recovered rather than lost prestige. His works were studied in the original, and many of the errors of his commentators removed.

The standard ed. of the complete works (including those now recognised as spurious) is that of I. Bekker and others (5 vols.), 1831-70. See also *The Works of Aristotle Translated into English* (ed. J. A. Smith and W. D. Ross). There are also trans. of the *Metaphysics*, *Nicomachean Ethics*, *Politics*, and *Athenian Constitution*, and *Poetics* in Everyman's Library. See W. D. Ross, *Aristotle* (2nd ed.), 1930. and W. Jaeger, *Aristotle* (trans.), 1934.

Aristotle's Lantern, jaw apparatus in the sea-urchin, consisting of 5 hard pointed teeth in sockets formed by 5 ossicles. The teeth protrude through the mouth membrane and are actuated by muscles that enable them to be drawn

together or apart, inwards or outwards. The animal is thus enabled to scrape algae and seaweeds from the rocks to feed itself.

Aristoxenus, Gk philosopher, b. Tarentum c. 370 BC, a pupil of Aristotle. Three books of his *Harmonics* and part of his *Elements of Rhythm* are extant. There is an ed. with trans. and commentary by H. S. Macran, 1902.

Arita, tn of Sagakan, Japan, on the is. of Kiusiu. It is famous for the manuf. and export of porcelain. Pop. about 13,000.

Arithmetic, that branch of mathematics which treats of numbers. The study of A. is included in every scheme of education, mainly on account of its bearing on the practical side of everyday life. Measurement and the calculation of money values are dependent on some theory of number, and it is difficult to realise what we owe to the system of numeration by local value which we have adopted from the Hindus. The Greeks and Romans used clumsy symbols, and some idea may be formed of the difficulty of calculating in such symbols by attempting, say, to multiply CLIX by MDIV without using the decimal notation. The Hindu, or, as it is commonly called, the Arabic, system was introduced into Europe in the 11th cent., the double rule of 3 or compound proportion was introduced in the 16th, and in the next cent. Napier of Merchiston invented his system of logarithms, since when there has been little advance in the rules of A. proper.

A. as usually taught in schools consists of the consideration of the 4 elementary operations: addition, subtraction, multiplication, and div.; the application of those rules to measures of length, weight, money, etc.; the splitting up of numbers into factors, leading to the determination of least common multiple and greatest common measure; the system of fractions, vulgar and decimal, and its application to the determination of values by what is called practice; and the rule of 3, or proportion. An attempt is usually made to introduce ideas relating to commercial life by calculations on imaginary transactions involving percentages, interest, simple and compound, stock investments, bill discounting, etc., but sometimes this is relegated to what is called commercial A.

The value of A. as a school subject is threefold: it serves to equip the pupil for carrying on business involving quantities and values, it has a disciplinary or purely educational effect on the mind, as its processes illustrate the methods of reasoning, and it serves as an introductory step to the study of mathematics generally, which in its turn has its educational and purely utilitarian values. The disciplinary value depends mainly upon the methods of teaching, but the practical utility of A. depends upon the ease, accuracy, and rapidity with which the simpler relations of addition and multiplication can be recollected. It is customary and necessary for the addition of all pairs of numbers up to 10, and the multiplication of all pairs of numbers up to 10 or 12, to be learned 'by heart': that is, there should be no necessity to call up any

mental image of the quantities involved in the addition or multiplication; 7 times 9, for instance, should suggest 63 with certainty at once.

Text-books are numerous, and the number increases yearly, but the following may be referred to as being of general interest: F. A. Yeldham, *The Story of Reckoning in the Middle Ages*, 1926; L. T. Hogben, *Mathematics for the Million*, 1936; C. V. Durrell, *General Arithmetic for Schools*, 1936; R. T. Hughes, *Arithmetic*, 1939 (more advanced).

Arithmetical Complement of a number is the difference between that number and the next highest power of 10, e.g. the A. C. of 6 is $10 - 6 = 4$; of 49 is $100 - 49 = 51$; and of 7642 is $10,000 - 7642 = 2358$.

Arithmetical Mean, see MEAN.

Arithmetical Progression is a series of numbers which increase or decrease by a common difference, such as 2, 4, 6, 8, 10, 12, or 25, 20, 15, 10, 5. If a denote the first term, l the last term, d the common difference, and n the number of terms, then $l = a + d(n - 1)$ and the sum of all the terms $= \frac{(a + l)n}{2} = \frac{n[2a + d(n - 1)]}{2}$, obtained by substituting $a + d(n - 1)$ for l . See also MEAN.

Arius (c. 256-336), originator of the Arian heresy, b. Libyn, became one of the chief figures of the first great controversy in the Church. He went to Alexandria, and was there ordained deacon. In the Meletian schism he sided with Meletius and suffered excommunication; but later repented and was received back into the Church by Achillas, Bishop of Alexandria, who then ordained him priest, and gave him charge of one of the city churches. So great was the repute of A. that on the death of Achillas he expected to receive the see, but Alexander was chosen. When quite an old man, about the year 321, A. first broached his heresy, which in a less developed form had long been current at Antioch, where he had received his education. He denied that the Son was consubstantial (q.v.) with the Father, though affirming that He was begotten before time, and that by Him the Father created all things. A.'s aim was to prevent the idea of there being 2 Gods; and to avoid this he described the Son as a created Being, though far surpassing all others. Alexander excommunicated him, but he refused to give way, and sought help throughout N. Africa. Alexander also sent a circular letter to the bishops informing them of the course of events. Many favoured A., and the chief of his supporters were Eusebius, Bishop of Nicomedia (q.v.), who had been his fellow student at Antioch. A. was a skilled propagandist, and in his *Thalia* he explained his doctrines in verse set to music which was soon sung throughout the land. The controversy soon reached Rome, and Constantine, failing to realise the importance of the dogma in debate, made efforts for a compromise. This failing, he called the first oecumenical council at Nicæa in 325. Athanasius (q.v.), deacon

of Alexandria, was the chief exponent of the orthodox view, which insisted that the Son was 'of the same substance' (*homoousios*) with the Father, and round this word the battle raged. A. was condemned, and, with 2 bishops who supported him, banished to Illyria, while the orthodox creed was promulgated. The continued support of Eusebius of Nicomedia secured the recall of A. in 330, and he secured the ear of the emperor. Constantine, finding it impossible to compel Athanasius, now Bishop of Alexandria, to reinstate the heretic, banished the prelate to Gaul in 335. At last, in 336, Alexander, Bishop of Constantinople, was persuaded to consent reluctantly to admit A. to communion, but before this was done the latter was taken suddenly ill, and within a few hours was dead. Arianism became practically extinct in the empire before the end of the 4th cent. For a couple of cents. longer it lingered among the Goths and other Teutonic tribes who had received Christianity from Arian missionaries, chief of whom was Ulfilas.

Arizona (Indian Sp., meaning 'few springs' or 'dry belt'), state of the Union, N. America, situated between Utah on the N., New Mexico on the E., and Nevada on the W. It is known as the 'Valentine State.' It ranks fifth among the U.S.A., with a gross area of 113,999 sq. m., 329 sq. m. of this being water. The state is divided diagonally into 2 parts by the Mexican Cordillera. The N. region consists of a plateau, broken by high mts, which in the San Francisco Range attain a height of over 12,700 ft. In the S. and SW. are wide, desert plains watered by the Salt and Gila R.s. The Colorado and its trib., the Little Colorado water the NW. region. The ann. precipitation ranges from 1 to 10 in. In the W. and from 10 to 25 in. in the E. Few crops are grown without irrigation in the lowlands, the climate being dry and clear, suitable for astronomical observations, and the soil unproductive. Sev. large reservoirs have been constructed, the most notable being the Roosevelt, Coolidge, and Horse Mesa dams. The Yuma project for tapping the lower Colorado has recently been completed. It is a reclaimed section (96,000 ac.) receiving water from the All-Amer. Canal. Projects have also been made for supplying water for electrical power to the state copper mines. The most important crop is cotton, but wheat, barley, corn, etc., and semi-tropical fruit are also cultivated. Cattle and sheep are reared on the pasture lands, and the forests (13,668,000 ac.) provide good timber. The state is rich in mineral deposits, the greatest output being in copper, gold, silver, lead, and zinc, while granite, limestone, asbestos, molybdenum, tungsten, manganese, helium, and quicksilver are also worked in the state. The chief industry is the smelting and refining of copper. Lumbering, meat packing, food processing, cotton ginning, flour milling, and tanning are also important. A state univ. was founded at Tucson in 1891. There is also at Tucson a state agric. school. Enormous subterranean

caves, rivalling the Mammoth Caves of Kentucky, were discovered in 1909. The country was discovered by Marcos de Niza, a Spaniard, in 1539, rumours of its wealth having reached Spain through the explorer, de Vaca. In the following year Vasquez de Coronado explored the country, but the earliest settlements were made by Sp. missionaries at Tucson and Tubac about 1772. A. remained under the influence of Spain till 1821, when it achieved its independence. In 1848 it was ceded to the U.S.A., and was organised as a ter. in 1863, becoming a state of the Union on 14 Feb. 1912. In Congress A. is represented by 2 members of the lower House and 2 senators. In 1950 the pop. was 749,587. There are still 55,000 Indians. Pop. of Phoenix (cap.), 106,818; Tucson, 45,454; Flagstaff, 7663.

Ark of Noah, see FLOOD.

Ark of the Covenant, sacred chest of shittim (acacia) wood borne by the Israelites in the journey in the desert. It contained the 2 tablets of the law (Deut. x. 2) and was a focus of the Divine presence. It figured at the taking of Jericho, where it was borne, as was the rule, by the Levites. It was kept at Shiloh until captured by the Philistines and set up in the temple of Ashdod. Finally it found its resting-place in the temple of Solomon, until the fall of Jerusalem in 587 when (according to 2 Macc. 2) Jeremiah hid it in a cave until God should gather his people again. In post-exilic and N.T. times it no longer existed (Heb. ix. 5).

'Ark Royal', Brit. aircraft carrier, commissioned in 1939. Standard displacement 22,000 tons; main armament, 16 4.5-in. guns; h.p. 102,000; maximum speed, 30.75 knots. She was the third of her name in the annals of the R.N., and, in her record, a worthy successor to the first, the ship of 800 tons burthen which bore the Lord Admiral's flag in the fleet which defeated the Sp. Armada in 1588. She was torpedoed by a Ger. submarine in the W. Mediterranean near Gibraltar at about 6.30 p.m. on 12 Nov. 1941, and sank some 12 hrs later with the loss of only 1 man. Throughout her 2 years of service in the Second World War no ship was so frequently 'sunk' by enemy propagandists as was the *A. R.*, yet in fact, beyond a few scratches by splinters of bombs which fell in the sea, she suffered no damage in action until hit by a torpedo and sunk. Earlier in the war the *A. R.* disconcerted the enemy by appearing at Cape Town in search of the *Graf Spee*. It was her aircraft which ensured the destruction of the *Bismarck* (q.v.) in May 1941. Many ships of the It. Navy bore scars from the blows of her bombers, as did numerous bombers and reconnaissance craft of the *Regia Aeronautica*. Altogether some 67 It. aircraft fell victim to those of *A. R.*

A further carrier was later named *A. R. Arkansas*, S. central state of the U.S.A., bounded on the N. by Missouri, E. by Tennessee and Mississippi, S. by Louisiana and Texas, and W. by Oklahoma. The surface of the state is very varied. It

may be divided about equally into the NW. highland div. and the SE. lowland div. Out of the broad alluvial bottoms of low elevation which border the Mississippi R. and its chief W. trib. rise the Coastal Plains, which extend NW. to the Boston Mts belonging to the Ozark Uplift. The Mississippi forms the E. border, while its trib., the Arkansas, bisects the state from W. to E. Other important rivs. include the St Francis and White R.s to the N., and the Saline, Ouachita, and Red R.s to the S. The climate is pleasant and healthy, except in the malarial swampy dist. of the E. The normal rainfall is from 45 to 55 in., but even this is not sufficient for the rice-fields, which have to be flooded through artificial means. The chief product is cotton. Irrigation has made rice-growing an important industry, and much fruit is grown, also oats, hay, rice, and soya-beans. It is the only state in which diamonds have been found. Over a million tons of coal are raised annually, and upwards of 25,000,000 barrels of petroleum. Bauxite deposits give the U.S.A. 90 per cent of its supply. Lumber and timber products hold the first place in industry. There are good railroads, except in the mountainous dists. of the N. and W., the chief being those which connect the cities of the N.-central states with the Gulf cities of the S. There are natural hot springs, world-famed as a cure for rheumatism and kindred ills, and the tn of Hot Springs has sprung up beside them. A. was visited by the Spaniard, de Soto, in 1541, but the first settlement was made by Frenchmen at A. Post in 1686. The Mississippi was explored further by Marquette and Joliet (1673) and La Salle (1682), and the ter., after passing through Fr. and Sp. hands, was purchased by the U.S.A. in 1803. A. was made a ter. in 1819 and admitted as a state into the Union in 1836. Area 52,725 sq. m. One-fourth of the pop. is Negro. Pop. 1,909,511. The chief cities are Little Rock, the cap., 102,200; Fort Smith, 47,942; Texarkana, 40,628; Pine Bluff, 37,000; Hot Springs, 29,300; El Dorado, 23,706.

Arkansas River, after the Missouri the largest trib. of the Mississippi, rises in the mts of central Colorado, and flows SSE. and E. to Pueblo, Colorado (the Royal Gorge, 1050 ft deep, is here), E. to Hutchinson, Kansas, and SE. to the Mississippi 35 m. SE. of Pine Bluff, Arkansas. The flow varies greatly, and disastrous floods have occurred. Along much of the lower course there are levees. Length 1450 m.

Arkeeko, seaport on the W. coast of the Red Sea, 3 m. S. of Massawa.

Arklow, seaport tn and resort of co. Wicklow, Rep. of I., at the mouth of the R. Avoca, the Vale of which is famous for its scenery. There is a tradition that St Patrick landed there. A. was stormed by Cromwell in 1649, and in 1798 was the scene of sanguinary conflict between the Eng. soldiery and the United Irishmen, whose leader, Father Murphy, was killed there. Shelton Abbey mansion (2 m.), once the seat of the Earl of Wicklow, is

now a state forestry centre. Industries include shipbuilding, pottery, chocolate making, paint manuf., and fur dressing and dyeing. Pop. 5200.

Arkona, the NE. promontory of the Ger. Is. of Rügen (q.v.), in the Baltic Sea. On its summit is a lighthouse whose light is visible for 35 m., and on the W. are the ruins of the temple of the Wend deity, Svantevit.

Arkwright, Sir Richard (1732-92), inventor of cotton-spinning machinery, b. Preston, Lancs, the youngest of 13 children. His parents were poor, and he was early apprenticed to a barber. He estab. himself in this occupation at Bolton in 1750, where his profits were increased by his invention of a special method of dyeing

came to England in 1721. In London he painted the miniatures of the Pretender's sister and of the Duke of Marlborough. He bequeathed many books and curios to the library at Geneva.

Arlberg, mt mass in the Alps between the Austrian provs. of Tirol and Vorarlberg. These provs. are connected by the A. Pass, 5300 ft high; a railway tunnel (highest point 4300 ft) 6720 yds long has been in use since 1884.

Arlen, Michael (1895-1956), novelist, b. Rustchuk, Bulgaria, of Armenian parents. His original name was Dikrân Kouyoumdjian, but he changed it when he became a naturalised Brit. subject in 1922. Educ. at Malvern College, in 1920 he pub. *The London Venture*, and 2 years

THE AMPHITHEATRE, ARLES

human hair. He also gave himself to the study of the cotton machinery, but, as he had little mechanical skill, he secured the assistance of John Kay, a watchmaker of Warrington, in the carrying out of his designs. About 1767 he seems to have invented his celebrated *spinning-frame*, of which the chief value was its provision of the warp, which Hargreaves's spinning-jenny had been unable to supply. In 1769 he took out a patent for this, and erected his first mill at Nottingham. In 1771, with Jedediah Strutt and Samuel Need as partners, he built larger factories at Cromford, in Derbyshire. In 1775 he took out a fresh patent for further improvements, but these patents were continuously infringed on all sides, and in 1781 he took action in the courts. Public opinion, however, was inimical to him, and the verdict was unsatisfactory. The working classes hated him as a labour-saver, but his common sense enabled him to amass a fairly large fortune.

Arlaud, Jacques Antoine (1668-1743), miniature painter, b. and d. Geneva. He was held in great reputation in Paris, and

later his *Piracy* obtained favourable notice. Other books of his are *These Charming People*, 1923; *The Green Hat*, 1924, which brought him a fortune; *May Fair*, 1925; *Lily Christine*, 1928; *Young Men in Love*, 1929; *Babes in the World*, 1930; *Men Dislike Women*, 1931; *Hell! Said the Duchess*, 1934; *Flying Dutchman*, 1939.

Aries, Fr. tn, cap. of an arron., in the dept of Bouches-du-Rhône. It is on the A. canal, at the head of the Rhône (q.v.) delta. Originally a Gk., and later a Rom., settlement, A. became in the 4th cent. the chief city of Gallia (q.v.). At the beginning of the 10th cent. it became the cap. of the kingdom of A., which was formed from the anct kingdoms of Provence and Burgundy (qq.v.). In 1378 it passed to the Dauphin, afterwards Charles VI (q.v.). During the Second World War the in suffered some damage from air-raids. The picturesque, narrow, winding streets of A. are famous, and there are remarkable Rom. remains, including an amphitheatre, an aqueduct, and baths. The Romanesque-Provençal

church of St Trophime (formerly an archiepiscopal cathedral) has fine cloisters and a notable 12th-cent. portal. There are important museums, containing collections of pagan and Christian sarcophagi. In modern times the town has been celebrated for its connection with Van Gogh (q.v.). There are manufs. of sausages, machinery, and cement, and there is a trade in fruit and wine. Pop. 20,200.

Arlincourt, Charles Victor Prévôt (1789-1856), Fr. author, b. at the castle of Merantris, near Versailles. He held sev. gov. positions, but soon retired and gave his time to literature. Among his works are *La Caroleide*, a poem; *Le Siège de Paris*, a tragedy; and sev. novels in the style of Ann Radcliffe.

Arling, old name for the bird wheat-eat.
Arlington, Henry Bennet, Earl of (1618-1685), politician, b. Arlington, Middx. and educ. at Westminster School and Christ Church, Oxford. He fought for the Royalists and was wounded in the Civil war, and was employed afterwards by Charles as his agent at Madrid. Returning to England at the Restoration, he became a member of the 'Cabal'; he was created Lord A. in 1663, and Earl of A. in 1672. He was unsuccessfully impeached as a promoter of popery, a self-aggrandiser, and a betrayer of trust in 1674, and subsequently retired from politics.

Arlington: I. Town in Massachusetts, U.S.A. It manufs. textile machinery, wood products, and leather goods, and has an agric. trade (truck products, celery, dairy-ing). Pop. 14,453.

2. Co. in Virginia. On the heights across from Washington is situated the most famous of Amer. national cemeteries. The building and grounds were once part of the estates of the Lee and Custis families. The grounds were taken over by the Federal Gov. Here lie buried over 33,000 soldiers, among whom are many of the famous Federal officers of the Civil war. The body of the unknown soldier lies here in a splendid monument. In the co. are also U.S. Fort Myer, the National Airport, and the Pentagon Building.

Artiss, George (1868-1946), stage and film actor, b. in London. He made his first stage appearance at the old Elephant and Castle theatre, London, 1887, and his first tour in the U.S.A. with Mrs Pat Campbell, 1901. In New York he created the role of Zakkuri in *The Darling of the Gods*, 1902. After that year he devoted most of his acting time to theatres in America, where he became a universal favourite. In England he repeated his Amer. success in *The Green Goddess*, by William Archer. He also made a great reputation as a film star with impersonations of Disraeli, Wellington, Rothschild, and Voltaire. See *George Artiss, by Himself*, 1940.

Arion, cap. of the prov. of Luxembourg, S.E. Belgium. It is a thriving place, having considerable trade in corn, ironware, tobacco, clay pipes, and crockery. It is mentioned as early as AD 870. Pop. 12,300.

Arm, fore or upper limb in man from the shoulder to the wrist. The *humerus*, or bone of the upper arm, has at its upper extremity a convex spheroidal surface which fits into the glenoid fossa of the scapula, or shoulder-blade. The lower extremity has a small head or *capitellum* for articulation with the *radius*, and a *trochlea* or pulley for guiding the movements of the *ulna*. The *ulna* and *radius* are the bones of the forearm, and are articulated with each other and with the wrist-bones at the lower extremity.

The *deltoid* is the large muscle forming the shoulder cap, and serves to raise the A. from the side; it runs from the shoulder-blade to the middle of the humerus. The chief muscles engaged in lowering the A. again are the *latissimus dorsi*, which runs forwards and upwards from the back and

ARM, WITH FOREARM FLEXED

A, biceps; B, triceps; C, ulna; D, radius; F, tendons.

side of the chest wall to be attached to the front of the neck of the humerus; the *coraco-brachialis*, attached to the middle of the front of the humerus; and the *pectoralis major*, which forms the front fold of the armpit. The A. is flexed by the *biceps*, running from shoulder to elbow-joint in front, and is straightened by the *triceps*, running from shoulder to elbow at the back of the A. The muscles of the forearm consist of the flexors and extensors of the wrist and fingers.

The chief arteries are the *axillary*, passing through the armpit, and becoming the *brachial* as it traverses the upper arm, and the *radial* and *ulnar* arteries, which are the branches of the brachial running down the lower arm.

Fracture of the upper end of the humerus may result from direct or indirect violence. The neck or narrow part below the head is the most frequent seat of the fracture, which may result from a fall upon the shoulder, or indirectly from a fall on the outstretched hand or elbow. The bone is usually broken transversely with outward displacement of the upper fragment. Fracture of the shaft of the humerus is usually caused by a blow on the A. The broken ends as a rule overlap considerably owing to the pull of the muscle spasm. Fractures of the lower end of the humerus are commonly

caused by falls on the outstretched hand, and may involve the elbow joint. A rare but unpleasant complication of fractures in the region of the elbow is known as Volkmann's ischaemic contracture. In this condition the blood supply to the forearm is considerably reduced with the result that the muscles waste, becoming fibrosed and contracted, causing a flexion deformity. At one time it was thought that faulty splinting and compression of the brachial artery was the cause, but, although this may be a cause, it is now thought to be due to a spasmodic contraction of the blood vessels caused by the fracture itself.

Of the bones of the forearm, the radius is more liable to fracture, but both may be broken by a direct blow or by a fall.

Colles's fracture is a fracture of the end of the radius, from $\frac{1}{2}$ in. to $1\frac{1}{4}$ in. above the articular surface. It is usually caused by a fall on the open palm when the elbow is slightly flexed, and produces a characteristic backward displacement of the lower fragment and the hand. When fixing the A. in splints, the fingers should be left unconfined, so that after the first day the patient may move them freely; this is necessary in order that adhesion of the tendons to their sheaths may not occur.

Armada, Spanish. Armada is a Sp. word meaning simply an armed force, but is now applied especially to the great Sp. fleet fitted out against England in 1588.

As early as 1585 Philip II of Spain had decided to strike a decisive blow against England by invading the country with the help of a gigantic naval fleet under the command of the Duke of Medina Sidonia. It eventually consisted of about 130 ships, carrying 30,000 men, including about 19,000 soldiers. Probably only about 124 ships and 24,000 men actually entered the Channel, however. After sev. delays the A. left Lisbon in May 1588, it being planned that it should work in liaison with a military expedition from the Low Countries under the Duke of Parma, though quite how this liaison was to have been effected is not clear. Philip had been assured by Cardinal Allen that all Eng. Catholics would rally to the invaders.

The A. was scattered by a storm shortly after leaving Lisbon and had to put in at Corunna for repairs. It entered the Eng. Channel on 19 July. On 21 July Howard's fleet first estab. contact with it and a naval battle began which continued until 30 July, when the battered remnants of the A. broke off the fight and fled for the N. Sea. At first the battle was indecisive, Howard only being able to pick off isolated Sp. stragglers, while the main body of the A. sailed up the Channel towards Calais, practically intact. But Sp. morale was badly shaken by the Eng. tactics, and Sidonia, contrary to instructions, took refuge in Calais, and thus allowed the initiative to pass to the English. On the night of 28 July Howard, who had now been reinforced, sent 8 fireships into the midst of the Sp. galleons. In the ensuing confusion and

panic the Spanish cut their cables and made off in the direction of Dunkirk. At dawn on the 29th the Eng. ships engaged them at Gravelines. Furious fighting went on all day, practically every large vessel in the A. being severely damaged by the Eng. fire, and a shifting NW. wind soon threatened to blow the entire fleet on to the Dutch sand-banks. Sidonia decided to abandon the invasion attempt and to return to Spain by sailing round the Orkneys, Howard pursuing him as far as the Firth of Forth. Storms in the N. Sea and Atlantic caused further losses to the A. and it was Sept. before Sidonia and what was left of his fleet reached Spain.

Sp. losses cannot be accurately assessed. Probably about half the A. was totally destroyed, while the English lost not a single ship. Sp. morale suffered a devastating shock by the defeat, whilst morale in England and Protestant Europe rose correspondingly. Elizabeth I had a medal struck bearing the inscription: '*Deus flavit, et dissipati sunt*'. 'God blew, and they were scattered.'

The total tonnage of the 2 fleets was about equal; but the Eng. ships were faster and far more manoeuvrable, and in contrast to the Sp. concentration on soldiers, practically all those on board them were experienced seamen. The Eng. ships were armed with heavier guns, and their accurate fire could destroy the larger Sp. vessels from a distance beyond the range of the Sp. ordnance. Sp. strategy had all along visualised a naval battle in terms of land warfare, i.e. won primarily at close range by grappling and boarding, in the traditional manner. The Eng. long-distance salvos were a total departure from the accepted practice of cents., for which the Spanish were totally unprepared. See *State Papers relative to the Defeat of the Spanish Armada*, ed. by J. K. Laughton, 1894, and J. S. Corbett, *Drake and the Tudor Navy*, 1898-9. For the Sp. point of view, see J. A. Froude, *The Spanish Story of the Armada*, 1892, and F. Duro, *La Armada Invencible*, 1884-5.

Armadales, burgh of W. Lothian, Scotland, $2\frac{1}{2}$ m. W. of Bathgate, with iron and steel foundries and brick works. Pop. 5800.

Armadillo (Dasypodidae) is a family of edentate mammals peculiar to America, consisting of various species; it belongs to a family intermediate between the sloths and the ant-eaters. They are not, however, toothless, but have a variable number of simple molars, interlocking when the mouth is shut. They are covered with a hard bony shell, consisting of shields on the forehead, shoulders, and haunches, and of movable cross bands of plates across the back. They are of nocturnal habits, feeding on insects, worms, fruits, and roots; they are inoffensive, and their flesh is edible. By day they live in burrows in the forests or plains. Their range is from Texas to Patagonia.

Armageddon, in the Apocrypha, symbolic name for the last fight between the powers of good and evil. Its name is

indubitably taken from Megiddo, the famous battlefield (Judges v. 19) in the plain of Esdraelon.

Armagh: 1. Inland co. of N. Ireland, of 512 sq. m., bounded on the N. by Lough Neagh, on the E. by co. Down, on the S. by Louth, and on the W. by Monaghan and Tyrone. The NW. of the co. is undulating and fertile; the N. has extensive bogs, and on the S. is a range of barren hills. The chief rivs. are the Blackwater, which separates A. from Tyrone; the Upper Bann, which discharges itself into Lough Neagh; and the Callan, which flows into the Blackwater. The geological features of A. are: Lower Silurian rocks in the S. and centre; the trap of Antrim, with the underlying greensand, in the dist. round Portadown; carboniferous limestone in the basins of the Blackwater and Callan; granite in the S.E. mts.; and Tertiary strata in the neighbourhood of Lough Neagh. Lead veins have from time to time been worked in various parts of the co. The climate of A. is one of the most genial in Ireland, with the least rainfall of any co., and it has a large area of cultivable soil. The number of cattle, sheep, pigs, and poultry is increasing. The prin. crops are oats and potatoes, but grain crops are decreasing. Much flax is grown, and linen is still the prin. industry, though it has somewhat declined in modern times. Apples are grown in such quantities as to entitle the co. to its name, 'the orchard of Ireland.' The Great Northern Railway, whose main line from Belfast divides at Portadown, sends off lines to Omagh, Clones, and Dublin. A branch from Omagh joins the Dublin line to Goragwood, and from this line there is a branch to Newry in co. Down. An electric tramway connects Bessbrook, a tn with important linen manufs., to Newry. Pop. 109,000. The chief tns are Armagh, Lurgan, and Portadown. The co. returns 4 members to the Parliament of N. Ireland, and 1 to that of Great Britain and Ireland.

2. The co. tn of A., where the assizes are held. A. is the see of an archbishop of the Church of Ireland, who is the primate of all Ireland, and also of a Catholic archbishopric. The Gothic Protestant cathedral occupies the traditional site of the church built by St Patrick, and the Catholic cathedral was erected in 1840-73. Pop. 9300.

Armagnac, anct dist. in the S. of France, a part of Gascony, now generally included in the dept of Gers. It has a fertile soil, and is noted for its wine and brandy. The cap. was Auch (q.v.). See BRANDY.

Armagnac, Counts of, members of an anct ruling family of the Fr. prov. of A.; they ruled from 1319 to 1525. The most famous member of this family was Bernard VII, who gave the name of A. to the faction which was opposed to the Burgundians in the Civil war of 1410-35. In 1410 Bernard VII married his daughter to the young Duke Charles of Orleans, and henceforth was the head of the Orleans, or A., party. The Burgundians had on

their side the univ., the Paris mob, and the powerful guild of the butchers; whilst the A., or aristocratic, party were supported by Queen Isabella and the princes and aristocracy of Paris. The A. faction had for their banner that of the A. family, a white flag, whilst the Burgundians carried the cross of St Andrew. The struggle of the rival parties was ended in 1435 by the treaty of Arras, when the Burgundian court was reunited to that of France.

Armaments, Limitation of, see DISARMAMENT.

Armature, see ELECTRIC MACHINES.

Armavir, tn in Krasnodar kray of N. Caucasus, on R. Kuban'. Industries include food and agric. engineering. Railway junction. Pop. (1956) 102,000 (c. 1914, 44,000; 1926, 75,000; 1939, 84,000). Founded in 1848 as an Armenian colony, it was an important trade centre before 1930.

Armed Neutrality, league of the N. powers of Europe—Russia, Denmark, and Sweden—formed in 1780, which first gave international validity to the principle that 'free ships make free goods.' A proclamation of Catherine of Russia laid down (1) that neutral ships may sail freely from port to port and along the coasts of belligerents, so long as they do not carry contraband of war; (2) that only real and effectual blockade shall be recognised. The doctrine was accepted by Prussia and Austria in 1781, but refused by Great Britain. The league was suspended at the peace of 1783, but revived in 1800 for a short time. The settlement of the questions in international maritime law involved in the doctrines of the league was only made in 1856 by the declaration of Paris.

Armengaud, Jean Germaine Désiré (1797-1869), Fr. writer. He devoted his time to the study of art, visited the museums of Europe, and became a great critic. Among his works are *L'Histoire des peintres de toutes les écoles, depuis la Renaissance jusqu'à nos jours*, 1849, *Les Galeries publiques de l'Europe*, 1856-65, and *Les Chefs-d'œuvre de Rubens à la cathédrale d'Anvers*, 1859.

Armenia (Armenian *Hayastan*): 1. In the wider sense the ter. which in the past formed the core of the Armenian state and which until the end of the 19th cent. was to a considerable extent populated by Armenians. It comprises, besides the present Armenian Rep. (see below), adjacent parts of Soviet Azerbaijan (Karabakh, Nakhichevan'), the N.E. provs. of Turkey, and the W. parts of Persian Azerbaijan.

2. In the narrower sense the Armenian Soviet Rep., a constituent rep. of the U.S.S.R. It lies in the S. of central Transcaucasia and is largely a mountainous area with a dry, continental climate. It has large deposits of copper and of various mineral building materials. Area 11,500 sq. m.; pop. (1956) 1,600,000, mostly Armenians (83 per cent in 1939) and Azerbaijanis. There are copper, chemical, engineering, food, and textile industries; viticulture, horticulture, and

sericulture are practised; and cotton, wheat, and dairy cattle are raised. A cascade of hydro-electric stations is under construction on the R. Razdan which flows from the mountain lake Sevan (q.v.). The prin. tns are Yerevan (cap) and Leninakan. A. formed the N.E. part of the anc't Urartu (q.v.) state, later conquered by the Assyrians, Medes, Persians, and by Alexander the Great. A. regained independence in 189 BC. and under the dynasty of Artashesidae became a strong Hellenistic state, but after a series of military defeats had to accept a Rom., and later joint Rom.-Parthian, protectorate. A new dynasty of Arshakidae (AD 63-428) introduced Christianity as a state religion in 301. In 387 A. was divided between Persia and Byzantium; in 628 the whole of A. became a vassal of Byzantium, and in 652 of the Arabs, who soon transformed it into their prov. Under the third dynasty of Bagratidae (886-1045) A. regained independence and prosperity. Then followed new conquests by Byzantium, Seljuk Turks, Mongols, and Timur (1386-1402) and other Turkic conquerors. In the 17th-18th cents. A. was a scene of struggle between the Ottoman Empire and Persia. In 1828 N.E. A. was ceded by Persia to Russia and became a Russian prov. After the seizure of power in Russia by the Bolsheviks in 1917, Russian A. formed a part of the anti-Bolshevik Transcaucasian Federation (q.v.). Upon the latter's break-up an independent Armenian Rep. was set up, dominated by the Dashnaktsutyun (q.v.) party. Owing to the international situation (Turkish invasion, disputes and war with Georgia and Azerbaijan) its existence was precarious, and it was easily occupied by the Red Army in 1920 and transformed into a Soviet rep. which in 1922 was included in the Transcaucasian Federal Rep. and the U.S.S.R. Since the abolition of the Transcaucasian Federal Rep. in 1936 A. has been a constituent rep. of the U.S.S.R. Anti-communist guerrilla warfare continued in A. until 1923, and complaints of nationalist deviations in the rep. have been frequent. See J. de Morgan, *The History of the Armenian People* (New York), 1949; F. Kazemzadeh, *The Struggle for Transcaucasia* (New York), 1951; R. Pipes, *The Formation of the Soviet Union* (Cambridge, Mass.), 1954.

Armenian Atrocities. After the change in Russian policy and the failure of the great powers to secure reforms on their behalf from Turkey, following on the treaty of Berlin, the advanced party (Nihilist) amongst the Armenians determined to try to produce disturbances such as those that had resulted in the independence of Bulgaria, and so gain their object. The sultan then (1894) issued a *firman* calling upon all loyal subjects to aid in suppressing the revolt, and regular troops were called up from Erzerum. A massacre of a most brutal character followed, which aroused great indignation in Europe, and especially in Britain. In spite of international protests massacre followed massacre in quick

succession well into 1896, culminating in the butchering of about 7000 Gregorian Armenians in a 2-day massacre in Constantinople itself in Aug. 1896. The total number of those killed has been estimated at between 25,000 and 33,000, including those at Constantinople. Armenian revolutionary societies continued their propaganda down to the granting of the Turkish constitution in 1908; meanwhile further massacres occurred here and there, notably at Mush in 1904 and Van in 1908. Under the Young Turks 20,000 Armenians died in the Adana massacres in 1909.

In 1915 Christian Armenia was the scene of the most devastating massacres that had yet taken place. The Turks, in fact, were aiming at exterminating the entire Armenian race, in order to destroy any possible chance of Armenians acquiring autonomy then or at any future time; and such protesting voices as were raised were, in the nature of things, few and ineffective. Probably about 800,000 people died as a result. Further massacres took place at the time of the revival of Turkish aspirations in Europe and the Graeco-Turkish war, 1922, and mobs of refugees flocked into Iraq to seek the protection of the Brit. authorities there.

Armenian Church, founded by St. Gregory the Illuminator (q.v.), its first bishop. The A. C. isolated itself from all the rest of Christendom in the 6th cent. when it rejected the Council of Chalcedon, and excommunicated all who accepted it. It became monophysite, but its strongly national character led it to refuse communion even with the other monophysites. It embraces the whole of the Armenian nation, and has spread with this enterprising people all over the world. It is the largest of the Christian churches of the E. after the Orthodox. It is ruled by a Patriarch (the Catholics) with an Armenian Patriarch of Constantinople, and of Jerusalem, under him. Its bishops are chosen from the higher celibate clergy, entitled Vartapads. Its liturgy is more latinised than any other E. Christian rite.

Armenian Language and Literature. A., which Lord Byron considered 'a rich language which would amply repay anyone the trouble of learning it', belongs to the Indo-European (q.v.) family of languages. Old A. or *Grabar* is still the literary and eccles. medium, and is distinguished from the vernacular A., which has been employed since about the middle of the present millennium. It is termed *Ashksarhabar* or *Ashksarhik*, and contains a large proportion of Persian and Turkish elements. The language as a whole has many peculiarities of structure. There are 7 cases, and no distinction of gender amongst nouns; whilst there are in verbs 4 conjugations and 4 tenses. There are 2 main dialects, the Eastern (which is nearer to *Grabar* and is spoken principally in the mother country) and the Western (spoken in the 'diaspora'). The differences are chiefly grammatical and in the pronunciation of the consonants *b-p*, *g-k*, and *d-t*. The A. scripts are used

both for the *Grabar* and the vulgar forms of speech. A. as a whole has great strength and flexibility, but is consonantal and harsh to the ear. The alphabet originally contained 36 characters. Later 2 more signs were added. There are 2 types, capitals and minuscule. In the course of time the letters changed very slightly. No literary remains of the period before the introduction of Christianity exist save a few old songs and ballads. These suffice to show that in ancient times the Armenians were influenced by the Assyrian and Medo-Persian civilisations. The 5th cent. AD was the Golden Age of A. literature. A famous school of translators, the *surb thargmanitchek* (or 'holy translators'), was founded by St Sahak (see below). Sometimes the Gk alphabet was used by the W. and Syriac by the E. Armenians. Arzan (d. 459) trans. the works of St Athanasius into A., and wrote treatises against idolatry. In the beginning of the 5th cent. St Mesrob, with Sahak the Great, wrote the A. trans. of the Bible, which was esteemed the highest model of classic style. However, the earliest extant dated MSS. belong to the 9th (3 MSS.) and the 10th cents. (6 MSS.). The majority of the A. codices, including beautifully illuminated copies of the Bible, belong to the 12th and later cents. In the 14th cent. literature began to decline, and few works worthy of note were produced after this period; but since their dispersion the Armenians have always cherished their national literature. The A. script and versions of the Bible were the chief means of crystallising A. speech, which was the main factor in upholding the existence of the A. Church and nation. Armenian literature was purely monkish: there was not, as in the neighbouring country of Georgia, any epic or romantic literature. See E. Lidén, *Armenische Studien*, 1906; J. Marquart, 'Über das armenische Alphabet, etc.', *Handes Anzorya*, 1911; Y. Lalajian, *Catalogue of Armenian Manuscripts of Vassbourajan*, 1915; W. L. Williams, *Armenia, Past and Present*, 1916; J. J. M. de Morgan, *Histoire du peuple arménien*, 1919; E. Mader, *L'Evangile arménien*, 1920; H. Pettersson, *Arische und armenische Studien*, 1920; H. B. Dale, *Landmarks in Armenian History*, 1922; F. Nansen, *Armenia and the Near East*, 1928; A. Abegian, *Neuarmenische Grammatik*, 1936; S. Der Nersessian, *Manuscripts Arméniens illustrés*, etc., 1937; D. Tutaeff, *The Soviet Caucasus*, 1942.

Armenians (Armenian *Hay*), people of Middle-Eastern origin, numbering c. 3,600,000, of whom roughly one-third live in the Armenian Rep. (see ARMENIA), another third live in other parts of the U.S.S.R., and the rest are dispersed in many countries of Asia, Europe, and America (Georgia 390,000, Azerbaijan 360,000, Iran 130,000, Turkey 125,000, Syria over 100,000, France 120,000, U.S.A. 180,000). The Armenian language (q.v.) forms an independent branch of the Indo-European family. A. were christianised in the 3rd cent. AD by St Gregory the

Illuminator; the majority of them now belong to the monophysitic Armenian Gregorian Church, a minority to the Armenian Catholic (Uniate) Church. From ancient times A. have played important roles in the commercial and political life of neighbouring countries and of great empires; e.g. many Byzantine emperors were A. in origin, and the Armenian dynasty of Bagratidae (q.v.) for seven cents. ruled Georgia. Until the end of the 19th cent. the majority of A. lived in the NE. provs. of the Ottoman Empire, but the massacres of 1894-1922 which cost the lives of over 1,000,000 A. led to the present concentration of the Armenian pop. in Transcaucasia. See *Armenian Review*, Boston, Mass., 1948 ff.; J. de Morgan, *The History of the Armenian People*, New York, 1949; S. Atamian, *The Armenian Community*, New York, 1955.

Armentières, Fr. tn in the dept of Nord, on the R. Lys. It was the centre of the heaviest fighting during the final Ger. drive against the Brit. armies in 1918 (see WORLD WAR, FIRST: GERMAN OFFENSIVE OF SPRING, 1918). The tn was completely rebuilt after the First World War. There are textile manufs., including linen, velvet and lace, and breweries and copper industries. Pop. 22,700.

Armeria, genus of tufted perennials, 50 species, family Plumbaginaceae; *A. maritima* is the Sea Pink or Thrift, native to Britain and Europe.

Armfelt, Gustav Moritz, Count of (1757-1814), Swedish general, b. Finland. He showed great courage during the war between Sweden and Russia, 1788-90, and as military representative of Gustavus III concluded the peace of Verela. When Gustavus was deposed A. went into Russian service, and became the first Governor-General of Finland under Alexander I.

Armiak, cloth woven of camel's hair by the Tartars, also a caftan made of A.

Armida, tn of New S. Wales, Australia. It is the centre of a sheep-rearing dist., and the seat of the univ. of New England. Pop. 8860.

Armiger, see ESQUIRE.

Armilla (Lat. 'ring'), bracelet worn by both sexes among the Medes, Persians, Gauls, and Sabines. Both Greeks and Romans looked upon them as feminine adornments, but in some cases of signal merit an A. was conferred publicly upon Rom. soldiers. See BRACELET and REGALIA.

Armillary Sphere. The Lat. word *armilla* signifies a bracelet, and an A. S. is one in which the prin. circles of the heavens are shown by means of metal rings put together in their relative positions. Its use has been superseded by the celestial globe. See GLOBES.

Armin, Robert (c. 1568-1615), comic actor and author, b. Kings Lynn. A pupil of the clown Tarleton, he became one of James I's company of players, and acted the part of Dogberry in *Much Ado About Nothing*. His jest-book, *Fool upon Fool*, was enlarged as *A Nest of Ninnies*,

1608. He also wrote a play, *The History of the Two Maids of Moreclacke*, 1609. His works were ed. by Grosart, 1880.

Arminians, see ARMINUS, JACOBUS.

Arminius (c. 16 BC-AD 21), chief of the Ger. tribe of the Cherusci. He served in the Rom. army, and reached the rank of *eques*. Returning home, he placed himself at the head of the discontented tribes near the Rhine, and completely annihilated 3 Rom. legions under the governor, Quintilius Varus, in the Teutoburg Forest in AD 9. He was subsequently assassinated. A. is regarded as a Ger. national hero and an impressive monument to his memory was unveiled near Detmold in 1875.

Arminius, Jacobus, or Jakob Harmensen, founder of Arminianism, b. in 1560 at Oudewater in S. Holland, studied in the univ. of Leyden, and at Geneva, where his chief theological tutor was Theodore Beza. Appointed minister of a church in Amsterdam on his return, he was chosen to refute a work totally opposed to Beza's doctrine of predestination. He was, however, convinced by the arguments of the work, and on declaring his opinions openly in 1603, he was to the end of his life engaged in a series of bitter disputes with his opponents. A. asserted that God bestows forgiveness and eternal life on all who repent and believe in Christ; Franz Gomar and his party maintained that God had by an eternal decree predestinated which persons should be saved. A. died in 1609.

Armistice, temporary suspension of hostilities between 2 opposing belligerent powers by mutual agreement. It is sometimes concluded for a few hours to allow of a parley, burying of the dead, etc.; a general A. is the usual preliminary to a peace. A general, as opposed to a partial or local A., suspends all military and naval operations of the belligerents and, being concluded by the commanders-in-chief on behalf of their respective govts., requires ratification. The dates of the various A.s in the First World War were: Central Empires-Russia, 29 Nov. 1917; Rumania-Central Empires, 7 Dec. 1917; Central Empires-Ukraine, 9 Feb. 1918; Allies-Bulgaria, 29 Sept. 1918; Allies-Turkey, 30 Oct. 1918; Allies-Hungary, 3 Nov. 1918; Allies-Germany, 11 Nov. 1918. The famous A. of 11 Nov. 1918 was concluded by Marshal Foch and Adm. Wemyss for the Allies with the civil and military representatives of Germany. The allied representatives were, however, acting under the fullest instructions from the Supreme Council in Versailles. This A. was modified sev. times before ratification, and under it the Germans had to evacuate the invaded territories, including Alsace-Lorraine, within a fortnight and fall back to a stated distance beyond the Rhine, thereby establishing a neutral zone, and obviating any possibility of collision between the troops. Germany was to bear the cost of maintaining the armies of occupation in the Rhineland and Alsace-Lorraine. The other primary conditions imposed on Germany included the surrender of 10 battleships, 14 battle

cruisers and light cruisers, 50 modern destroyers, and all her U-boats; also 5000 heavy and field guns, 30,000 machine guns, and 2000 aeroplanes, besides a large quantity of rolling-stock and lorries.

The treaty of Versailles, concluded in 1919, embodied these provisions with, of course, extensive additions. In the forest of Compiègne is an A. monument, situated in a *Carrefour de l'Armistice*, which was unveiled on 11 Nov. 1922. It marks the spot where the Germans signed the A. and bears the inscription: 'Ici le 11 Novembre 1918 succomba le criminel orgueil de l'Empire allemand vaincu par les peuples libres qu'il prétendait asservir.' There exists no similar monument in England, but the Cenotaph in Whitehall serves much the same purpose. In 1940 Hitler, having routed the Fr. armies, forced the Fr. commander, Pétain, to an A., which was signed in the forest of Compiègne on 22 June (regardless of the existence of a Franco-Brit. agreement forbidding the making of a separate A. or peace). This A. was tantamount to unconditional surrender and put the Germans in occupation of the N. half of France and the whole Fr. coast. With a sense of the melodramatic Hitler's plenipotentiaries met those of France in the forest of Compiègne on the same spot, in the same railway coach, as that where Foch had handed his terms to the Germans in 1918. A Fr.-It. A. was signed at a villa near Rome on 24 June. There was no A. at the end of the war. On 14 Mar. 1945 it was announced in Washington that allied military leaders were prepared to accept unconditional surrender of Ger. units of any size but would not enter into any A. or truce. The N. Korean-U.N. forces A. was signed on 27 July 1953.

Armley, since 1926 part of the city of Leeds (q.v.).

Armonica, musical instrument from which the sounds are produced by the friction of moistened fingers on glass or metal tubes, used in the 11th cent., but nowadays a toy. Gluck played it during his visit to London, and Mozart wrote a Quintet with a part for it. There was a later form with a keyboard. The name A. belongs properly to Benjamin Franklin's mechanised form (c. 1762) of the 17th-cent. musical glasses.

Armorial Bearings, general term for heraldic insignia. Strictly speaking, it should be confined to those devices 'borne' on the shield. See HERALDRY.

Armorica, Rom. name for the coastal dist. of Gaul between the Seine and the Loire, roughly the same ter. as the later prov. of Brittany (q.v.).

Armour, Donald John (1869-1933), neurologist and neurosurgeon, b. Cobourg, Ontario; son of a Canadian chief justice and president of the Court of Appeal. He qualified in medicine at London Univ. in 1894 and became a fellow of the Royal College of Surgeons in 1899. Lettsoman lecturer, Medical Society of London, 1927, and president of that body, 1929-30. Wrote *Surgery of the Spinal Cord and its Membranes and Injuries to the Brain and Spinal Cord*.

Armour, Philip Danforth (1832-1901), Amer. merchant and philanthropist, b. Stockbridge, New York. In 1863 he founded the firm of Plankinton, Armour & Co., pork packers, at Milwaukee. In 1870 the firm removed to Chicago and was reorganised as A. & Co., becoming the largest of its kind in the world. A. founded the A. Institute of Technology (since 1940, Illinois Institute of Technology) and the A. Mission in Chicago.

Armour. *Defensive armour* first appeared in the form of the shield (q.v.), made of wood, and carried in the left hand, leaving the right hand free for striking. With the advent of bronze and, shortly after, iron, one finds swords with leaf shaped blades. The means of protection greatly increased; the Greeks had cuirasses of bronze shaped to the body.

The shield of Homeric times was generally large and circular, reaching from the shoulder to the thigh. The Etruscan and Rom. A. was derived from Gk forms, but in Imperial times iron was increasingly used and the legions were furnished with standard equipment. The Rom. shield was often rectangular, commonly of wood, and markedly convex so that it fitted to the body, and the insignia of the legion was shown upon it in metal.

GREEK HOPLITE 5TH CENTURY BC.

From a red-and-black wine cup. Royal Scottish Museum, Edinburgh.

The body A. of a legionary generally consisted of hoops of iron or leather round the body, joined over the shoulders by wide protective braces. The Rom. sword was rather short and two-edged though there was a larger variety known as the *spatha*. After the fall of Rome the barbarians of the Dark Ages wore little body A., and plate A. fell into disuse for some 800 years. The later Romans had used mail, which they had probably

derived from sources outside Europe, and this was increasingly worn by both the Franks and the Vikings. By mail is meant a textile formed of interlocking links, sometimes loosely called 'chain A.'. The great advantage of mail was in its flexibility. From the time of the Norman Conquest both sides were wearing conical helmets with nasals which gave some protection to the face, mail shirts,

KNIGHT WEARING MAIL AND CONICAL HELMET WITH NASAL, 12th CENTURY. WINCHESTER BIBLE.

and, in some cases, mail leggings. The Norman shield was long and kite-shaped for use on horseback; the English had both round ones and kite-shaped ones of the Norman pattern. Footmen had spears and horsemen lances, which were another kind of spear specially light in weight. The feudal system produced a special military caste of heavily armed horsemen. The shield was shortened, a great helm enclosing the entire head was introduced, and the mail protection of the body was covered with a linen surcoat. Helmet, shield, and surcoat, and also the trappings of the horse, were brilliantly decorated by the newly devised art of heraldry, which indicated the wearer's identity.

The disadvantage of mail was that it had not obviated contusion, which necessitated wearing a heavily padded gambeson beneath it. This quilted garment was also sometimes worn as a defence itself. Plate A. began to reappear in the form of pieces to protect the elbow and knee

FIELD ARMOUR, c. 1475. CHURCH OF THE HOLY CROSS, SCHWÄBISCH-GMUND

joints, and soon began to cover the arms and legs. During the course of the 14th cent. plate A. was rapidly developed until, at the beginning of the next cent., the man-at-arms was completely encased in plate, so articulated by means of rivets and straps that it allowed movement of body and limbs. The making of A. has always had something magical about it. In the old days there were the legends of Weyland the Smith, and of Siegfried's sword. In the course of the Middle Ages

the art of the armourer made great strides in the tempering of sword blades and in their decoration. The helmet was equipped with a movable visor, and in place of the mail mittens were articulated gauntlets of plates, the forms of the plates being so fashioned as to give the maximum glancing surface to any blow. With the advent of plate A. the shield fell into disuse in battle, though its heraldic functions survived and it was still used in the tiltyard, and by infantry in war. In the course of the 15th cent. the workshops of S. Germany, such as Augsburg and Nürnberg, produced A. of great elegance, known to-day as 'Gothic' from the details copied from the style of architecture bearing that name, with pointed cusps, finials, and rippled surface. In N. Italy Milan had become the great A.-making centre of worldwide renown. The A. which was produced there in the 15th cent. was more rounded and simpler in form than the Ger. style, but of superlative quality. During the Hundred Years War the skill of the Eng. archer proved that the old feudal horseman was no longer invulnerable, and a cent. later the introduction of firearms was a further blow to the man-at-arms. On the other hand, the tournament continued to flourish and was regarded as the best training for warfare of the military caste. Firearms, which had begun in the form of cannon, were later reduced in size to become portable. They were in the beginning expensive and required trained men to use them, but it was firearms which won the final battle of the Hundred Years War in 1453, though it was a long time before A. and the old hand-weapons were given up. In the course of the 16th cent., when Europe was torn by the rivalry of the Emperor and France, and later by the wars of Religion, organised armies with specialised corps were put in the field. The infantry had never been heavily armed for obvious reasons, and one finds the use of professional mercenaries such as the *Landsknechts*, equipped with spears, hauberks, and swords, and wearing partial A. The old heavy cavalry was still used, but more to deliver the final blow than to manoeuvre. For this purpose light cavalry wearing half-A. was employed. The makers of A. were still busy making fine period A., magnificently embossed in the style of the Renaissance and damascened with gold and silver, and also A. specially designed for the tournament.

The number of *offensive* weapons is legion, but they can be divided under three heads: (i) swords and daggers; (ii) staff weapons, which include spears, lances, halberds, partisans, glaives, pole-axes, etc.; (iii) projectile weapons: bows and arrows, slings, and of course firearms. The precursors of cannon were the siege machines, shot by means of a counter-balance or by taution, which date back to remote antiquity, and also the catapult, ballista, the medieval trebuchet, and the mangonel, whose middle syllable is the origin of the word *gun*.

Defensive armour was worn in Europe

for the last time during the first half of the 17th cent. In the Thirty Years War the cuirassiers, or heavy cavalry, played an important part, but were quickly abandoned in the Civil war in England. Bodies of disciplined pikemen carrying long pikes and wearing defensive A. of long pikes and wearing defensive A. of helmet, breast- and back-plate, and tassets on the thighs, and horsemen wearing a helmet of iron, a cuirass, and a coat of stout buff leather, were employed by both sides. After the Civil war A. was virtually abandoned in favour of cloth uniforms, and the pike was combined with the musket with the invention of the bayonet, which made for great economy in tactics. Nearly 300 years later A. made its appearance again in the form of the steel helmet introduced in 1916 during trench warfare on the Western Front, and some months later in the armoured vehicle known as the tank. In the Second World War body A. was being supplied to Amer. Army airmen in the form of 'flak jackets' or vests—light but strong A. Made in 2 sections, the jacket covered back and front from neck to waist, and it was of fabric, with squares of 20-gauge manganese steel sewn in so that they overlap on all sides, giving complete coverage of chest and neck. The vest would resist a .45 bullet at 30 ft. See ARMS; MAIL; ARMOUR; SHIELD; SWORD; and articles on other individual weapons.

Armoured Cars are the fastest offensive vehicles of a land force, being capable of about 45 m.p.h. on roads and about 25 m.p.h. cross-country. They are armed with a 2-pounder gun and a machine-gun. An armoured car regiment is allotted to each armoured div. and to each corps. A regiment consists of H.Q., H.Q. squadron, and 4 squadrons with their services. The main purposes of an armoured car regiment are reconnaissance ahead of forward troops, the covering of an exposed flank, offensive action in pursuit, and independent raiding.

Armoured Corps, Royal, formed in April 1939, when it consisted of 18 cavalry regiments and all the units of the Royal Tank Corps, which later was renamed the Royal Tank Regiment. Most of these cavalry regiments had already been mechanised, and their incorporation in the R.A.C. confirmed the permanent substitution of the internal-combustion engine for the horse. Strictly the hist. of the R.A.C. begins only in 1939, but its very existence is due to the tank and armoured car, which had records dating from the First World War, and indeed sev. of the regiments now forming part of it first saw service more than 250 years ago. In 1927 an 'Armoured Force' was formed on Salisbury Plain, made up of a reconnaissance group of tankettes and armoured cars, a main group of about 50 medium tanks, supporting artillery, a machine-gun battalion, and Royal Engineers and signal services, but not all armoured. This force was the first armoured formation, and on its work were founded the principles in use throughout the R.A.C. in later years. The conversion of the 11th Hussars and

the 12th Lancers in 1928-9 into a 'cavalry armoured car regiment' was the forerunner of wholesale conversion 10 years later, when only the Household Cavalry, 1st Royal Dragoons (converted into an armoured car regiment during the Second World War), and Scots Greys remained horsed cavalry. The formation of the R.A.C. was announced immediately after this conversion, thus concentrating all the armoured units of the Army into one corps. The 10 years' delay was regrettable but was due to constantly changing tank design and tactics, parl. refusal to incur heavy military expenditure, and prejudice in favour of the horse. When the bulk of the cavalry regiments were converted, some were mechanised as light tank regiments, and some as 'mechanised divisional cavalry regiments.' The latter performed the role of the old horsed divisional cavalry—i.e. primarily that of reconnaissance and holding ground for short periods—and, for these duties, they were equipped with light tanks and scout carriers very similar to the later Bren-gun carriers. After the Dunkirk evacuation in 1940 these divisional cavalry regiments were not re-formed as such. In Mar. 1940 it had been decided to group them into 'Armoured Reconnaissance Brigades,' and when the B.E.F. advanced into Belgium these regiments, preceded by armoured cars, led the advance. But after Dunkirk their duties were performed by battalions of the Reconnaissance Corps. Armoured cars were widely used in the First World War, and formed the nucleus of the 'Light Armoured Motor Batteries' of the Machine-Gun Corps, which operated mainly in the Middle E. Later they became incorporated in the Armoured Car Companies of the Tank Corps when it was reorganised after the war. In the period before the Second World War almost all the Brit. armoured cars were in India, and saw service on the NW. Frontier. The R.A.F. also used them with advantage in Iraq. The 1st Royal Dragoons (armoured car regiment) played a very notable part in the operations in the W. Desert in 1941-2 and in Tunisia. The Queen's Bays (tanks) also rendered effective service with the Eighth Army and, later, with the First Army against the Axis forces in N. Africa. The fact that no invasion of Britain took place in 1940 enabled the War Office to proceed with mechanisation and motorisation. Thus many of the units re-formed after Dunkirk became 'motor-machine-gun regiments,' and later the motor-machine-gun brigades became armoured brigades, and very soon new armoured divs. were in existence. Some of these armoured forces fought with great success in Libya, Greece, Burma, and elsewhere. When the R.A.C. was formed the Royal Tank Regiment retained its corps badge. The badge of the R.A.C. is a mailed fist in a plain circular frame, with a crown at the top. See J. R. W. Murland, *The Royal Armoured Corps*, 1943.

Arma, offensive weapons used in warfare. The cross-bow (q.v.), or arbalest, came into England with the Normans,

and consists of a steel bow released by a trigger, the whole being set on a wooden stock. Its use, forbidden to Christians by Rome, was antecedent to that of the long-bow. The first firearms (q.v.) were introduced to England in the 14th cent., breech-loading cannon being the earliest form, with projectiles of shaped stone. The hand gun was little known until 2 centuries later, and then was so heavy as to require a stand. The early forms were fired by a slow-match applied to the touch-hole, and in many respects resembled the cross-bow. These were improved by the invention of the match-lock and again by the wheel-lock and snap-hance, or flint-lock. In these forms the gun remained in use until 1807, when Alexander Forsyth patented the percussion-lock; there followed the needle-gun, and the breech-loading rifle superseded the old muzzle-loading system; then came magazine rifles. Rifling, which was an old patent, became customary when the advent of machinery made accurate manuf. easy. Pistols and revolvers are the result of guns being modified for cavalry, and their advancement is generally concurrent with that of guns, the same principles being applied. The idea of the machine-gun can be traced back to the 15th cent., when numbers of muskets mounted side by side were used for defensive purposes. Many forms of this gun were found, but the first single barrel machine-gun was made by J. Puckle in 1722. It fired 63 times in 7 minutes. It was, however, an American, R. J. Gatling, who in 1862 produced the first really successful battery or machine-gun, firing from 4 to 10 barrels which rotated round a central axis. By 1876 this gun was capable of firing 700 rounds per minute. The Gatling was followed by the Fr. Montigny mitrailleuse, the Gardner, and the Nordenfeldt, all of which employed the multi-barrelled system, and were hand-operated. The Maxim gun, introduced in 1883, was the first type of single-barrelled automatic gun, followed by the Hotchkiss, the Vickers, the Lewis gun, and many others during the first quarter of the 20th cent. Almost every country has now developed some form of heavy and light machine-gun of its own type. The latest developments in A. include the rifle-grenade discharger, the self-loading rifle, and machine-guns of larger calibre for use against tanks and armoured vehicles.

Artillery A. have developed from the metal cannon firing rough projectiles to the powerful weapons of the world wars period, consisting of guns and howitzers capable of firing explosive shell at long range with great accuracy, and since the Second World War there has been yet a further development—the atomic cannon, already in use in the U.S. army. *See also* FIREARMS.

Arms, Coats of, ensigns or armorial bearings, are the distinguishing devices used to denote particular families, corporate bodies, kingdoms, etc., throughout the world. Though originally assumed at will by the bearer, they are now granted

in Great Britain and the Commonwealth by the College of Heraldry.

Armstead, Henry Hugh (1828–1905), sculptor, b. London, educ. at Royal Academy under Bailey, Leigh, and Carey; became an R.A. 1879. His work includes part of the frieze at the base of the Albert Memorial, carved oak panels in the robing room at the New Palace of Westminster, the effigies of Bishop Wilberforce at Winchester and Lord John Thynne in Westminster Abbey, and a marble statuette of 'Remorse,' now in the Tate Gallery. *See* life by C. W. Armstead, 1906.

Armstrong, Archibald, or Archy (d. 1672), court jester to James I and Charles I of England. He greatly disliked Buckingham and Archbishop Laud, and, in the presence of the latter, said the following grace, 'Great praise be given to God and little Laud to the devil.' Charles I later dismissed him from court, and he eventually retired to Arthuret, Cumberland.

Armstrong, John (1709–79), poet and physician, b. Castleton, Roxburgh. Educ. at Edinburgh Univ., he practised in London. He is remembered as the friend of Thomson, Mallet, and other literary celebrities of the time, and as the author of a poem on *The Art of Preserving Health*, 1744, in which a somewhat uncompromising subject for poetic treatment is gracefully and ingeniously handled. His other works, consisting of some poems and prose essays, and a play, *The Forced Marriage*, are forgotten, with the exception of 4 stanzas which he contributed to the end of the first part of Thomson's *Castle of Indolence*, describing the diseases incident to sloth.

Armstrong, Samuel Chapman (1839–93), an Amer. soldier and philanthropist, b. in the Hawaiian Is., son of missionary parents; served on the Union side in the Civil war, and acquired distinction as a commander of Negro troops. Founded the Hampton Normal and Industrial Institute in 1868.

Armstrong, Sir William George, 1st Baron (1810–1900), engineer, b. Newcastle upon Tyne; he was articled to a firm of solicitors and afterwards became a partner. His tastes, however, lay elsewhere, and, in 1840, he produced an improved hydraulic engine, and, 2 years later, a hydro-electric machine. In 1845 he invented the hydraulic crane. The next year he founded the Elswick engine-works (Newcastle); later, when joined by Whitworth, the Armstrong-Whitworth Co. (*see* VICKERS and WHITWORTH). Here he commenced the manuf. of the A. rifled cannon (which he invented) and other ordnance, in which he was very successful. In 1858 he was knighted, and shortly afterwards appointed chief engineer of rifled ordnance under gov., which position he retained till 1863, when he returned to Newcastle. In 1887 he was created a peer with the title of Baron A.

Army. *General Sketch of the History of Armies.* Evidence derived from all periods of hist. shows that more or less organised A.s have played a prominent

part in the hist. of their countries. The early oriental nations, such as Egypt, Assyria, and Persia, all possessed large A.s, which were easily raised and placed in the field in time of war. Standing A.s were unknown, except in so far as rulers employed special corps of picked soldiers to act as their bodyguard and to form a nucleus for an A. in time of war. The earliest A. of which we have any record is that of the Egyptian Rameses II (c. 1300 BC), who is supposed to have conquered W. Asia to the boundaries of India with an A. of more than 1 million men. To him also is ascribed the formation of a warrior caste, the members of which had to serve in his A.s when necessary, had certain of the taxes remitted as a kind of retaining fee, and were also granted military fiefs. Herodotus (vii. 19 ff.) describes the A. gathered together by Xerxes, and which, according to his computation, numbered well over 2 million men. It took full 4 years to mobilise.

Egyptian and Persian military science was well advanced, and the method of raising an A. on a system of quasi-conscription was introduced by the Egyptians. The principles of attack and defence were elaborated by the A.s of Assyria. The hist. of Gk A.s falls into sev. well-defined periods. In the first of these, A.s assembled round their leaders, in what was practically a feudal levy. The Grecian A. before Troy can be taken as an example of this. In the latter days of Gk hist. conscription was normal. Every citizen of Athens had to serve in the A. and had to undergo military training during a given period, after which he was placed in a certain reserve section of the A., and was liable to service when called upon. In many cases military service formed the basis for political gov. The A. was divided into infantry and cavalry, the greater part of the pop. serving as infantry, while the richer men formed the cavalry. For some very long period, however, the cavalry was a very secondary part of the Gk A. In Sparta every man was compelled to serve between the ages of 18 and 60, the military training being much more severe than elsewhere. Gk A.s were composed of hoplites, cavalry, and light-armed troops formed principally from mercenaries. During the 4th cent. BC they underwent considerable change. Hitherto they had been national levies; henceforward they consisted chiefly of mercenaries. The expedition of the Ten Thousand was the first expedition of a purely mercenary A.; hence warfare became a trade, in which only specially trained and paid soldiers took part. The free soldiers of Greece declined more and more, until we find the mercenary element alone represented. The most important development in Gk military science was the phalanx. This was a formation of parallel lines drawn up in a dense and practically impenetrable mass. The early phalanx had about 6 to 8 lines of men, the later development—the Macedonian phalanx

—consisted of 16 columns of soldiers armed with Macedonian pikes about 24 ft long, drawn up in close order. The Macedonian A. of Philip was probably the second standing A. of the world.

Meanwhile the Rom. A. was on the way to becoming the most perfect form of military organisation in the world. The Roman, like the Greek, was, as a citizen of the rep., bound to serve the commonwealth as a soldier. All Rom. citizens between the ages of 18 and 46 were bound to serve in the A. They received a good military training during their early military career, and for the first few years they served with the *juniores* or active A., afterwards passing to the reserve (*seniores*), where they continued their service until they reached the age limit. The richer citizens became members of the cavalry, but the greater part of the A. was composed of infantry. During the periods of active service the soldiers received pay. The A. was organised into legions, which in turn were subdivided into cents, and maniples. The sections were commanded by military tribunes, who took their orders from the consul or propraetor. Up to the time of Marius (q.v.) the Rom. A. was recruited purely from the Rom. rep.; but thereafter the recruiting areas were extended to the whole of Italy and beyond, while the cohort became the tactical unit. Augustus estab. a permanent A., the greater part of which was stationed on the frontiers of the empire. In its best days the Rom. A. excelled all others from the point of view of discipline and *esprit de corps*; but its quality gradually declined. The free citizen of Rome no longer regarded it as an honour to form part of the legion; the frontier of the empire was guarded by troops stationed in one particular place and recruited from the inhab. of that country. Barbarians began to assume an important place in the legions, and the power of the Rom. A. passed into the hands of barbarian mercenaries. Not only had this a grave effect on the A. itself, but it had grave repercussions in the political field and hastened the downfall of the empire.

The Teutonic A.s which overran the Rom. dominions were essentially nations in arms. It was the privilege of the freeman to bear arms. None but a freeman could do so, and then only when he had been pronounced worthy of the honour by the chieftain of his 'clan.' These chieftains were invested with absolute power as long as the war continued, but laid it down as soon as peace was declared. From a system of clan warfare to one of feudal warfare was not a far step. Warriors who fought on terms of equality naturally demanded an equal share of the conquered ter. The chieftains divided the conquered lands amongst the warriors of the victorious A.s, and from this beginning most historians have traced the gradual rise of the feudal system. The discipline of the 'barbarian' A.s was largely obtained from the Rom. A. Prisoners of war and deserters from the Rom. A. afterwards fought in

the barbarian ranks, and in this way the discipline of Rome was rudely learnt. The A.s were almost entirely composed of infantry, which was divided into light-armed forces which fought in conjunction with what cavalry there was, and the heavy infantry which fought in a wedge-shaped formation, and on which fell the greater burden of the fighting.

The system of 'commendation' was common amongst the Ger. tribes; the young men of good birth commended themselves to some chieftain and became his men. They formed his bodyguard in time of peace, the nucleus of his A. in time of war. Gradually this idea spread, and many small landowners commended themselves to the 'lord,' and in return for his protection rendered certain services to him. When ter. was conquered the land was divided by the lord among his followers, and in the course of time he demanded as a return for these gifts an absolute supremacy over their property and persons. Under the early Carolingian kings we have the transition period—the period when the national A., i.e. the nation in arms, and the feudal A. work together; but under the greatest of the Carolingians, Charlemagne (q.v.), we find the full feudal system in force. From this time until the feudal A.s the national A. disappears, and the baronial militia takes its place.

The feudal levy was the gathering together of the lord, his men-at-arms, and his other dependants and retainers. The A. was no longer composed of national levies, but was divided roughly into cavalry and infantry, which div. represented a social as well as a military difference. The lord and his men-at-arms—the cavalry—represented the nobility; the peasant and the serf—the infantry—the poor of the estate. There were many drawbacks in a feudal A. In the first place, service was restricted. Forty days to 3 months in the year was the longest service which was given, and after that the A.s disbanded. Further, no developments took place in military science; true, the barons and the knights improved their armour and their weapons, but always at the expense of the infantry, whom it was policy to keep ill armed and badly equipped. Dependence was placed almost entirely upon the heavy cavalry charge, a charge which swept all before it, until, by a development of tactics (see STRATEGY AND TACTICS, *Military*), it was shown that it could be met and overthrown by infantry and archers. The crusaders gave rise to new tactical systems, which showed that the day of the heavy cavalry charge was over. The battles of Falkirk (1298) and Bannockburn (1314) were both examples of the new development. The combination of missile and shock tactics employed by Edward III and Henry V showed that the feudal cavalry of France was *ofete*. The methods of raising an A. adopted by Edward III showed that the beginning of the end of feudal levies was in sight. Scutage had led to the employment of mercenaries. Edward III employed

mercenaries on a large scale; kings could depend on mercenary A.s, and could with their aid overthrow feudalism. There were similar trends on the Continent; the fns were enfranchised and raised militia forces, while the invention of gunpowder still further weakened the old-fashioned organisation. Henry V had used artillery before Harfleur, but it was not until the end of the 18th cent. that artillery became really effective.

The decline of feudal A.s was followed almost immediately by the rise of standing A.s. The earliest example of a standing A. in Europe is the formation of the Turkish corps of janissaries in 1362. For a cent. this remained the only standing force; but after the Swiss infantry had proved that they were more than a match for the Burgundian cavalry, and when Charles VII had won repeated victories over the English, a standing A. was created in W. Europe. A force of about 9000 men was raised by Charles VII and divided into *compagnies d'ordonnance*, which were to remain in existence even in times of peace; a few years later a larger force of infantry was raised by the same king. A standing A. gave an overwhelming advantage to the king; and got rid of the necessity of employing mercenaries, who were as much a disadvantage to their employers as they were a check to the enemy. This example was soon followed by other European powers, and the practice of calling out the feudal levy practically ceased from this time. Firearms began to appear in increasing numbers until by the middle of the 17th cent. there were twice as many musketeers as there were pikemen. The method of raising a standing A. was similar to that already used by Edward III. The duty was entrusted to the great nobles, and in this way there originated the Brit. regimental system. The noble destined to command a regiment was given a certain sum wherewith to recruit it, and was also allowed an ann. sum for its maintenance. At first mercenaries were very largely employed, but later the A. became to a very great extent a national and *voluntary* A. The improvement in arms led to improvements in military science, and to the development of the art of war. Under Gustavus Adolphus and Wallenstein (q.v.) great changes were brought about, and instead of the *mêlée* of feudal warfare we find an organised system of military tactics which depended very largely upon the organisation of the military units.

The campaigns of Louis XIV led to the formation of the larger divs. and brigades. Under Frederick the Great (q.v.) we have the beginnings of strict military training and discipline, which made Prussia a first-class military power. The Fr. Revolution, however, brought with it a fundamental change in the methods of raising an A. The bloody wars from which France had emerged victorious by 1797 had led to a serious draining of her resources. In 1798 the law of conscription was brought forward. By this law every citizen was bound to serve in the A.s of France. The whole Fr. pop.

between the ages of 20 and 25 was immediately enrolled, and became liable to service when called upon. To this scheme was due to a very large extent the success of Napoleon. It followed, then, that if the other nations of Europe were to keep their positions as powers they must adopt a similar plan, and at the present time all the continental powers have conscripted A.s; Great Britain alone maintained her voluntary A. until 1939, when, owing to increasing tension throughout Europe, a limited measure of conscription was introduced. From the Prussian A. came further developments: A.s were raised and trained for a year, being then sent back to their homes as a reserve force, liable to be called upon when necessary. The system proved successful, and with the battle of Sadowa (1866) it proved so effective that the system of a reserve A. and a short-service system was taken up by practically every power. Most nations now have 3 lines of service, a standing A., a reserve A., and a second line of reserve, a militia, or similar force formed on a territorial basis.

See BRITISH ARMY (and further cross-references at the end of that article) for modern developments in the U.K.; see also RED ARMY; UNITED STATES ARMY; and sub-headings *Defence* in the main articles of the countries of the world.

Army Emergency Reserve, see RESERVE ARMY.

Army News Services. The occupation of the Rhineland by Brit., Fr., and Amer. armies after the First World War saw the estab. of the first modern news-sheets printed by and for the troops. The Brit. Rhine Army newspaper, the *Cologne Post*, was the first issued as a daily, in Mar. 1919. When the Brit. army moved to Wiesbaden, the paper was re-estab. there as a bi-weekly, ceasing pub. in Nov. 1929. Its big 'scoop' was the printing of the text of the prin. clauses of the Versailles treaty.

In the Second World War the earliest attempts to provide newspapers for the forces were in the W. Desert, where the Eighth Army had its own paper, *Eighth Army News*, and in Algeria, where the First Army started *Union Jack*. These were produced by journalists serving with the forces and followed up the troops as they advanced, being printed on local presses where possible. At the end of the war there were some 15 army papers between them covering all theatres of operation. They included, apart from those listed above, *Parada* (in Italy, pub. in Polish, for the Polish Army); *Contact* (India); *S.E.A.C.* (South-east Asia Command); *B.C.O.N.*, later *Japan News* (Japan); and *Mid-East Mail* (Palestine, Transjordan, Syria). The last paper to cease pub. was *Union Jack*, at Athens in July 1948. The Amer. Army also ran an extensive news service for its troops in Europe and Asia.

Since the Second World War no Brit. Army newspaper has been printed, but numerous news-sheets have supplied troops abroad with information of international, local, and sporting events. The

best-known of these is *Circle News* (later known as *Crown News*, produced for Commonwealth troops in the Korean theatre, and still (1957) being pub.).

Army-worm, or *Leucania unipunctata*, is the larva of an insect of the order Lepidoptera and family Noctuidae, which receives its name from its habit of marching in great numbers. It does much damage to Amer. crops. The final stage of its life occurs when it becomes a nocturnal moth.

Arnaldus de Villa Nova, see ARNOLDUS.
Arnarson, Örn, see STEFANSSON, MAGNÚS.

Arnatta, see ANNOTTO.

Arnaud, Arsène, see CLARETIE, JULES.
Arnaud, François Thomas Marie de Baoulard d' (c. 1718-1805), Fr. writer and dramatist, b. Paris. His literary merit attracted the attention of Voltaire, by whom he was recommended to the King of Prussia. He was for a time at the court in Berlin, but returned to Paris the year before the outbreak of the Seven Years War (1755). During the latter part of his life he lived a life of great poverty and misery. His chief works are the melodramas *Le Comte de Comminge*, 1764, and *Euphémie*, 1768, and the novel *Les Délassements de l'homme sensible*, 1783-93.

Arnaud, Henri (1641-1721), Fr. pastor and general of the Vaudois of Piedmont, b. Embrun. He was educ. at La Tour, and later at Basel and Geneva. He was later appointed pastor at the vil. of La Tour. After the expulsion of the Waldenses (q.v.) by Victor Amadeus of Savoy he became their leader, and in 1689 he led the expedition which was to attempt 'la glorieuse rentrée.' After encountering almost unsurpassable difficulties, they were besieged during the whole winter by the French and the Savoyards; but in 1690 the Duke of Savoy became an ally of William III of England and for the next few years A. and the Waldenses helped the allies to fight the French. At the end of the war the duke turned against the Waldenses again, and they were forced to leave the country. About 3000 of them followed A. into exile in Germany. He visited England about 1707. He d. at Schönenberg. During his exile he wrote his *Histoire de la glorieuse rentrée des Vaudois dans leurs vallées*, which was trans. into English in 1827.

Arnaud de Cervole (d. 1366), Fr. brigand chief, b. Périgord, who fought with King John at Poitiers in 1356, and with him was taken prisoner. On his release he returned to the S. of France and held Pope Innocent VI to ransom. He was assassinated by one of his followers.

Arnaud de Villeneuve, see ARNOLDUS.

Arnauld, Angélique de St Jean (c. 1624-1684), nun at Port Royal who was elected prioress in 1673, and by her piety and courage set an example to all the sisters during the Jansenist controversy. She was abbess from 1678 until her death. She wrote *Mémoires pour servir à l'histoire de Port Royal* and literary pictures of her 2 famous aunts.

Arnauld, Antoine (1612-94), twentieth

and youngest son of Antoine A., famous Fr. lawyer. He is usually distinguished by the name 'le grand A.' Originally intended for the Bar, he chose rather to study theology. He became a Jansenist, and his book, *De la fréquente communion*, raised an uproar that forced him into hiding for 20 years. His letters, *A un duc et pair*, an outspoken attack on Jesuit methods, elicited the famous *Lettres provinciales* of Pascal, but these failed to save A. from being solemnly expelled from the Sorbonne and degraded, 1656. The 'Peace' of Clement IX suspended attacks on Jansenism, and A. emerged from retirement, to be graciously received by Louis XIV. In *La Perpetuité de la foi* he now defended transubstantiation and attacked Calvinistic doctrines. His submission proved external only, and when Jansenism (q.v.) was condemned by Alexander VIII in 1690, A. fled to Holland. There he conducted controversies with Jesuits, Protestants, and even with Malebranche. The *Art de penser* (Port-Royal Logic) was written in conjunction with Nicole (q.v.), and remained a text-book until recently.

Arnault, Antoine Vincent (1766-1834), Fr. poet and dramatist, b. Paris. Almost immediately after starting his dramatic writings he was successful with his tragedy *Marius à Minturnes*, 1791. He left France during the Terror, but returned and was arrested, and for a short time imprisoned. He was patronised by Napoleon and remained faithful to him during the Hundred Days. Because of this he remained in exile until 1819. Ten years later he was again elected to the Academy and in 1833 became secretary. Among his works may be mentioned *Blanche de Montcassin*, 1798, *Fables*, 1812, and *Souvenirs d'un seigneur*, 1833.

Arnaut, Daniel (c.1180-1210), Provençal poet, b. Ribérac, Dordogne. His name remains to us as that of the greatest of troubadours, owing to the praise bestowed upon him by Dante. He seems to have been a knight of Périgord, who attached himself as a troubadour to the court of King Richard I of England. He was a great composer of love songs, and both Dante and Petrarch are loud in their praises of the *sestina*, a poetic form which he invented. His versification is complicated and to-day it is difficult for us to understand the admiration which it once excited. See V. A. Canello, *La Vita e le opere del trovatore Arnaldo Daniello*, 1883.

Arnaut, Turkish and Serbian word meaning a native of Albania; an Albanian.

Arnaut de Mareuil (fl. 1180), Provençal troubadour who settled at the court of Toulouse. By his passionate songs addressed to the Countess Adalasia he roused the wrath of his rival Alfonso II of Aragon and was forced to flee into exile. He probably d. before the end of the 12th cent. See R. C. Johnson, *Les Poésies lyriques du troubadour A. de Mareuil*, 1935.

Arndt, Ernst Moritz (1769-1860), Ger. poet and patriot, the son of an emancipated serf. Intended for the ministry, he renounced it, and led for some time a wandering life. In 1803 he pub. *Versuch*

einer Geschichte der Leibeigenschaft in Pommern und Rügen, a hist. of serfdom which led to its abolition in 1806 in Pomerania. In 1806 he issued the famous call to the Germans to throw off the yoke of France, and such excitement did it produce that he was forced into exile in Sweden to escape Napoleon. In 1810 he wrote pamphlet after pamphlet full of hatred of the French, and pub. 2 vols. of patriotic songs (1813-15). In 1818 he was appointed to the univ. at Bonn, and threw himself into the movement for constitutional reform. He was elected to the Ger. Diet in 1848. A monument in his honour was erected at Bonn in 1865.

Arndt, John (Johann) (1555-1621), Lutheran divine, b. Ballenstädt in Anhalt; studied theology under Lutheran teachers. Among his mainly mystical and devotional works is his *Wahres Christenthum* (True Christianity). In this he balances Christ's life in His people with the main Lutheran doctrine, His death for His people.

Arne, Thomas Augustine (1710-78), composer, b. London and educ. at Eton. He was the son of an upholsterer and was intended for the Bar, but his love for music decided his career. In 1733 he produced his first opera, *Rosamond*, in which his sister Susannah Maria, afterwards the famous Mrs Cibber, took the principal part. He wrote music for Fielding's *Tom Thumb*, Congreve's *Judgment of Paris*, Milton's *Comus*, and Thomson and Mallet's masque, *Alfred*. In the last-named appeared the famous 'Rule, Britannia.' In 1744 he was appointed composer to the Drury Lane theatre. In 1746 he supplied music for the masque *Neptune and Amphitrite* and the songs in *The Tempest*. He composed 2 oratorios, *Abelard and Judith*. He was made a Mus. Doc. in 1759. He afterwards became famous as a music teacher. He was buried at St Paul's, Covent Garden. A's dramatic works are very numerous, but except *Arlaxerxes* and the It. *L'Olimpiade* are rarely operas properly speaking. He also wrote some church music, cantatas, odes, overtures, concertos, sonatas, and songs. His son Michael (c. 1740-86) was also a composer, mainly for the stage.

Arnee, native name of the *Bos bubalus*, or *Bubalus arni*, a buffalo found in the W. Indies. It has large horns and is of great size.

Arnheim, Johann Georg von, see ARNIM.

Arnhem, cap. of the prov. of Gelderland, Netherlands. It is situated on the Lower Rhine, 35 m. ESE. of Utrecht. Its surroundings are extremely beautiful. The chief manufs. are cotton and woollen goods, soap, carriages, and tobacco. A. was a member of the Hanseatic League. Sir P. Sidney d. here in 1586. The tn suffered considerable damage in the Second World War. First Allied Airborne Div. landed here 17 Sept. 1944. After 9 days' heroic stand 2000 men were brought back, with heavy losses to the div., on 26 Sept. Brit.-Canadian troops captured A. in April 1945. See WESTERN FRONT IN SECOND WORLD WAR. Pop. (1954) 116,420.

Arnhem Land, reservation for aborigines in the N. of N. Ter., Australia, area about 31,200 sq. m., comprising the region between the Gulf of Carpentaria and the Timor Sea. Cape A. is on the extreme NW. of A. L., on the Gulf of Carpentaria; A. Bay is an inlet of the Arafura Sea on the E. of the N. coast of A. L.

Arni, see ARNEE.

Arnica, genus of Compositae found in cold and temperate climates. *A. montana*, the Mountain Tobacco, perennial herb, common to Alpine woods, contains an acrid resin and a volatile oil.

Arnim, Bettina von (1785-1859), Ger. authoress, the sister of Clemens Brentano. In 1807 she made the acquaintance of Goethe, for whom she had a great attachment. She married in 1811 the writer Ludwig Achim von A. (q.v.). Her most famous pub. was the *Goethes Briefwechsel mit einem Kinde*, 1835. This purported to be a correspondence between herself and the poet, which was at first believed to be authentic, but was later proved to be to a great extent fictitious. She also wrote on political and social questions.

Arnim, Elizabeth Mary, Countess von (later Countess Russell) (1866-1941), Brit. authoress, b. Sydney, Australia, daughter of H. Herron Beauchamp, was a cousin of Katherine Mansfield (q.v.). While married to Count August von Arnim, who d. in 1910, she won popularity with *Elizabeth and her German Garden*, 1898, containing amusing sketches of her domestic life. It was followed by *The Solitary Summer*, 1899, and *The Adventures of Elizabeth in Rügen*, 1904. 'Elizabeth,' as she signed herself, became widely known for the lively wit of her writing. In 1916 she became the third wife of the second Earl Russell, but they separated in 1919. Her later novels include *The Enchanted April*, 1922, *Introduction to Sally*, 1926, *The Jasmine Farm*, 1934, and *Mr Skeffington*, 1940. *All the Dogs of My Life*, 1936, is an autobiography.

Arnim, or Arnheim, Johann Georg von (1581-1641), Ger. soldier, b. Brandenburg. He served under Gustavus Adolphus in 1613, and in the Polish army, and in 1626 entered the imperial service under Wallenstein. In 1630 he left it for that of the elector of Saxony, and commanded part of his army at Breitenfeld in 1631. He took part in the negotiations between the elector and Wallenstein during 1633-4; and defeated the Imperialists under Colloredo at Liegnitz, 1634. D. at Dresden while leading the Imperial and Saxon forces against the French and Swedes.

Arnim, Ludwig Achim von (1781-1831), Ger. poet and novelist, b. Berlin. He received a scientific training, but his natural tendency was towards literature, with a fondness for romance and the supernatural. He collected old popular legends and songs in travelling through Germany, which he pub. in collaboration with his friend Clemens Brentano in 3 vols., entitled *Des Knaben Wunderhorn*, 1806-8. Other works were *Arnul, Reich-*

tum, Schuld und Busse der Gräfin Dolores (a novel), 1810, *Halle und Jerusalem* (dramatic romance), 1811, and *Isabella von Aegypten*, 1811. In 1817 he pub. a historical romance, *Die Kronenwächter*. A.'s importance lies chiefly in having discovered the treasure of folk poetry.

Arnim, General Sixt von (1851-1930), Ger. general. In the final Ger. offensive, begun Mar. 1918, he commanded that one of the 7 armies which occupied the line from the sea to the R. Lys. His objective was, in conjunction with Gen. von Quast, commanding from the Lys to Arras, to thrust back the Brit. First Army under Gen. Horne upon the Brit. armies which were in retreat to the Aune and so isolate the Second Army under Gen. (later F.M.) Plumer. He took Mont Kemmel (24-6 April) by violent frontal and flank assaults, but his losses were so severe that he was unable to secure other hills belonging to the same system, and so could no longer jeopardise Ypres. This failure, together with that at Hazebrouck, was the beginning of the end of the great Ger. thrust of 1918.

Arno, riv. of Italy, which rises on Mt Falterona in the Apennines (q.v.), 25 m. N. of Arezzo (q.v.). It flows generally W. for 150 m. to the Ligurian Sea, which it enters 7 m. after passing Pisa (q.v.). At Florence (q.v.) it is 400 ft wide, but it can be forded in summer. It flooded disastrously in 1537 and 1740. There was bitter fighting around the A., near Florence, July-Sept. 1944, during the Second World War. See further under ITALIAN FRONT IN SECOND WORLD WAR.

Arnobius (fl. c. 300), teacher of rhetoric at Sicca Venerea in Numidia. In the first decade of the 4th cent., soon after his conversion to Christianity, he pub. his celebrated work *Adversus Gentes*. This was intended as an answer to the pagan allegation that contemporary disasters were due to the impiety of the Christians; its tone is bitter and ironical, but the author was not at that time well grounded in Scripture. See the ed. of A. Reifferscheid in *Corpus Scriptorum Ecclesiasticorum Latinorum*, 4, 1875.

Arnold, Benedict (1741-1801), Amer. general and traitor, b. Connecticut. A. joined the Amer. Army in the War of Independence and distinguished himself in the battles of Ticonderoga and Quebec. He reached the rank of major-general and was one of the most trusted officers of Gen. Washington, although he had previously been much embittered by the promotion of sev. officers of junior rank over his head. But he continued at his post, fought at Ridgefield and Saratoga, was commander at Philadelphia in 1778 and then put in charge of the all-important post of W. Point on the Hudson R. in 1780. A court martial resulting from disagreements with civil authorities, although he was cleared of all serious charges, apparently led to his entering upon communication with the Brit. command for the betrayal to them of his post. A young Brit. officer, Maj. John André, was sent to meet him. André was captured and hanged as a spy, but A. escaped to the Brit. lines, where he

received a command and fought against his fellow countrymen. He sailed for England in 1782, where he lived more or less in obscurity. Eventually he d. in London, a disappointed and embittered man.

Arnold, Edward Augustus (1857-1942), Eng. publisher, only son of the Rev. Edward Ponrose A., he was thus a grandson of Thomas A. of Rugby, and a nephew of Matthew A. and of Mrs Humphrey Ward. He was educ. at Eton and Hertford College, Oxford. After learning publishing for some years with the firm of Richard Bentley, he started his own business in 1890, at first in Bedford St, Strand, and later in Maddox St, where it still continues. He was president of the Publishers' Association in 1928-9.

Arnold, Sir Edwin (1820-1904), poet, b. Gravesend, son of a Sussex magistrate, and educ. King's School, Rochester, King's College, London, and Univ. College, Oxford, where he gained the Newdigate prize for a poem on Belshazzar's feast. He went to India as a schoolmaster, and during the mutiny was able to render signal service to the gov. Later he became a journalist, and was on the staff of the *Daily Telegraph* (of which he was ultimately editor), and it was he who was largely responsible for the dispatch of Stanley to the Congo. He is, however, best remembered as a poet. His most famous poem is *The Light of Asia*, 1879, an epic poem on the life and teachings of Buddha. In *The Light of the World*, 1891, he attempted, less successfully, a similar treatment of the life and teaching of Jesus. Amongst his other works are *The Song of Songs of India*, 1875, *The Song Celestial*, 1885, *With Sa'di in the Garden*, 1888, *Adzuma*, 1893. He was made a C.S.I. in 1877, and K.C.I.E. in 1888.

Arnold, John (1736-99), horologist, b. Bodmin, Cornwall, where he was apprenticed to his father, a watchmaker. He first made his name as the maker of a very small half-quarter repeater for King George III, but later became famous for his chronometers. See also CHRONOMETER and WATCH.

Arnold, Malcolm (1921-), composer, b. Northampton, studied at the Royal College of Music in London and first played trumpet in the London Philharmonic Orchestra. He quickly made his way with a number of witty, high-spirited, and well-designed works, including the overture *Beckus the Dandypat*, a symphony for strings, clarinet and horn concertos, sonatas, etc.

Arnold, Matthew (1822-88), poet and critic, b. Laleham, Middx, on Christmas Eve. His father was the famous headmaster of Rugby School. From here, having obtained a scholarship at Balliol, A. went on to Oxford in 1840. Even at this early time his mind had already turned to literature, and his poem, *Alaric at Rome*, had been recited in Rugby School in 1840. In 1843 he obtained the Newdigate prize with a poem on Cromwell. In the following year he took his degree, and a year later was rewarded with a fellowship at Oriel

College. After leaving the univ. A. for a short time taught classics to the fifth form at his father's old school, but he did not long remain a schoolmaster. In 1847 he became private secretary to Lord Lansdowne, then a leader of the moderate Whigs, and on him A., to a large extent, modelled his politics.

In July 1849 appeared *The Strayed Reveller and other Poems*, by 'A.' The pub. attracted but little attention, so little, in fact, that the ed. was withdrawn very hastily. This collection, although it contained a number of poems of little merit, at the same time contained much that has gained for itself a permanent place in Eng. literature. In 1852 appeared his *Empedocles on Etna and other Poems*, again by 'A.' but this also was quickly withdrawn, to be followed, however, in the next year by a collection of poems, many of which had been already pub., together with an essay which embodied A.'s idea of poetry. A year before the pub. of *Empedocles on Etna*, A. had been appointed by Lord Lansdowne to an inspectorship of schools, and he did an immense amount of good to education in England by the work which he performed as an inspector. His official reports on the various foreign tours of inspection which he undertook were of great utility. He had a great admiration for the Ger. system of education. He himself remarked that the Fr. univ. lacked liberty, the Eng. science, but the Ger. neither. Many of his advocated reforms were carried out both in schools and in univs.

In 1857 A. had been appointed to the chair of poetry at Oxford, and he retained this chair for 10 years, being the first layman to occupy it. Amongst the new poems which were pub. in 1867 we find his greatest poem, *Thyrsis*, a monody on his dead friend, Arthur Clough. He had ceased to be prof. of poetry, but he still occupied a place as a poet second to none, save perhaps Tennyson. By his half-philosophical, half-theological books A. attracted much attention, and he struck the keynote of his philosophy in preaching his favourite doctrine of 'sweetness and light.' His application of literary methods of criticism to the Bible aroused great interest in the country. He argued that much that was wrong in the theology of the time rested solely on the fact that the Bible was read as a scientific work, whereas his own conception of it was that it was literary, and therefore the methods of literary criticism could be applied to it. *Literature and Dogma*, 1873, marks the breaking away entirely of A. from Christian doctrines. His methods of criticism were not always fair, nor always in good taste, but his own criticism roused so much bitter feeling that the methods adopted by both sides contain much that cannot be commended. In 1883 he received a pension of £250 per annum, and in the same year he lectured in the U.S.A. He d. at Liverpool of heart failure, and was buried at Laleham.

His works, in addition to those already mentioned, include *Essays in Criticism*,

1865, *New Poems*, 1867, *Lectures on the Study of Celtic Literature*, 1867, *Culture and Anarchy*, 1869, *Irish Essays*, 1882, and *Discourses on America*, 1885. His collected works (including a bibliography) were pub. in 1903-4, and letters in 1895 and 1901. See lives by A. Birrell, 1892; G. Saintsbury, 1899; F. L. Bickley (*Matthew Arnold and his Poetry*), 1911; Sir A. T. Quiller-Couch, 1918; Sir W. Raleigh, 1923; E. Blunden, 1932; L. Trilling, 1939; E. K. Chambers, 1947; C. Dymont, *Matthew Arnold* (selection, with introduction), 1948.

Arnold, Samuel (1740-1802), Eng. musician. He was employed by the musical directors of Covent Garden, for whom he wrote many musical plays. His first was *The Maid of the Mill*, which was produced in 1765. In 1769 he leased Marylebone Gardens, where he produced many stage works. In 1773 he took the degree of D. Mus. at Oxford Univ. He became organist of the Chapel Royal 10 years later, and was afterwards appointed to the same position in Westminster Abbey. He is best known as the editor of a collection of cathedral music and of the works of Handel.

Arnold, Thomas (1795-1842), headmaster of Rugby, b. W. Cowes. His early education was received at Warminster, but in 1807 he went to Winchester, where he remained until he entered the univ. of Oxford in 1811. He entered at Corpus Christi College, but 4 years later was elected a fellow of Oriel College, where he remained until 1819. His dread of insincerity led him to hesitate deeply before he took orders, but once his doubt of his own realisation of the Christian faith had passed, he became a devout and passionate Christian. After leaving the univ. he settled at Laleham, near Staines; here he took pupils for preparation for the univ., and also devoted himself to study and began to write his *History of Rome*. He was appointed to the headmastership of Rugby School, 1828, and here he proceeded to do what had been prophesied of him, 'that he would change the face of education all through the public schools of England.' Schools were no longer to be mere places where the classics and a certain amount of general knowledge were learnt, but places in which the intellectual and the moral life were harmoniously blended, training places for Christian gentlemen. Though his influence has sometimes been exaggerated, the modern Eng. public school system, with its insistence on character training and its breadth of knowledge, owes more to A. than to any other single individual; and his influence has been passed down to schools outside the public school range. He found time to continue his studies amidst his school work, and he did a great amount of literary work. In 1841 he was appointed regius prof. of modern hist. at Oxford. He pub. many vols. of sermons, an ed. of Thucydides, a *History of Rome to the Second Punic War* in 3 vols., 1838-43, and *Introductory Lectures on Modern History*, 1842. See life by J. J. Findlay, 1917.

Arnold, Thomas (1823-1900), scholar, younger son of Dr A. of Rugby. Educ. there and at Oxford, he was an inspector of schools in Tasmania. In 1856 he became a Rom. Catholic, and was Prof. of Eng. at the Catholic Univ., Dublin, 1856-62. His works include a *Manual of English Literature*, 1862, and many eds. of the Eng. classics.

Arnold, Thomas Kerchever (1800-53), Brit. educationist. Educ. at Cambridge, he was rector of Lyndon, Rutland, 1830-1853. He pub. many text-books, including his well-known *Practical Introduction to Greek Prose Composition*, 1838, and the corresponding work on Lat. prose, 1839.

Arnold, tn and par. of Notts, England, 4 m. N.E. of Nottingham, in Sherwood Forest, with hosiery and brewing industries. Pop. 22,000.

Arnold-Forster, Hugh Oakeley (1835-1909), politician, grandson of Thomas Arnold of Rugby. He was b. at Dawlish and educ. at Rugby and Univ. College, Oxford. He soon became interested in politics, especially those dealing with Irish questions. His political ideas, in the beginning of Liberal tendencies, changed to a sympathy with the Unionist cause. Under Balfour he was offered the position of secretary for war (1903), but resigned when his fellow ministers disagreed with his projected army reforms (1906).

Arnold of Brescia (d. 1155), It. monk and reformer, b. Brescia, and one of the most prominent opponents of the temporal power of the papacy. He was b. c. 1100 of noble parents. Educ. Paris, he may possibly have studied under Abelard. On his return to Italy he became a canon regular, and was noted for his extreme asceticism. Accused by St Bernard of being a follower of Abelard, he shared Abelard's condemnation in 1140. He took refuge at Zürich, where he remained for 3 years. On his return to Rome (1143), A. joined the republican movement, of which, before long, he became the most prominent leader; he made continual attacks upon the clergy, vehemently denying their right to hold property. On the accession to the papacy of Adrian IV (Nicholas Breakspear), however, in 1154, A. was forced to flee into Campagna. Here he was seized and brought to Rome (1155). In Rome he was condemned, hanged, and burnt, and his ashes thrown into the R. Tiber.

Arnold von Winkelried, see WINKELRIED.

Arnoldus de Villa Nova, also called **Arnaud de Villeneuve** (d. c. 1313), probably of Sp. origin, famous as an alchemist, astrologer, and physician. He lived during the 13th and 14th cents., and appears to have studied chem., medicine, and Arabian philosophy. After living at the court at Aragon he is believed to have lived for some time in Paris. He was forced into exile in Sicily owing to the hostility of the Church towards him. On the illness of Clement V he was summoned to attend him at Avignon, but d. on the way. Amongst the writings attributed to him on somewhat small

authority are *Rosarius Philosophorum*, *Novum Lumen*, *Flos Florum*, and the *Breviarum Practicæ*.

Arnolfo di Cambio, or di Lapo (1232-1302), It. architect, *b.* Colle di Val d'Elsa. Designed the following buildings in Florence: the church of S. Croce, c. 1294 onwards; the cathedral, 1296 onwards; and, according to Vasari, the Palazzo Vecchio, 1298-1314.

Arnott, Archibald (1771-1855), physician, *b.* Dumfries. He was surgeon to the 20th Foot Regiment, was posted to St Helena in 1819, and there gained the friendship of Napoleon, whom he attended in his last illness. He signed the post-mortem report on Napoleon. In 1822 he pub. *Account of the Last Illness of Napoleon*.

Arnott, Neil (1788-1874), physician, *b.* Arbroath. After having graduated M.D. at Aberdeen he studied medicine (M.D., 1814), and was appointed surgeon to the E. India Company. He began to practise in London and attained eminence as a physician and physicist, being appointed physician extraordinary to the queen in 1837. Author of *Elements of Physics*, 1828-9, and of sev. hygienic inventions, including the water-bed.

Arnotto, or Arnatta, see ANNOTTO.

Arnould, Sophie (1740-1802), Fr. operatic singer, *b.* Paris; she entered the Opéra in 1757 and was the most prominent singer there till 1778. Among her chief parts were those of Iphigenia in Gluck's *Iphigénie en Aulide*, Eurydice in his *Orphée et Eurydice*, and the prin. roles in Rameau's works. She was famous for her wit and conversational powers, and was the friend of d'Alembert, Helvétius, Diderot, and Rousseau. See collection of her *bons mots* in *Arnouldiana*, 1813, and her life by the brothers Goncourt, 1857.

Arnould-Plessy, Jeanne Sylvanie (1813-1897), Fr. actress, *b.* Metz. She married Auguste Arnould, a Fr. man of letters. She created a large number of roles, but excelled in the part of a coquette.

Arnprior, tn of Renfrew co., Ontario, Canada, on Chats Lake, 38 m. W. of Ottawa. In the neighbourhood are marble quarries and iron mines, and the tn contains large lumber mills. Pop. 4829.

Arnsberg, Ger. tn in the *Land* of N. Rhine-Westphalia (q.v.), in the Ruhr valley (q.v.), 55 m. ENE. of Düsseldorf (q.v.). It was a centre of the Fehmle Courts (q.v.), and was a member of the Hanseatic League (q.v.). There are brewing and paper industries. Pop. 10,000.

Arnstadt, Ger. tn in the dist. of Erfurt, 10 m. S. of Erfurt (q.v.). In its church of St. Boniface, Johann Sebastian Bach (q.v.) was once the organist. It is a railway junction, there are fluorspar and manganese mines in the dist., and there are manufs. of machinery and radio equipment. Pop. 28,000.

Arnsvalde, see CHOSZCZNO.

Arnau, Nicolas (1629-92), Fr. theologian, *b.* Nérancourt. He was appointed prof. of theology and metaphysics at Padua, where he d.

Arnulf 1. A Rom. emperor. He was an

illegitimate son of Carloman, and nephew of Charles the Fat, the indolent and cowardly King of the W. Franks, who d. in the 9th cent. AD. A., having been made ruler of Carinthia by Carloman, then marched against Charles, whose cowardice in buying off his foes had disgusted him; and when Charles was deserted by his ministers, A. became king in his place and, repairing to Rome, was made emperor. Displayed signal bravery in a great fight near Louvain against the Northmen. Later, allied himself with the warlike Magyars in the vain hope of breaking up the domains of the Moravians. D. about AD 899.

2. See ERNULF.

Aroa, copper mining tn in Yaracuy state, N. Venezuela. Pop. 2150.

Aroa, see ARN.

Aroer, name of 2 O.T. places. The first (belonging to the tribe of Gad) was near a trib. of the Jabhok, and opposite Itabba of the Ammonites. Jephthah fought the latter near A. The other A., also in Palestine, was situated near Armo. It was in ant. times the frontier tn of Amorheus, and later of the tribe of Reuben. It belonged to the Moabites in the time of Jeremiah. The ruins of it are now called Arrayr. See Num. xxxii. 34, 1 Sam. xxx. 28, 2 Sam. xxiv. 5, 1 Chron. v. 8, Isa. xvii. 2, Jer. xlviii. 19.

Arolsen, Ger. tn in the *Land* of Hessen (q.v.), 96 m. NNE. of Wiesbaden (q.v.). It was once the cap. of Waldeck (q.v.), and has 2 fine castles. Pop. 3000.

Aromatari, Giuseppe degli (1586-1660), It. physician and naturalist, *b.* Assisi and d. Venice. He studied logic, philosophy, and medicine at Padua, and practised as a physician at Venice for 50 years, although he had offers from the Duke of Mantua, the King of England, and Pope Urban VIII. He had an immense library, which contained many MSS. He wrote *Riposte alle Considerazioni di Alessandro Tassoni sopra le Rime del Petrarca*, Padua, 1611, and also works on medicine and natural hist., including an essay on hydrophobia and a letter on the generation of plants from seeds.

Aromatic Compounds form one of the great divs. of organic compounds. They may be looked upon as derivatives of benzene, and are distinguished from fatty or aliphatic compounds by their molecules containing closed chains. The molecular formula of benzene, for instance, is C_6H_6 , but the molecular formula of another organic compound, dipargyl, is also C_6H_6 . The chemical behaviour of the 2 compounds is, however, markedly different; dipargyl combines easily with bromine, giving additive compounds, and is very unstable; benzene is remarkably stable, and usually gives substitution products, that is, products where certain atoms are displaced by an equivalent number of other atoms or radicals, without the state of combination of the rest of the molecule being altered. Examination of the behaviour of benzene led Kekulé in 1865 to the conclusion that the molecule of benzene is symmetrical, and that each carbon atom is directly united to one, and

only one, atom of hydrogen. As carbon is assumed to be quadrivalent, its combination in a compound must be expressed in a graphic formula by drawing 4 lines from each carbon atom to the other atoms to which it is directly united. This has been done in sev. ways, each of which agrees with many of the phenomena in the chemical behaviour of benzene. The earlier formulae were:

A later formula, suggested by Armstrong and Baeyer, appeared to be more satisfactory. In this formula one valency of each carbon atom appears directed towards the centre, in order to express that by the mutual action of all the 6 valencies the power of each is rendered latent, and this agrees with the facts relating to benzene and its derivatives.

Modern work on valency (q.v.) has thrown new light on the whole problem. Thiele's suggestion that the residual valency of each carbon atom is uniformly distributed round the ring is now accepted in essentials.

A.C.s usually contain a larger percentage of carbon than aliphatic compounds, and have a characteristic reaction with nitric acid, producing nitro-compounds; and also with sulphuric acid, producing sulphonic derivatives. When nitro-compounds are reduced they are converted into amino-compounds, which are converted into diazo-compounds on treatment with nitrous acid in the cold; if the solution is warmed, phenols are obtained.

Aromatic alcohols are prepared by methods analogous to those employed in producing aliphatic alcohols: the corresponding halogen derivatives are heated with water, weak alkalis, or silver hydroxide.

Aromatics, substances characterised by a fragrant, spicy taste and odour, as cinnamon, ginger, eucalyptus, camphor, etc.

Arona, It. tn in Piedmont (q.v.), at the SW. end of Lake Maggiore (q.v.). It has a church with a 10th-cent. tower, and a ruined castle in which St Carlo Borromeo (q.v.) was b. A. has a transit trade with Switzerland, via the Simplon Pass (q.v.), and is a terminus for the boat traffic on the lake. Pop. (tn) 8000; (com.) 10,200.

Aroodje of Oroosh, see BARBAROSSA, HORUK.

Aroostook, name of a riv. which rises to the N. of Maine, and flows into the St John in New Brunswick. In length 140 m., it is known in hist. on account of its connection with the much-discussed and troublesome question of the N.E. boundary between Brit. America and the U.S.A.

Arosa, Swiss holiday resort, 19 m. S.E. of Chur (Grisons), situated amidst pine woods, at an altitude of nearly 6000 ft.

Arouet, Jean François, see VOLTAIRE.

Arpad (c. 870-907), hero of Hungarian ballad and romance, and founder of the kingdom of Hungary. He founded the A. dynasty, which lasted till 1301.

Arpeggio, chord in music of which the notes are played in very rapid succession, instead of simultaneously.

Arpino (anc. Arpinum), It. tn in Lazio (q.v.), standing on a hill 12 m. E. of Frosinone (q.v.). Originally a tn of the Volsci (q.v.), it later fell to the Samnites (see SAMNIUM), and eventually came under Rom. dominance. There are pre-Rom. remains. Cicero (q.v.) was b. here, and Marius (q.v.) was b. at Casamare (anc. Cereatae) near by. Paper and textiles are manuf., and there is a trade in agric. produce. Pop. (tn) 2800; (com.) 11,300.

Arpinum, see ARPINO.

Arquà Petrarca, It. vil. in Veneto (q.v.), 12 m. SW. of Padua. It is in the Euganean Hills (q.v.) and is famous for its associations with Petrarch (q.v.), whose house and tomb are preserved here. Pop. 2000.

Arquata del Tronto, It. tn, in the Marche (q.v.), on the Tronto, 17 m. SW. of Ascoli Piceno (q.v.). Pop. (com.) 5500.

Arquebus, or **Harquebus**, hand-gun, forerunner of the modern rifle, dating from the 15th cent. Those of the earliest construction were fired by a 'match' from the touch-hole. They were first fired from a forked rest at the height of the chest, but the Germans invented a hooked form of butt, and elevated the barrel. See also FIREARMS.

Arracacia, genus of S. Amer. plants of the family Umbelliferae. The tuberous roots of *A. xanthorrhiza* (arracach) and *A. esculenta* are edible.

Arracan, see ARAKAN.

Arrack, spirituous liquor manuf. in the E. Indies from a large variety of

substances, fermented rice or coco-nut juice, etc. Pure, clear, and transparent, and of the colour of straw, when properly made it has a peculiar but agreeable taste. It contains 52-4 per cent of alcohol.

Arragon, see ARAGÓN.

Arrah, tn in the Shahabad dist. of W. Bengal, India, 320 m. N.W. of Calcutta. In 1857 a dozen Englishmen, with 50 Sikhs, defended an ordinary house against 2000 sepoys and a large mob, till finally relieved by Maj. Eyre.

Arraignment, Eng. legal term signifying the calling of the prisoner to the bar of the court to plead 'guilty' or 'not guilty' to the indictment against him. It corresponds to the Scottish legal term 'calling the diet.'

Arrajan, see BEHBEHAN.

Arran, James Hamilton, 2nd Earl of (c. 1515-75), nobleman, regent of Scotland during the minority of Mary Stuart. He was created Duke of Châtelherault by Henry II of France. In 1554 he resigned his position as regent to the queen-mother, Mary of Guise, and went into exile in France. He returned to Scotland to take part in the intrigues against Elizabeth. In 1573 he acknowledged James VI's authority.

Arran, James Stuart, Earl of (d. 1596), statesman. He overthrew Morton, who had been regent of Scotland since 1566, and with the Duke of Lennox managed the affairs of Scotland until 1585, when he was deprived of his authority.

Arran, is. of Bute co., Scotland, the largest is. in the frith of Clyde, lying between the Mull of Kintyre and Ayrshire. It is about 20 m. long, and 11 m. broad at its widest part. Its area is 105,814 ac. In winter a daily steamer maintains communication with Brodieck and Lamlash, whilst in the summer the number of steamers which call is much greater. The general aspect of A. is mountainous, the N. peaks being very imposing. An ancient sea margin encircles the coast with a low platform; the country rises abruptly to the high peaks on the S. and SW. The geology of A. is of peculiar interest, for within its comparatively confined limits distinct sections of the great geological formations can be observed; the botany, also, of the dist. repays study by the variety and rarity of many of its plants. Relics of ancient times exist in the shape of Dan. forts, cairns, standing stones, etc. A few red deer may still be found in the wilder hilly dist., and blackcock and grouse abound; the game of the is. is, however, strictly preserved. Lamlash, which possesses a very fine natural harbour, and Brodieck are the chief vils. The is. is a favourite resort of summer visitors. Pop. 2500.

Arrangement, or Transcription, of music is the adaptation of a piece of music to an instrument or instruments other than those for which it was originally composed, as when orchestral compositions are arranged for the pianoforte. The pianoforte A.s of Liszt are acknowledged to be unexcelled, but they are equalled by those of Busoni.

Arras, Fr. tn, cap. of the dept of Pas-de-Calais, on the R. Scarpe. It was the ancient cap. of the Celtic Atrebates, and subsequently of the prov. of Artois (q.v.). It was famous for its tapestry, hence the Eng. word 'arras.' The old tn stands on an eminence, with the new tn below it. It is the seat of a bishopric. The 18th-cent. cathedral and the beautiful 16th-cent. tn hall were very seriously damaged during the First World War, but have been reconstructed. A. was the bp. of Robespierre. Prin. manufs. are agric. implements, hosiery, lace, and beet-sugar, and there is a large trade in cereals and vegetable oil. Pop. 33,300.

Arras, Battle of, the first of the big battles of the third year of the First World War. The previous year (1916) had closed on the doubtful note of the battle of the Ancre (q.v.), which had at least pressed the Germans back to the Hindenburg line. This famous line they reached by April of 1917. As a position it left almost nothing to be desired in point of natural and artificial defences, besides giving to the enemy the advantage of a much shorter front than on the Somme and Ancre. Its flaw was the uncertainty of its axes—the positions round A. to the N. and those of Laon to the S. In the hope of pushing home such advantages as had been gained in 1916, the Allies were now preparing a general offensive on both these axes. The French were to attack on the Laon front and the British on that of A. The Brit. general advance began on Easter Monday, 9 April, after the usual preliminary bombardment, on a front of about 48 m., the objectives being, in the N., Lens and its surrounding cluster of coal vils., and in the S. Quent, the nearer end of the hard-contested and powerfully fortified Brocourt 'switch' line. Had the Brit. offensive succeeded in taking these 2 points, the road to Cambrai would have been open. All went well in the opening stages, and by 11 April the famous Vimy Ridge, together with 3000 yds of the formidable Hindenburg line, was taken, in addition to over 10,000 prisoners and 160 guns. All arms co-operated smoothly, the work of the tanks being a great advance on their performances of 1916. But though Lens was hemmed in, Quent, at the other end, was not shaken. It now remained for the French to deliver their blow, and the result was the disastrous battle of the Aisne heights begun on 16 April. (*See under AISNE, BATTLE OF THE.*) The idea of the 'decisive blow,' which was to be struck simultaneously at A. and Laon, had failed. In Mar. 1918 the Germans made a desperate attempt to capture A., but the Brit. line held firm and so saved not only that city but also Amiens (q.v.). In the Second World War Brit. troops entered A. on 1 Sept. 1944.

Arrastre, Mexican and Amer. mule-mill for grinding ore.

Array, Commissions of, see COMMISSION, MILITARY.

Arreau, see AURE.

Arreboe, Anders Kristensen (1587-1637), Dan. poet. After having studied

at Copenhagen Univ., he took holy orders, and became Bishop of Trondheim in 1618. His conduct of life being, however, such as to disgrace his office, he was deposed therefrom. His chief work was the religious poem *Hexameron, or Six Days of the Creation*, and his trans. from the psalms.

Arrest is the restraint of a man's person, in order that he may be compelled to obey the law, or be brought to trial. It is defined to be the execution of the command of some officer of justice or some court of record. A.s in England can take place in either civil or criminal cases. In civil cases, however, it is only in somewhat exceptional instances that A. takes place. The chief, and practically the sole, cause of such A. is 'contempt of court'; all the superior courts have power to arrest persons for this reason. This is done by the issue of a writ, by an order of the court or of a judge to the sheriff. Imprisonment for debt was ended by the Debtors Act of 1869, and consequently the writ 'capias ad satisfaciendum' is now rarely issued. It is only made use of in such cases as are excepted from the above Act; such are, when non-payment involves contempt of a competent court, or when a trustee refuses to comply with the order of a court of equity. A debtor may also be arrested to prevent him from absconding or removing his property out of the jurisdiction. A. 'in mesne process,' that is, during the progress of a suit, is now abolished, with the above exceptions. The following are exempt from A. on civil process: ambas, or diplomatic representatives of foreign courts, peers of the realm, Members of Parliament, clergymen during divine service, or on their way to or from service, and all persons attending a court of justice in any capacity, such as witnesses, solicitors, counsel. No person is, however, exempt from A. for contempt of court.

All persons without exception are liable to A. in criminal cases, and outer doors may be broken open for such a purpose. The A. may be either with or without a warrant. A warrant is an order addressed to a peace-officer by a judge or magistrate. If the person named thereon is not in the jurisdiction of the issuing authority, the warrant must be 'backed' by a magistrate of the place where he actually is. A private person is entitled to A. anyone who commits a felony, or inflicts a dangerous wound on anyone, in his presence, anyone whom he has good cause to suspect of felony, or anyone whom he discovers committing certain offences specially provided for by statute. The remedy for wrongful A. is an action for false imprisonment.

Arrest of Judgment, see JUDGMENT.

Arrestment, Scottish legal term, is the process by which a creditor detains the goods or effects of the debtor in the hands of a third party till he is paid. It is divided into 2 kinds: (1) A. in security is used when a claim has not yet become enforceable, as at the commencement of the legal proceedings; (2) A. in execution is used following on a decree of the

court, or on a registered document. A. merely retains the effects; the process of 'furthercoming' is necessary to realise on them. Such funds as are necessary for the sustaining of life are not liable to arrestment.

Arretium, or **Aretium**, modern **Arezzo** (q.v.), one of the most important of the 12 cities of Etruria, especially famous for its red pottery. Interesting architectural excavations have been made; here also was discovered the celebrated bronze chimaera now at Florence.

Arrhenius, Johan (1811-99), Swedish botanist and agriculturist, b. Klöfdala, Sweden. He was a member of the scientific societies of Upsala and Stockholm; sev. plants have been named after him.

Arrhenius, Svante (1859-1927), Swedish scientist, b. Upsala; studied and began to teach at Upsala Univ.; became a prof. of physics at Stockholm in 1891. He was awarded the Davy medal in 1902, the Nobel prize for chem. in 1903, and became a member of the Chemical Society in 1898. His theory of electrolytic dissociation is a valuable contribution to science. He investigated the influence of light pressure on minute particles and showed how it affected the tails of comets. His *Text-book of Electro-Chemistry* has been trans. from the German by McCrae. He pub. *Destinies of the Stars* (Eng. trans. by Fries) in 1918, and the year before he d. he issued a revision of 2 of his earlier astronomical works.

Arrhidaeus, or **Aridaeus** (d. 317 bc), son of Philip II of Macedonia and a courtesan, was half-brother to Alexander the Great, and on his death in 323 bc was named his successor. He married Eurydice, granddaughter of Philip's elder brother, Perdicas, and, being an imbecile, became the tool of his father-in-law, his wife, then of Antipater and Polysperchon. He and Eurydice were put to death by Olympas, mother of Alexander.

Arrhythmia, medical term applied to irregularity of the action of the heart, manifesting itself in a lack of rhythm in the beat of the pulses, etc.

Arria, wife of Caecina Paetus, who, when her husband was implicated (AD 42) in the plot of Scribonianus against Claudius and condemned to death, resolved not to survive him. After stabbing herself, she handed the dagger to her husband with the words: 'It does not hurt, Paetus.' Her daughter A. was married to Thrasea Paetus, and when the latter was condemned to death by Nero (AD 66) she would have imitated her mother's example, but was dissuaded by Paetus for the sake of their children. She was banished.

Arriaca, see GUADALAJARA.

Arriaga, Manoel José de (1839-1917), Portuguese president and lawyer, b. Horta, Azores, of a distinguished family which was descended from Don Alfonso III of Castile. He became the first president of the Portuguese rep. A. studied law at Coimbra Univ., and while there was disinherited by his father for his republican sympathies. Elected

deputy for Funchal as a republican in the parliament of 1882-4 and for Lisbon, 1890-2. Elected president 1911, defeating Bernardino Machado. Wrote essays on jurisprudence and political economy.

Arrianus, Flavius (c. AD 95-c. 175), Gk historian and philosopher, b. Nicomedia in Bithynia. In youth he was the friend and pupil of Epictetus (q.v.). Hadrian appointed him Governor of Cappadocia, in which capacity he served from 131 to 137 and distinguished himself in a campaign against the Alani. He also spent much of his time at Athens, where he was Archon in 147-8. The latter years of his life were

legislative assembly, and in 1852 was made senator.

Arria, in architecture, the sharp edge produced by the intersection of 2 plane or curved surfaces.

Arroba, see METROLOGY.

Arrol, Sir William (1839-1913), head of the firm of Wm A. & Co., engineers, who constructed the Tay and Forth Bridges and the Manchester Ship Canal under his direction. Represented S. Ayrshire in Parliament, 1895-1906.

Arromanches, Harbour of, artificial prefabricated harbour used in the early days of the Anglo-Amer. invasion of

C.O.I.: Crown Copyright

PIER AND PIERHEAD AT ARROMANCHES

The first traffic moving off a completed pier, 18 June 1944.

spent at Nicomedia, where he devoted himself to writing the following works: *Moral Discourses* and *Enchiridion* of Epictetus (ed. from verbatim notes); *Anabasis of Alexander*; *Indica*; *Campaign against the Alani* (a fragment); *Periplus of the Euxine*; *Cynegeticus*; and the *Tactica*, sometimes attributed to Aelian. See A. G. Roos, *Flavii Arriani quae exstant omnia* (2 vols.), 1907-28. There is also a text with trans. by E. I. Robson (Loeb Library, 2 vols.), 1921-33.

Arrière Ban, feudal summons to freemen to follow their sovereign to the field with vassals, provender, etc.

Arrighi, Lodovico degli, see VICENTINO.

Arrighi, Toussaint, Duke of Padua (1778-1853), Corsican general, b. Corte, in Corsica, and d. Paris. He distinguished himself in the Egyptian campaign, and in 1809 was made general and Duke of Padua. He also took a leading part in the battle of Leipzig, 1813, and in the campaign of France, 1814. In 1849 he was appointed deputy for Corsica at the

Normandy in 1944. Without this harbour it would have been necessary to storm Cherbourg or Le Havre, but great difficulties would have been experienced in attempting to reoccupy those ports, for the Germans, even had they been expelled, would have wrecked the port installations, and the subsequent development of the battle of Normandy might have been very different (see WESTERN FRONT IN SECOND WORLD WAR). The specialised civil engineering knowledge and experience essential to such an undertaking were first acquired in 1941-2 in constructing military ports in Scotland to supplement Brit. civil ports and in planning port extensions in the Middle E. to offset the closing of the Mediterranean. At this time, too, special landing craft were developed, and amphibious trucks for unloading stores. But in 1942 the Directorate of Ports and Inland Water Transport, which supervised these developments, was asked to produce piers a mile long to extend from shore

to water deep enough for coasters to lie alongside; at the same time the piers would have to be strong enough to take the heaviest weapons and capable of being put together in a few days and of riding out summer storms. This meant an entirely new design for the spans and the pontoons of standard Royal Engineers' floating bridging equipment. The prototype was constructed on a Scottish beach early in 1943, and tests showed that 6 spans mounted on floats or about 500 ft of the floating bridge could be towed in the open sea in any weather up to a given wind force, and that the unit would be complete in itself and ready for joining up. Sev. pierhead pontoons could be assembled together in various ways according to the purpose in view—in line to form a wharf, in extension of the pier to form a jetty, or by combining both forms. Mooring the floating bridge was effected by the 'kite' anchor with a great holding power, and so designed as to allow each pontoon to be moored fore and aft in 6 min. The arrangement of the connection of the bridge girders with the pontoon saddles gave sufficient play for lateral and vertical movement between the spans of the pontoon. Many types of breakwater were considered in the effort to find one that would not break itself or its moorings, but, for really rough weather, the only immediate alternative was lines of blockships. These, however, were only effective in up to 1 fathom of water, and the pierheads had to have 3 fathoms. Hence it was necessary to have some kind of caisson for the bulk of the breakwaters. Six miles of breakwater were required, and dry-dock facilities round the Brit. coast were much strained by the labour of constructing the caissons, which were all about 200 ft long and in 6 heights varying from 60 ft down to 25 ft, with dead weights from 7000 tons to 1700 tons each; but the large size constituted the greater part of the breakwater. To increase structural strength the units had cross walls and a central longitudinal watertight bulkhead, thus forming cells on each side of the bulkhead. Flooding valves of varying sizes were allocated to the watertight compartments, and when all the valves were open the sinking times at A. varied from 5 min. to 20 min. according to the depth of the water and other factors.

Dispatch of the equipment across the Channel began on the evening of D-Day (6 June 1944), and by 10 June the harbour construction at A. was proceeding well. But 12 days after D-Day a storm of unprecedented force for June sprang up and held for sev. days. On the side W. of A., where the Americans were establishing their harbour, great damage was done. But at A. the damage was not nearly so vital, and after the storm it was soon brought up to full efficiency as a port. A. functioned as a harbour in every sense of the word, and its name will be remembered in the hist. both of civil engineering and of the world's ports. See Sir Bruce G. White, 'The Harbour of Arromanches,' in the *Overseas Engineer*, Oct. 1945, and Sir F. Morgan, *Overture to Overlord*, 1950.

Arrondissement, name of the largest sub-div. of the Fr. dept. It is composed of cantons, which are divided into coms. Each A. has a sub-prefect and council to manage its affairs.

Arroo, or **Arru**, see **ARU**.

Arrow, see **ARCHERY**.

Arrowgrass, or *Triglochin palustris* and *T. maritimum*, is a plant of the family Juncaginaceae, occurring in Britain. The former species is common in marshes and pools, while the latter grows in salt-water marshes.

Arrowhead, or *Sagittaria sagittifolia*, is a species of the family Alismataceae and genus *Sagittaria*; it is a native of Europe. It is a water-plant, only the arrow-shaped leaves and the flowers appearing above the surface. There are also leaves below the water, and these are very thin and ribbon-like; the root is a rhizome.

Arrowrock Dam, dam 350 ft high, 1150 ft long, on the Boise R., Idaho, U.S.A. It was constructed by the Bureau of Reclamation, a body estab. by Act of Congress, 1902. It forms Arrowrock Reservoir (capacity 286,500 ac.-ft), used to irrigate c. 170,000 ac.

Arrowroot, farinaceous substance prepared from the roots or tubers of various plants: *Maranta arundinacea*, *Curcuma angustifolia*, and *Tacca leontopetaloides*, the E. Indian A.; *Arum maculatum*, the Portland A. Ground down, strained carefully, and dried in the sun, the preparation forms a valuable and easily digested food; it is often adulterated with potato starch. The S. Amer. Indians used to apply the roots of a plant confounded with *Maranta* as an antidote to the effect of poisoned arrows—hence the name.

Arrowsmith, Aaron (1750–1823), distinguished cartographer, b. Winston, co. Durham. He came up to London, and by 1790 had founded a great map-making business, raising the execution of maps to a pitch of excellence never before attained.

Arrowsmith, Edmund (1585–1628), b. Haydock, near St. Helena, and educ. Douai. Ordained priest in 1612, he pursued his missionary labours in his native co. from 1613 to 1628, being received into the Society of Jesus in 1623. Twice apprehended for his faith, he was found guilty of treason in 1628 and accordingly sentenced to be hanged, drawn, and quartered.

Arrowsmith, John (1790–1873), nephew of the elder Aaron A., to whose business he succeeded. His first pub., in 1834, was the well-known *London Atlas*. Helped to found the Royal Geographical Society in 1830. He received a gold medal in 1863 for his services to geographical science.

Arroyo Molinos, Sp. vil. in the prov. of Cáceres, the scene of a victory of Viscount Hill (q.v.) over the French in 1811 during the Peninsular War (q.v.).

Ars Poetica, or the *Epistle to the Pisos*, is one of the finest of the poems of Horace. The date of it is uncertain, though it appeared before the poet's death in 8 bc. The title of the *Art of Poetry* for the *Epistle to the Pisos* is as old as Quintilian, but it is now agreed that it was not intended for a complete theory of the poetic

art. It is conjectured with great probability that it was intended to dissuade one of the younger Pisos from devoting himself to poetry, for which he had little genius, or at least to suggest the difficulties of attaining to perfection.

The poem is a discussion of dramatic poetry, largely based on Gk text-books, but full of Horace's own experience and of his own good sense. Young aspirants to poetical fame regularly began with tragedies, and Horace, accepting this as an actual fact, discusses the rules of tragedy with as much gravity as if he were dealing with some really living and national form of poetry. This discursive and fragmentary poem was taken in later ages as an authoritative treatise; and the views expressed by Horace on a form of poetical art with which he had little acquaintance had, at the revival of literature, and even down to the last cent., an immense influence over the structure and development of the drama. Just as modern comedy based itself on imitation of Plautus and Terence, and as the earliest attempts at tragedy followed in the steps of Seneca, so in the theory of both Horace, and not the Greeks, was the leading influence. See HORACE.

Arsaces, Persian name occurring on Persian seal. A. I was the founder of the Parthian dynasty, and of the dynasty of the Arsacides which fl. in the 3rd cent. BC. About 250 he raised the standard of revolt against the rule of the Seleucidae, and, having succeeded in emancipating his countrymen, was elected king. Reigned for 2 years. All Parthian kings officially bore the name A.

Arsacidae, dynasty of Parthian kings from its founder Arsaces (q.v.), who wrested a kingdom for himself from Seleucid Antiochus II about 250 BC. The greatest kings were Mithridates and Tiridates. The Arsacidean empire was overthrown in AD 226 by Ardashir, founder of the Sassanid empire.

Arsamas, see ARZAMAS.

Arsenal. The name appears in Romanic languages under various forms, and is of Arabic origin; It. *arsenale*, Sp. *arsenal*, Arabic *dar aḥḥind'ah*, meaning a house of trade or manuf. The word has been adopted to imply (1) a public estab. where arms and equipment are manuf.; and (2) a repository or magazine of arms and military stores of all kinds, both for land and sea service. An A. of the premier or first class includes gun and carriage factories, laboratory, ammunition and small-arms factories, powder factory, and specious storehouses. In an A. of the second class the factories are replaced by workshops. As an A. is a source of supply during war, great care is taken to erect it in a suitable position. A.s of the first class should be situated at the base of operations, secure from attack, at a safe distance from the frontier.

The prin. A.s in Great Britain are the Royal A., Woolwich, and Chatham, Sheerness, Portsmouth, and Plymouth A.s. Gov. foundries are at Woolwich and small-arms factories at Enfield. Malta and Gibraltar are the chief overseas A.s.

The sub-divs. of branches in a large A. are: (1) storekeeping; (2) construction; (3) administration. Under (1) are the armoury, the ordnance dept, and the magazines. Under (2) come ammunition, laboratories, and firearms of all descriptions, and under (3) clerical work and its officials.

The chief continental naval A.s are: *France*, (Cherbourg, Brest, Toulon, Bordeaux); *Germany* (before 1939), Kiel, and the inland factory at Esson; *Russia*, Kronstadt, Leningrad, Sebastopol; *Italy* (before 1939), Naples, Spezia, Genoa, Venice; *Spain*, Cartagena, Cadiz, Barcelona; *Portugal*, Lisbon. For Amer. A.s see UNITED STATES, *Arsenals*.

Arsenic, chemical element (symbol As, atomic number 33, atomic weight 74.91) which is generally looked upon as a semi-metal, connecting, with antimony and bismuth, the great div. of non-metals with that of metals. The term is often applied to the white oxide of A. (As_2O_3) which is the most important compound commercially.

The element occurs in very small quantity in nature; it is more usually found as the trioxide in arsenolite, as the sulphide in orpiment and realgar, or as a compound with iron, cobalt, etc., as in arsenical iron and mispickel or arsenical pyrites, $FeSAs$. The metallic A. of commerce is chiefly prepared by strongly heating mispickel in earthenware retorts from which the air is excluded, when most of the A. sublimes, together with a little sulphur. The crude metal is sometimes used as a poison for flies, and as a constituent of lead shot, a small quantity of A. hardening the lead and facilitating the formation of the spherical globules. The pure metal may be obtained from the white oxide by heating it with carbon in the absence of air, which may be effected by covering the oxide in a narrow test-tube with dry powdered charcoal, and nearly covering the mouth of the tube with the finger when heating. The A. sublimes on the cool part of the tube as a dark grey powder.

A. has a sp. gr. of about 5.7 and a specific heat of .083. It crystallises in rhombohedra, and rapidly vaporises at temps. above $100^\circ C$. The density of the vapour is 150 ($H = 1$), so that the gaseous molecule of the element must be looked upon as including 4 atoms.

The chief compounds of A. are the hydride, AsH_3 , the arsenious oxide, As_2O_3 , A. oxide, As_2O_5 , the disulphide, As_2S_3 , the trisulphide, As_2S_5 , the trichloride, tribromide, tri-iodide, and trifluoride ($AsCl_3$, $AsBr_3$, etc.). Arsenious oxide is formed when arsenical ores are roasted in air; it is sublimated as a white powder. A. oxide is produced when the lower oxide is heated with nitric acid. The 2 oxides are the anhydrides of the 2 acids, arsenious acid and A. acid, which may be distinguished by the colours of their silver salts; the addition of ammonia-silver nitrate producing a canary-yellow precipitate of the arsenious salt or arsenite, and a brick-red precipitate of the A. salt or arsenate.

As the A. compounds are extremely poisonous, it is of great importance that efficient tests of their presence should be known. Organic matter should first be expelled by digesting with hydrochloric acid and potassium chlorate, chlorine being driven off by boiling. The A. is then precipitated as a sulphite, which is dried, mixed with potassium cyanide, and heated. The A. is then deposited as a black sublimate, which is converted into arsenious oxide if heated in air. The oxide may be recognised by the production of a yellow precipitate with ammoniacal silver nitrate solution, or by a precipitate of Scheele's green with ammoniacal copper sulphate. Reinsch's test consists of boiling a strip of copper foil in the given solution with the addition of hydrochloric acid; if A. is present it is deposited on the copper and may be recognised as in the previous test. Marsh's test depends on the production of the hydride AsH_3 . An apparatus for the preparation of hydrogen is fitted with a narrow jet, at which the hydrogen is lighted. If a piece of porcelain be held in the flame no stain is produced if the materials used for the production of hydrogen are free from A. The solution to be tested is poured into the hydrogen-generating apparatus; if A. is present the flame assumes a lavender tint and a black stain is produced on the porcelain. The Gutzet test also depends on the formation of AsH_3 , which may be detected by silver nitrate paper (a black precipitate of metallic silver being formed) or by mercuric chloride or bromide paper (a yellow stain being formed).

In medicine arsenious oxide is used as an alterative and tonic in doses of from 1-60th to 1-15th gr. The most frequently used preparation is that known as Fowler's solution, which comprises arsenious oxide and potassium carbonate, together with a small quantity of compound tincture of lavender. This is administered in doses of 2 minims, greatly diluted, and gradually increased to 8 minims. In small doses it acts as a stomachic and is valuable in gastric neuralgia and in the vomiting of chronic alcoholism. In larger doses it acts as a nerve tonic, entering the blood by absorption. Used externally it is a powerful caustic, and its use has been advocated in cancer, lupus, and epithelioma. Large doses of A. preparations produce a burning sensation in the throat, stomach, and abdomen, followed by vomiting, diarrhoea, cramps, exhaustion, and collapse. Symptoms of arsenical poisoning are frequently observed in those working with arsenical pigments, or in those living in rooms where arsenical pigments have been used in the preparation of the wall-paper. In recent years widespread poisoning has been caused by the presence of A. in a supply of invert sugar used in the brewing of beer. By commencing with small doses and gradually increasing the quantity, a certain degree of tolerance is acquired, as in the case of the A. eaters of Styria, who have been known to swallow more than

6 times the minimum fatal dose with no untoward results.

The stomach pump or emetics are to be used in the treatment of arsenical poisoning. Large doses of castor oil are essential to clear out the intestinal tract to prevent reabsorption. A good antidote is provided by freshly prepared peroxide of iron, produced by adding soda or ammonia to the tincture of iron.

Arsenical Pyrites, see MISPICKEL.

Arsenius, St (354-450), probably of Rom. extraction. Renowned for his knowledge of Gk and Rom. literature. Theodosius the Great appointed him as tutor to the princes Arcadius and Honorius. Afterwards lived a secluded life in an Egyptian monastery at Scete, and *d.* at Memphis. His feast is kept by the Rom. Catholic Church on 19 July, and by the Orthodox on 8 May.

Arsenius Autorianus (*d.* 1273), patriarch of Constantinople. Educ. at a monastery in Nicaea, of which he became abbot. Retired as a solitary to a Bithynian monastery. Became patriarch of Nicaea *ad* 1255. Excommunicated Emperor Michael for blinding John, his ward, the rightful heir to the throne, and was banished to Proconnesus, where he *d.* 1273. The new patriarch, Josephus, absolved the emperor, and the quarrel between the Josephists and Arsenites caused the Arsenian schism, which lasted until 1315.

Arsië, It. tn in Veneto (q.v.), 22 m. SW. of Belluno (q.v.). Pop. 2000.

Arsinoë: 1. Daughter of Lysimachus, King of Thrace, and first wife of Ptolemy II Philadelphus (285-247 BC). Banished to Coptos for conspiring against her husband. Her son afterwards became king under the title of Euergetes.

2. (316-269 BC) Daughter of Ptolemy I and Berenice I; married Lysimachus, King of Thrace. Murdered her stepson, Agathocles, in order to secure the succession. Ptolemy Keraunos then murdered Lysimachus and married A., but murdered her son by Lysimachus. She then fled to Samothrace, and afterwards married her brother Ptolemy II, ousting (1), and assuming the name of Philadelphus, 'loving her brother.' He had her deified, and built the temple of Arsinoë-Aphrodite at Alexandria.

3. Sister and wife of Ptolemy IV, with whom she defeated Antiochus at Raphia (217 BC), and mother of Ptolemy V. She was murdered in 203 BC.

4. (*d.* 41 BC) Youngest daughter of Ptolemy XI and sister of the famous Cleopatra. During Caesar's attack on Alexandria the inhab. recognised her as their queen. After Caesar's victory she was allowed to return to Alexandria. She was put to death at Miletus after the battle of Philippi by order of Mark Antony and at her sister's request.

Arsinoë, name given to various tns and vils. founded in Ptolemaic times, and mostly named after Arsinoë II Philadelphus, the wife of Ptolemy II. They include two vils. in the Fayum and a military station near the S. end of the Red Sea. The Fayum was called Arsinoïtes after the same queen.

Arsinoitherium, enormous fossil ungulate mammal discovered by Beadnell in the lower Oligocene of Egypt. It resembled a rhinoceros in appearance and was herbivorous. Its brain was small, and the head massive, bearing two huge pairs of horns.

Arsis and Thesis (Gk 'lifting and setting down'). *Arsis* is that part of a poetical foot on which the stress of the voice falls, the rest of the foot being called the *Thesis*. According to original Gk usage, *Arsis* denoted the raising of the hand or foot in dancing, thus denoting the accented part of the metrical foot, and *Thesis* denoted the fall of the foot, and thus the unaccented part of the prosodial foot.

Arsmetrik, old term for arithmetic in Chaucer's English.

Arson (Lat. *ardere*, to burn), malicious burning of a dwelling-house or outhouse of another. Under Rom. civil law it was punishable by death. In ancient laws of England it was known under the term *boeruel*. Under the Saxons it was punishable by death, and still remained a capital crime on the consolidation of the laws in 1827 and 1837. The Eng. law concerning A. was repealed and replaced by the Malicious Damage Act in 1861. By this Act A. was punishable by imprisonment for life or minor degrees of punishment. By the common law of A. it is required that some part of the house or other building be actually burnt. An attempt or intention does not constitute the offence, but the burning of any part, however trifling, is sufficient to complete the offence. If any person be in the house at the time of burning it is a capital offence.

Under the Malicious Damage Act of 1861 persons setting fire to any place of divine worship, dwelling-house, farmhouse, factory, outhouse, or public building, or setting fire to any place with intent to defraud any person, are liable to be sentenced to imprisonment for life or for any term not less than 3 years. Setting fire to crops is punishable by imprisonment for not more than 14 years.

In Scotland A. is known under the term wilful fire-raising.

Art. The term *art*, in the most general sense, may be defined as the skilled exercise of human faculties. It would be justifiable to say that there is an A. in many different things that human beings do, or can do: e.g. one can speak of the 'A. of household management' or even the 'A. of war' as well as the 'A. of painting,' etc. Thus, under the heading *art*, the anc. Chinese included ritual, music, archery, charioteering, and calligraphy.

The 'doing of a thing' is essential to this definition, distinguishing A. from the pursuit of knowledge, as in science and philosophy, the 'knowing of a thing.' This rightly suggests that *art* is closely connected with *craft*, though they are not identical. There is indeed a second definition, 'all that which is not done by man in the way of utility,' in other words all that he does in the way of luxury, pleasure, or from a spiritual need. Prosperous periods, it has been pointed out,

have always been favourable to the production of great A., though the urge may exist even in adverse conditions.

If we go back to the first glimmerings of A. for a clue to the impulses that generated it, there is evidence to show that it was always thought serviceable to man. The cave paintings of the European Stone Age, possibly dating back to c. 30,000 bc (see articles on PRE-HISTORY; DORDOGNE; LASCAUX), were not produced merely to ornament a cave wall, but show a rudimentary connection between A. and religion. They were a form of magic, assumed to give a hunting folk power over their quarry. The artists frequently depicted the animals that provide food as transfixed by arrows. They had so little regard for aesthetic effect that the images

E.N.A.

SPANISH MURAL PAINTING OF THE
MAGDALENIAN PERIOD

of bison and deer are superimposed, one over another. The paintings in any case must have been executed by artificial light, and it is hard to suppose that such toil for meagre spectacular result would have been undertaken with mere decorative intent. It has further been computed that the various phases of A. devoted to *teaching* occupy periods amounting to 10 times as many cents, as do those concerned with *pleasing*. The figures in Egyptian and Assyrian processions are mere symbols a part of ceremonial or contemporary hist. The beginnings of Christian A. show again the use of symbolic figures for the same didactic purpose. Luxury and diversion were clearly not the impulse of these manifestations, and yet it is impossible to deny that aesthetic ideas were in the minds of their authors. Granting that these pictured forms did teach, they must have done so by impressing the spectator.

The principles of aesthetics have become so much an essential part of all considerations of A. matters that it is *feeling* more often than *doing* which is implied now by the word *art*. 'So-and-so may be a clever painter, but he is no artist' is a remark one often hears. It derogates the particular painter's work to an early definition of A. when the A.s were the trades, the tradesmen being artisans. But feeling alone no more fills the definition of A. than does manual skill alone. A. is only completely expressed when material is

re-formed, re-created, re-fused by what R. L. Stevenson called 'the ardour of the blood' and what is known as the *divine afflatus*. The actual re-formation of the stone, metal, or pigment may fall short of the workman's ideal; but if it have realisation enough to frame and hand on the author's message, to show eloquently and appealingly that for which the mind and the heart of the author could find no other utterance, then that work is a work of A.

This 'message,' 'voice,' 'mood' of the work of A. was held by the classic mind to characterise everything under the aegis of the muses (of which *music* was once the adjective or generic term). Thus music, poetry, and the drama depend also upon A. for their perfection. The Greeks, in fact, despite their eminence in sculpture, included no representative of the visual A.s among their 'muses nine.' The industrial A.s may be more or less amenable to an exercise of taste making for luxury and diversion. Hence it is that whilst a farrier is not expected to make horse-shoes except in the approved way, the blacksmith working at the same forge may make a gate that one day might find its way into a museum of objects of A. Farriery therefore is not an A., but smithing perchance may be.

To avoid confusion between all such industries possibly amenable to the artistic sense on the one hand, and the higher activities on the other, wherein material is worked, changed, or put together, not for a utilitarian purpose, but solely to form a medium for the author's emotion, the latter have been called by the name of the *Fine Arts* (q.v.). This term is held to cover architecture, painting, and sculpture, but it does not extend, in common parlance, to music or letters. Possibly the difference at the root of this anomaly in nomenclature is that music and poetry exist in the abstract, and painting and sculpture in the concrete. That, however, would not prove that the former are any less fine as A.s than the latter. The 'A. of architecture,' as a term, also offers a little difficulty, for whilst in its highest flights architecture may answer every requirement of a fine A., it is in its dual character almost always concerned with the immediate wants of life, which fact is enough to put it outside one definition of A. at least. Macaulay declared it was half a science, and others have decreed it to be more science than A. On the other hand, it is often regarded as the oldest and greatest of the fine A.s, for the reason that painting and sculpture are subsidiary to the buildings they adorn. But that is as much as to say that the ring is more worthy than the engraved gem it holds; and as for priority, we know that the graphic A.s were flourishing before men began to build.

We are led to the conclusion that probably the part of architecture that is fine A. is in reality a variety of sculpture, for it works in 3 dimensions; its beauty and effect are due to design and proportion, and its surface markings count in the complete effect. These are conditions which otherwise sculpture alone fulfils.

Sculpture and painting remain with a standing against which there seems to be nothing to urge, and the popular idea of what fine A. signifies would appear to confirm this standing, though more than ever do the conditions of their pursuit to-day prove them dependent upon the margin that a strenuous age can spare for luxury.

All forms of graphic and plastic A. are admitted under the generic names of painting and sculpture, and can be broadly

Alinari

WINGED VICTORY OF SAMOTHRACE
Greek sculpture in the Louvre, Paris.

divided as *naturalistic* and *decorative*. This div. is often no more than one of point of view, for it is obvious that the Parthenon frieze was both, as were the pictures of the Venetian masters. The various sub-divs. of fine A., such as the *idealistic*, the *realistic*, the *literary*, and so forth, are necessary to lucid criticism, but they do not affect the question of A., for which all are mediums. The latest developments of naturalistic A. have rather forsaken the literary or story-telling phase, even in book illustration, which is now more decorative than naturalistic in its best forms. But literary A. will always make a strong appeal to the popular mind, which naturally thinks first of anecdote, being more alive to the joys and woes of life than to the finer-drawn sensations of A. for A.'s sake felt by critics.

The terms *idealistic* and *realistic* are used in criticism to signify 2 opposite methods of approach on the part of the

artist. The idealist is one who gives form to incidents and scenes that were generated partly or wholly in his own mind. He may, and usually does, get the germ of his subject from something seen, but the material is gestated, so to speak, and the result appears with more generalisation and psychological import than its actual prototype possessed. The realist, on the other hand, labours to give a likeness of things as they are; showing a sincere desire for truth, his efforts may

appalling could he render them by invention. It is the power of communicating the spiritual or romantic force of things to the spectator that constitutes idealism in A. The realist also might imagine scenes, but he would present them in such a way that they might be mistaken for topographical records. They might be beautiful examples of fine A., but they would not be ideal. Fine A. must interpret, however, and inasmuch as the spirit stirs more deeply than the letter, the idealist is in a better position than the realist to set up that correspondence of feeling between artist and beholder which fine A. demands.

Of decorative A. the great mass finds expression in the crafts and industrial A.s. Much of it takes the form of ornament. But mural painting and stained glass belong legitimately to the fine A.s when they rise above the level of commercial mediocrity (see MURAL DECORATION; FRESCO; STAINED GLASS). Recent years have witnessed an increasing movement against naturalism, as being a phase antagonistic to the idea of the space decorated. The idea of this space, it is held, should not be forfeited to pictorial ideas. In the belief that such matters as linear and aerial perspective, round modelling, natural action, modulated colour, and other characteristics of realism prevent the wall upon which they appear from looking like a wall, modern decorative artists have adopted archaisms as a safeguard against the naturalistic view of things. The great decorative painters, Michelangelo, Veronese, Rubens, and others, strove, on the other hand, to eliminate the idea of the wall, and to that end represented starry heavens in ceilings, columns, and openings in wall spaces, and gave to figures a perspective view from the floor. For the most part decorative A. shows signs of free growth only in sporadic efforts to burst the bonds of its conventions.

An altogether different view-point is, however, possible—namely, that which regards both the idealistic and the realistic approaches as belonging to the category of naturalistic A., and therefore as opposed to another conception of A. which stresses its abstract qualities; that is to say, the qualities which constitute design apart altogether from its relation to nature or the natural objects which it may represent. From that point of view the formalised lion so frequently represented in ancient sculpture is better A. than Landseer's lions on the Nelson Monument, and the Italians of the Renaissance, generally speaking, are better designers than the Flem. or Ger. artists of the period. Of recent years distinction between the naturalistic or representational and the purely aesthetic or abstract qualities of A. has become more and more emphatic, leading eventually to designs in sculpture and painting which show no or only a barely discernible relation to nature or natural objects. See also AESTHETICS; ARCHITECTURE; DESIGN; DRAWING; PAINTING; SCULPTURE.

The hist. of A. shows that it is not an

Museum, Florence.

have a high quality as A. Turner presents an idealised view of nature whereas Constable approaches it in a realistic mood. The It. and Dutch schools of painting show the contrast forcibly. Sculpture offers Pheidias and Donatello respectively. But the case cannot be left so simply stated, because the 2 phases are, in a manner, combined in the finest works of A. It is evident that the idealist is really more in need of knowledge born of observation and study than is the realist, since the former does not oblige himself to copy from nature; and were he, moreover, not realist enough to carry conviction, his idealism would be but futile and meaningless. The more thoroughly a Turner could know the realities of sunsets and thunderstorms, the more magnificent or

isolated phenomenon, but is bound up with the hist. of civilisation. What is known as 'primitive' A. is not necessarily crude or ill-formed but the product of a certain type of early culture. The naturalism and vigour of cave A. is astonishing, though it belonged to a primitive society. In comparatively recent times the same wonderful power of animal drawing appears in the A. of the African Bushman (see BUSHMAN). We may go back to c. 4000 BC to find pottery with patterns that consciously emphasise the form and point to a pleasure in the craft, a refinement in the fashioning of tools. Among existing peoples with a primitive economy, Polynesians, Australian aborigines, or, at a somewhat different level, the Pueblo Indians, the same feeling for ornament and pattern exists. (See also CAVE ART; see L. Adam, *Primitive Art*, 1949.)

The connection between A., religion, and gov. develops in the early civilisations with organised city life. A. was an effort on the one hand to convey the power and magnificence of authority; and on the other to give visible shape and abode to the mysterious powers of the universe. Temple and palace were jointly the focus of the artist's activity. The dolmens and cromlechs of the Neolithic and Bronze Ages (see STONE AGE; BRONZE AGE; MEGALITH CULTURE; AVEBURY; STONEHENGE) point to the dawn of temple architecture, impressively perfected in Mesopotamia, Egypt, and, much later, in Mexico (see BABYLON; ASSYRIA; UR; EGYPT, *History*; MEXICO, *Archaeological Research*). The vast halls of Egypt with many columns, some of which were 70 ft high, were covered with coloured reliefs and held colossal statues 'in the round.' The advanced civilisation of Crete (see CRETE and AEGEAN CIVILISATION) yielded to the excavations of Sir Arthur Evans the vast palace of Minos, with paintings and sculpture of remarkable force and vividness. It is easy to understand why sculpture flourished in these early civilisations and why the representation of human beings became its main aspect. It gave a permanent record of success: of an Assyrian king triumphant in the lion hunt, muscular and invincible, of an Egyptian Pharaoh uniformly successful in battle. It also crystallised the idea of divinity. A god was a superior man, or alternatively a man with the added attributes of the animal creation. The need for working strictly to the requirements of ruler and priesthood accounts for the conventions governing A. in this ancient world. Only at rare intervals did it attain freedom or attempt to experiment (as in the reign of Akhnaton). It was the free mind of the Greek that produced the conception of A. that has had a lasting effect on Europe (see GREECE, *Greek Art*). It was idealistic in its attempt to conceive the perfect type of human being, and realistic in, for the first time, conveying what the human body was really like. By c. 450 BC Gk genius, in the persons of Phidias, Polyclitus, and Myron, had risen to the high level evidenced by the frieze of the Parthenon. All archaism had been

thrown off when Praxiteles, Scopas, and Lysippus added to the Phidian traditions greater facial expression and sweetness. The victories of Alexander closed the Hellenic period. From this time until the Rom. conquest the Hellenistic period extended. It added landscape to the scope of painting, and introduced emotional expression into sculpture, as in the 'Laocoön.' That the Greek was always a true artist every discovered object of common utility bears proof. Zeuxis, Apelles, and others were painters whose work we have to imagine; but decorated

In the Scrovegni Chapel, Padua.

vases survive in plenty which show beauty of form and grace of invention. Engraved gems have come down to us unspoiled by time. They have never been surpassed for the perfection of their beauty and skill. The Gk ideal in sculpture finds its only rival in the contemplative perfection of the Indian figures of Buddha.

The Romans, although they imported Gk artists and pillaged Gk soil for objects they had the taste to admire, were nevertheless the heirs of a native A. Etruscan A. had its own power (see ETRUSCAN AND ETRUSCAN ARCHITECTURE AND ART). The Romans, who, like the Assyrians, made use of the arch and the dome, produced viaducts, arenas, and other great works of utility. Their statues and reliefs are vigorous and realistic. Especially great are their vivid portrait busts (see ARCHITECTURE, Rome; POTTERY; SCULPTURE). From the Rom. A. and

architecture, influenced by oriental and Hellenistic A., evolved the Byzantine. The early Christian churches were modelled upon the Rom. basilica, and ornamented with mosaics stiff in design but gorgeous in colour. Byzantine A. avoided sculpture 'in the round' as appertaining to idols (see under BYZANTINE ARCHITECTURE and BYZANTINE ART). Its carvings, embroideries, and enamels were coveted all over Europe, and the epoch was one of great wealth and magnificence. The Rom. basilica, by the principles of the round and pointed arch, developed respectively into Romanesque and Gothic building (see ARCHITECTURE). The Gothic

Medici Society

RAPHAEL: SISTINE MADONNA

gave rise to a lively and human sculpture, in which naturalism revived.

The close connection of religion and A. was, as in pre-Christian times, a main element in the growth of civilisation. To begin with, the claims of religion once again tended to estab. conventions in A. The Gk delight in bodily perfection was incompatible with the task of expressing doctrine and spiritual discipline. Thus in the Middle Ages representations of the unclothed figure were timid and imperfect. Islam gives us a signal example of the effect of a monotheistic creed in banishing realistic representation altogether and substituting abstract design (see ARCHITECTURE, *Mohammedan*). European progress to the heights of the Renaissance (q.v.) was to some extent a return to the Gk freedom of realistic representation both in sculpture and painting. From the 14th cent. to the 16th cent. in Italy was a steady advance, from the first

efforts of Siena and Florence (see articles on Duccio and Cimabue) to, for example, the noble pictorial drama of Giotto (q.v.) and the naturalism of Masaccio (q.v.) in painting and of Donatello (q.v.) in sculpture (see ITALIAN ART and RENAISSANCE).

The Renaissance period dates from the 15th cent., when classic remains recalled men to the older ideals. Its result in architecture was that every nation adapted the classic elements to its own special needs. In sculpture and painting 3 great men represent supremely the passion for wide and exact knowledge combined with power and feeling that characterises the period—Leonardo da Vinci, Michelangelo, and Raphael (see individual articles). Leonardo's researches went beyond the bounds of A., but his few paintings are supreme in their expression of mysterious beauty. Michelangelo in sculpture and in his masterpiece in painting, the ceiling of the Sistine Chapel, showed a unique command of the human figure in expressive action. Raphael, 'the prince of painters,' is equally a master in vast rhythmic compositions and in small pictures of exquisite charm. Delight in bodily perfection and sensuous qualities of form and colour appeared in a wider range of subject-matter, mythological as well as religious, and is notable in Venice, which boasted the great names of Mantegna, Giorgione, Titian, Tintoretto, and Veronese (see articles on individual artists).

What came to be known (in the 18th cent.) as 'the Grand Style' was the special achievement of Italy. How A. is linked with racial character and differs with climate and environment is shown in the separate N. development of Gothic A. The soaring height of the Gothic cathedral opposed itself to the classic stability. In sculpture and painting there is an interest in realistic and sometimes grotesque detail, as opposed to generalised and ideal forms. Flem. painting (see FLEMISH ART), developing from the miniature into the minutely finished oil-painted panel (as opposed to the It. fresco), is an outstanding example, and such masters as Van Eyck, Memling, and Van der Weyden (qq.v.) display the N. realism at its best. Realism, a sombre or fanciful outlook, and much careful craftsmanship characterise Old Ger. art (see GERMAN ART, as in Grünewald (q.v.)), though some reflection of the Renaissance spirit appears in the great Dürer (q.v.) and of the Reformation in the highly individual portraits of Hans Holbein the Younger (q.v.).

Until the end of the 18th cent. the function of A. as an expression of secular power is as notable as its connection with religion. The portraits of Queen Elizabeth I are almost Byzantine in their formal reflection of authority and majesty. The idea of A. as propaganda for absolutism is to be seen in the immense decorative works of Rubens (q.v.); and even more strikingly in the France of Louis XIV (see FRENCH ART), when architecture, painting, and many forms of luxurious craftsmanship all ministered to the king's glory.

Yet A. in the post-Renaissance period

was already set on a new course and there was a growing independence of either religious or authoritarian rules. In Italy Caravaggio (q.v.), a born rebel, introduced the opposite of ideal types into ostensibly religious pictures, with violent effects of light and shade that were much copied. Velazquez (q.v.) in Spain, though an ornament of the Sp. court, was independent and realistic in his attitude to A. Claude and Poussin (q.v.), the greatest Fr. painters of Louis XIV's time, unaffected by its pomp, produced their masterpieces in Rome.

A tendency to reflect social life and surroundings is seen in Holland, freed from religious and political domination (see DUTCH ART). Protestant Holland in the 17th cent. had no call for religious works, but was prolific of portraits, *genre* subjects, and landscapes. Rembrandt, Hals, De Hooch, Ruysdael, Hobbema, Cuyp, and Vermeer are the names of some of the greatest men of this glorious epoch of healthy naturalistic A.

In the 18th cent. this trend continued. Fr. A., with Watteau, Fragonard, and Boucher (q.v.), reflects a charming and gay society. Chardin (q.v.) pictures middle-class life. In Italy Canaletto, Guardi, and Loughi (qq.v.) bring Venice and its life before us. England develops a national A. (see ENGLISH ART), eminently social in character. Hogarth (q.v.) substitutes moral lessons for religious fervour in pictures of modes and manners. The portrait painters, Reynolds, Gainsborough, Romney, Raeburn (qq.v.), are less formal than their predecessors in their appreciation of character. Sporting and rural scenes reflect the taste for country life. Landscape was one of the triumphs of secular A. and perhaps the most important Eng. achievement, with Wilson and Gainsborough (qq.v.) in the 18th cent. and Turner and Constable (qq.v.) in the earlier part of the 19th cent. The rise of the water-colour school, reflecting an interest both in foreign travel and in the scenery and antiquities of Britain, is a splendid phase of landscape, in which the names of Turner, Girtin, Cozens, De Wint, Cotman, and Bonington stand out (see articles on individual artists).

Two great events, the Fr. Revolution and the Industrial Revolution, brought further change in the idea of A., and connection with estab. institutions and forms of patronage was broken. The result was to let individual expression take its own course, to make the artist a critic of, or a rebel against, society, or one who concentrated solely on his aesthetic problems, as may be seen from the 'movements' that characterise the 19th cent.

It began with that conflict between emotion and discipline in A. that is represented by Romanticism against Classicism. In France there is Delacroix (q.v.) on the one side, Ingres (q.v.) on the other. In romantic mood, artists turned to nature. Eng. landscape had a powerful effect in France, and its influence is seen on Corot (q.v.) and the members of the famous Barbizon School (see BARBIZON). Another aspect of Romanticism was a discontent with the present that led artists to seek

style and inspiration in the past and more specifically in the A. of the Middle Ages. This trend is observable in architecture (the Gothic Revival), the industrial A.s (as shown, for example, at the exhibition of 1851), and the subject-matter of painters—though the results have never commanded unreserved admiration. Painters of the realist school, however, were willing to face the contemporary problem: Courbet (q.v.) in France, later the Impressionists (see IMPRESSIONISM); in England Pre-Raphaelitism in an early phase (see PRE-RAPHAELITE BROTHERHOOD). The idea

Mansell

'PORTRAIT OF THE ARTIST'S WIFE,' by
JAN VAN EYCK
Flemish School, Bruges.

of 'A. for A.'s sake' emerged, proclaiming the artist's freedom from all other ends except the creation of beauty. In England it produced some absurdities (see AESTHETICISM), but in France many painters lived solely for their A. (and for the first time in hist. completely divorced from a public), this isolation being dramatically illustrated by the 3 great figures of Cézanne, Gauguin, and Van Gogh (see individual articles; also POST-IMPRESSIONISM).

At the same time the 19th cent. had its 'popular A.' in many ways defective. Even the serious idealism of Watts (q.v.) and Leighton (q.v.), and the great abilities of Millais (q.v.), suffered from its general tendency. The new phenomenon of a wealthy middle class, avid of culture but without standards of aesthetic judgment, produced A. appealing to a love of sentiment and anecdotes in painting, and of meaningless elaboration and ornament in design. In opposition to this Wm Morris (q.v.) conceived the idea of a true popular

A., produced by the people in general, inherent in all their work, 'the expression of joy in labour.' Morris stimulated the revival of hand-craftsmanship and the A.s and Crafts movement that still has its adherents and had much influence in Germany and Austria (see ART NOUVEAU).

Some radical adjustments of view have been made in the last hundred years. An extended knowledge of A. in different parts of the world through archaeological discovery, the spread of communications, and other factors has made it clear that the Renaissance ideal and the views of

recommendation. Reviewing their complex inheritance original spirits in Europe turned to first principles, with a consequent rejection of the highly developed imitative A. of the time. The greatest individual influence was Cézanne (q.v.), who began as an impressionist but was driven to seek for basic principles of structure in nature that the impressionists had ignored. His insistence on the importance of geometry as the basis of form had its effect in the growth of Cubism (q.v.) and the work of its exponents, Picasso, Braque, Léger (qq.v.), and others. An abstract geometric A. was the logical conclusion, and a similar process of thought to that evinced in painting is evident in the austere simplicity of modern architecture (see ARCHITECTURE) and in the design of various objects of use (see INDUSTRIAL DESIGN).

Another aspect of the return to essentials is the value set on primal emotion, or natural and instinctive expression. Van Gogh (q.v.) is an example of the true 'expressionist' (see EXPRESSIONISM). The pursuit of this end is marked by the interest in naïve painters (e.g. Henri Rousseau 'Le Douanier,' also in the spontaneous A. of children. The relation of A. and the subconscious mind has been exploited by the Surrealist movement (see SURREALISM), an attempt to visualise the dream-life studied by psycho-analysis, as in the work of Dali and Ernst (qq.v.).

Somewhat apart, though developing from Cubism and Expressionism, was the short-lived movement, Futurism (q.v.), a whole-hearted acceptance of the machine age and rejection of the past, which fl. briefly in Italy, had its reflection in Eng. Vorticism (see WYNDHAM LEWIS), and gained a foothold in Russia in 1914. In the first fervour of Bolshevik revolution the Futurist conception of a 'machine A.' was enthusiastically taken up, though it has now been abandoned for some 30 years.

This breathless succession of new movements, accompanied by challenging manifestoes, shows how strongly the need has been felt to create a modern A., and their impact has been felt in every country and every form of A. They do not necessarily invalidate the work of artists who still belong to earlier or different traditions, as for instance Augustus John (q.v.) or Walter Sickert (q.v.); yet an essential difference marks off the specifically 'modern' work of A. Though post-impressionist developments have known many varying and sometimes contradictory aims, they have one thing in common: they all regard the work of A., whether sculpture or painting, primarily as a reality and not as an illusion or counterfeit of nature. In this sense there is a sharp cleavage between academic, idealistic, realistic, romantic, or impressionist A. on the one hand and modern A. on the other: the former categories being founded on appearances of nature, while the latter rests on the artist's inherent creative will (Wm Blake, q.v., gives a striking and solitary anticipation of this in an earlier day).

Mansell

'ISABELLA OF PORTUGAL,' BY TITIAN
Prado, Madrid.

18th-cent. aestheticians, based on the classic productions of Greece and Italy, are no longer the sole criteria. The stages were successively (1) the 'discovery' of the It. 'primitives' (see PRIMITIVE PAINTING); (2) the 'discovery' of the A. of the Far E. The Jap. colour prints (q.v.) that began to arrive in Paris c. 1860 modified ideas of composition and controlled colour harmony. The influence may be seen in Whistler's 'Battersea Bridge' (Tate Gallery), the posters of Toulouse-Lautrec, the drawings of Beardsley. The brilliance of the Persian miniature (see PERSIA, Art) and the calligraphic poetry of Chinese landscape (see CHINESE PAINTING) have in this cent. been brought freshly to W. eyes in the series of great Royal Academy exhibitions; (3) the 'discovery' of aesthetic value in forms of A. once dismissed as crude, e.g. African sculpture, Iberian sculpture, pre-Columbian Amer. sculpture, their powerful grasp of essentials in form being a main

In the post-war period one sees the continuing production of 'abstract' or non-representational A., equally in painting and sculpture: even more perhaps in the latter than the former. Henry Moore (q.v.) and Barbara Hepworth (q.v.) illustrate this strikingly, all the more if we turn back for comparison to the neo-classicism of Flaxman (q.v.) or the Renaissance revival of Alfred Stevens (q.v.). Such a distinguished naturalistic painter as Victor Pasmore has since 1951 abandoned his earlier aims, to devote himself

the Second World War the products of child A., encouraged in schools, have been frequently exhibited to an interested public. The therapeutic value of painting and drawing, in hospitals and periods of convalescence, has been observed (see A. Hill, *Art Versus Illness*, 1947); and the example of Sir Winston Churchill (*Painting as a Pastime*, 2nd ed. 1949) has its encouragement for the amateur. Contributors to a 'Painting for Pleasure' exhibition in 1955 (who included King Feisal of Iraq, the Duchess of Gloucester,

to experiments in pure form; nor has he been alone. On the other hand there is a rival trend to a new or reformed realism, both in France and England. Their coexistence must be accepted and it is well to bear in mind that we must judge finally by individual qualities, which necessarily vary, rather than in terms of allegiance to one movement or another.

Public appreciation, as one would expect, has hardly kept pace with the swift development of 20th-cent. A., though recurrent controversies are evidence of its trenchant effect. Painting which shows the characteristic vividness of modern colour finds acceptance with many on this account, as the present trend in colour reproductions goes some way to prove. The idea of free expression in A., outside the professional sphere, has had a noteworthy expansion in recent years. Since

Colonel J. J. (now Lord) Astor, and Mr Noel Coward) concurred in the view that 'painting is the best of all means of escape from the trials of life and work.'

Art and Part. In Scots Law no distinction is made between the commission of a crime and accession to it. Any person who aids the execution of a crime is said to be guilty A. and P. Guilt by accession may be incurred by advice, assistance, or incitement either prior to or at the time of the criminal act. Accession after the fact is not a crime in Scots Law except in treason.

Art Exhibitions. Whether organised for profit or otherwise, A. E. have become increasingly popular in modern times. Art galleries are always open in London with private shows of the works of artists who are offering them for sale; while, in recent years, public interest in art has been stimulated by the admirable series of ancient and modern A. E. organised by the Royal Academy of Arts, and also (since 1945) by the Arts Council. The Festival of Britain year, 1951, saw exhibitions distributed all over the country according to the local connections of artists, e.g. Gainsborough at Bath, Reynolds at Plymouth, etc. The most popular annual exhibition in London is that of the Royal Academy, first held in Pall Mall in 1768, and afterwards in Burlington House, where the 189th summer exhibition was held in 1957. The exhibits include oil-paintings, water-colours, designs in architecture, miniatures, engravings, etchings, and sculpture. Other important Academy exhibitions have since the war included 'The King's Pictures' (1946-7), 'Indian Art' (1947-8), 'Landscape in French Art' (1949-50), 'Holbein and his Age' (1950-1), 'L'Ecole de Paris, 1900-1950' (1951), 'Dutch Pictures' (1952-3), 'Flemish Art' (1953-4), and 'European Masters of the 18th century' (1954-5). Arts Council sponsorship has given, since 1946, a full view of continental moderns: Picasso, Klee, Braque, Rouault, Léger, Dufy, Munch; and such exceptional exhibitions as the 'Van Gogh' (1947), 'Masterpieces from the Vienna Galleries and Pinakothek, Munich' (1948, 1949), and 'Mexican Art' (1953). European exhibitions show alike development in scale and in scholarship; from many one might instance 'French Drawing from Fouquet to Cézanne' (Orangerie, Paris, 1950) or 'Giorgione and the Giorgionesques' (Venice, 1955).

The Royal Society of Painters in Water-Colours ('Old Water-colour Society'), Conduit Street, exhibits works of its

members and associates in the spring and autumn of each year; the Royal Institute of Painters in Water-Colours, 195 Piccadilly, exhibits annually works of any artists selected by their committee. In the same building the Royal Institute of Oil Painters gives exhibitions in the autumn on the same principle. The Royal Society of Brit. Artists, Suffolk Street, S.W., exhibits works of outside artists as well as of members; the Royal Society of Painter-Etchers and Engravers, Conduit Street, exhibits yearly works of its members and associates; the Royal Society of Portrait Painters, founded in 1891, with a limited membership, selects works of members and non-members. Ann. exhibitions of the New Eng. Art Club and London Group consist of works which the artists have felt to be outside the scope of other exhibitions.

The Royal Scottish Academy of Painting, Sculpture, and Architecture, Princes Street, Edinburgh, incorporated 1838, and the Royal Hibernian Academy of Arts, in S. Frederick Street, Dublin, also hold exhibitions; and in Wales the Royal Cambrian Academy of Arts exhibits in Conway.

Other well-known galleries with frequent exhibitions in the provs. are the Royal Glasgow Institute of Fine Arts, the Royal W. of England Academy, the Royal Birmingham Society of Artists, and the Walker Art Gallery, Liverpool.

Art Museums and Galleries. The world's public art galleries of to-day are almost entirely of 19th-cent. or later foundation even when depending on works accumulated in the past. The prin. collections of art treasures in Britain include: *London:* The British Museum (q.v.); Victoria and Albert Museum (q.v.); National Gallery (q.v.); National Portrait Gallery (q.v.); Tate Gallery (q.v.); Wallace Collection (q.v.); Sir John Soane's Museum (see SOANE); Dulwich Gallery (see DULWICH); Hampton Court Palace (q.v.); Kenwood House (see IVEAGH). The Guildhall Art Gallery, City of London, is noted for its paintings of civic occasions and ceremony. The National Maritime Museum, Greenwich (q.v.), and Royal United Service Museum, Whitehall, are of artistic interest in their collections of paintings and engravings of service hist., ship models, etc. Apsley House, presented to the nation by the present Duke of Wellington, has notable paintings by Velázquez and other masters. It was opened to the public in 1952.

Provinces. The many municipal museums and galleries need not be listed here, but the healthy tendency to revise and improve Victorian and Edwardian foundations by the addition of good modern work is to be remarked. Notable collections are the Birmingham Museum and Art Gallery, the Walker Art Gallery, Liverpool, and the Manchester Corporation Art Galleries (each with fine examples of the Brit. school and the Pre-Raphaelites in particular); Norwich Castle Museum and Art Gallery (for the 'Norwich School' especially); and Temple Newsam House, Leeds (pictures in period setting). The

Ashmolean Museum, Oxford (q.v.), and Fitzwilliam Museum, Cambridge (q.v.), have excellent picture galleries, and the former a very important collection of master drawings. The National Gallery of Scotland, Edinburgh, National Museum of Wales, Cardiff, and National Gallery of Ireland, Dublin, have collections of wide range. The Glasgow Art Gallery also requires special mention.

Dominions: See DOMINIONS ART MUSEUMS. *U.S.A.:* See AMERICAN ART MUSEUMS.

Europe. The great art collections on the Continent are those of the Louvre (q.v.), Paris; the Prado (q.v.), Madrid; the Uffizi (q.v.) and Pitti Palaces, Florence; the Vatican (q.v.) and Villa Borghese (see ROME); the Accademia (q.v.), Venice; the Brera Gallery (see MILAN); the Art Hist. Museum, Vienna (see VIENNA MUSEUMS); the Old and New Pinakothek, Munich; the Dresden Gallery; State Museum, Berlin (see GERMAN ART MUSEUMS); Rijksmuseum, Amsterdam, and Mauritshuis, The Hague (see DUTCH ART MUSEUMS); Antwerp Museum of Fine Arts and Palais des Beaux Arts, Brussels (see BELGIAN ART MUSEUMS). Other notable collections are at Athens, Budapest, Copenhagen, Naples, Oslo, Leningrad, Moscow (Museum of Modern W. Art), Stockholm, and Zürich. See also MUSEUMS. See H. Tietzel, *Treasures of the Great National Galleries*, 1955.

Art Nouveau, the 'new art' of the late Victorian (c. 1890) and Edwardian periods. It has two aspects: (1) as a decorative style, noted for extravagant curvature, and a late offshoot of Pre-Raphaelite floral design, flourishing in Austria and Germany, where the influence of Wm Morris in handicraft and Aubrey Beardsley in draughtsmanship was strongly felt; (2) a desire for a new simplicity in architecture, exterior and interior, with which its decorative side is sometimes curiously combined. Among the architects and craftsmen associated with the movement are C. R. Ashbee (1863-1942), George Walton (1867-1933), C. F. A. Voysey (1857-1941), and, outstandingly, C. H. Mackintosh (1868-1928) (Glasgow School of Art, 1897, the 'House of an Art Lover', Darmstadt, 1902). The metalwork of Sir Alfred Gilbert, the sculptor of 'Eros', and in France the glassware of René Lalique show the ornamental aspect of A. N. to advantage. See N. Pevsner, *Pioneers of the Modern Movement*, 1949; also *Victorian and Edwardian Decorative Arts* (Victoria and Albert Museum picture book), 1952.

Art Sales. Change in social conditions in England has had a notable effect on A. S. The maintenance of mansions or ancestral homes having become increasingly burdensome, through economic stringency and high taxation, heirlooms have been sold for the high prices they have been able to command. These sales often attract public attention, partly on sympathetic grounds and partly through excitement roused by Amer. competition. This rivalry in art collection existed in pre-war days, but not to so great an extent. Yet there were some very

notable A. S. before the war; e.g. Lord Duveen paid £1,000,000 in 1907 for the Rodolphe Kann collection of pictures and *objets d'art*, including a dozen splendid Rembrandts. In the following year the Holland sale realised £138,000 for some 400 lots, which was a record sum for a collection of paintings by modern artists. In 1910 the Yerkes sale in America brought in over £2,707,000, including the sum of £137,000 for Frans Hals's 'Portrait of a Woman'; and the E. H. Gary sale brought in \$2,297,000, including \$270,000 for Gainsborough's 'The Harvest Wagon.' Mantegna's 'Madonna and Child' sold for £31,000 in 1912 in Berlin, and about the same time Rembrandt's portrait of his son Titus was sold in the U.S.A. for \$270,000. In 1915 and 1916, during the early part of the First World War, there was naturally a slump in the sale of heavily priced pictures, though in 1917 Reynolds's portrait of Lady Ann Fitzpatrick as 'Sylvia' was sold for nearly £20,000. But after the war prices soon began to rise and, in 1919, the Hamilton picture sale brought in £169,000, including £6500 for Turner's drawing of 'Zürich' and £26,700 for Hals's portrait of Joseph Coymen. The sale of Sargent pictures in 1925 showed a total of £146,000 for 160 lots in one day, but sentiment played some part in the result. But in 1923 the total sum at the auction of the pictures of Sir John Robinson was only £200,000, though the lots included over 100 old masters, numbers of them failing to reach the reserve price. In 1927, however, a record was created in that more than 130 pictures priced at sums exceeding 1400 guineas each had changed hands during the year.

For many years the paintings which have realised the highest prices at auction sales have been mainly portraits by Rembrandt, Gainsborough, Romney, Hoppner, Van Dyck, Reynolds, and Raeburn. But there has also been an increasing demand for paintings of the 19th-cent. Fr. school: Courbet; Corot; the Impressionists—Manet, Monet, Renoir, Pissarro, Sisley; Cézanne, Gauguin, Van Gogh, Seurat, and such lesser artists in the same historic current as Boudin or Signac. A painting by Boudin was sold in Paris in 1951 for 910,000 francs. Record high prices were obtained at the Cognac sale of 1952 in Paris, Cézanne's 'Apples and Biscuits' selling for the equivalent of £38,500, Renoir's 'Young Girl with Hat' for £26,500, and Van Gogh's 'Thistles' for £19,500. These do not fetch the extraordinary prices realised by the old-established masters, though Cézanne's 'Vieille au Chapelet' was bought in 1954 for the National Gallery for about £30,000. A. S. also show the high value now attached to works by famous painters of the modern school such as Picasso, Matisse, and Braque. It was noted that at the Hôtel Drouot in 1951 (its centenary year) paintings by Matisse were sold for a million francs each. Probably the record figure for any picture was that obtained by Lady Desborough for the Cowper 'Madonna' by Raphael, the price being

about £175,000. The 'Cornaro' Titian, bought for the nation from the Duke of Marlborough for £120,000, also ranks very high in the list of the record prices. In the private sale of the Duke of Westminster's collection was included Gainsborough's 'The Blue Boy,' which was sold for the Huntington collection of California for well over £100,000, while in the same sale Reynolds's 'Mrs Siddons as the Tragic Muse' was sold for little less than £100,000. 'The Blue Boy' was actually bought in 1803 by John Hoppner for £65, having been sold 7 years earlier for half that price. Up to that time the highest price at any auction for a Gainsborough picture was £20,000, which was paid for 'The Market Cart.' In 1926 Gainsborough's portraits of Miss Tatton and Master Heathcote each fetched £16,000. £100,000 was paid by a Philadelphia buyer for Lord Lansdowne's 'Mill' by Rembrandt, and the same sum was realised for Frans Hals's 'The Artist's Family,' Reynolds's portrait of Lady Betty Compton, and the portrait of King Philip IV by Velazquez. Other high prices include the following: Gainsborough's 'Hon. Ann Ducombe,' £84,000, and the same painter's 'Harvest Wagon,' £72,000 (resold in America in the Gary collection); Holbein's 'Duchess of Milan,' bought for the nation for £82,000; 'A Spanish Statesman' by Velazquez, £80,000; the portrait of Mary M. Barrett (known as 'Dinkie') by Lawrence, 74,000 guineas; Piero della Francesca's 'Crucifixion'—a small wood-panel—£75,000; Romney's beautiful portrait of Mrs Davenport, £60,900; Rembrandt's 'Man Holding a Scabbard,' 48,000 guineas; the Rokeby 'Venus and Cupid,' by Velazquez, bought for the nation for £45,000; Van Dyck's 'Portrait of Anton Triest,' £29,000; Gainsborough's 'Anne, Countess of Chesterfield' and Van Dyck's portrait of Jacques le Roy, each 17,000 guineas; Hobbema's 'Woody Landscape,' £15,750; and Hals's 'Portrait of a Gentleman,' £9000. These 2 last-mentioned prices illustrate the capriciousness of taste in some cases, for Hobbema's picture was sold in 1890 for £3400 and again, in 1938, for 3500 guineas, while that of Hals changed hands in 1884 for 4 guineas. The Eng. National Gallery secured Raphael's 'Ansidei Madonna' in 1885 for only £70,000 from the Duke of Marlborough, while J. Bache, a New York banker, paid £120,000 for the sole example of a male portrait by the same master. In 1947 a set of 12 floral studies by Jacob van Huysum, painted in the 18th cent. for a comparatively modest fee, was sold for £13,500. See also CHRISTIE'S; NATIONAL ART COLLECTION FUND; NATIONAL GALLERY.

The sale in 1951 of a Leonardo da Vinci drawing from Lady Melchett's collection (bought by the Metropolitan Museum, New York, for £8000), of a Guardi drawing at the Ashburnham sale in 1953 for £4500, and of 9 etchings by Goya at Sotheby's in 1952 for £1800 shows the high value which attaches to graphic art.

The leading sales rooms in London are

Christie's, King Street, St James's, SW.; Sotheby's, New Bond Street, W.; Robinson & Foster, Queensberry Hall, S. Kensington, SW.; Puttick & Simpson, New Bond Street, W.; and Knight, Frank & Rutley, Hanover Square, W. Details will be found in the ann. vols. of *Art Prices Current*, and in *The Year's Art*.

Arta, tn and dept of Greece. It derives its name from the R. A., or Aracthus, on which it stands. This riv. was, before the Balkan war of 1912, the frontier between Greece and Turkey. A. has many fine buildings, among which are a Byzantine castle; a palace belonging to the Gk metropolitan; the church of the Virgin of Consolation, and other Byzantine churches of the 13th and 14th cents. There is a famous medieval bridge. Chief manufs. are woollens and cottons, embroidery, Russian leather. Soil is fertile, and gardens and orchards surround the tn. In 1083 it was taken by Bohemund of Tarentum, in 1449 by the Turks; 1798 Ali Pasha captured it; 1881 ceded to Greece. Pop.: dept, 72,700; tn, 13,000.

Arta, Gulf of, or Ambracian Gulf, an arm of the Ionian Sea, about 23 m. long. From 1832 till 1912 its N. shores belonged to Turkey and its S. to Greece. Fish are plentiful, especially eels, mullets, and soles. On its shores are ruins of many ant. castles.

Artabanus, name of 4 Parthian kings.

Artabanus I succeeded his nephew Phraates II c. 127 bc, and perished in battle against a Mongolian tribe.

Artabanus II (c. ad 10-40), made king by a party of nobles who rejected Vonones I, the Rom. nominee, who fled to Armenia. When A. invaded the latter country Tiberius sent Germanicus to restore peace. Later Tiberius, at the instance of A.'s Parthian opponents, sent Vitellius to enforce Rom. authority in the E. A. eventually concluded a treaty with Vitellius and renounced the throne. See Tacitus, *Annals*, ii. 3 sqq.

Artabanus III reigned for a short time in ad 80 and the following years.

Artabanus IV, last Parthian king, in Babylon till ad 222. He defeated Macrinus (217), and was killed in battle 226.

Artabazus: 1. Persian general in the army of Xerxes, served under Mardonius at Plataea (479 bc).

2. Persian general under Artaxerxes II, Artaxerxes III, and Darius III. One of his daughters, Barsine, became by Alexander the Great mother of a son named Hecates.

Artanthe Elongata, shrub of the family Piperaceae, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds.

Artaxerxes I (465-424 bc), son of Xerxes, King of Persia. In his time peace was restored between Persia and Athens after a war of 51 years. A. gave Ezra permission to return to Jerusalem with 1500 Jewish families.

Artaxerxes II, Mnemon (405-350 bc), King of Persia, succeeded his father Darius II. His reign is marked by the revolt of Cyrus, his younger brother,

who was assisted by 10,000 Greeks, and was defeated at Cunaxa in 401. The peace of Antalcidas (387) terminated the wars with the Greeks. Shortly afterwards a widespread revolt of the satraps in the W. provs. took place, which collapsed after the defection of the Pharaoh Takhos, although disturbances were still going on at the time of A.'s death.

Artaxerxes III, or Ochos (359-338 bc), King of Persia, succeeded his father, A. II. He murdered 2 of his brothers, and afterwards put to death all the remaining branches of the family. He put down the revolt of the satraps which had begun under his father, and reconquered Egypt. A. was poisoned by his eunuch Bagoas.

Artedi, Peter (1705-35), distinguished Swedish naturalist, b. Anund in Angermanland, Sweden, and was drowned in a canal at Amsterdam. He went to the univ. at Upsala, where he was a fellow student with Linnaeus. He first studied philosophy and theology, but gave up these studies for medicine and natural hist., especially the study of fishes. In 1734 he came to London, where he wrote the preface to his *Ichthyologia*, which work took sev. years to complete. He assisted Linnaeus in his *Systema Naturae*, and Albert Seba in his work on natural hist. His works, including *Ichthyologia* and *Synonymologia*, were pub. by Linnaeus in 1738.

Artemidorus: 1. Gk geographer, lived c. 100 bc. The 11 books of his work on general geography are lost, but we possess small fragments as well as some longer excerpts from an abridgment made in the 5th cent. ad by Marcianus of Heraclea.

2. Soothsayer and dream interpreter who lived about the 2nd cent. ad, during the reigns of Hadrian and Antoninus. Called himself Daldianus. His work on interpretation of dreams is said to have been written by command of Apollo Daldianus. The work is in 4 books, and gives a valuable insight into ant. superstitions.

Artemis, Gk goddess, daughter of Zeus by Leda, and twin sister of Apollo (q.v.). Like Apollo, she was of non-Hellenic origin, but at first had no connection with him. She was worshipped in pre-Hellenic Greece, Asia Minor, and Crete as 'an earth goddess associated essentially and chiefly with the wild life and growth of the field and with human birth' (J. Farnell, *Cults of the Greek States*, 1896-1909). Her care extended particularly over the young of every species. Under the influence of Homeric religion her character as a universal mother was largely obscured, and she became rather the virgin huntress, patroness of chastity. But much of her earlier character remained. She was always, for example, a goddess of child-birth; and at Ephesus her distinctive position as a universal mother was represented by the many-breasted figure in her temple there. A., like Hecate and Selene, with whom she was sometimes identified, was associated with the moon because of its supposed influence upon organic and erotic life. She was identified

with the Dorian goddess Orthia, and later by the Romans with Diana. See W. K. C. Guthrie, *The Greeks and their Gods*, 1950.

Artemisia: 1. Queen of Halicarnassus in Caria, one of the allies of Xerxes at the famous battle of Salamis, 480 BC.

2. Another queen of Halicarnassus, wife and successor of Mausolus (353-350 BC). She is noted for her love for him, the extraordinary grief with which she mourned his loss, and the magnificent monument which she built to his memory. This monument, called the Mausoleum, was adorned with fine Gk sculptures, portions of which were discovered in 1857 and are now in the Brit. Museum.

Artemisia, genus of Compositae very common in N. countries, has many species noted for their bitterness. *A. vulgaris*, Mugwort; *A. absinthium*, Wormwood; *A. maritima*, Sea Wormwood; and *A.*

of elasticity involves an increased resistance to the blood current, and consequently increased strain on the heart. The disease is caused by the toxins of rheumatism and syphilis; by chronic alcoholism and lead poisoning; by overstrain and overeating; and in association with chronic nephritis (q.v.). A form of arterio-sclerosis known as athero-sclerosis is part of the degenerative process of old age. The other chief affection of the A.s is *aneurism* (q.v.).

The *aorta* is the large A. rising from the left ventricle of the heart, which curves round in an arch, proceeding downwards until it bifurcates into the right and left *iliac* A.s at the level of the 4th lumbar vertebra. The head, neck, and upper limbs are supplied by the *innominate*, which, arising from the arch of the aorta, divides into the *right common carotid* and

ARTESIAN WELL

campestris, Field Southernwood, are Brit. species. *A. abrotanum*, Lad's Love, Old Man, or Southernwood, has a peculiar aromatic scent, and is found in S. Europe and the E.; *A. stelleriana*, Old Woman or Dusty Miller, a garden escape, is from NE. Asia. *A. dracunculus* is tarragon (q.v.).

Artemisium, in anct geography, a cape of N. Euboea, Greece, off which a famous naval battle was fought between the Greeks and the Persians in 480 BC.

Artëmovsk (until 1920's *Bakhmut*), tn in the Stalino Oblast of E. Ukraine, 40 m. N. of Stalino, the biggest centre of salting in the U.S.S.R. Local cultural centre. Pop. (1956) 57,000 (1897, 19,000; 1939, 55,000). Known since 1571 as fort and salt works; in 1783; administrative centre of Donets coal-mining industry, 1920-4.

Artemus Ward, see BROWNE, C. F.

Arterio-sclerosis, see ARTERY.

Artery, one of the tube-like vessels through which the blood is propelled by the heart to all parts of the body. They consist of sev. coats: the outer, or *tunica adventitia*, composed of connective tissue; the *yellow elastic coat*; the *muscular coat*; the *elastic penetrated coat*, which is perforated by small apertures; and the *tunica intima*, composed of endothelial cells. The walls undergo degeneration in cases of *arterio-sclerosis*; the elastic coats are destroyed or greatly impaired, and the other walls are thickened. This loss

of the *right subclavian*; the *left common carotid* and the *left subclavian* each arise independently from the aortic arch. The carotids supply the organs of the head, and the subclavians passing through the armpits are called *axillaries*, *brachials* as they pass down the upper arms, bifurcating into the *radial* and *ulnar* A.s in the forearms. Branches are given off from the aorta to supply the tissues of the heart and the viscera of the abdomen. The *iliac* bifurcates into the *internal iliac*, supplying the pelvic viscera, the organs of generation, etc., and the *external iliac*, which becomes the *femoral A.* as it descends the thigh and runs to the back of the limb, where it is called the *popliteal A.*, bifurcating into the *anterior tibial* and the *posterior tibial A.s*.

The *pulmonary A.* springs from the right ventricle of the heart, and bifurcates into branches for supplying the right and left lungs with blood.

Artesian Wells. The term A. W. is used strictly to apply to wells from which water rises under hydrostatic pressure and overflows at the surface. If the water rises insufficiently to overflow, the well is a *sub-artesian* well. The term has also been loosely used for bored wells, not necessarily artesian (see WELL BORING).

The principle is illustrated in the figure, which shows a geological section of natural rock structure, impermeable rocks being hatched and permeable rocks stippled. Rain falls on the permeable stratum until

the rocks are saturated up to the level of the 'water table' (shown by a broken line), after which it overflows at the surface at springs. If a well is bored through the upper impermeable stratum into the permeable stratum, as shown and the head of the well is below the water table, water will rise to, and overflow from, the head of the well, which is therefore an artesian well.

A. W. are of great value when the supply of surface water is insufficient. In Queensland and S. Australia the scanty rainfall is often supplemented by water drawn in this way from great depths. Watercourses that usually run dry in summer have been converted into permanent streams by the surplus from these wells, and it is estimated that the yield in Queensland is equivalent in irrigating effect to a yearly rainfall of 12 in. over 110,000 sq. m. The water obtained from A. W. naturally contains many mineral salts in solution, and so may be unsuitable for washing or certain manufs., but the general absence of organic impurities makes it valuable for drinking purposes. In some dists. of the Atlantic coast plain in the U.S.A., the development of artesian water supply has promoted a marked improvement in public health.

Many A. W. over 300 ft deep have been sunk in London. In the neighbourhood of Paris the borings are often much deeper. At Grenelle a well 1798 ft deep was sunk, the operations lasting from 1834 to 1841. In America many wells are over 2000 ft deep, and in Putnam Heights, Connecticut, there is one 6004 ft deep.

Artevelde, Jacob van (c. 1300-45), Flemish rebel, said to have been a brewer of Ghent, who became Governor of Flanders. During the revolt against Count Louis in 1337 he was chosen chief of the insurgents. He afterwards united with Edward III against the King of France and assisted at the siege of Tournai in 1340. In the truce which followed he stipulated the independence of Flanders, and became its governor. Later he offered the crown of Flanders to the Prince of Wales. He was massacred in a popular rising against his despotic rule at Ghent.

Artevelde, Philip van (c. 1340-82), Flemish rebel, son of Jacob van A. (q.v.), was chosen captain of people of Ghent in a revolt against Count Louis II in 1381. A. defeated Louis, took Bruges, and ruled quite independently. Louis, after obtaining assistance from France, entered Flanders with a Fr. army. He defeated the Flemings at the battle of Roosebeke and A. was killed.

Arth, vil. In the canton of Schwyz, Switzerland, at the S. end of Lake Zug. 17 m. E. of Luzern. It is a terminus of the Rigi railway, and stands on the site of the Goldau landslide of 1806.

Arthrectomy (Gk *arthron*, a joint; *ektomē*, a cutting out), excision of a joint.

Arthritis, inflammation of a joint. A. may occur as a result of infection via the blood stream with almost any bacterial organism, the commonest type perhaps being the streptococcal A. associated with

rheumatic fever (q.v.). *Gonococcal A.* can occur as a complication of gonorrhoea. *Tubercular A.* (see TUBERCULOSIS) is an all too frequent manifestation of bovine tuberculosis infection. *Septic A.* may result from the introduction of organisms into a joint from an injury such as a penetrating wound. Suppuration may be a feature of septic A. *Rheumatoid A.* is non-suppurative polyarthritis of unknown aetiology. The inflammation of the joints in rheumatoid A. is but one sign, albeit the most noticeable, of a generalised disease affecting the whole body. The essential pathological lesion of rheumatoid A. is a degeneration of what is known as the 'collagen' component of the fibrous connective tissues of the body, and this collagen degeneration is a feature common to all true rheumatic diseases. The disease may start at any age, but usually starts round about 40. It is estimated that 5 to 6 per cent of the population are affected. Females are affected three times as frequently as males. In children it is known as *Still's disease*. As a rule rheumatoid A. starts insidiously with general ill health, tiredness, anaemia, loss of weight, and painful stiffness. Occasionally the onset may be sudden, with a raised temperature and joint pains resembling an acute infective arthritis or rheumatic fever (q.v.). Following the stage of ill health the small joints of the hands and feet first become swollen and painful, then the larger joints become involved, sometimes even the spine. The pain and stiffness are more marked in the mornings and after rest, easing after movement. Muscle wasting and general loss of weight follow. The flexor muscles retain greater power than the extensor, and their pull, unless corrected, will give rise to flexion deformity of the joints. This, together with the swelling of the joints and the marked muscular wasting, gives the typical deformity so well known to those who have observed a severe case of rheumatoid A. The inflammatory process in rheumatoid A. starts in the synovial membrane of the affected joints and later spreads to the joint capsule, the adjoining tendons, and the joint cartilage. Fibrous tissue replaces normal tissue. The end result is a complete disorganisation of the joint and sometimes complete ankylosis (q.v.). The pain, particularly on attempted movement, is considerable. It is difficult to forecast the course of the disease. Remissions alternating with exacerbations occur, and for some reason pregnancy and jaundice inhibit its progress. About half of the total number of cases remain stationary for many years, and the activity of the disease becomes arrested. Other cases become progressively worse. The mode of onset gives no indication of the subsequent progress of a case. Treatment consists in rest and in preventing by splinting and other means the development of deformities. Physiotherapy plays a part in encouraging active, and performing passive, movements and generally maintaining muscle tone. Measures for building up the general and psychological condition of

the patient are essential. In a crippling and painful disease such as rheumatoid A., for which there is no known specific cure, it is natural that many treatments should have been tried and failed. Removal of teeth, tonsils, and surgical treatment of other possible foci of infection used to be widely practised in the belief that focal infection was a cause of the disease. This belief is no longer held. Gold injections, although not altogether without danger, have proved helpful in some cases, and their effectiveness has stood the test of time. But gold does not arrest the disease in every case. Simple aspirin or codeine tablets are most valuable in relieving pain, and in many cases aspirin also seems to have some specific curative effect. Hensch and his colleagues in the U.S.A. first demonstrated in 1949 the effects of cortisone and A.C.T.H. (adreno-corticotrophic hormone) on rheumatoid A. Patients given the hormone were at first relieved of their symptoms in a most remarkable way, and after a few days were able to move freely and without pain. It was thought that a cure had been found and that a diminished secretion of adrenal hormones was the causative factor in rheumatoid A. It was soon realised, however, that this was not the case. When cortisone is withdrawn, and even when it is continued, symptoms tend to return, and it is now known that it only suppresses temporarily the inflammatory condition of the joints, and does not cure the disease. A committee of the Medical Research Council reported in 1954 and 1955 on a comparative trial of aspirin and cortisone in two selected groups of cases. After two years' treatment neither group showed any marked improvement over the other. Nevertheless cortisone has proved of great benefit in relieving acute cases, and it is of great help to the patient's morale to be free for a time from distress. Cortisone therapy may also be valuable in tiding a patient over an exacerbation of the disease. The use of cortisone is contra-indicated in certain conditions such as heart failure, diabetes, high blood pressure, renal disease, and tuberculosis, and it must always be given with caution. More recently a drug called butazolidin has proved very effective in controlling the pain, and to some extent the inflammation, in rheumatoid A. It has its dangers, however, and must be taken under strict medical control.

Osteo-arthritis, degenerative disease of the joints. Osteo-A. affects mostly the larger joints such as the hips, knees, and shoulders. It may occur in more than one joint but is not widespread like rheumatoid A. It usually attacks people over middle age and the elderly. It is commoner in men than women. It seems to occur in those joints which during the course of life have been subjected to most strain and stress. In osteo-A. the cartilage of the joint degenerates and wears away, the corroded bone ends being left to grate one on the other. There is pain on movement and at night when the protective muscular spasm relaxes,

Treatment of osteo-A. is partly surgical, and operations have been designed for ankylosing the affected joint in a functional position, thus relieving the pain of movement. Drug therapy is similar to that for rheumatoid A.

See W. S. C. Copeman, 'Rheumatoid Arthritis,' *British Medical Journal*, 1952, 1, 1185; Report of the M.R.C. Committee, *British Medical Journal*, 1954, 1, 1223, and 1955, 2, 695.

Arthrodires, Devonian placoderm fishes in which the bony armour plates over the head on the one hand, and over part of the body on the other, were jointed together. They had bony jaws and a heterocercal tail. *Cicosteus* is a typical genus; *Dinichthys* is of gigantic size (about 30 ft long).

Arthropoda (Gk *arthron*, joint; *pous*, foot), invertebrate animals with jointed limbs, including insects, spiders, and crustaceans. They are segmented animals, bearing appendages on some of the segments, are bilaterally symmetrical, and covered with a firm chitinous cuticle. At least one pair of the appendages function as jaws. The perivisceral space mainly consists of an enlargement of the haemocoel. The phylum is divided into the Onychophora (*Peripatus*), Trilobita (extinct group), Crustacea, Myriapoda (millipedes and centipedes), Insecta, and Arachnida (spiders, mites, king-crabs, scorpions, etc.).

Arthur, usually described as a hero of mythological romance; but even if the exact historic existence of A. cannot be proved, at least some of the deeds ascribed to him can be traced to historical personages. The great authority for the authenticity of a historic A. is Nennius, but, as has been pointed out, Nennius lived at least 150 years after the deeds he describes, and no mention of A. can be found in contemporary writers. The historic battle of Mons Badon, as great a battle from the point of view of the Britons as the battle of Deorham is from the point of view of the Saxons, can at any rate be ascribed to Ambrosius Aurelianus. The battle is described by Gildas as taking place, as far as we can gather from his data, about the year 516. This great battle, which beat back the W. Saxons and prevented their further advance, is ascribed by Nennius to A. Since Gildas was a contemporary, whereas Nennius was not, and since the former gives the names of all important Brit. chieftains and omits that of A., we can safely conclude that A. was not a personage known to Gildas. On the other hand, Nennius gives the names of 12 great battles which A. fought, finishing up with the battle at Mons Badon. At this latter battle 960 men are given as having fallen to A.'s sword alone. In judging the authenticity of a historic A. we must bear in mind that A. is a fairly universal personage, but that all nations with which his name is closely identified are those of Brythonic origin. His name occurs in Gaelic hist. and in Welsh poetry, but of a very much later date than that to which the battle of Mons Badon belongs.

Nennius definitely gives us the places where these 12 battles were fought, but archaeologists still dispute the probable sites of the battles. The sites of some of them can be quite easily identified, as, for example, the ninth 'in Urbe Legionis,' i.e. Chester, and the twelfth at Mons Badon. In the eighth, which was fought 'in Casbello Guinon,' we are told that A. carried an image of the Blessed Virgin on his shoulders, 'and the heathen were put to flight on that day, and great slaughter made of them through the merits of Our Lord Jesus Christ and through the merits of the Blessed Virgin His mother.' Whatever truth there is, however, in the story of A. must be ascribed either to the details give by Nennius or to the data given by Gildas, since much that has been written of A. is obviously the invention of a later day, and the A. of Geoffrey of Monmouth is almost as impossible historically as is the creation of the mind of Tennyson. The romance of A. developed on the lines of medieval chivalry, and the A. of the tournaments cannot be compared with an A. fighting at Mons Badon, or, as one record describes him, beating back the armoured bands of the Romans on the Rom. walls. It remains now simply to trace the A. as we know him in his development by the romantic writers of later centuries. From the Ambrosius of Gildas to the Artorius of Nennius is a long step, and one in which the character and exploits of A. have not suffered. But from Nennius to Wm. of Malmesbury is a still longer step, and a step during which the character and exploits of A. are developed still more fully and become more and more painted in the light of a contemporary monarch. The A. of Gildas, if not also the A. of Nennius, must have been simply a Romanised Briton, who led his countrymen against the attacks of a common foe. But later A. becomes the centre of a picture of the ideals of chivalry and romance, the perfect knight, the perfect king, the perfect lover. We find the foundations of all Arthurian legend in Geoffrey of Monmouth and later developments in the stories of Sir Thomas Malory and Lord Tennyson. In later romance he has become the beau idéal of the true Christian knight—the knight who, accoutred in the armour of medievalism, goes forth to conquer wrong and free the oppressed. It has already been noted that the stories of our Prince A. are universal; the best-known story of how A. will come again is told by the Ger. peasantry as how Frederick Barbarossa will come again. The only conclusion that we can draw from so much contradictory evidence is that there may be a historical A. but he is certainly not the hero of romance that later ages have made him out to be. *Le Morte d'Arthur* (Malory); *Poems* (containing the 'Idylls of the King') (Tennyson); and *Two Morte d'Arthur Romances* are included in Everyman's Library. See also J. D. Bruce, *The Evolution of Arthurian Romance*, Göttingen and Baltimore, 1923-4.

Arthur, Duke or Count of Brittany (1187-1203), son and heir of Geoffrey,

third son of Henry II. His hereditary claim to the Eng. throne was therefore stronger than John's. The King of France used A. as a pawn in his campaign against Angevin power in France, and in 1202 John took A. prisoner at Mirebeau. A. d. at Rouen, probably murdered at John's instigation.

Arthur, Chester Alan (1830-86), the twenty-first president of the U.S.A., b. Fairfield, Vermont. He graduated from Union College in 1848; practised law in New York from 1853. Noted for his eloquence on behalf of the coloured people. At the time of the Civil war he was inspector-general and quarter-master-general for the state of New York. He was a Republican and held the office of collector of the port of New York (1871-1878). In 1880 he was elected vice-president, and in 1881 became president on Garfield's assassination, but was defeated for renomination by James G. Blaine in his candidature in 1884. His administration was marked by measures affecting the tariff, polygamy in Utah, the Chinese, the navy, and civil service reform. See *UNITED STATES, History*. See also biographies by Smalley, 1880, and G. P. Howe, 1934.

Arthur, Sir George, 3rd Baronet (1860-1946), soldier and biographer. Educ. at Eton and Oxford, he obtained a commission in the Life Guards and served in the Sudan 1884-5. In 1914 he was appointed private secretary to Lord Kitchener, and in 1920 pub. *The Life of Lord Kitchener of Khartoum*. Among his other works are lives of Sarah Bernhardt, 1923, Earl Haig, 1928, Queen Alexandra, 1934, Queen Mary, 1935, and King George V, 1937. He also ed. the letters of Lord and Lady Wolsley, 1922, and collaborated in a life of Lord Wolsley, 1924, and *The Story of the Household Cavalry*, 1909-26. *Not Worth Reading*, 1938, is an auto-biography.

Arthur, Timothy Shay (1809-85), Amer. author of moral and domestic tales, especially *Ten Nights in a Bar Room*, which had a great contemporary reputation. He founded *Arthur's Home Magazine* in 1852.

Arthur's Seat, hill to the E. of Edinburgh (q.v.), roughly in the form of a lion couchant, about 822 ft high. The ascent is easy, and a fine panorama can be seen from the top.

Artichoke. The true Globe A. is *Cynara scolymus*, native of N. Africa, herbaceous perennial, grown for its edible flower heads; the Jerusalem A. is *Helianthus tuberosus*, a N. Amer. plant of which the roots are edible. Both belong to the Compositae.

Article, Indefinite, see A.

The definite A. 'the' is allied to the Ger. *der* and the Dutch *de*. In Latin the definite and indefinite A.s do not exist.

Articles, Six, name given to a statute passed in 1539 at the instance of Henry VIII, who was alarmed at the increasing influence of the Eng. Protestants. These A. asserted the position of the Eng. Church on 6 fundamental Catholic doctrines, and were as follows: (1) belief in

transubstantiation; (2) communion in both kinds not necessary; (3) celibacy for the priesthood; (4) chastity to be observed when vowed; (5) private mass permitted; and (6) auricular confession necessary. The penalties for contravention of these A. were very severe, and refusal to believe in transubstantiation was punishable by burning alive. Death was also the penalty for a second offence against the other A. The A. were repealed in 1547, after Edward VI came to the throne.

ARTICHOKE

Articles, The Thirty-nine, see THIRTY-NINE ARTICLES.

Articles of Association, printed list of rules for the conduct of a joint-stock company. See COMPANY AND COMPANY LAW.

Articles of War were formerly ordinances issued by the king, or by the Commander-in-Chief with the king's authority, governing the conduct of a military campaign and ceasing on its conclusion. Until the passing of the first Mutiny Act (q.v.) in 1789 these were the only ordinances regulating the governance of troops, and in times of peace acts such as desertion or disobedience were only liable to the civil law, that is to say they were merely breaches of contract. The issuing of A. of W. was a prerogative of the Crown which was not taken away by the first Mutiny Act, but in 1803 it was superseded by statutory power to be found now in section 69 of the Army Act, 1881. This power to issue A. of W. is not now likely to be used, for the annually renewed Army Act or Mutiny Act covers the whole ground. Similar in every respect to those of the Army are the naval A. of W., and like them they are now embodied in a statute, the Naval Discipline Act.

Articulata (Lat. *articulare*, to join), an obsolete term applied by Cuvier to segmented animals, as the Crustacea, Myriapoda, Insecta, and Arachnida, now placed under the div. Arthropoda. He included the Annelida, which are not arthropods, and grouped the myriapods with insects.

Articulation. In the production of any sound the tongue is adjusted with relation to the palate at the place called 'place of A.' This is where the tongue has for that sound the maximum elevation. The common use of A. and this technical use are very often used too indiscriminately even by phoneticians.

In anatomy an A. is a junction, or joint, between the bones in the skeleton of a vertebrate animal. Such a joint may be immovable, when the bones are directly united (synarthrosis), as in the bones of the skull; or slightly movable, when they are connected by an intervening substance (amphiarthrosis or symphysis), as in the sacro-iliac joints; or more or less freely movable, when the articular surfaces are covered with smooth cartilage and surrounded by a fibrous capsule, lined with membrane, secreting a lubricating fluid called synovia (diarthrosis), as in the limb joints.

Articulator, telephone contrivance to produce smoothness of tone; also a moulder of bones for medical study.

Artificer Engineers, warrant rank in the Brit. Navy, open to engine-room artificers of not less than 8 years' service and over 35 years of age. A. E. are on a level with carpenters, and wear the same uniform, with a distinctive stripe of purple cloth on the cuff.

Artificers, Engine-room, rank of petty officers in the Brit. Navy. Candidates for this position must be not less than 21 nor more than 28, and have had some experience in either coppersmith's work, engine-fitting, boiler-making, or general smith's work. There are 4 classes of Engine-room A., the first or highest being reached after 12 years' service. A fifth class consists of boys over 15 in training.

Artificial Flowers, see FLOWER.

Artificial Limb, mechanical contrivance attached to the stump of an amputated limb and designed to perform the functions as far as possible of the natural limb. An early example, exhibited in the London Royal College of Surgeons, is said to have been made c. 300 BC. It is an artificial leg, made with pieces of thin bronze fastened to a wooden core; the foot, which has vanished, was probably made of wood. Another A. L. of historical interest is the hand of 'Götz of the Iron Hand,' with which he was able to grasp sword and spear.

The great improvement in methods of amputation in recent years has occasioned a corresponding improvement in designs for A. L.s. The surgeon aims at leaving a stump which will preserve the greatest possible length of limb, and which will bear the pressure consequent upon the use of an artificial substitute. In the arm the pressure of the appliance is greatest at right angles to the bone, so that the need for a considerable amount of padding over the end of the bone is not so great as in the case of the leg. The 'modified circular' method of amputation, which leaves the cicatrix over the end of the bone, is therefore suitable, as it can be carried out comparatively close to the injured or diseased part. Disarticulation

at the wrist-joint leaves a widened stump which is especially suitable for an artificial attachment. Amputation through the forearm, if it does not result in the fusion of the ends of the radius and ulna, leaves the power of pronation and supination, that is, of making the movements turning the palm upwards and downwards. Amputation through the upper arm naturally leaves a stiff-arm movement from the shoulder. A hand has been devised by which a certain amount of voluntary and variable movement is imparted to the thumb, by means of hydraulic power controlled by an india-rubber ball placed under the arm-pit.

The old method of screwing a hook into the stump of the arm has now been discarded for a spring or snap catch. The Mackay arm is a well-known modern pattern, and is made for high amputation at the shoulder and for amputation at the elbow; the hand is of rubber or wood and the remainder in light perforated metal. Since the First World War progress has been made in A. L.s, and to-day, with the assistance of harness (usually made of webbing), it is possible for some people to accomplish with their A. L.s almost as much as they could with their natural limbs. This advance is particularly noticeable in connection with artificial hands, for which a mechanism has been invented for grasping and releasing objects by control from the shoulder. Similar progress has also been made in an A. L. for the leg. An essential contributory factor to the success of an A. L. is the determination of the patient to overcome his disability. Aluminium is now extensively used in the construction of A. L.s because of its strength and lightness.

Artificial attachments to the lower limbs also depend upon the extent to which the functions of the limb are impaired. Amputation of a part of the foot leaves the ankle action unrestricted, and the skin incisions are so arranged that there is no cicatrix or skin-grafting in the part walked upon. It may be generally said that the availability for artificial attachments to the lower limb is best served by a 'dap' method of amputation, as the weight must be borne on the end of the bone, and such methods not only provide a sufficient 'cushion,' but can be arranged so that the cicatrix does not come in the line of greatest pressure. It was formerly the custom in amputating the lower leg to sever the tibia just below the knee, so that the artificial leg received the bent knee, the stump pointing backwards. The adoption of numerous devices in which the natural action of the ankle is imitated has now led to the preservation of as much of the natural limb as possible, because the extent of curtailment of a limb determines not only the extent of functional loss, but also the amount of leverage available; and consequently the amount of effort required to use an A. L.

Artificial Respiration, mechanical restoration of the act of breathing when it has been suspended by asphyxiation,

drowning, poisoning, etc. The aim of A. R. is not speed of movement but to obtain as deep a ventilation of the lungs as possible, so that air is put into the lungs and oxygen into the blood. The natural movements should be imitated as far as possible, and should be performed rhythmically 12 or more times per min. The method at one time adopted by the Royal Life-Saving Society and by the St John and British Red Cross organisations is called the 'prone pressure' or Schäfer method, and is described in the former body's handbook of instructions thus:

'The apparently drowned person must be placed at once, face downwards, on the nearest flat surface. Place yourself on one side of the patient, facing the head, in a full kneeling position, with knees and hip bent. Put your hands on the small of the patient's back, the wrists nearly touching, the thumbs as near each other as possible without strain and the fingers passing over the loins on either side, but not spread out. Then, bending the body from the knees and somewhat straightening the hip-joints, swing slowly forward, keeping the arms quite straight and rigid, so that the weight of your body is conveyed to your hands. No exertion is required; the necessary pressure is imparted by the weight of your body. In this way the patient's abdomen is pressed against the ground; the abdominal organs are forced against the diaphragm; the diaphragm rises and air is driven out of the lungs, together with any water or mucus which may be present in the air passages and mouth, thus producing expiration.

'Next, swing the body slowly backwards to its first position, thus removing its weight from the hands (which are kept in position) and relaxing the pressure on the abdomen. The organs now resume their former position, the diaphragm descends, the thorax is enlarged and air passed into the lungs, inspiration being produced. Repeat the movements regularly about 12 times a min., swinging the body alternately forwards and backwards from the knees.'

Another method is that of Sylvester. The patient is placed upon the back, the shoulders being slightly raised. The operator grasps the arms just above the elbows, and by raising them gently and steadily to their full extent behind the head induces inspiration. After 2 or 3 sec. they are lowered to the side of the chest and pressed against it, thus causing expiration. The movements, which should be supplemented by friction and preceded by an inversion of the body to drain off water, are often successful even after more than an hour's apparently unsuccessful work.

The most up-to-date method of A. R., and now adopted by the Royal Life-Saving Society and the St John and Brit. Red Cross organisations, is that of Holger Nielsen. The air pushed out by the Schäfer method in 1 cycle is about 500 c.c. The air pushed out and then pulled in by the Holger Nielsen method is over 1000 c.c. The oxygen saturation of the blood

THREE METHODS OF ARTIFICIAL RESPIRATION

Top, Sylvester (photos: Barbara Wagstaff); centre, Schäfer; bottom, Holger Nielsen (photos by courtesy of the St John Ambulance Association).

attained by the Holger Nielsen method is 93 per cent as against 67 per cent by the Schäfer. The technique of the Holger Nielsen method is as follows. The unconscious patient is placed flat on the ground face downwards. The arms are placed forwards on each side of the head and the elbows bent outwards so that the hands, lying palm downwards one on top of the other, are beneath the forehead. The position of the arms may be understood if the reader, while standing erect, first puts the back of his left hand flat and horizontally on the forehead, and then places the back of the right hand similarly,

but in this case resting on the palm of the left hand, which is already in position. In this way the patient's forehead is pillowed on the back of the uppermost hand, leaving the mouth and nose clear of the ground. False teeth and any foreign bodies obstructing the mouth or throat should be removed and the prone body slapped smartly between the shoulder-blades until the tongue falls forward. The operator then kneels on the right knee in line with the patient's head and facing towards his back, the operator's left leg being placed with the heel near the patient's right elbow. The

hands are then placed on the patient's shoulder-blades pointing towards his feet, with the thumbs on the spine and the wrists pressing against the ridges of the shoulder-blades. The operator should be nicely balanced with the arms straight but not actually pressing on the patient's back. A swing forward movement is then made until the straight arms are vertical and the operator is leaning on the body of the patient. This is the phase of forced expiration; it should last $2\frac{1}{2}$ sec. and it drives out the air and anything that may be blocking the air passages. Next the pressure is relaxed and the operator slides his hands along the patient's arms until the elbows are reached. This movement is done deliberately and should take 1 sec. The patient's arms and shoulders are then lifted upwards until the weight is felt, but not to the extent of raising the chest from the ground, nor must the position of the patient's head be disturbed. This lifting movement causes inspiration and should last $2\frac{1}{2}$ sec. The patient's elbows are then lowered again and the operator's hands are returned to the shoulder-blades. The whole cycle is then repeated. Each complete operation should take about 7 sec., or about 9 cycles to the min. It is to be noted that the number of cycles per min. is fewer in the Holger Nielsen method than in Schäfer's. In Schäfer's method pressure is applied to the abdominal contents to squeeze air out of the lungs, but nothing active is done to suck air in. In Holger Nielsen's method, however, the air is pushed out and sucked in, and it is therefore more efficient as a means of ventilating the lungs.

Another valuable method of A. It., and one which is far less exhausting to the operator, is Eve's rocking method. Here the patient is rocked to and fro lying face downward on an apparatus like a seesaw; when the head is down the abdominal contents press on the diaphragm and expel air from the lungs, and when the head goes up, and the feet are down, the abdominal organs fall away from the diaphragm and cause air to be sucked into the lungs. The tilt of the rocker should extend 45 degrees from the horizontal and the cycle should be carried out 10 times per min. An advantage of Eve's method is that it helps to re-establish circulation as well as respiration. Owing to the apparatus necessary, Eve's method is more suitable for use in factories and places where there is an equipped first-aid station. A makeshift rocker can be made, however, out of a stretcher or a wide piece of board placed astride a fulcrum, such as a fallen tree trunk. The patient must be tied firmly to the stretcher and care is needed to prevent it slipping off the fulcrum. A makeshift Eve's method therefore cannot be carried out by one operator, except for small children, who can be rocked in the arms. Nowadays many factory medical aid posts and mobile resuscitation units are equipped with apparatus for giving asphyxiated patients a mixture of oxygen and carbon dioxide gases at the same time as A. It. is

carried out. The CO_2 stimulates the respiratory centre in the brain (*see* RESPIRATION). A very recent form of apparatus is designed to force the gases into the lungs under positive pressure and then empty the lungs by a negative pressure phase, the positive-negative pressure phases alternating in regular cycles. The connection to the patient is made by means of an air-tight rubber face mask which fits over the nose and mouth. *See also* DROWNING and RESUSCITATION. *See* F. C. Eve, *Artificial Respiration Explained*, 1946; Royal Life-Saving Society, *Handbook of Instruction*; St John Ambulance Association, *First Aid to the Injured*.

Artificial Silk, *see* RAYON.

Artigas, Fernando José (c. 1755-1851), S. Amer. soldier and politician, b. Montevideo; became captain of a corps in the Sp. provincial service, but left this in 1811 for the Revolutionary army. Later he joined the Republican army, but was outlawed by the commander, Sarraatea, for independent action. He then organised a troop of gauchos, and was so successful that he was recognised as an independent chief and given the whole of Uruguay in 1814. He expelled the Portuguese from Montevideo and became dictator, but was ultimately defeated, and in 1820 fled to Paraguay, from where he was sent into exile in Candelaria.

Artillery (from O.F. *artillerie*; It. *artiglieria*; Sp. *artillería*). Its former meaning comprised all implements of war, and it was generally used in the plural. Then the word was used particularly to denote engines for discharging missiles, as catapults, bows, crossbows, and slings. In modern use the word denotes: (1) all firearms discharged from carriages in contradistinction to small arms; (2) the particular troops engaged in the service of such firearms; (3) the science which treats of the use and management of ordnance.

Early History. In the O.T. 'engines invented by cunning men to shoot arrows and great stones' are mentioned. Continual improvements were made, and under the names catapult, ballista, and trabuchet such arms were used in medieval warfare. A small piece of cannon was contrived by Schwartz, a Ger. cordelier, soon after the invention of gunpowder in 1330. But even on the discovery of gunpowder these weapons were not readily displaced. The first occasion on which guns were used was probably at the siege of Cividade in Italy, when the Germans employed one piece. It is also said that the Moors of Algeciras used A. in Spain in 1343. According to some historians guns were used at Crécy in 1346, when Edward III used 4 pieces of cannon. The English also used A. at the siege of Calais in 1347. The Venetians employed A. against the Genoese in 1377. At the siege of Harfleur (1415) 25 'master gunners' and 50 'servitour gunners' were employed. Gunners of that time had charge of all guns and stores, and laid and fired the cannon in action.

Sixteenth and Seventeenth Centuries. In

the wars of Charles VIII, Louis XII, and Francis I of France in Italy, A. played a conspicuous part in siege and field warfare, e.g. at Ravenna (1512) and Marignan (1515). Nevertheless when the arquebus and other small arms became efficient very little was heard of the field A. The efficiency of the Eng. archers denied opportunities for developing the arm in England. During Henry VIII's reign culverins were used as heavy pieces, and sakers and falcons as lighter pieces.

During the Eng. Civil War guns were in use. Cromwell in his sieges made great use of shells. Before his changes in the position of the A. the pieces were placed in the front of the force. He later relegated the heavy pieces to the rear.

Eighteenth and Nineteenth Centuries. Cromwell's policy was followed in the campaigns of Louis XIV. In the days of Turenne heavy guns were much employed. Marlborough also had about 9 pieces per 1000 men, and as he had an army of about 11,000 he used about 99 guns. The pike disappeared about 1700, and then infantry fire power became the decisive factor in battles. The Royal Regiment of A. was founded in 1717. In the year 1793 the Eng. force of A. had increased to 4000. For 4 cents. the word A. was strictly limited to mean garrison A. The field A. existed only in time of war. In 1793 horse A. was introduced, and a driver corps in the following year. Field brigades of 6 guns were then formed, horse-A. batteries being styled troops. A troop of horse A. and a field brigade each had 5 guns and 1 howitzer. The driver corps of 1794 was divided into troops. The addition of one of these to a company of foot A. converted the latter into a field brigade.

French Revolution and Napoleon. During the wars of the Fr. Revolution the A. of the field army received the name of the field A. The field guns were organised into batteries, each complete in itself. The Fr. A. steadily improved in manœuvring power during the Fr. wars. Napoleon himself maintained that the man who was clever enough to bring up an unexpected force of A. unknown to the enemy was sure to win the day.

After 1815 the hist. of A. becomes merely a matter of perfecting a material already discovered. Infantry fire being more variable in its effectiveness, the period 1815-70 saw many changes in the relations of the 2 arms. The introduction of the rifled musket demolished the A. manœuvres of the smooth-bore days. Up to this time A. forces depended very much on case-shot firing or firing their guns at close quarters. On the introduction of the new musket, infantry armed with a far-ranging rifle could keep the guns beyond case-shot firing and compel them to use only round shot or common shell. In the Amer. Civil War the attacking infantry on reaching close quarters met the full force of the defenders' A., together with the full force of the musketry. Battles began to be fought at increased ranges,

and the ineffectiveness of the projectiles used by the A. neutralised the effect of rifled guns. After the Franco-Ger. war many lessons were learnt and many changes were made in the use of A. New ideas on A. spread rapidly, and the quick-firing gun was soon introduced into every army. The original designs have been greatly improved, but the principles still remain. Improvements include the mechanical absorption of the recoil by means of buffers, and the development of time shrapnels as projectiles of the field A. Attention was next turned to the increase in rate of fire. A shield was then attached to the gun for the protection of the detachment. One result of the Boer War was to reintroduce heavy ordnance into field armies. Field howitzers also reappeared. At the latter part of the 19th cent. siege and fortress A. also underwent many great changes and developments. During the Franco-Ger. War of 1870-1 rifled guns 'long and short' for direct and curved fire were used as siege A. At present howitzers are the prin. siege guns.

Organisation, British Field Artillery. The basic Brit. A. unit is now the regiment made up of a number of batteries, together with a signal troop and a R.E.M.E. detachment. Each battery is divided into troops. The number of troops and batteries in a regiment varies according to the function of the regiment (e.g. anti-aircraft, etc.).

Horse Artillery differed from field A. in that the whole detachment was mounted, leaving guns and wagons free from the load of men. Only one horsed R.H.A. unit now survives—the King's Troop, which is employed solely for ceremonial purposes. With mt A. the whole equipment was carried on the backs of mules and other animals.

Development in the First World War. Four years of scientific warfare in the First World War saw a consistent development in the power and influence of A., both in the actual battle and in all the stages which lead up to it.

Ever-increasing demands for guns were made in the first 2 years of the war. The only modern heavy howitzer available to the Brit. Army in 1914 was the 9.2-in. Mark I howitzer. When in 1916 Gen. Haig was calling for more guns, he selected the latest 'Marks' of existing models in order to facilitate construction and ensure uniformity in design. At the same time the Commander-in-Chief insisted that every effort should be made to increase the range and accuracy of guns, and that there should be no cessation of research and no finality of design.

The main principle on which the construction programme was based was to give a decisive fighting superiority per div. over the Ger. A. There was a preference for the howitzer over the gun. Its 'life' is greater, e.g. for a 6-in. gun, Mark VII, the 'life' is 1500 rounds, for a 6-in. howitzer, 10,000 rounds. The howitzer, too, is much easier to place in position in the field, and many can be sited in a comparatively restricted

area, owing to the higher line of departure of the shell. Though they have less range than guns of a similar shell-power, howitzers are more mobile and, fired at horizontal ranges, their accuracy is greater.

In 1914 there were in the original Brit. expeditionary force 486 guns and howitzers, 24 of which were of medium calibre; at the armistice there were 6437 guns and howitzers of all kinds (excluding anti-aircraft A. and trench mortars), of which 2211 were medium and heavy A. The Ger. A. comprised only a few howitzers of 16½-in. calibre. The Fr. field gun was the famous 75-mm. quick-firing gun, with the recoil controlled by compressed air.

The later technical improvements in Brit. A. design included long-range, modern 6-in., 8-in., 9.2-in., and 12-in. howitzers, 6-in. Mark XIX guns on field carriages, and 9.2 in., 12-in., and 14-in. Mark XIII guns on railway mountings. Other improvements were instantaneous fuses, gas and smoke shells, stream-line shells, and incendiary and star shells.

Second World War Developments. The Second World War saw a great development of anti-aircraft and tank guns. Also various types of self-propelled guns were used for assault or close support. One type was a 75-mm. mounted on a light tank chassis, and another a 150-mm. on a medium tank chassis. The advantage of these was that A. accompanied tanks and could fire straight away. The type was first used in the big battle for Libya (1941-2).

The improved Ger. 88-mm. gun was probably the best 3-purpose gun (i.e. anti-tank, anti-aircraft, and field A. piece) developed during the war. Many new types of A., including very large mortars and long-range field guns, were under development or construction in Germany in the closing stages of the war. Some of them had rocket-assisted shells. Among these were a 380-mm. howitzer and rocket 'guns' with smooth-bore barrels, 400 ft long, intended for the bombardment of London. A new 120-mm. anti-tank gun was likewise in development. The Germans were also working on a 32-in. siege gun, with a barrel 141 ft long, which fired an 8-ton projectile. In the last months of the war in the Far E. the Japanese also introduced some heavy mortars and heavy rockets. Amer. recoil-less guns were another notable development.

Post 1945 Developments. The successful employment of the rocket in the latter part of the Second World War has led to the increasing manuf. of this weapon in preference to conventional forms of A. Coast A. has already been discarded in Great Britain, and the organisation responsible for its administration has been disbanded.

In the Amer. and other armies atomic cannon have now been introduced. Details of developments in this field are described in F. O. Miksche's *Atomic Weapons and Armies*, 1955. Miksche estimates that certain of these cannon have a destructive power equal to 5000

conventional guns. See **ROYAL REGIMENT.** See also Col. H. Betnell, *Modern Guns and Gunnery*, 1910; Lt.-Col. H. W. Hime, *The Origin of Artillery*, 1915; W. Ley, *Shells and Shooting*, 1942; Lt. A. W. Wilson, *The Story of the Gun*, 1944; Maj.-Gen. Y. F. C. Fuller, *Armament and History*, 1946.

Artiodactyla (Gk *artos*, pair; *dactulos*, finger), order of cloven-hoofed mammals, all excepting the pigs and hippos having molar teeth with broad crowns suitable for crushing vegetable food. The order comprises the following groups: (1) *Pecora*, including giraffe, okapi, deer, oxen, sheep, goats, antelopes, etc., characterised by horns or antlers, 2 or 4 teats, 4 cavities in the stomach, and no upper incisors; (2) *Tylopoda*, including camels and llamas, characterised by absence of horns, few teats, 1 pair of upper incisors, and a cushion-like pad on the foot to bear the weight of the body; (3) *Tragulina*, the chevrotians, or mouse-deer, characterised by absence of horns, no upper incisors, 4 complete toes on each foot, and 3 stomach cavities; (4) *Anoplotherina*, comprising extinct species with complete series of teeth and a general resemblance to carnivorous animals; and (5) *Suina*, or pigs, including Old World pigs, Amer. peccaries, and hippopotamus, and characterised by at least 1 pair of upper incisors, the cheek-teeth prominent and studded with tubercles.

Artists' Rifles, formed in 1869 as a volunteer corps by Lord Leighton and other professional men. In 1908 it became part of the National Territorial Army as the 28th Batt. of the Co. of London Regiment (Artists' Rifles). In 1947 it became the 21st Special Air Service Regiment (Artists' Rifles) Territorial Army.

Artocarpus, genus of the Moraceae which grows in Asia. *A. incisus* is the bread-fruit tree common to the S. Sea Is.; it has a spurious fruit called a *sorosis* (cf. pineapple), which is roasted and eaten as bread. *A. integrifolius*, the Jack tree, has a prickly fruit which is not so wholesome as that of *A. incisus*. *A. hirsutus* makes good timber.

Artois (Lat. *Artesium*), anct Fr. prov., comprised of the greater part of the present dept of Pas-de-Calais. The cap. was Arras. It was made a co. by Louis IX in 1237, passed into the hands of Burgundy, and afterwards belonged to the Hapsburgs. It was ceded to France by the Peace of the Pyrenees (q.v.) in 1659. Louis XV created his grandson, the future Charles X, Count of A. The first artesian well in Europe was sunk in 1126 in A., from which the word 'artesian' is derived.

Artois, in the First World War. The first heavy fighting in the A. region was in 1915, when the French and British in co-operation delivered a general attack, beginning on 25 Sept., a few in. to the N. of Arras. The opening stages of the A. advance were crowned with success. Fr. troops under d'Urbal took Souchez and the foot of the famous ridge overlooking the little town of Vimy, while the forces of Sir John French carried the enemy's first and most powerful line of entrenchments,

extending from W. of the mining tn of Lens to a point near the notorious Hohenzollern redoubt, covering a front of some 4 m. Loos fell to the British, who pressed on to the outskirts of Hulluch near La Bassée. On the reduction of the Ger. second line the dominating position known as Hill 70, beyond and to the E. of Loos, was captured, and a position rapidly consolidated whence it was hoped soon to overcome the third and last line of the enemy. Considerable success had, at the same time, attended the simultaneous Fr. onslaught in the Champagne; but thereafter the allied attacks lost their impetus. It was soon realised in England that some much greater effort in the production of material would be required before any further attempt on a big scale could be made with a reasonable hope of success. (See also ARRAS, BATTLE OF and LOOS, BATTLE OF.)

In 1916 the Germans delivered a local attack on Vimy Ridge in May, but the battle of that name was fought between 9 and 11 April 1917, when Canadian troops were conspicuous in the attack. In the same year was fought the battle of Hill 70, between 15 and 25 Aug., in the Souchez R. dist. from Lens to Angres. In 1918 there were heavy engagements in the course of the second battle of Arras (Aug. to Oct.) during the successful operations for the breaking of the Hindenburg line. In the final advance the last fighting in A. was approximately on 17 Oct., when Douai fell to the Allies.

Artophorion (Gk 'bread-holder'), ciborium or pyx (q.v.), used in the Gk Church. See Neale, *History of the Holy Eastern Church*, 1850.

Artôt, Desirée (1835-1907), Belgian singer. She first sang at concerts at Brussels, and then, on the recommendation of Meyerbeer, she went to Paris, and made her début in *The Prophet* in 1858. She afterwards went to Italy and to Berlin, where she took part in Ger. and It. operas. In 1868, during a visit to Russia, she became engaged to Tchaikovsky, but the next year she married Padilla, the Sp. singer.

Arts, Degrees in, see DEGREES.

Arts, Fine, see FINE ARTS.

Arts Council of Great Britain, set up under royal charter on 9 Aug. 1946 to develop a greater knowledge, understanding, and practice of the arts, to increase their accessibility to the public, to improve their standard of execution, and to advise and co-operate with gov. depts, local authorities, and other bodies on any matters connected with these objects. It was the successor to the Council for the Encouragement of Music and the Arts (C.E.M.A.), which was created in 1940 to serve the artistic needs of the public in war-time. The A. C. consists of not more than 16 members, who are appointed by the Chancellor of the Exchequer after consultation with the Minister of Education and the secretary of state for Scotland. It receives an ann. grant-in-aid from the Treasury, the greater part of which is passed on in the form of subsidies to independent bodies connected

with the promotion and performance of the arts in Great Britain. The work in England comes directly under the control of the A. C. itself; but there are separate committees for Scotland and Wales, which are in receipt of ann. grants from the council for the purpose of carrying out the council's work in those two parts of the country. There are four panels of experts in music, drama, the visual arts, and poetry, who advise the council on such matters as are referred to them. The council's H.Q. are at 4 St James's Square, London, SW1.

Artveldt, Andries van (1590-1652), Flem. painter, who worked for sev. years at Genoa. His pictures were mostly landscapes and seascapes. His portrait was painted by Van Dyck.

Artz, David Adolf Constant (1837-90), Dutch genre painter, inspired largely by Josef Israels (q.v.). Among his characteristically realist paintings are 'With Grandmother,' 'The Old Fisherman,' 'In the Dunes,' and 'The Return of the Flock.'

Aru, or Aroe, is. group in the S. Moluccas, in the Arafura Sea, Indonesia. The total area is 3306 sq. m., and the chief tn is Dobo. They are generally fertile with swampy coastal areas, pearl fishing, and trepang. The natives are of mixed Papuan-Malayan stock.

Aruba Island, one of the Dutch Antilles, near coast of Venezuela, now a great centre of oil refining. Area 67 sq. m. Chief tn Oranjestad. Pop. 55,000.

Arum, family Araceae, genus of European and Mediterranean tuberous herbs, distinctive for their large spathe and club-shaped spadix. *A. maculatum*, Lords and Ladies, Cuckoo Pint, is native to Britain; *A. dioscoridis* is a popular water garden plant.

Arumi, see MORON DE LA FRONTERA.

Arun, River, rises in St Leonard's Forest, flows W. and then S. through Sussex, past Arundel to Littlehampton on the coast. It is 40 m. long, and is navigable for a part of its course.

Arunda, see RONDA.

Arundel, Thomas (1353-1414), Archbishop of Canterbury, son of the Earl of A. A. was made Bishop of Ely in 1374, and lord chancellor 12 years later. He became Archbishop of York in 1388 and Archbishop of Canterbury, 1396. In the next year he was banished for high treason. He supported Bolingbroke, and when the latter returned to England A. returned with him, and crowned him Henry IV. A. is best remembered for his persecution of the Lollards (q.v.). With Courtenay (q.v.) he helped to suppress Lollardy at Oxford. He was also responsible for some splendid building at Canterbury and Ely.

Arundel, municipal bor. of Sussex, England, on R. Arun, 10½ m. E. of Chichester. The tn is dominated by A. Castle, ancestral home of the Duke of Norfolk as Earl of A. (see next article). Though of 12th-cent. and earlier foundation, the castle now consists mainly of 19th-cent. buildings, in the medieval style. The modern Rom. Catholic church of St

Philip Neri, another fine example of 19th-cent. Gothic, is a prominent landmark. Pop. 2650.

Arundel, Earls of. The earldom of A. has been held chiefly by the Fitzalans and their descendants the Howards.

Richard Fitzalan (1267-1302), Earl of A., son of John, Lord of A. (1246-72). Richard was called Earl of A. c. 1289. He fought for Edward I in France and Scotland.

Edmund, successor of Richard (1285-1326). He was an enemy of Piers Gaveston and declined to march with Edward II to Bannockburn. In 1321 he became connected with the Despensers and sided with the king. He was executed at Hereford by partisans of Queen Isabella.

Richard, son of Edmund (c. 1307-76), soldier and faithful servant of Edward III. He was present at Sluys and siege of Tournai, 1340. He led an Eng. div. at Crécy, and was present at the siege of Calais. He inherited estates of his uncle John, Earl de Warenne, and assumed the title of Earl of Surrey. Regent of England, 1355.

Henry Fitzalan, 12th Earl of A. (c. 1317-80), son of Wm., 11th Earl of A. He was made lord-deputy of Calais, 1532, and in 1544 commanded an Eng. expedition to France and took Boulogne. On returning to England he was made lord chamberlain. He was imprisoned in the Tower in 1551 for being implicated in Somerset's plot against Northumberland. On Edward's death Henry joined Northumberland, though secretly in alliance with Mary. In Northumberland's absence he denounced him and proclaimed Mary as queen. Elizabeth I made him a privy councillor and lord steward, but he was soon suspected of intriguing to set Mary Queen of Scots on the throne, and fell from favour. He was imprisoned after the exposure of the Ridolfi plot but escaped execution.

Arundel Marbles, or *Marmora Arundelliana*, major portion of an important Gk chronicle discovered on the is. of Paros (hence known as *Marmor parium*). The author tells at the beginning of this chronicle that he intends to list the main events of Athens from the period of Cecrops (a mythical King of Athens, attributed to c. 1581 bc) down to 264-263 bc (probably his own time). The A. M. contain 93 lines (with several lacunae); they were brought to England in 1627 on behalf of Thomas Howard, Earl of Arundel, and were pub. the following year by John Seldon (*Monumenta Arundelliana*, London, 1628). A smaller fragment of 33 lines, dealing with the years 336-335 to 299-298, was discovered in 1897 and pub. by M. K. Krispien and A. Wilhelm in *Athenische Mittheilungen*, XXII, 1897, pp. 183 ff.

Arundo, genus of plants of the Gramineae which grows in Europe, Asia, and Africa. *A. donax* is our largest cultivated grass, which grows to 10 ft in height; the stems are made into fishing-rods. *A. phragmites*, or *Phragmites communis*, is the common reed.

Aruspex, see HARUSPICES.

Aruwimi, trib. of the Congo. It was explored by Stanley for 100 m. in 1883, and by its means Stanley advanced to help Emin Pasha in 1887. It has its source near Lake Albert (Nyanza) and is formed by many sub-tribes. The main riv. flows for most of its length through the great equatorial forest, and in its densest part. It joins the Congo in lat. 1° 12' N., 28° 38' E. and is navigable for nearly 100 miles as far as the Yambuya rapids.

Arvad, or **Aradus** (Jezireh Ruad), anct Phoenician city. It occupies a very small is., 2 m. from the coast, near the mouth of the R. Eleutherus (Nahrel Kebir). It is said to have been founded by Sidonians. The inhab. were skilled navigators.

Arval Brethren (*Frates Arvales*), college of 12 priests in Rome, who made yearly offerings to the field Lares for increase in the fruits. Romulus was claimed as their founder. Niebuhr suggested that this college was originally connected with the Lat. element of the Rom. state. The sister college was the *Sodales Tituli*. The badge of office, which was lifelong, was a chaplet of ears of corn worn with a white band. The prin. festival lasted for 3 days in May, in honour of Dea Dia, who is supposed to be Ceres, and an account of the festival is preserved in an inscription from the first year of the Emperor Elagabalus, AD 218. Considerable fragments of the A. B.'s records have survived.

Arve, riv. of France and Switzerland: rising in the Col de Balme (q.v.) it flows through the vale of Chamonix, and joins the Rhône near Geneva. Length 62 m.

Arverni, anct Gallic tribe in the Auvergne Mts in France (the name Auvergne derives from A.). They offered a stubborn resistance to the Romans, but were finally crushed, 52 bc, and subsequently adopted Rom. civilisation quite readily.

Arvers, **Alexis Félix** (1806-50), Fr. poet and dramatic writer, b. Paris. His first work was entitled *Mes heures perdues*, 1833, a collection of poems, which earned for him the reputation of a poet. His dramatic works consisted of *En attendant*, with Bayard and P. Foucher, 1835; *Les Deux Maîtresses*, with Scribe, 1836; *Les Dames patronnesses*, with Scribe, 1837; *Rose et Blanche*, 1837; *Les Anglais en voyage*, 1844; *Suzon et Suzanne*, 1850. His sonnet to Marie Nodier, *Mon âme a son secret*, has remained famous.

Arveyron, trib. of the Arve (q.v.). It is an outlet of the Mer de Glace in Chamonix valley. It issues thence through a wonderful grotto of ice, known as the Ice Gates of A. The course is short.

Arvida, the aluminium city in Quebec, Canada, 5 m. E. of Chicoutimi. Founded in 1927 by the Aluminum Co. of Canada; the company's plants cover a sq. m. and are the means of livelihood of practically the entire pop. of the city. Pop. 12,800.

Arya Samaj, reformist Hindu society founded by Dayananda Sarasvati (d. 1882) which rejects idolatry and seeks to

bring India back to the pure Vedic path. It became mainly a political body, aiming at the self-gov. of India, and determined to drive out the foreigner, and it has at times been a rather militant opponent of the proselytising activities of non-Hindu faiths.

Aryabhata (b. c. AD 467), Hindu mathematician and astronomer, was one of the pioneers of the development of algebra and trigonometry; b. at Patalliputra (Patna), he wrote a book on astronomy at the age of 23, but his chief claim to immortality is in his working out of rules for summing up series of natural numbers and of the powers of natural numbers, in his calculation of the sine ratios of angles at intervals of $3\frac{1}{2}$ degrees and in working out the value of π at 3.1416. He discusses the rules of arithmetic and the rules of signs of Diophantus of Alexandria, fundamental to the study and use of directed numbers.

Aryan, or **Arian**, derives from Sanskrit *ārya*, originally a national name indicating the Brahmins, and later meaning 'of noble, of good family,' from Old Persian *ariya* and Middle Persian *ariya*, with similar meanings; and from Gk *Ἀρία*, Lat. *Arīa* or *Arīa* and *Ariana*, indicating E. Persia, nowadays 'Iran,' the name of Persia. The term A., or rather Indo-A., is now generally applied to the Indo-Iranian group of the Indo-European family of languages (see INDO-EUROPEAN).

A new connotation was lent to the term A. by the so-called A. Paragraph, under which in Germany before the Second World War full rights were granted only to 'A.s,' or persons who could trace their 'A.' descent back for at least a period of 100 years. The aim of this policy was anti-Semitic and the policy was a cardinal feature of Hitler's conception of a Third Reich comprising only the pure 'Nordic' peoples of W., Central, and E. Europe. At the time of its introduction there were estimated to be 600,000 Jews in Germany, and such a policy necessarily required some ethnological justification for the persecution of so large a body of Ger. citizens, including many of world distinction. The hypothesis of the Ger. people being the leading representatives of the Nordic 'A.' race was taken from the teaching of Gobineau (q.v.) as developed by Houston Stewart Chamberlain (q.v.), the renegade Englishman, von Ranke, Lapouge, and others. Gobineau tried to explain hist. as an eternal conflict between the long-headed or dolichocephalic and the broad or short-headed or brachycephalic races, and at the apex of the world's races he placed the big blond dolichocephalic or 'A.' race; while the later writers went still farther, and relegated the Jews or Semitic 'races' to the Mulatto class. But hist. would seem to show that all the 'progressive' races are composed of the same 3 stocks—Nordic, Alpine, and Mediterranean—and, if this be true, the political edifice founded on race prejudice must collapse. The term A., too, can only be applied to speech, and Nordic, which indicates a breed, can only be applied to

race. The Jews, like the Germans, were of 2 different races: if they came from Poland they apparently (at least in great part) were of the Alpine stock; if from Spain, they may have been of the Mediterranean race to which the Jews of Palestine itself may have belonged, when not of the Armenoid race; and, broadly speaking, the term Jew should be mainly employed in connection with religion. Most of the European Jews are really of Alpine stock, and brachycephalic, like the rest of the mid-European peoples; and Ger. Jews, racially, were Alpines, like the S. Germans. Consult Julian Huxley, A. C. Haddon, and A. M. Carr-Saunders, *We Europeans*, 1935.

Arzamas: 1. Oblast in Central Russia, E. of Moscow, situated in the Volga uplands, and covered by wooded steppe. It has small iron ore deposits. Area 10,500 sq. m.; pop. (1956) 1,068,000, mostly Russian (until 17th cent. predominantly Mordva, q.v.). A. has high-grade steel production, wheat and hemp growing, poultry (A. geese), and old home industries. The prin. tns are Arzamas, Kulebaki, Vyksa.

2. Cap. and cultural centre of the above, 53 m. S. of Gor'kiy. It has flour mills and tanneries. It was founded in 1578, absorbing an anc. settlement of the Mordva. From 1802 to 1862 it had a school of painting, the first prov. school of its kind in modern Russia. Pop (1956) 39,000.

Arzano, It. tn, in Campania (q.v.), 3 m. N. of Naples (q.v.). It has some beautiful villas. Pop. 10,000.

Arzerum, see ERZERUM.

Arzeu, Algerian seaport between Oran and Mostaganem. Has exports of salt and esparto grass. Near A. are the Kleber marble quarries, and the remains of the anc. tn of Arsenaria. Pop. 7700.

As (Ger. *Asch*), Czechoslovak tn in the region of Karlovy Vary (q.v.), near the Ger. border. Manufs. include textiles, beer, and musical instruments. Pop. 11,500.

ROMAN AS

Obverse, two-faced head of Janus;
Reverse, prow of ship.

As. This Rom. term had a threefold meaning—unity in 3 senses. It denoted (1) a weight of 12 oz, equivalent to the *libra* or Rom. pound; (2) a copper coin, varying in weight at different periods from 12 oz to less than half an oz; (3) a measure equivalent to a linear ft or sq. ac.

Asa (913–873 BC), 3rd King of Judah, succeeded his father Abijah. He adopted

stringent measures against idolatry. He was a successful warrior, repulsing the Egyptians, and in alliance with Benhadad, King of Syria, defeating Baasha, the Israelite king. See 1 Kings xv; 2 Chron. xiv-xvi.

Asa Dulcis, synonym of benzoin, is a drug made from the balsamic resin of *Styrax benzoin*, a plant of the family Umbelliferae. It has a soothing effect when locally applied in cases of inflammation or abrasions of the skin.

Asachi, Gheorghe (1788-1869), Moldavian author. His importance in the Rumanian cultural revival depends on his work as educator, reorganiser of Moldavian schools, founder of academies and an art school, translator, initiator of the Moldavian theatre, journalist (he founded the first Moldavian periodical, and many others), diplomat, and statesman.

Asafoetida, gum resin obtained from the root of *Ferula foetida*. The active principle is an ethereal oil, allyl sulphide. It acts as a stimulating expectorant, and has been used in bronchial affections. It was at one time used in nervous and hysterical ailments, possibly controlling the erratic nervous phenomena by the psychological influence of its disgusting smell.

Asam, name of a family of Ger. artists, the prin. members of which were: (1) Hans Georg (d. 1696), whose work consisted of frescoes and oil-paintings. (2) Cosmo Damian (c. 1686-1742), a painter, and Aegidius Quirinus (d. 1746), a sculptor, both sons of Hans Georg. They worked together at the churches of Innsbruck, Munich, Schleissheim, and Mannheim. (3) Cosmo Damian's 2 sons, Franz Erasmus (1720-94) and Engelbrecht, both painters.

Asaph, musician under David and Solomon (1 Chron. xvi. 5), and chief of the Levites appointed by David to minister before the ark with praise and thanksgiving (1 Chron. xxv. 1). A. is regarded as the founder of the 'Sons of A.', a guild of singers in the second temple (Neh. vii. 44). Psalms l and lxxii-lxxxiii bear his name.

Asaph, St (d. c. 600), Welsh ecclesiastic. He became head of a monastery at the confluence of the R.s Clwyd and Elwy, succeeding St Kentigern. It is most probable that he was the first bishop of the see of Llanelwly, which was afterwards known as St A. His feast is on 1 May.

Asaph, St, Welsh tn, see ST ASAPH.

Asar, or Oesar, Swedish name for the long, winding ridges of gravel and sand found in the low-lying parts of Sweden. These ridges sometimes extend for more than 100 m., one main ridge being joined by many trib. ridges. The appearance that these give to a riv. delta has given rise to the belief that the deposits were formed by streams underneath the ice-sheets which covered Sweden during the Glacial Period, and that the direction of the ridges may mark the site of sub-glacial rivs. Similar ridges of gravel and sand are found in Ireland, where they are called eskers, and in Scotland, where the name kames is given to them, and in the N.

states of N. America. Also a Persian gold coin formerly worth about 6s. 8d.

Asarabacca, Eng. name of *Asarum europaeum*, a perennial herb of Europe, rarely native in Brit. woods, at one time grown as a medicinal plant, its leaves being used as snuff.

Asarin, or Asarone, preparation from the plant *Asarum europaeum*, smelling like camphor.

Asben, see AIR.

Asbestos (Gk. 'unquenchable'), name applied to varieties of fibrous minerals of the serpentine and hornblende groups. A. has great resistance to heat and chemical attack and can be woven into cloth; in this form it was used by the ancients to enclose dead bodies so that when placed on the funeral pyre the ashes could be retained. The varieties used in manuf. are principally chrysotile, a form of serpentine, and crocidolite and amosite, which are amphiboles of the hornblende series. Chrysotile, the most important commercial fibre, has a greenish lustre in the massive form, but when broken down to fibres assumes a whitish colour and is commonly called 'white' A.; the prin. workings of chrysotile are in the Quebec prov. of Canada, S. Rhodesia, and Russia, although lesser deposits are widely distributed. Amosite and crocidolite ('blue' A.) are mined in the Union of S. Africa. Raw A. is first crushed in special mills to break down the rock, and after screening is further fiberised so that it may be processed on textile machinery to produce yarns or cloths, or compounded with rubber, cement, or synthetic resins to produce many important industrial products. A. has high resistance to heat, is a poor conductor of electricity, and is unaffected by most corrosive chemicals. Crocidolite has particularly good acid resistance.

A.-based materials are widely used for the sealing of glands and joints in steam and industrial plant and machinery of all kinds and for the thermal insulation of pipework and boilers. A.-cement sheets are used for the roofs and walls of industrial buildings. A. cloths are used for firemen's suits, theatre safety curtains, and filtration purposes. A. tapes and tubes are used for the insulation of electrical machinery. A. reinforced plastics are used for structural parts of aircraft and electrical and mechanical plant.

Asbjörnsen, Peter Christen (1812-85). Norwegian writer and folklorist. After studying at the univ. of his native city, Christiania (now Oslo), he served for some

years as a country tutor, giving much time to the study of the poetry and folklore of the peasantry. He subsequently returned to Christiania, where he studied medicine and science. From 1846 to 1853 he was engaged by the Norwegian Gov. in scientific work on the coast. Later he became a gov. inspector of forests. In addition to sev. handbooks and memoirs on scientific and practical subjects he wrote in collaboration with his lifelong friend, Jörgen Ingebrektsen Moe, the collection of Norwegian fairy-tales which appeared under the title of *Norske Folkeeventyr* (1st series, 1842; 2nd series, 1844; 3rd series, 1871). In 1845 he pub. alone the first book of the *Norske Huldreeventyr og Folkesagn*. In these delightfully written classics may be traced much of the modern national spirit in Norwegian literature. They have been trans. into English in Dasent's *Popular Tales from the Norse*, 1859 (new ed. 1903), and *Tales from the Field*, 1874; also Brackstad's *Round the Yule Log*, 1881. See K. Liestøl, P. C. Asbjörnson, *Mannen og liesverket*, 1947.

Asbjörnsson, Jón (1890-), lawyer and scholar, judge in the Supreme Court of Iceland, founder (1928) and president of the Icelandic Old Text Society, which is doing extremely valuable work, bringing out improved eds. of the Old Icelandic classics.

Asbury, Francis (1745-1816), first Methodist bishop of the U.S.A., b. Hands-worth, England; sent to America in 1771 as Wesleyan missionary, in which capacity he showed untiring zeal and energy. He d. at Richmond, Virginia. See his *Journal* (3 vols.), 1821, and Strickland's *Pioneer Bishop*, 1858.

Asbury Park, city of Monmouth co., New Jersey, U.S.A., 6 m. S. of Long Branch. It is a favourite resort area. It manufs. clothing, electrical products, and confectionery; it has a seafood industry and there are fruit and truck farms. Pop. 17,090.

Ascalon (modern **Ashkelon**), Israel, on the Mediterranean, 40 m. SW. of Jerusalem, one of the 5 chief cities of the Philistines, and the seat of the worship of the Syrian goddess Derceto. It was the bp. of Herod the Great, who did much to beautify it. During the crusades it suffered many vicissitudes. In 1099 the Christians gained a victory outside its walls. In 1153 it was captured from the caliphs by Baldwin III, King of Jerusalem. Captured by Saladin in 1187, it later fell into the hands of Richard Cœur de Lion. Its fortifications were finally destroyed by the Sultan Baibars in 1270. From A. is derived the name of the eschalot or shallot, a kind of onion originally grown in the surrounding country.

Ascania, name of a Ger. dynasty founded in the 12th cent. by Albert the Bear, first margrave of Brandenburg (q.v.), whose castle, near Aechersleben (q.v.), bore this name. This ruling house was closely connected with that of Anhalt (q.v.).

Ascanius, or **Iulus**, legendary son of Aeneas and ancestor of the Julii. He

accompanied his father to Italy from Troy, and later founded Alba Longa.

Ascaris (Gk *askris*), a kind of worm, a genus of thread-worms, or Nematoda, which includes sev. intestinal parasites, sometimes of considerable size. *A. lumbricoides*, the ringworm found in man, may attain 14 in. in length; *A. megalocephala*, found in horses and cattle, 17 in. *A. mystax* occurs in dogs and cats.

Ascasubi, Colonel Don Hilario (1807-75), Sp.-Amer. poet, b. Buenos Aires. He took an active part in the contests against Quiroga and Rosas, and realised his political ambitions by the separation of the confederated provs. His studies of the lives of the gauchos bore fruit in his poetical romances of the pampas. In 1864 he attended the Confederation of Paris as Argentine ambas.

Ascendant, see ASTROLOGY.

Ascension, Brit. is. of volcanic origin, situated in the S Atlantic, lat. 7° 56' S. and long. 14° 22' W., 760 m. NW. of St Helena, 7½ m. long by 6 broad, with an area of 34 sq. m. The is. derives its name from the fact of its having been discovered on Ascension Day, 1501, by the Portuguese navigator, Juan de Nova. It was occupied by the British in 1815 in connection with the captivity of Napoleon at St Helena, and until 1922 it was under the supervision of the Admiralty, who maintained a small naval station there. In Sept. 1922 it was made a dependency of St Helena and placed under the control of the Colonial Office. A barren, rocky peak, it has no vegetation, except at the highest elevation, but has been cultivated to an extent permitting the maintenance of 300 sheep and the growth of shrubs and various vegetables. The climate is very healthy. There is a sanatorium at Green Mt (2870 ft), the highest point of the is. Green turtles, land-crabs, and fish are abundant. Noted, too, for its tern. George Town, in the NW., supplies the only good anchorage. It is connected by telegraph with St Vincent, St Helena, and Sierra Leone and is an important station of Cable and Wireless Ltd, whose manager is normally appointed Resident Magistrate and represents the Governor of St Helena. Pop. (1954) 173, of whom 133 were St Helenians and the rest British. See Darwin, *A Naturalist's Voyage*, 1889.

Ascension, Right, of a heavenly body, the arc of the celestial equator measured from the first point of Aries to the foot of the perpendicular on the equator from the body. This perpendicular is a great circle from pole to pole of the heavens. R. A. is always measured eastward from 0° to 90°. In every hour of time 15° of equatorial arc passes the meridian, so that if the first point of Aries passes the meridian at twelve o'clock midnight, the bright star Capella, which has a R. A. of 79°, was on the meridian 5 hrs 16 min. earlier. The adjective 'right,' which is always used with the term ascension, is used in the sense of 'proper,' and means that the calculation is made on a right sphere, that is, one in which the polar axis corresponds with the polar axis of the heavens.

Ascension Day commemorates Christ's ascension into heaven 40 days after the resurrection, and is consequently celebrated on the fortieth day after Easter. *See also* BEATING BOUNDS.

Asceticism. This word, derived from the Greek *askesis*, covers in Christianity forms of spiritual exercise, and especially the discipline of the body and its appetites to bring it into subjection to the soul (cf. 1 Cor. ix. 27). Mainly of oriental origin, A. has taken many forms at different times, among different peoples, and in different religions. Consisting at its lowest of such mortifications of the flesh as flagellation and torture, we find it to include in its higher forms the uprooting of worldly thoughts and separation from the ordinary relations of life. Varying forms of A. are found in the teachings of the Socratic school, with its view of the soul as imprisoned in the body; of the Stoics and Cynics, with their contempt for the material refinements and comforts of life; and of the Neo-Platonists, who regarded marriage and meat-eating as obstacles to the attainment of divinity. In early Egyptian religion we find A. in the practices of circumcision, fasting, and abstinence from all uncleanness. Among the Jews A. seems to have been confined to special classes, such as the prophets, and to times of special distress, though eremitism appears shortly before the time of Christ amongst the Therapeutae in Egypt and the Essenes in Palestine. The most acute A. is the self-mortification of the Hindu fakirs, while some of its most spiritual manifestations are the meditations and penances of the Buddhists and Persian Sufis. A. has from the beginning played an important part in Christian life, especially in monasticism. In its extreme forms it was attacked in the early Christian Church by Jovianus, Vigilantius, and others. This opposition, developed by such men as Peter of Bruys, Henry of Lausanne, Wycliffe, and Jerome of Prague, reached its height in the Reformation.

Asch, Sholem, *see* ASH.

Asch, see AS.

Aschaffenburg, Ger. tn in the Land of Bavaria (q.v.), on the Main (q.v.), 168 m. NW. of Munich (q.v.). It is on the site of a Rom. fortress. The Renaissance castle of *Johannisburg*, severely damaged during the Second World War, was once the residence of the Archbishops of Mainz. The tn is a riv. port, a holiday resort, and has a trade in wine, paper, and timber. Pop. 52,000.

Ascham, Roger (1515-68), scholar and writer, a native of the Yorks vil. of Kirby Wiske, near Northallerton. He was adopted by Sir Anthony Wingfield, who had him educ. with his own sons. Impressed by A.'s scholarship his patron sent him in 1530 to St John's College, Cambridge, where he proved himself a brilliant classical student and gained a fellowship. He took his B.A. degree in 1534, and his M.A. in 1537. The fame of his knowledge of Greek brought him many pupils. The year 1545 saw the pub. of his delightful prose treatise on archery,

Toxophilus, which secured for him the favour of Henry VIII and a pension of £10. In 1546 he succeeded Sir John Cheke as public orator of his univ., and in 1548 became tutor to the Princess Elizabeth, an appointment which he relinquished 2 years later owing to a quarrel with the lady's steward. From 1550 to 1553 he was in the suite of the Eng. ambas. at the court of Charles V, during which time he visited various places on the Continent, including Italy. In 1553 appeared his *Report on the Affairs of Germany*. During his absence abroad he was appointed Lat. secretary to Edward VI, an office which, through Bishop Gardiner's influence, he was able to continue under Mary in spite of his Protestant views. Under Elizabeth he became secretary and tutor, retaining these offices till his death. His chief work, *The Scholemaster* (ed. by J. E. B. Mayor, 1863), a treatise on education, was pub. by his widow in 1570. His letters are to be found in Dr Giles's ed. of his work (3 vols., 1864-5). *See also* studies by A. Katterfeld, 1879, and S. A. and D. R. Tannenbaum, 1946.

Ascherleben, Ger. tn in the dist. of Halle, 29 m. NW. of Halle (q.v.). It was once the seat of the house of Ascania (q.v.), and has a 15th-cent. church. There are lignite and potash mines in the dist., and there are textile, steel, and chemical industries. Pop. 42,000.

Asciano, It. tn in Tuscany (q.v.), 13 m. SE. of Siena (q.v.). It has Rom. remains, and sev. fine old churches. Pop. (tn) 4400; (com.) 9600.

Ascidicea (Gk *askidion*, little bottle), the sea-squirts, an order of Tunicates which may be fixed and individual, free-swimming and colonial; the adults have neither a tail nor a notochord. *Molgula* and *Ascidia* are genera.

Asцитes (Gk *askos*, skin-bag), abnormal collection of serous fluid in the peritoneal cavity. The fluid, which coagulates on standing, is usually clear and of a pale yellow colour. It is due to systematic circulatory failure, obstruction of the portal circulation (*see* CIRRHOSIS), or to irritation of the peritoneum.

Asclepiad, form of metre invented by the Gk poet Asclepiades (3rd cent. BC). The Asclepiadic line consists of a spondee followed by 2 (or 3) choriambi and an iambus. The best-known poems in this metre are Horace's. An example in English is:

Look now, over the hill, speeding beyond,
lost in the cloud, it flies.

Asclepiadaceae, family of dicotyledons, perennial herbs or climbing shrubs, mostly tropical, about 1700 species. Leaves are simple and opposite, flowers regular, perfect and 5-parted, in cymes, racemes, or umbels; ovary superior, with 2 carpels, united by their styles, with the anthers of 5 epipetalous stamens united to the edge of the stigma. Pollination is by insects. Important genera are *Arauja*, *Asclepias*, *Calotropis*, *Cynanchum*, *Hoya*, *Orypetalum*, *Sarcostemma*, *Staphelia*, etc.

Asclepiades, Gk lyric poet of Samos, who

fl. in the 2nd cent. BC. Supposed to have been the master of Theocritus and inventor of the metre called after him, *metrum Asclepiadeum*. Forty-five of his epigrams have survived. See W. R. Paton, *Anthologia Graeca* (with trans.), 1916.

Asclepiades (124-56 BC), Gk physician of Prusa, Bithynia, who settled in Rome 91 BC, where he estab. Gk medicine on a respectable footing. He founded the 'Methodist School.' His treatment consisted of open-air exercise, bathing, and change of diet. The fragments of his writings which have survived were trans. into English, with a biography, by R. M. Green, 1955.

Asclepias (after Aesculapius, the god of medicine), Milkweeds; genus of herbs or shrubs of the New World and S. Africa. *A. curassavica*, Blood flower, is a beautiful tropical perennial for a hothouse. *A. decumbens*, *A. incarnata*, *A. syriaca*, Silkweed, and *A. tuberosa* are hardy N. Amer. showy border plants.

Asclepius, see AESCULAPIUS.

Ascoli, David d', Jewish author of the 16th cent. He issued a manifesto against Pope Paul IV for unfair measures against the Jews, and was the author of *Apologia Hebraeorum* (Strasburg, 1559).

Ascoli, Francesco (Cecco) Stabili d' (1257-1327), It. poet and astrologer. At one time astrologer to Carlo di Calabria, brother of the King of Naples, he incurred the enmity of the Inquisition, was driven from the professorship of astrology at Bologna, and finally burnt at the stake. His chief works were *De principiis astrologiae*, in Latin, and a didactic allegory, *L'Acerba*, in Italian.

Ascoli, Graziadio Isaia (1829-1907), It. linguistic scholar, b. Gorizia (N. Italy). He was the founder of It. linguistics. Prof. of linguistics in the Milan Accademia Scientifico-letteraria (which later became Milan Univ.), 1861. Founder of *Archivio Glottologico Italiano* (1873). Pub. works on Friulan (1846), oriental languages (1854, 1855, 1861), Ladino (1876), Rumanian (1865), Iranian (1866); also on Gk, Indian, Celtic, on It. dialects, on Franco-Provençal dialects, and other linguistic subjects. He attempted to prove the common origin of the Indo-European and of the Semitic languages.

Ascoli di Satriano, It. tn in Apulia (q.v.), 19 m. S. of Foggia (q.v.). It has a cathedral, and is supposed to be the site of the anct Asculum, or Ausculum, the scene of the defeat of the Romans by Pyrrhus (q.v.) in 279 BC. Pop. 9000.

Ascoli Piceno: 1. Prov. of Italy, in the S. of the Marches (q.v.). It is in the Apennines (q.v.) and is mainly mountainous, very high in the W., but with an undulating coastal plain on the Adriatic in the E. The chief rvs. are the Aso and the Tronto. The prin. tns include A. and Fermo (qq.v.). Area 822 sq. m.; pop. 331,000.

2. (anct **Asculum Piceum**) It. tn, cap. of the prov. of A., on the Tronto, 52 m. S. of Ancona (q.v.). It has a cathedral (14th-19th cents.), other interesting

churches, and a notable picture gallery, as well as a museum housed in the 13th-cent. 'People's Palace.' There are glass and pottery manufs., and silkworm culture. Pop (tn) 20,700; (com.) 38,100.

Ascomycetes, large class of fungi, the Sac Fungi, whose spores are contained within asci or tubes. It contains over 12,000 species in 15 families or 1564 genera.

Asconius Pedianus, Quintus (9 BC-AD 76), Rom. grammarian; author of a commentary on Cicero's speeches, part of which has survived (in *Pisonem*, *pro Scauro*, *pro Milone*, *pro Cornelio*, and in *Toga candida*). The MS. was rediscovered by Poggio Bracciolini in 1416; the best ed. accessible to Eng. readers is that of A. C. Clark (1907). See J. N. Madvig, *De Asconii Pediani Commentariis*, 1828.

Ascot Heath, Berks, 6 m. SW. of Windsor, is famous for its circular race-course, nearly 2 m. long, the scene of the ann. Ascot meeting in June. King Edward VII took great interest in the alteration and improvement of the course in 1902.

Ascot Vale, suburb of Melbourne (q.v.), Australia, with the Royal Agric. Society's show grounds. Pop. 15,980.

Asculum, see ASCOLI DI SATRIANO.

Asculum Piceum, see ASCOLI PICENO.

Asdic, electronic device fitted in warships for the detection of submerged submarines. The equipment emits pulses of high frequency sound which pass through the water. When the pulses strike a solid object such as the hull of a submarine or a whale, the operator hears an echo or 'ping.' Skilled operators can detect the difference between different types of echo. The name ASDIC is derived from the initials of the Allied Submarine Detection Investigation Committee, set up during the First World War owing to the very serious shipping losses suffered from U-boat attack. Although the principle of A. remains unchanged, the equipment has been much improved since its invention, and during the last war it was a vital factor in the many 'killings' achieved by the Allies during the almost continuous warfare that had to be waged against enemy submarines. A. has recently been adapted for use by naval helicopters. The equipment is lowered into the sea as the helicopter hovers above and the operator in the aircraft listens for echoes, as does his colleague afloat. A. has also been installed in some long-distance trawlers in recent years and has proved useful in the detection of large shoals of fish.

Aselli, Gasparo (1581-1626), It. anatomist, b. Cremona. He is best known for his discovery of the lacteal vessels, described in his *De Lactibus* (Milan, 1627), which was also the first book to contain anatomical plates printed in colours. A. was prof. of anatomy and surgery at Pavia.

Asellus (Lat. 'little ass'), small isopod crustacean commonly found in ponds and stagnant water in Britain. It belongs to the family Asellidae, and is allied to the wood-lice.

Asepsis, absence of injurious micro-organisms. A condition is said to be *aseptic* when no pathogenic germs are present; *antiseptic* when there is present some substance designed to destroy or prevent the development of such germs.

Aesir, or **Aesir**, race of Scandinavian gods. Odin was their chief, Thor, Baldur, Bragi, Heimdal, and Loki next in importance; the chief goddesses were Freyja, Frigg, Saga, Snotra, and Idun.

Asexual, biological term applied to plants and animals which can reproduce their kind and are yet devoid of sex. In the case of some algae (plants which include seaweeds), e.g. *Ullothrix*, a cell will produce sev. ciliated spores which form new plants either by themselves or by fusion with spores identically the same (and consequently sexless). In the case of some animals, e.g. *Amoeba*, the solitary cell divides in two, thus forming 2 individuals; this process is known as *self-division*, and occurs also in low plant life. Budding or germination is the outgrowth of buds on a parent plant or animal which form new life of a similar character (see SEX). The reproduction of multicellular animals by budding is usually distinguished from parthenogenesis (the development of an unfertilised egg), which may be reproduction without a 'sexual' process, but implies the development of sex and subsequent loss of the fertilisation process. By contrast, the bud always consists of a number of cells, and does not evolve from a single cell, which would be a gamete.

Asgard, 'tn of the Aesir,' the home of the Scandinavian gods, or Aesir. Like the Gk Olympus it rose from the earth (midgard or middle world). In A. Odin and the 12 Aesir dwell, holding council every day under Yggdrasil, the ash-tree. The palace of the gods was Gladsheim, that of the goddesses Virgulf; here also was Valhalla, the home of heroes slain in battle.

Asgeirsson, Asgeir (1894-), educationist and politician, President of Iceland since 1952.

Asgill, Sir Charles (1762-1823), son of the 1st baronet, was taken prisoner in the Amer. War of Independence, and chosen by lot to be executed in the place of Capt. Lippincot, whom the English refused to yield to Washington for hanging an Amer. officer. A. was ultimately released, and became a general.

Ash, Edward (1763-1829), physician. b. London, is known because of his discovery that every time metals which are unequally oxidisable are brought in contact electricity is generated; this is the base of the galvanic battery.

Ash (or **Asch**), **Sholem** (in Heb. *Shalom*) (1880-1957), Yiddish and Heb. writer, b. Kutno (Poland), in 1910 emigrated to the U.S.A., where he became naturalised, 1920. His first Yiddish short stories appeared in Jewish newspapers and magazines, 1900; his Heb. stories in *Tushiya*, Warsaw, 1902 onwards. His work *Dos shetlet*, still a classic, was pub. 1904 (Eng. trans. *The Town*, 1907). In W. Europe he became

known by his play *God der Rache* ('God of Vengeance'), which Reinhardt produced in 1907 in Berlin, and which was the first E. European Jewish play to be produced on a W. European stage. A. wrote numerous short stories and novels, which were trans. in sev. European languages (Eng. *Three Cities*, 1933, *Salvation*, 1934, *Mottke the Thief*, 1935, *Mother*, 1937, *Three Novels*, 1938, *Song of the Valley*, 1939, *One Destiny*, 1945, *East River*, 1946, *Tales of my People*, 1948, and *Passage in the Night*, 1953). He also wrote historical and religious novels and books of philosophy (*Kiddush*

Ministry for Foreign Affairs, Reykjavik

ASGEIR ASGEIRSSON

ha-Shem, 1916, *The Witches of Castella*, 1917, *The Nazarene*, 1939, *What I Believe*, 1941, *The Apostle*, 1943, *Moses*, 1951, and *Prophet*, 1955; plays (*Sabatay Zvi*, 1909, *Der bund fun shwach*, 1910, and *Jiftachs tochter*, etc.); and biblical stories (*Krecz Israel*, 1911, and *Masselech fun chumish*, etc.). His work shows a great power of observation and a gift of vivid description. In the books dealing with E. European subjects (*The Town*, *Three Cities*—Petersburg, Warsaw, Moscow—and so forth) he describes the conditions of the poor Jewish masses with affectionate and realistic insight.

Ash, name applied to sev. plants of the genus *Fraxinus*, which are related to the olive, privet, and lilac. *F. excelsior* is the common A.; *F. ornus* the manna A. or flowering A. of S. Europe; *F. americana*, White A.; *F. caroliniana*, Water A.; *F. lanceolata*, Green A.; *F. nigra*, Black A.; *F. pennsylvanica*, Red A.; *F. quadrangulata*, Blue A.; and *F. tomentosa*, Pumpkin

A. The Prickly A. is a shrub, *Zanthoxylum americanum*.

Ash, Mountain, or Rowan-tree, is the *Sorbus aucuparia* of the family Rosaceae. **Ash of Jerusalem,** old term for woad or dyers' weed.

Ash Wednesday, first day of Lent, derives its name from the Catholic ceremony of sprinkling on the heads of the faithful ashes from the burning of the undistributed branches of consecrated palm. The custom is said to have been instituted by Gregory the Great, and was finally sanctioned by Pope Celestine III in 1191.

Ashango, name of an African tribe of the Fr. Congo. There are sev. subtribes, including the pigmy Obongos. The A.s are fetish-worshippers and slave holders, and are remarkable for being fully clothed.

Ashanti, ter. of Ghana (q.v.), W. Africa, consisting largely of forest country. It is divided into 2 provs., the E., with H.Q. at Kumasi, and the W., with H.Q. at Sunyani. Area 24,379 sq. m.; pop. 818,904 (1948 census). The country is inhabited by a large number of confederated tribes, the prin. of which are the Bekwais, Kokofus, Nkwantas, Kumasis, Agunas, Mampons, Nantaw, Kumawus, Bompatas, Juabins, and Adjisus. Each tribe has its own head, but from time immemorial the King of Kumasi has been recognised as the king paramount of the confederation. The country is hilly and, on the whole, unhealthy. The land is fertile and well cultivated near the tns, producing, amongst other things, rice, maize, millet, cocoa, sugar, fruits, gums, and timber. Gold, rubber, kola, and cocoa are exported in considerable quantities. Kumasi (Coomassie) is the chief tn (pop. 77,689). Agriculture is expanding and coffee plantations are also being formed. There are rich forests of mahogany and cedar. The ann. gold output is valued at £500,000. Railway tracks traverse the once forbidding Prah; Kumasi is the railroad of 2 lines which link up with the coast, only

120 m. distant. A motor road passes N. over swamps, escarpments, and rivs. to emerge from the forest belt into a land of open country. Until 1896, when it became a Brit. protectorate, A. was a separate native kingdom. The Ashantis have long been noted for their warlike and predatory tendencies. According to tradition they derive their origin from the fugitives driven southwards about 300 years ago by Muslim tribes from Senegal and the Niger. Their attacks on the Fantis led to the first Brit. expeditions, 1807-11. In 1874 Sir Garnet Wolseley captured and burned Kumasi. Another expedition, in 1895-6, ended in the removal of the king, Premph, and the estab. of the protectorate. Further troubles were suppressed by the expedition of 1900, and the country was definitely annexed by Great Britain in 1901. Before the Brit. settlement, human sacrifices were a regular part of the fetish religion, and they still occur covertly.

The Gold Coast Gov.'s confidence in the loyalty of the Ashantis led to the return from exile of Premph; he d. in 1931, and was succeeded by his nephew, Ossi Ayyiman Premph II, as Omanheue of Kumasi, 7 July 1931. In 1935 the Golden Stool of A., which since the 17th cent. has been accepted as the symbol of the soul of the A. nation, was restored to the A. people, when Ossi Ayyiman was proclaimed the new Ashantihene (or A. overlord) Premph II. In effect the restoration marked the revival of the old A. confederacy for purposes of domestic policy. The Golden Stool is so named because it is covered with plates of pure gold and hung with golden balls. In 1956 the strongest representations were made, both officially and unofficially, to the Brit. Gov. by A. nominees, who protested with some degree of vehemence against the proposed constitution which makes the Ghana Gov. unitary as opposed to the federal gov. which an impressive section of the A. demand. They openly declared and warned that rather than be subservient to southerners the A. would resort to insurrection. Riots did occur on this issue in Jan. and May 1955. It should be noted that although overall there is a high illiteracy rate in Ghana, the illiteracy rate is much higher among the Ashantis than among the southerners. This means that the most articulate politicians are from the S. Officers of the armed forces, too, are mainly being chosen from the S., while the rank and file are from the N. It is questionable whether this fact has been thoroughly appreciated and the significance understood; in any widespread internal disorders any natural antipathy the northerners may have for the southerners might be reflected in mass disaffection within the armed forces.

See J. Dupuis, *Journal of a Residence in Ashanti*, 1824; H. J. Rickotts, *Narrative of the Ashanti War*, 1831; J. Beecham, *Sketch of Ashanti*, 1841; J. D. Hay, *Ashanti and the Gold Coast*, 1873; H. Brackenbury and E. L. Hayshe, *Fanti and Ashanti*, 1873; A. C. Beaton, *The*

Ashbourne, Edward Gibson, 1st Baron (1837-1913), b. Dublin. He was M.P. for Dublin Univ., 1875-85; attorney-general for Ireland, 1877-80; Lord Chancellor of Ireland, 1885-92, and 1895-1906. He was created a baron in 1885, the year in which he guided the passing through Parliament of the Land Purchase Act known as the Ashbourne Act.

Ashbourne, or Ashborne, mrkt tn of Derbyshire, England, 13 m. NW. of Derby, on the Dove. The fine cruciform church, dating from the 13th cent., has a beautiful spire over 200 ft high known as the 'Pride of the Peak,' and a fine monument by Banks. The grammar school was founded in 1585. Two engagements took place here during the Civil war. A. forms the 'gateway' to Dove Dale. Pop. 5440.

Ashburnham, John (1603-71), Eng. Royalist, friend and agent to Charles I, whom he assisted in various negotiations of the Civil war, including the treaty of Uxbridge and the visit to the Scots army. He is said to have engineered the king's escape from Hampton Court.

Ashburton, Alexander Baring, 1st Baron (1774-1848), Brit. statesman and financier, a son of Sir Francis Baring, founder of the famous banking house of Baring Brothers, and succeeded his father in 1810 as head of the business. From 1806 to 1832 he was the Liberal member for Taunton, Callington, and Thetford. In 1833 he became the moderate Conservative member for N. Essex. He was president of the Board of Trade in Peel's gov., 1834-5, and was created a baron in 1835. As special commissioner to the U.S.A. he concluded the A. treaty of 1842, which settled the NW. frontier between Canada and the U.S.A.

Ashburton, William Baring, 2nd Baron (1799-1864), is best remembered for the salon of his first wife, who entertained many distinguished politicians and writers.

Ashburton: 1. Tn in S. Devonshire, on the Yeo, 10 m. NW. of Totnes. It became a stannary tn in 1328 by a charter of Edward III. It has a fine cruciform church, St Andrew's. Until the Reform Act of 1832 it returned 2 members to Parliament; from then till 1868 one. Pop. 2700.

2. Tn in A. co., S. Is., New Zealand, on the A. R., 53 m. SW. of Christchurch. Pop. 10,160.

Ashburton River, NW. of W. Australia, 400 m. long, flows into the Indian Ocean near Exmouth Gulf.

Ashbury, par. and vil., Faringdon dist., Berks, England, 6½ m. E. of Swindon. Near it is Wayland Smith's forge. Pop. 500.

Ashby-de-la-Zouch, mrkt tn, Leics, England, 16 m. NW. of Leicester. Has manufs. of biscuits and soap. The name derives its suffix from the Norman family of La Zouch, who built a castle here. The castle was rebuilt in the 15th cent. by Sir Wm Hastings, and served for some time as a prison of Mary Queen of Scots. It was demolished by the parliamentarians during the Civil war. The fine old church of St Helen contains a 'finger pillory,' and the tombs of that branch of the Hastings family which received the earldom of Huntingdon. Pop. 6516.

Ashcroft, Dame Peggy (1907-), Eng. actress. Her first success was with Matheson Lang in *Jew Suss* at the Duke of York's Theatre, London, in 1929. She is to-day a leading player both in Shakespearean and in modern plays, being especially noted for beauty of voice and clarity of diction. She excelled as Ophelia, Juliet, Cleopatra, and as Hedda Gabler. Modern plays in which she has appeared include *Eduard My Son*, *The Heiress*, *The Deep Blue Sea*, and *The Chalk Garden*. Created D.B.E. in 1956.

Ashdod (modern **İsdu**, or **Esdú**), Palestine, 22 m. SW. of Joppa, now a mud vil., was formerly one of the chief Philistine cities. The Philistines brought here the ark of the covenant and placed it in the temple of Dagon. It figures in the N.T. under the name of Azotus. It was captured by the Assyrians in the 8th cent., and by the Egyptians in the 7th cent. BC. After being sacked by the Maccabees it was rebuilt by the Romans.

Ashdown, vil. in the Vale of the White Horse, Berks, England, 3½ m. NW. of Lambourn. In 871 Alfred won a victory over the Danes at A.; near by the figure of a horse has been cut on the chalky hillside (see WHITE HORSES AND HILL FIGURES).

Ashdown Forest, area of heathland in Sussex, England, lying between E. Grinstead and Uckfield, formerly thickly wooded. There is a noted golf course laid out on part of A. F.

Ashé, Simeon (d. 1662), Eng. Puritan divine, educ. at Emmanuel College, Cambridge. When the Civil war broke out he became chaplain to the Earl of Manchester, and after the war became rector of St Austin and a Cornhill lecturer. He was among the divines who went to meet Charles II at Breda.

Asher, 'blessed,' tribe whose lands reached from Lebanon to Dor; descended from A., the eighth son of Jacob, born to him by Zilpah the handmaid of Leah.

Ashera, see ASTARTE.

Ashes, residue from the burning of animal and vegetable matter. Vegetable A. are composed of oxygen, hydrogen, and carbon. Animal A. consist principally of phosphate of lime, with traces of salts of lime, magnesia, and soda. Mineral or volcanic A. consist of mineral fragments ejected from volcanoes; they may form cinder cones around the volcanic vent or be carried by the wind to fall to the ground

as ash beds. Volcanic ash from Krakatoa encircled the world after the eruption of 1883. *See also* VOLCANO.

Ashes, The, mythical trophy for which England and Australia compete in test match cricket. Its origin goes back to 1882 when Australia beat England at the Oval and the *Sporting Times* pub. a mock obituary notice: 'In affectionate remembrance of English Cricket which died at the Oval on 29th August 1882, deeply lamented by a large circle of sorrowing friends and acquaintances. R.I.P. N.B. The body will be cremated and the ashes taken to Australia.' When the Hon. Ivo Bligh took an Eng. team to Australia the following winter it was said that he had gone to recover the A., and his victory by 2 matches to 1 against Murdoch's team was marked by the presentation to him of a small urn containing the ashes of a bail. This urn, also referred to as the A., is now in the museum at Lord's. It has never been competed for as a trophy.

Ashville, co. seat of Buncombe co., N. Carolina, U.S.A., on Fr. Broad R., 210 m. W. of Raleigh. Situated in a picturesque setting, it is a favourite health resort. It has manufs. of cotton, furniture, leather, and machinery. Pop. 53,000.

Ashfield, Edmund (fl. 1680-1700), Eng. painter, pupil of Michael Wright. According to Horace Walpole, he was equally clever with oils and pastels.

Ashfield, metropolitan municipality of Sydney, in Cumberland co., New S. Wales, Australia, situated in the inner W. portion of the metropolis. Pop. 39,080.

Ashford, Daisy, authoress, b. Petersham, Surrey. She was educ. at The Priory, Haywards Heath, and her claim to immortality is based on a novel which she wrote at the age of 9. Pub. in 1919, when she was grown up, *The Young Visitors*, which was sponsored by J. M. Barrie, won instantaneous success by its artless charm and became a sort of juvenile classic. Miss Ashford married J. P. Devlin and lived in Norwich.

Ashford, urb. dist. of Kent, England, on the R. Stour, 14 m. from Canterbury. It has a fine old church with a Perpendicular tower. Cider-making, brick-making, and tanning are the chief industries, and there are large railway workshops. Pop. 24,780.

Ashi (352-427), Jewish doctor, b. Babylon. He was president of the academy of Sura. He collected all the Jewish laws, doctrine, and tradition into the Talmud of Babylon, which work was completed at the end of the 5th cent. by Rabina.

Ashikaga, city famous for its silk industry, in Tochigiken, Japan, about 50 m. N. of Tokyo. Founded in the 8th cent., it was once the seat of an anc. academy of Chinese lore, and a statue of Confucius is still existent here. Pop. 77,000.

Ashington (anc. *Assundun*), vil. of Essex, England, on the R. Crouch, where Edmund Ironside was defeated by Canute in 1016. Canute built the minster (1020) which is still in use as the par. church. Pop. 1270.

Ashington, tn of Northumberland,

England, 4 m. from Morpeth, centre of a coal-mining dist. Pop. 28,500.

Ashira, Negro tribe inhabiting the coastal dist. W. of the Fr. Congo, and between the Congo R. and the Equator. They are of good physique, and are skilful workers in iron and copper, and in cloth-weaving.

Ashkelon, *see* ASCALON.

Ashkenaz, N. race mentioned in Gen. x, who lived in Armenia. They were supposed to be descended from Gomer.

Ashkenazim, Ger.-Polish Jews, who arrived in this country via Holland, chiefly under Wm of Orange, and estab. a synagogue here (*see also* SEPHAIDIM).

Ashkhabad: 1. Oblast (prov.) of Turkmen S.S.R. of Soviet Union, bounded S. by Iran, W. by Caspian Sea. It has irrigated and dry farming (orchards, wheat, cotton) and there are coal, natural gas, and sulphur deposits. There are fisheries along the Caspian Sea coast. Industry is centred at A., Krasnovodsk, and Kizyl-Arvat. Area 87,000 sq. m.; pop. (1946) c. 550,000, Turkmen and Russians.

2. (*Poltoratsk*, 1920-1) Cap. of A. oblast and Turkmen S.S.R. of Soviet Union. It has cotton-ginning and silk-spinning plants, and glass and meat-packing factories. It was badly damaged by an earthquake in 1948. Pop. 120,000.

Ashland: 1. City of Boyd co., Kentucky, U.S.A., with a large trade in iron, steel, and woollen goods. It is a rail and river shipping point, with an airport. It manufs. bricks, ballast, chemicals, leather, shoes, and food products. Pop. 31,131.

2. Tn of Hanover co., Virginia, U.S.A., 16 m. N. of Richmond; it is the seat of Randolph-Macon College. Pop. 2610.

Ashlar, squared building stone with fine joints, laid in regular courses.

Ashley, Lord (1621-83), Eng. politician, was the early title of Anthony Ashley Cooper, 1st Earl of Shaftesbury (q.v.).

Ashley, Sir William James (1860-1927), Brit. economist, educ. at Balliol College, Oxford. He became prof. of political economy at Toronto, and later prof. of economic hist. at Harvard. He returned to Birmingham to organise a faculty of commerce at the univ. there, the first of its kind in England. His works include *Introduction to English Economic History and Theory*, 1888-93, and *Economic Organisation of England*, 1914. A. was knighted in 1917.

Ashmedai, *see* ASMODEUS.

Ashmole, Elias (1617-92), antiquary, the founder of the Ashmolean Museum at Oxford, b. Lichfield. He studied law, and in 1638 became a solicitor in Chancery. In 1645 he became one of the gentlemen of the ordnance in the Royalist garrison at Oxford, and afterwards entered Brasenose College, applying himself to natural philosophy, mathematics, and astronomy. In 1660 Charles II appointed him to the position of Windsor herald. He was called to the Bar in the same year and made an F.R.S. In 1677 he presented to Oxford Univ. his collection of curiosities, and subsequently bequeathed his library to the univ.

Ashmolean Museum, Oxford, founded (1683) to house the collections given to the univ. by Elias Ashmole (1617-92) (q.v.), which included the well-known collection of natural and artificial curiosities acquired by Ashmole from the Tradescant family at Lambeth. For two cents it was housed in the old Ashmolean building in Broad Street. About 1860 the natural hist. exhibits went to the Univ. Museum and the MSS., books, and coins to the Bodleian (q.v.); and in 1886 the ethnographical specimens went to the Pitt Rivers Museum. In 1894 the archaeological material, greatly expanded by

Courtesy Ashmolean Museum
THE ALFRED JEWEL

Arthur Evans (keeper, 1884-1908), was moved to an extension of the univ. galleries in Beaumont Street, and in 1908 this joint institution was renamed the A. M. of Art and Archaeology.

The museum possesses the Alfred Jewel (of gold, enamel, and rock-crystal, made in the 9th cent., probably for King Alfred, and found near Athelney, Somerset, in 1717), Guy Fawkes's lantern, and other historical relics, very comprehensive and valuable collections of European, Near E., and oriental art and archaeology, and extensive series of ancient and modern coins and medals. The museum is the centre of fine art and archaeological study in the univ. and possesses an important library and gallery of paintings and drawings.

Ashmunin, small vil. of Upper Egypt. It is situated a few m. from the l. b. of the R. Nile. It possesses the ancient ruins of Hermopolis Magna.

Ashokan Reservoir, reservoir constructed 13 m. W. of Kingston, New York, for

collecting the main part of the New York water supply from the Schoharie, Esopus, and Catskill watersheds. Approximately 12 m. by 1 m. with a maximum depth of nearly 200 ft.

Ashover, par. of Derbyshire, England, near Chesterfield, engaging in fluorspar mining and agriculture. Pop. 2500.

Ashraf, small scattered tribe of African Arabs. They inhabit a region near Tokar and the Amara country to the N. of Snakin. They claim descent from Mohammed, hence their self-designated name (Shurefa), Sherif being the term applied to his descendants.

Ashridge Park, estate in Herts, Bucks, and Beds, England, formerly belonging to the Dukes of Bridgewater and Earls of Brownlow. A portion, including Ivinghoe Beacon, has been acquired by the National Trust and another portion forms part of Whipsnade (q.v.) Zoological Gardens.

Ashridge College was originally the Bonar Law College, Berkhamsted, Herts, the Conservative centre for educating persons in economics, politics, social science, and political hist., with special reference to the development of the Brit. Constitution and the growth and expansion of the Brit. Commonwealth. Independent courses on similar lines are still organised at this imposing mansion, built by Wyatt (1808).

Ashtabula, city of Ohio, U.S.A., on Lake Erie, 55 m. N.E. of Cleveland. It is an iron ore transshipment point. Among its manufs. are leather goods and agric. implements. A great proportion of the pop. are of Finnish extraction. Pop. 23,700.

Ashthead, since 1933 a ward of Leatherhead (q.v.) urb. dist., mentioned in Domesday Book (as *Stede*), and for long a small agric. vil. Tiles and bricks were made here in Rom. times (before AD 200) and also in the 14th and late 18th cents.

Ashton, Frederick (1906-), dancer and choreographer, b. Ecuador. A pupil of Massine and Marie Rambert, he presented his first ballet, *The Tragedy of Fashion*, in 1926. For the Ballet Club between 1930 and 1936 he staged many ballets, including *Capriol Suite*, 1930, and also produced *Facade*, 1931, and other works for the Camargo Society. During this period sev. of his ballets were taken into the repertory of the Vic-Wells Ballet, the most popular being *Les Rendezvous*, 1933, and *Facade*, but it was not until 1935 that he joined the company as resident choreographer, a post he has held ever since. His 20 years with the company have estab. him as the leading Eng. choreographer, with a reputation that is international. Among his best-known works are *Apparitions*, 1936, *Les Patineurs*, 1937, *Symphonic Variations*, 1946, *Daphnis and Chloë*, 1951, and 2 full-length ballets, *Cinderella*, 1948, and *Sylvia*, 1952. He has also worked as guest choreographer with the Ballet Russe de Monte Carlo, Ballet Theatre, the New York City Ballet, and the Royal Dan. Ballet, for whom he produced a full-length ballet, *Romeo and Juliet*, in 1954. Awarded the C.B.E. in 1950.

Ashton-in-Makerfield, urb. dist. in

Lancs, England. There are large collieries, and iron goods are extensively manuf. Pop. 19,100.

Ashton-under-Lyne, manufacturing tn in the great industrial belt of S. Lancs, England, 6 m. from Manchester; the prin. industries are cotton spinning, calico printing, bleaching, dyeing, finishing of textiles, cloth weaving, iron founding, engineering, coal-mining, the manuf. of air conditioning plant, filter equipment, and cigarettes. Pop. 46,490.

Ashur, name of the first cap. of Assyria (q.v.). Its site at Qala'at Sherqat, on the W. bank of the Tigris c. 50 m. S. of Mosul, was excavated by the German Andrae in 1902-14. There were 3 *ziggurats* (q.v.) and a large temple of Ishtar, consort of the city's patron god A. (see ASSUR), which was traced back to an original archaic shrine. The excavation is a fine example of careful stratigraphical investigation. Pub. of the finds, including many inscriptions, continues.

Ashurbanipal, or **Assur-bani-pal**, King of Assyria, 669-633 BC, succeeded his father Esarhaddon at Nineveh. The chief events of his reign were the maintenance of Assyrian control in Egypt, the defeat of the Elamite Teuman, and the sack of Babylon in 648 BC following the revolt there led by his brother Shamash-shumukin. A. was patron of the arts and learning. He collected at Nineveh (q.v.) a large library of cuneiform texts and literature, now, like his reliefs, in the Brit. Museum. See ASSYRIA.

Ashwell, Lena (Lady Simson) (1872-), actress, daughter of Commander Pocock, R.N. Studied at the Royal Academy of Music. First appearance in 1891 in *The Pharisee*. She managed successively the Savoy Theatre and the Great Queen Street Theatre, which she reopened as the Kingsway Theatre.

Asia, the largest continent, occupies the N. portion of the E. hemisphere, extending beyond the Arctic circle and nearly reaching the equator. It contains about one-third of the whole of the dry land, and one-twelfth part of the whole surface of the globe. The philological origin of the name is unknown, though it seems probable that it was at first used with a restricted local application, gradually extended to the whole continent. Geographically speaking, Europe is a mere appendix to A., and exact delimitation in that sense is impossible, though the line of separation from Africa is better defined by the Red Sea. The N. boundary of A. is the Arctic Ocean, the extreme N. point being Cape Siyvero-Vostochny. The S. boundary it is impossible to fix with exactitude, but the volcanic chain of is. which can be traced through the Molucca and Sundra Is. may be taken as the limit. The S. coastline is much more irregular, and broken by the 3 great peninsulas of Arabia, Hindustan, and Cambodia. The Mediterranean and Black Seas form natural W. limits to the continent, as does the Red Sea lying between A. and Africa. The Ural R. and Mts are the common conventional boundaries with Europe N. of the Caspian, whilst the

Manych depression is used as the limit of A. between the Black and the Caspian Seas, and the Bering Strait, 36 m. wide, separates A. from America. For information on A. contained in this encyclopaedia, see the following main articles (in alphabetical order): AFGHANISTAN; ARABIA; ARYAN; ASSYRIA; BABYLONIA; BALUCHISTAN; BUDDHISM; BURMA; CENTRAL ASIA; CEYLON; CHINA; HEBREW; HIMALAYA; HINDUISM; INDIA; INDIAN SUB-CONTINENT; INDO-CHINA; IRAQ; ISLAM; ISRAEL; JAPAN; JEWS; KARAKORUM; KOREA; KURDS; MALAYA; MANCHURIA; MONGOLIA; PAKISTAN; PALESTINE; PERSIA; RUSSIA; SEMITES; SIBERIA; SYRIA; THAILAND; TIBET; TRANSJORDAN; TURKESSTAN; TURKEY. See also the individual articles on persons, places, and subjects.

Asia Minor, **Anatolia**, or **Anadolu**, obsolescent geographical term applied to an area corresponding roughly to present-day Asiatic Turkey. The name Anatolia, first used in the 16th cent., was applied to the country under the Byzantine emperors and was retained by the Turks in the form Anadolu to signify Asiatic Turkey. The hist. of A. M. has a peculiar character owing to its unique geographical position. The bridge between Asia and Europe from very early ages has been the battleground of the E. and W. nations. Thus the hist. of the country is a chronicle of the march of armies and of the rise and fall of small disunited states, rather than the record of the progress of a single state under an independent monarch. In the earliest period of which any knowledge can be gathered, A. M. was the home of various non-Aryan tribes who differed but little from each other. Much light has of late years been thrown on the civilisation of the Hittites or Syro-Cappadocians, the centre of whose power is supposed to have been Boghaz Keui. The date of the great Aryan immigration into A. M. from Europe is unknown, but it was declining in the 11th and 10th cents. BC. The kingdom of Lydia was the next to obtain supremacy, and following the fall of Lydia in 546 BC the Persians became rulers. In 334 BC Alexander the Great invaded A. M., but following his death the dynasty of Seleucus was the most powerful there, though it never held sway over the whole of the country. Then by degrees Rome conquered practically the whole of A. M., and it was the dominant power when Christianity was introduced there. With this introduction of Christianity a great advance took place. The old religions and languages disappeared, and the people, with one language and one religion, began to have a united identity. In the 6th cent. A. M. was rich and prosperous. From the 6th to the 10th cent. Persian and Arab raids took place, and in the 11th cent. the Seljuk Turks became the chief power. Then the Mongol power gained the ascendancy in the 13th cent., to be superseded by that of the Osmanli Turks of Brusa from 1307. Tamerlane swept through the country in 1402, and though the Osmanli supremacy was finally

re-estab., it was after a lengthy contest. Thenceforward the hist. of A. M. becomes the hist. of Turkey (q.v.).

Asiago, It. tn in Veneto (q.v.), on the plateau of the 'Sette Comuni', N. of Vicenza (q.v.). It has an observatory of Padua (q.v.) Univ., is a winter sports centre, and is known for its cheese and wine. There is a large military graveyard. Pop. 3000.

Asiago Plateau. Some of the heaviest fighting on the It. front in the First World War took place on the A. P., notably in the anxious period of the Austro-Hungarian invasion of Italy in Oct. to Dec. 1917. The Austro-Ger. forces having taken Gen. Cadorna's H.Q. at Udine on 30 Oct., being foiled in the effort to force a crossing of the Lower Piave, tried to outflank the new It. lines, which, however, had been reinforced by Brit. and Fr. troops, by a direct assault on the A. P. and mts between the Brenta and Piave. Large bodies of Austro-Ger. troops were flung in vain against the mt masses, but, though the Italians gave up some of the ground, the effort to reach the Venetian plains failed. In the following Dec. the Austro-Ger. forces made a further and desperate attack on the plateau and the upper reaches of the Brenta. Monte Asolone and the summits of Monte Tomba fell to them; but both, together with the Piave bridgehead at Zenon, were retaken by the Italians in Jan. 1918, and their positions on the plateau consolidated.

Asian Review, quarterly periodical, estab. in 1953 to cover current affairs in Asia. It has a literary section and publishes the papers read before the E. India Association; formerly it was *Asiatic Review* (estab. 1886).

Asiatic Society, Royal, institution formed for the furtherance of oriental studies. Monthly meetings are held every year from Oct. to June inclusive, when papers on recent research and discoveries, and on cognate subjects, are read. Its jour. is pub. twice yearly.

Asiatic Turkey, see ASIA MINOR and TURKEY.

Asiatious, see ANTIOCHUS.

Asiento, see ASSIENTO.

Asinius, see POLLIO, GAIUS ASINIUS.

Asir (i.e. 'the inaccessible'), region in Arabia (q.v.) belonging to the kingdom of Saudi Arabia. It extends from a line drawn inland from Birk on the S. border of the Hejaz to the N. border of the Yemen, some 10 m. or more N. of the port of Midi, for about 180 m. in an easterly direction.

Arabian geographers include it within the Yemen, but since the war between Ibn Sa'ud, King of Saudi Arabia, and Yahia, Imam of the Yemen, there have been political changes in this region. Included in the ter. also are the Farsan Is., which were believed to contain oil deposits. The maritime lowland has many fertile areas near the wadis, which are suitable for some cereals and afford pasturage. The chief tns are Abha (A. Sarat) and Jizan (A. Tihamah). Area 14,000 sq. m.; pop. 1,000,000.

Asialium, see ASSISI.

Askania-Nova, nature preservation park (feather grass steppe) in the Kherson oblast of S. Ukraine, 22 m. N. of Perekop isthmus. Founded in 1828. Research institute for cross-breeding and acclimatization of animals (1932).

Askari (Arabic *askar*, army), term used for native soldiers in Africa when trained and officered by Europeans.

Aske, Robert (d. 1537), lawyer, fellow of Gray's Inn. He was a member of an old estab. Yorks family. He led the Pilgrimage of Grace (q.v.) in 1536, but, after gaining considerable successes in his native co., ordered his followers to disperse to their homes on the promise of a royal pardon. Henry VIII invited him to London, allegedly to discuss the reasons for the NE. disturbances. A. was then arrested, tried for high treason, and eventually hanged at York, though he had been promised a pardon by the king. See fictional impression by H. F. M. Prescott, *The Man on the Donkey*, 1952.

Askeaton, mkt tn in the co. of Limerick, Rep. of Ireland, with monastic ruins. Pop. 600.

Asker, see NEWT.

Askern, vil. of the W. Riding of Yorks, England, 6 m. N. of Doncaster, centre of a mining dist.

Askew, Anthony (1722-74), scholar, b. Westmorland, and educ. at Emmanuel College, Cambridge, and at Leyden. He was a practising physician, but is better known as a classical scholar. He helped to develop public interest in rare MSS., scarce eds., and fine copies, and laid the foundations of an extensive library, the Bibliotheca Askeviana. His MS. vol. of transcribed inscriptions is in the Brit. Museum.

Askja, volcano of Iceland. It possesses a huge crater measuring 17 m. in circumference, and rises from a bed of lava called Odátharaun. It is the largest volcano in the is. It throws forth volumes of steam incessantly, and by many eruptions has built up a mt 4832 ft high. See W. G. Lock, *Askja, Iceland's Largest Volcano*, 1881.

Askwith, George Ranken, 1st Baron (1861-1942), Eng. lawyer, educ. at Marlborough and at Brasenose College, Oxford. A. was called to the Bar in 1886. He will be remembered for his success as an arbitrator in labour disputes, having received a good training under Lord James. His conciliatory policy settled many strikes and lock-outs, notably the cotton dispute of 1910 and the transport workers' strike of 1911. During the First World War he was chairman of the Gov. arbitration committee under the Munitions Acts. In 1931 he was chairman of the Malta royal commission (see MALTA). He was made a peer in 1919. Pub. *Industrial Problems and Disputes*, 1920; *British Taverns, their History and Laws*, 1928; *Lord James of Hereford*, 1930.

Asmara, tn of Ethiopia, Africa, about 50 m. SW. of Massawa. It was the seat of governmental residence of the former

It. colony of Eritrea. It was captured by allied troops on 1 April 1941. It is a modern tn, 75 m. by rail from Massawa, with new motor roads to Hassowa, Agordat, and Keren. A. has a fine cathedral and many modern buildings. Pop. (1939) 85,000 (of whom 50,000 were Italians).

Asmodeus, or **Ashmedai**, evil genius of Heb. tradition. He is mentioned in connection with Solomon in the pseud-epigraphical *Testament of Solomon* and in the Talmud. In the apocryphal book of Tobit he slays the 7 successive husbands of the beautiful Sara, daughter of Raguel, because of his own love for her, but is ultimately defeated by Tobias.

Asmoneans, or **Hasmoneans**, family of the Maccabees who delivered Judaea from Antiochus Epiphanes, King of Syria (175-164 bc). Their hist. is to be found in the books of the Maccabees, the last 2 books of the Apocrypha. The name is derived from *Hashmon* (*Asmoneus*: cf. Josephus, *Antiquities* XII. vi. 1), a collateral form of Simeon, founder of the family (1 Macc. ii. 1).

Asnières, Fr. tn in the dept of Seine, on the Seine. It is a NW. suburb of Paris, and a boating centre for Parisians. There are aircraft, perfume, and dye manufs., and some boatbuilding. Pop. 72,000.

Asoka, Emperor of India, grandson of Chandra Gupta, the conqueror of Seleucus. He reigned from 264 to 230 bc over ter. roughly corresponding in area to Brit. India excepting Burma. He was a disciple of Buddha and organised Buddhism as a state religion. There is evidence of his proselytising zeal in rock inscriptions in various dists. of N. India. See Allan Menzies, *The Religions of India*.

Asolo, It. tn in Veneto (q.v.), 18 m. NW. of Treviso (q.v.). It is at the foot of the Alps, looking across the plain to Venice, is a bishopric, and has ant. walls and many old buildings. Browning (q.v.) celebrates the place in his *Asolando*. Caterina Cornaro (q.v.) lived in A. castle. Pop. 7000.

Asp, an ophidian reptile closely related to the Brit. adder, properly termed *Vipera aspis*, of the family Viperidae; it is found in S. Europe. The term is also loosely applied to other snakes, as the *Naja haje*, the spy-slang of Africa, of the family Colubridae. Cleopatra's asp was probably *Cerastes cornutus* or horned viper, of the family Viperidae, found in Arabia, N. Africa, and Syria.

Aspalathum, see SPLIT.

Asparagus, family Liliaceae, genus of over 100 herbs of the Old World. *A. officinalis* is the perennial vegetable, grown for its succulent stems; *A. medeoloides*, the florists' Smilax; and *A. plumosus*, the Asparagus Fern.

Asparagus Stone is a variety of apatite (q.v.), a mineral which is formed chiefly of phosphate of lime.

Aspasia, courtesan of Athens in the 5th cent. bc. In 445 Pericles, after divorcing his wife, made her his mistress, and later was able by his influence to legitimise a son he had by her. She is believed to have had considerable influence over him,

and by some authorities the Samian and Peloponnesian wars are attributed to her. On the death of Pericles she became the mistress of Lysicles, who d. a year after Pericles in 428. There is a bust of her in the Vatican.

Aspasius (fl. c. AD 80), Gk peripatetic philosopher and commentator. Later writers refer frequently to his remarks upon the *Categories*, *De Interpretatione*, and *De Sensu* of Aristotle; but the works themselves are lost, as are also those on the Dialogues of Plato. His only surviving work is a commentary on parts of the *Nicomachean Ethics*, ed. by G. Heylbut, 1889.

Aspatia, mrkt and industrial tn in Cumberland, England, 20 m. from Carlisle by rail. Pop. 3100.

Aspe, Sp. tn in the prov. of Alicante, with a trade in ore and wine. Pop. 8000.

Aspect, in astronomy, position of the planets in certain relative distances. During the vogue of astrology there were 5: conjunction, sextile, quartile, trine, and opposition. Conjunction is applied when 2 planets are in the same lat.; when they are 60° apart they are sextile, 90° quartile, 120° trine, and at 180° (necessarily opposite) in opposition. The only 2 terms surviving are conjunction and opposition, and these take place with or to the sun, respectively, when the differences of apparent geocentric long. are 0° and 180°.

ASPEN

Aspen, *Populus tremula*, tree native to Britain, with leaf petioles strongly compressed laterally, causing the leaves to tremble with the least movement. See POPLAR.

Asper, Hans (1499-1571), Swiss painter, b. Zürich; a contemporary of Holbein, best known as painter of flowers and fruit.

Asper, name of a Turkish money of account. The name means white, and is probably derived from the whiteness of newly coined silver. The A. was a silver coin of very small value, 120 being required to equal in value a piastre. It

is also the name of silver coins in Trebizond, Rhodes, and Genoa.

Asperges, ceremony of sprinkling people with holy water before mass. It is observed in the Rom. Catholic Church, and derives its name from the first word of the invocation *Asperges me, Domine*, etc. (Ps. li. 7). The vessel used to hold the water is an aspersorium, while the sprinkling brush is called an aspergill. The sprinkling of the water itself is called an aspersion.

Aspergillosis, see POULTRY, Common Diseases.

Aspergillum, genus of molluscs of the family Clavagellidae and order Eulamelli-branchiata. *A. javanum*, the watering-pot shell, is so called from its shape, the bivalve shell occurring at the end of a perforated shelly tube.

Aspergillus, genus of minute fungi of the family Moniliales. *A. niger* causes smut (q.v.) of figs and dates, black mould of fruits, vegetables, etc. Some have Eurotium stages; *E. aspergillus* is the mould that forms on jam. Others are used in Japan in making saké or rice wine, shoyu sauce, soy cheese, etc.; elsewhere in making citric acid.

Aspern and Essling, Austrian vils. in the Marchfeld (q.v.). In the battle of A.-E. in 1809 Napoleon was defeated by the Austrians under Archduke Charles (see CHARLES LOUIS).

Aspertini, Amico (1475-1532). It. painter, b. Bologna. He was a pupil of Francesco Francia, and imitated the painters of different periods, though this did not prevent his criticising very harshly the imitators of Raphael. He painted frescoes in a somewhat grotesque fashion, and decorated a large number of buildings, but his character was more original than his talent, for he painted with both hands at once.

Asperula, family Rubiaceae, genus of perennial herbs, European, Asian, and Australian; *A. odorata*, Sweet Woodruff; *A. laurina*, Pink Woodruff; and *A. cynanchica*, Squinancy Wort, are found in Britain.

Asphalt, naturally occurring form of bitumen. It consists of a mixture of hydrocarbons, the elements carbon, hydrogen, oxygen, nitrogen, and sulphur being present. The manner in which the deposits are produced is a matter of some doubt, but they are probably formed by the oxidation and evaporation of liquid petroleum which has found its way from surrounding outcrops of petroleum-bearing strata. The best-known deposit is the 'Pitch Lake' at La Brea, in the SW. corner of the Is. of Trinidad, which covers an area of about 100 ac. It was known from a very early period, for the buccaneros caulked their ships with the material; it is now worked by the New Trinidad Asphalt Co., who export about 100,000 tons annually. Other deposits of A., somewhat different in composition, are found in Venezuela, Cuba, the Dead Sea, and Switzerland. That found at Val de Travers in Switzerland is really a bituminous limestone, and is largely used for preparing A. camits,

which contains a great proportion of limestone, and is much in demand in the form of blocks for street paving and floors. A. is also used for damp-courses in the walls of houses, for preparing waterproof flooring and roofing, and as an ingredient in Japan varnish. An artificial A. is made from coal-tar pitch, and for some purposes is an efficient substitute for the naturally occurring substance.

Asphalter's Work, in building (q.v.), consists of laying asphalt, hot, to form continuous coverings for floors or flat roofs, or to form continuous waterproof membranes ('tanking') below and around basements or other parts of buildings constructed below ground-water level.

Asphodel, common name of Asphodelus (q.v.). Scotch A. is *Tofieldia pusilla*; Bog A. is *Narthecium ossifragum*; both natives of Britain.

Asphodeline, family Liliaceae, genus of Mediterranean herbaceous plants with erect, leafy stems. *A. lutea*, Golden Asphodel or King's Spear, with yellow fragrant flowers, is the best known.

Asphodelus, family Liliaceae, genus of Mediterranean herbs, hardy in Britain; *A. alba*, White Asphodel, *A. cerasiferus* and *A. microcarpus* are perennials, *A. fistulosus* is an ann.

Asphyxia (Gk *a*, not; *sphuxis*, pulse), suspension of vital phenomena due to absence of the requisite proportion of oxygen in the lungs. The condition may be brought about by any obstruction to the passage of air to and from the lung, as in drowning, constriction of the wind-pipe, or the presence of foreign bodies or morbid growths in the air passages; or an insufficient supply of oxygen in the atmosphere breathed; or any interference with the muscular actions which produce breathing, such as may be occasioned by paralysis or great pressure on the walls of the chest and abdomen. In the lungs a continual exchange of gases goes on, oxygen being absorbed and carried to the tissues by the blood, and carbon dioxide being formed by the decomposition of carbonates in the blood. The proportion of carbon dioxide in the air of the lungs remains fairly constant, and this proportion can only be maintained by the inspiration of air rich in oxygen and the expiration of air with a relatively large proportion of carbon dioxide. If there is need for a larger consumption of oxygen, as during muscular exertion, the breathing becomes quicker and deeper; excess of carbon dioxide stimulates the breathing, so that the actual proportions of the gases in the air of the lungs do not alter, although the outer air be vitiated. If, however, the supply of air is so restricted or vitiated that the proportion of carbon dioxide within the lung increases, symptoms such as headache and nausea immediately present themselves, the skin takes on a blue tinge, and as the percentage increases consciousness is lost, respiration ceases altogether, and finally the heart stops beating.

The treatment in case of A. consists of first removing the cause and then resorting to artificial respiration (q.v.). If

the cause be inhalation of bad air, the patient must at once be removed to the open air, and the clothing about the neck, chest, and waist loosened. When choking is threatened through the presence of a foreign body in the air passages, an effort should immediately be made to dislodge it by means of the fingers, as there is risk of sudden A. An attack of vomiting or coughing may also succeed in ejecting the obstacle; or if a surgeon be at hand and the urgency of the symptoms demand it, laryngotomy or tracheotomy, according to the position of the obstacle, may allow air to pass to the lungs.

Asphyxiants, chemical substances which have a poisonous effect on the human system, producing suffocation. Many of them are used in the manuf. of ammunition.

Aspie, name given to the transparent, light-coloured jelly in which fish, meat, etc., are sometimes served. The jelly has a savoury flavour as it is prepared from stock flavoured with vegetables and a variety of vinegars. The liquor is cleared with egg whites and set with gelatine.

Aspidistra, small genus of Asiatic Liliaceae. It has broad leaves, and the species *A. lurida* is often grown as an indoor foliage plant in Britain.

Aspidium, genus of ferns now reclassified botanically among genera *Dryopteris*, *Polystichum*, *Nephrolepis*, and *Tectaria*.

Aspinwall, William H. (1807-75), Amer. railway builder, b. New York; in 1837 a partner in the shipping firm of Howland & A. In 1850 he left this to construct the Panama railway across the isthmus. It was completed in 1855, and the E. terminus was named after him. He was one of the founders of the Pacific Mail Steamship Co.

Aspinwall, see COLON.

Aspirate (Lat. *spiro*, I breathe). It denotes a sharply defined audible breath, and as such signifies in Eng. grammar the letter *h*. In Greek the *spiritus asper*, or rough breathing mark, when placed over an initial vowel has the effect of prefixing an *h* in the reading or pronouncing of the word. The A. is also used in application to 2 classes of consonants, i.e. those blended with *h*, as in the Sanskrit, and those followed by *h* in English in examples like *th* and *ch* with *f* and *v*. Thus, in the latter and broader sense of the term, 8 of the 16 Eng. mute sounds are *lene*, i.e. possess their corresponding aspirate.

Aspirator, apparatus used for drawing air or other gases through vessels connected with it. The simplest form consists of a large bottle filled with water, and supplied with a stopcock at the bottom. The apparatus through which the gas is to be drawn is connected with the neck of the bottle and the stopcock is opened. As the water flows out of the bottle, air or gas flows in to take its place through the only available channel, that is through the apparatus connected with the A.

Another form of A. consists of a narrow tube connected with a supply of water

under pressure. This jet is surrounded by another tube closed at the top and connected laterally with the vessel from which the air is to be withdrawn. Air is carried down with the jet so that a continuous current is set up from the vessel to be exhausted.

Aspirin, trade name for acetylsalicylic acid, $C_9H_8O_4$. It is also known as acidum and acetosalicum or salaceticin, and is made through the action of acetic anhydride on salicylic acid. Though first introduced into medicine under the name of A., it has many other trade names, e.g. Genasprin and Aspro. The dose is from 5 to 15 grains, and it is prescribed for rheumatic fever to reduce temp., and is widely used for neuralgia and headaches. It has the same action as salicylic acid, but is not so prone to produce secondary effects such as gastric disturbance. Care is to be taken to avoid exposure after administration, as perspiration often follows the dose.

Aspland, Robert (1782-1845), Unitarian divine. He was originally intended for the Baptist ministry, but was expelled from that body in 1800 for 'unsoundness,' and entered business, doing 'supply' preaching on Sundays. In 1801 he became minister to the General Baptist church at Newport, Isle of Wight; in 1805 he went to Norton, Derbyshire, and later in that year began his 40 years' ministry at the Gravel Pit Chapel, Hackney. He estab. sev. Unitarian periodicals, was secretary to numerous denominational societies, and in 1812 founded the Hackney Academy at Durham House for the training of Unitarian preachers. He was chiefly responsible for the formation of the Brit. and Foreign Unitarian Association in 1825. See *Memoirs* by R. Brook A., 1850.

Asplenium, genus of ferns of the family Polypodiaceae, commonly known as spleenworts, and having medicinal properties. *A. trichomanes* is the maidenhair spleenwort; *A. adiantum-nigrum*, the black spleenwort; *A. viride*, the green spleenwort; *A. ruta-muraria*, the wall rue, grows on rocks and old walls. *A. bulbiferum* is curious on account of the young plants which grow on its leaves; *A. rhizophyllum*, the walking fern, roots at its leaf-tips when bent to the ground; *A. nidus*, the bird's-nest fern, is a beautiful tropical plant.

Asplund, Gunnar (1885-1940), Swedish architect, b. Stockholm; prof. of architecture there 1931-40. Prin. buildings designed by him: extensions of the law courts, the railway station, the public library, the Skandia cinema, the exhibition, and the crematorium—all in Stockholm; extensions of the tn hall at Gothenburg; numerous schools.

Aspromonte, mt. of Calabria (q.v.), Italy. It is situated at the W. extremity of the range of the Sila Mts and rises just behind the peak of Reggio di Calabria. Its slopes are forest clad, and its height 6420 ft. It was the scene of Garibaldi's (q.v.) arrest in 1862.

Aspropotamos, see ACHELOUS.

Aspuzo, see MALATYA.

Asquith, Herbert Henry, see OXFORD AND ASQUITH, FIRST EARL OF.

Asquith, Lady, see OXFORD AND ASQUITH, COUNTESS OF.

Ass, general name for the braying members of the horse genus (*Equus*). It differs somewhat from the horse in having a tuft of hair at the end of its tail, in having no warts on its hind legs, and in the presence of stripes, which are absent in the domestic A. Its characteristics are long ears and an upright mane, together with a proverbial stupidity. The Egyptians used the head of an A. to signify the sign of extreme dullness. It is only fair to add on behalf of the A. that this celebrated stupidity is more superstitious than actual. Although the domestication of the A. took place at a very early date, the common 'donkey' was not introduced into England till the time of Elizabeth I. The animal is particularly adapted for transport purposes on account of its surprising hardihood, endurance, and docility when treated kindly. The usually wretched specimens seen in England are more the result of bad treatment than naturally so. In Arabia, Syria, and Egypt, among other places, its careful treatment has resulted in the evolution of an animal of remarkable value, and a Sp. he-ass was worth £200 in 1939. The wild variety is much hunted in Persia, and its flesh greatly prized. Because of the presence of more sugar and less cheese in its milk, invalids take it with benefit. Its skin is manu. into shagreen leather, and also used in the making of drums. The variety called albino, i.e. white, was used by the ancients on state occasions, and reserved for the highly honoured. Wild A.s are found in Asia and Africa, the former being more horse-like. The largest and handsomest is the Kiang (*Equus kiang*) from Tibet.

Assab Bay, situated on the W. coast of the Red Sea. Formerly an It. trading station; in 1880 it was taken over by the It. Gov. from a private company and used as a coaling station. There is a good harbour and a lighthouse. Harbour extensions have been planned and a possible rail route to connect with the railway from Jibuti to Addis Ababa. 378 ships totalling 411,124 tons used the harbour, 1953-4: unloading 37,636 tons and loading 99,869 tons.

Assai, beverage much in favour with Brazilians. It is made by soaking in water the fruit of the *Kuterpe edulis*, or A. palm. The concoction is said to be very nutritious.

Assal, or **Bahr Assal**, extensive salt lake of Fr. Somaliland. It is nearly 600 ft below sea level. Caravans call there to gather the salt that thickly encrusts its shores.

Assam, state of India covering much of the Brahmaputra Valley and the hills to the N., bounded on the N. by Bhutan and Tibet, on the E. by Burma and Manipur, on the W. and S. by E. Pakistan and Tripura. A. has 3 distinct regions—the A. or Brahmaputra Valley (an extension of the Indo-Gangetic trough); the Surna-Barak Valley; and the highlands. A.

has a phenomenal rainfall, its problem being not irrigation but flood control. Cherrapunji in the Khasi Hills, called the world's wettest spot, gets 428 in. of rain yearly; in 1861 it had 905 in. (41 in. on one day). A. is also subject to severe earthquakes.

History. The A. Valley, 400 m. long and mostly under 50 m. wide, with much of its area taken up by jungle and the wide sprawling riv., has a hist. of its own. Its people have always been subject to incursions from all sides. The Ahoms, who give the valley its name, came from the E. in the 13th cent. and were always at war with Muslims from Bengal. Later Burmese incursions terrorised A. so much that the British occupied it in 1825, making it part of Bengal and later a Chief Commissioner's prov. It became a separate prov. in 1919. It prospered with the growth of plantations, especially tea, introduced by the E. India Company in 1835. In 1944 A. was a theatre of war when the Japanese entered the Tiddim area, Kohima, and Imphal in Manipur. For the story of their repulse see BURMA, SECOND WORLD WAR CAMPAIGNS.

Development. The valleys are fertile; main food crops are rice, mustard, sugar, potatoes, fruit. Plantation crops for export are tea (A. has half of India's acreage under tea), jute, and cotton. Forests are a big potential asset, yielding increasingly teak, sal, rubber, lacquer, and elephant ivory. A. has a considerable oilfield at Digboi (65-80 million gallons a year), and a coalfield. Riv. steamers carry much of A.'s trade. Roads and air links, to connect A. with India without entering E. Pakistan, are being developed. The war stimulated exploitation of resources and road building, but A. has much undeveloped land and water potential, and little of the pop. pressure general in India.

Culture. A. is distinct from India, many of its people (33 per cent) belonging to tribes in the hills, some very primitive and some in conditions similar to Burma. Assamese is the tongue of 55 per cent of A.'s people—it is akin to Bengali. The pop. has changed its composition since plantation labour entered from Bihar and S. India. A.'s first univ. was estab. at Gauhati in 1948.

Government. The governor has a council of ministers, who are responsible to an assembly of 108 members. In India's Parliament A. has 7 members in the Upper and 12 in the Lower House. The cap. is Shillong (pop. 54,000); Gauhati (pop. 75,000) is the univ. tn and former cap. Area 84,924 sq. m.; pop. 9 million.

Assandun, see ASHINGDON.

Assary, see AS.

Assas, Louis, Chevalier d' (1733-60), Fr. hero, b. Vigan. He joined the army and reached the rank of capt. in the regiment of Auvergne. The story runs that, on the night of 15 Oct. 1760, he entered a wood to reconnoitre, and was surrounded by the enemy, who warned him that if he spoke a word he would be killed immediately. Thereupon he uttered his

famous cry, still quoted frequently, 'À moi, Auvergne, ce sont les ennemis!' The truth of the story has been questioned by historians in modern times, but the legend remains popular in France.

Assassin, term applied to one who murders another by surprise or by some secret means or treachery. The word is derived from *hashish*, the opiate made from the juice of hemp leaves. It was originally the name for a sect of the Shiites, known otherwise as Ismailites, founded by Hassan ibn Sabbah in the 11th cent. Till the 13th cent. the sect was in a flourishing state, when the Mongols under Hulagu destroyed its power. Hassan captured by a ruse the fortress of Alamut in Persia and settled there as chief of the society afterwards called the A.s. The doctrines of the A.s were those of the Ismailites, with the additional custom of the secret removal of all their enemies. At the head was Hassan ibn Sabbah, now known as Sheikh al Jabel, who was assisted by 3 grand priors. Beneath these were the semi-initiated members, and last the actual agents of assassination, who were called *fedais*, meaning devoted ones. They worked in absolute ignorance of the objects and rites of the society, and from them was exacted the most implicit obedience. One of the first victims was Hassan's former friend, Nizam-al-Mulk, followed shortly by the murder of the Shah Malik. Shah Malik's successor fought against the A.s unsuccessfully. It is said that no precautionary measures ever seemed to avail against the machinations of the society, which transferred its centre of operations to Syria in the 12th cent. A massacre of 12,000 of the A.s in 1255 by order of the Tartar khan, and a subsequent ravaging of their country by Bibars, the Mameluke Sultan of Egypt, completely destroyed their power.

The application of the word **assassination** is now generally limited to the taking of the life of a public personage for the motive purely of destroying his life. During the 16th and 17th cents. political assassination became prominent. During the reign of Elizabeth I many attempts were made to assassinate her. At this time political enthusiasts resorted to the most extreme methods of gaining their ends, and assassination, the very height of violence, was frequently and successfully perpetrated by these fanatics. Among the most famous victims of assassination were Julius Caesar, 44 BC; Thomas Becket, 1170; David Rizzio, 1566; Lord Darnley, 1567; William of Orange, 1584; Wallenstein, 1634; Marat, 1793; Paul, Tsar of Russia, 1801. Three presidents of the U.S.A. have been assassinated: Abraham Lincoln in 1865, James A. Garfield in 1881, and William McKinley in 1901. Ex-President Theodore Roosevelt was shot in 1912, but escaped serious injury. An unsuccessful assassination plot in 1696 was organised for the contemplated murder of William III by the Jacobites. More recent assassinations include those of Carnot, Fr. president, 1894; Humbert I, King of

Italy, 1900; Carlos I, King of Portugal, and his elder son, the Crown Prince, 1908; Nicholas II, Tsar of Russia, his wife and children, 1918; Paul Doumer, Fr. president, 1932; Alexander I, King of Yugoslavia, and M. Barthou, Fr. Foreign Minister (at Marseilles), 1934; Adm. Darlan, 1942; Mahatma Gandhi, 1948; King Abdullah of Jordan, 1952. Of unsuccessful attempts at assassination there are examples without number, and the causes which have actuated them are chiefly political distortion or personal animosity. There is not space enough here to recount a list of attempted assassinations, but among the most important during recent years are those committed upon Alfonso XI of Spain, 1878 and 1879; Amadeus of Spain, 1872; Bismarck, 1866 and 1874; Francis Joseph of Austria, 1853; George III of England, 1786 and 1800; George IV, while regent, 1817; Humbert I of Italy, 1878; Isabella II of Spain, 1847, 1852, 1856; Louis Philippe—no less than 6 attempts during 1835–46; Lord Lytton, 1878; Napoleon I, 1800; Napoleon III, 1855 (twice); Queen Victoria, 1840, 1842 (May and July), 1849, and 1882; William I of Germany, 1861, 1875, 1878; Theodore Roosevelt, 1912; Mussolini, 1925, and thrice in 1926; Franklin D. Roosevelt, 1933; Venizelos, 1933; Hitler, 1944; Harry S. Truman, 1950.

Assault in the narrow legal sense is a threat to inflict unlawful force upon another. Mere words, however threatening, unaccompanied by an act of violence do not constitute an A. The person threatened must reasonably apprehend the application of force on his person. Thus, to present a gun at a person within firing distance, to throw a missile or to shake a fist at him within striking distance, to attempt to kiss a woman against her will, to incite a dog to attack a person, are all forms of common A. The term A. is often used to denote *battery*, which is the actual unlawful application of force to the body of another. An A. usually but not necessarily precedes a battery, e.g. an unexpected blow struck from behind would only be a battery. A person assaulted may use such force as is reasonable to end the A., but must not seek revenge. Scots law seeks to discover which person was struck the first blow in a breach of the peace and allows him a greater measure of retaliation than does Eng. law, provided it does not exceed just resentment. A person assaulted may prosecute in the criminal courts and/or sue for damages in the civil courts. A defendant acquitted of a charge of common A. may obtain from the magistrates who tried him a certificate protecting him from civil proceedings. Before seeking damages for trespass to his person, a person assaulted should prosecute for A. and battery. In criminal proceedings A.s are either common or aggravated. The former is a misdemeanour punishable in the magistrates' court by a fine of £5 or 2 months' imprisonment and at the assizes by a maximum of 1 year's imprisonment. Aggravated A.s have been

defined by a number of statutes and include: indecent A.s on women; A.s on children; A.s on police and other public officials, including the clergy, in the execution of their duty; A.s causing actual bodily harm. These aggravated A.s are often classed as felonies punishable with imprisonment. The Scots law has no div. between A. and A. and battery.

Assaye, vil. of Hyderabad in S. India. It is celebrated as the scene of a battle between the combined Mahratta forces and the British under Wellesley, afterwards Duke of Wellington, in 1803. It resulted in a complete victory for the British.

Assaying, chemical process the object of which is the determination of the amounts of certain metals in an ore or alloy. The methods used fall into 2 classes, dry and wet. In a dry assay the ore is reduced by fusion with suitable fluxes, so that the metal is recovered in a pure state. Wet methods are those in which by the action of certain reagents a solution of a salt of the metal is first obtained. The salt may be precipitated and weighed, or the strength of the solution may be determined by observation of the amount required to bring about a certain reaction with a standard solution of known strength. The composition of the salt being known by analysis, a simple calculation will determine the amount of the metal present.

The results of A. processes are dependent for their accuracy on the perfection of the balance used to estimate the different weights of the metals, which should be so constructed as to reveal the most minute differences in weight.

Before proceeding with an assay, it is necessary to obtain a true sample of the material: that is to say, a sample which is likely to contain the same proportions of its constituents as exist in the whole bulk of the material. There are various devices for accomplishing this, the usual method being the div. of a large supply of material into 2 unequal parts, the smaller part being subdivided and so on until a sample of convenient size is obtained. In the case of alloys in a solid state, holes are drilled right through the metal in different places, and the drillings taken for testing.

It is important to determine the amount of moisture in an ore. The simplest method is to heat a sample in an air-oven to a temp. of less than 100° C., when the loss of weight when the mass is quite dry indicates the weight of water in the sample.

The principle upon which the A. of gold and silver by cupellation depends is that all metals with which those precious metals are usually alloyed are convertible into oxides by exposure to atmospheric air at a high temp., whereas the precious metals themselves remain unacted upon.

The general methods of A. as applied to particular ores, etc. are seen in the following examples:

Lead. The dry assay of galena, or lead sulphide, is carried out by mixing

the ore with a flux consisting of sodium carbonate and borax. The mixture is heated in a clay crucible at a red heat for about 20 min. and the fused material poured out. The lead button generally contains impurities, such as silver, antimony, and copper, so that its weight gives too high a percentage. The percentage of lead can also be gravimetrically determined by the formation of the sulphate. The ore is first dissolved in nitric acid, to which sulphuric acid is afterwards added. The excess of acid is removed by evaporation, and a precipitate of lead sulphate remains. This is washed with water to remove the iron and copper salts, and the insoluble matter is treated with dilute sulphuric acid. After filtering, the solid portion is treated with hot alkaline ammonium acetate to dissolve the lead sulphate. After again filtering, the filtrate is treated with alcohol and sulphuric acid to re-precipitate the lead sulphate, which is then filtered, again washed with strong alcohol, and weighed. When, as is sometimes the case, the carbonate or white lead ore is found in considerable quantities, the process is similar, but a different flux is used.

Copper. The percentage of metallic copper in an ore may be determined by electrolysis. The ore is treated with nitric and sulphuric acids until all the copper salts are dissolved, when the solution is freely diluted and submitted to electrolysis in a glass vessel with platinum electrodes, the copper being deposited on the negative electrode. The process is somewhat lengthy, but gives fairly accurate results. The potassium cyanide wet method depends on the fact that when potassium cyanide is added to a copper salt which has been rendered blue by the addition of ammonia, the colour gradually disappears. The ore is treated with nitric and sulphuric acids and then heated until the nitric acid is evaporated. The pure copper may be obtained from the solution by placing a small piece of aluminium foil in the solution. The copper is soon precipitated and sulphuric acid is added to dissolve the aluminium. The solid portion is washed and then treated with nitric acid, which dissolves the copper. Ammonia is added to the filtrate until it is just blue. The strength may then be estimated by adding the standard solution until the blue colour vanishes. This method is only satisfactory if small amounts of copper are present.

Zinc. Dry methods are not used, owing to the difficulty in separating the pure zinc from the other metals found in the ores. The chief volumetric method depends on the reaction between zinc chloride and potassium ferrocyanide, zinc ferrocyanide and potassium chloride being formed. The ore is treated with a mixture of potassium nitrate and nitric acid, and a strong solution of potassium chlorate in nitric acid is afterwards added and the mass evaporated to dryness; sodium hydroxide and sodium carbonate are added and the mixture is filtered, after which the filtrate is treated with

excess of hydrochloric acid. Any copper present is precipitated by passing sulphuretted hydrogen into the solution, after which the standard solution of potassium ferrocyanide is added. The end of the reaction is determined by testing a small drop of the solution with uranium nitrate. The appearance of a brown tint announces the presence of potassium ferrocyanide in excess.

Silver. In what is called the scorification assay, the ore is mixed with an excess of lead and heated in a scorifier or clay dish. The silver compounds are decomposed, the silver forming an alloy with the lead, and part of the lead oxidising and combining with the other constituents of the ore. The metallic button produced therefore contains a small part of the lead used and all the silver. This alloy is then cupelled. Cupels are small vessels moulded out of bone ash, which has the property of absorbing molten litharge or lead oxide, whilst the metallic portion is unaffected. The temp. used is just below the melting-point of silver until just before the process is complete, when it is suddenly raised. The result is that the lead is oxidised and thus separated from the silver. The assays are slowly cooled so as to avoid 'spitting' of the silver button.

Gold, when the alloy consists of copper, is assayed by the same method as is used for silver, and any silver present is removed by the action of strong nitric acid, the metal being previously rolled into a thin plate, so that every part of it may be reached by the acid. When the alloy consists of silver the process is called parting. Generally, however, both processes have to be resorted to. Amalgamation with mercury is also resorted to when gold has to be separated from sand, gravel, etc.

Iron. Dry methods are almost obsolete, and wet methods are all based on the readiness with which ferrous salts can be oxidised to ferric salts, or ferric compounds reduced to the ferrous condition. A standard method is the addition of potassium dichromate to an acid solution containing iron in a ferrous state. The ferrous salt is oxidised and the colour changes to green owing to the formation of a chromium salt. The indicator used is diphenylamine or sodium or barium diphenylamine sulphonate in the presence of syrupy phosphoric acid. At the end point the colour becomes purple. Another method utilises standard potassium permanganate, which is its own indicator in the presence of sulphuric acid, the end point being the production of a faint but permanent pink colour. The amount of the standard solution of potassium dichromate or potassium permanganate used determines the strength of the solution of the ferrous salt.

Asse (previously **Assche**), tn in the prov. of Brabant, Belgium, 9 m. NW. of Brussels. Pop. 11,700.

Assagai, or **Assagai**, weapon for throwing, usually a light spear made of wood and tipped with iron. It is used by all

the Bantu peoples of Africa. There are the long and short A.s.

Assemani, **Giuseppe Simone** (1687-1768), member of a famous family of Syrian orientalist. He was educ. at the Maronite College in Rome, and was later transferred to the Vatican Library, and afterwards made archbishop in *partibus* of Tyre. The Pope sent him on an expedition to Egypt and Syria in search of valuable MSS. He ed. and pub. rev. of the most valuable oriental MSS. of the Vatican.

Assembly, Church, see CHURCH ASSEMBLY.

Assembly, General, of Scotland, see GENERAL ASSEMBLY.

Assembly, National, see NATIONAL ASSEMBLY.

Assembly of Divines, see WESTMINSTER ASSEMBLY OF DIVINES.

Assen, cap. of the prov. of Drenthe, Netherlands, 16 m. S. of Groningen. Peat-cutting is the chief industry. Pop. 26,300.

Assent, Royal. When a Bill has passed through both Houses of Parliament in the same session it does not become an Act, or the law of the land, until the sovereign has signified his or her consent, such consent being known as the R. A. The Parliament Act, 1949, provides that where a Bill has passed the Commons twice in 2 successive sessions, such a Bill may be presented direct to the sovereign for his or her A. even if the Lords refuse to agree to its passage. The R. A. is sometimes given by the sovereign in person but more often by lords commissioners representing him, the power to do this being conferred by 33 Henry VIII, c. 21. The commissioners are usually 3 or 4 of the great officers of the state, and they hold letters patent under the great seal, signed by the sovereign's hand. They or the sovereign signify the R. A. in the House of Lords, but the Commons are also present at the bar, to which they are summoned by the black rod, and to which they repair headed by the Speaker, the ministers, and the officers of the House. The A. is given in Norman-French in the following picturesque fashion. After the title of the Bill is read by the clerk of the Crown, the clerk of the Parliament says 'Le Roy (or, La Reine) le veut.' An expression of thanks for the 'benevolence' of 'ses bons sujets' is coupled to the A. to a money Bill, and there is yet another formula for assenting to a private Bill. Should the king refuse his assent to a Bill, the form of announcement is 'Le Roy s'avisera' (the king will consider it). But as the sovereign can now act only on the advice of his ministers, i.e. the Cabinet, this contingency never arises. The last instance in which the R. A. was refused was by Queen Anne in 1707, when she refused her A. to a Scotch militia Bill, but in former times the refusal of the R. A. was a common enough occurrence. Queen Elizabeth I once at the end of a session refused to assent to 48 Bills out of a total of 91 presented to her. In 1858, says Prof. Lowell, Queen Victoria

was nearly advised by ministers to veto a private Bill obtained by the Pinilco Co. because the House of Lords had not permitted the Board of Trade to appear and oppose something which it ought to have opposed before the Private Bill Committee. Unless it is stated to the contrary in the body of a Bill, a Bill becomes the law of the land and its operation commences from the day it has received the R. A. A bill to abolish the use of French in all proceedings in Parliament and courts of justice was passed by the House of Lords in 1706 but was dropped in the House of Commons, so that French is still used for the R. A., although it was enacted in 1731 that all proceedings in courts of justice should be in English.

Asser, or *Asserius Menevensis* (d. c. 910), monk of St David's, b. Pembrokeshire. King Alfred made him his preceptor and companion, and promoted him as Bishop of Sherborne. In 1572 his life of Alfred, *De rebus gestis Aelfredi Magni*, was pub. by Archbishop Parker. There is an ed. by W. H. Stevenson, 1904.

Assessment in its fiscal sense is the fixing by the authorised assessor of the value of a property or income for the purpose of taxation or judicial award. See COSTS; DAMAGES; RATES AND RATING; TAXATION.

Assessor. The word is derived from the Lat. *adessor*, one who sits beside another, and signified one who was learned in the law and sat by a magistrate or other functionary, such as a governor of a prov., to aid him in the discharge of the judicial duties of his office. In modern times the word has been applied in a similar sense to one who, having a special technical knowledge, assists a judge to arrive at a decision, though having, of course, no part in the judgment. The Judicature Act, 1873, provided for their employment in all High Court cases, and the Appellate Jurisdiction Act, 1876, empowered the Judicial Committee of the Privy Council to obtain the help of the archbishops and bishops in eccles. causes. In maritime causes particularly A.s are frequently employed, such A.s generally being Trinity Brethren. The power to employ A.s in hearing appeals from the Admiralty Court was conferred on the House of Lords by the Supreme Court of Judicature Act, 1891, and under the Patents Act, 1883, either party in an action for infringement of patent is entitled to demand that the case be heard with an A. The Clergy Discipline Acts require that the bishop inquiring into the case should be assisted by 3 A.s, one of whom must be a barrister and another being generally his chancellor. Apart from eccles. and maritime causes, the help of judicial A.s is not often resorted to, their functions having long since been performed by expert witnesses.

Assets, in ordinary commercial parlance, implies any property or stock-in-trade of a merchant or company, and the term in this sense is used generally in relation to bankruptcy and insolvency. The more strict and legal application of the term (which is derived from the

Norman-French *assetz*, meaning 'enough') is to the real and personal property of a deceased person, which, in the hands of either his heir, devisee, executor, or administrator, is chargeable with the payment of his debts and legacies. Strictly speaking, therefore, the term does not apply to an intestate person's estate or to the estate of a person who dies with no debts to be paid. A. are either *personal* or *real*. The former comprehend goods, chattels, and debts, whilst the latter include real estate (i.e. landed property), whether it descends or is devised to the heir-at-law. Both classes, by the operation of the Land Transfer Act, 1897, now devolve on the executor or administrator in the first place. A. are also divided into *legal* and *equitable* A., a distinction derived from the nature of the claim of the creditors on the heir or administrators of the estate. 'Specialty' creditors, i.e. those whose debts arose from a sealed instrument or bond, were formerly entitled to payment before those whose debts were in the nature of a simple contract, but this privilege has been abolished, and both classes of creditors now rank *pari passu*. The first charge upon a deceased's estate is the expenses of the funeral and the expenses involved in administering the estate. The next charges, if they are legal A., are those which have statutory priority, such as unpaid taxes, rates, judgments of the courts, etc. Next come ordinary creditors, and finally voluntary obligations. In equitable A., however, the executor must pay whomsoever first obtains a judgment for his debt: he cannot plead that he must keep back any part of the A. to meet other creditors' demands. When all the A. have been expended to meet the demands of various creditors and there are still creditors after the estate is exhausted, the administrator is entitled to protect himself by the plea of *plene administravit*, i.e. that he has fully administered the estate. When this plea is put forward the creditor is awarded a judgment of A.s in *future*, meaning that he shall be paid out of any A. that may accrue to the defendant. In Scotland, although the word is used in the general sense of property, there is no legal term A. For administration of a bankrupt's A., see BANKRUPTCY.

Assheton, William (1641-1711), Eng. divine, b. Lancs. He became rector of Beckenham, Kent, in 1676. He was a voluminous if prejudiced and superstitious writer, as is shown in his work, *The Possibility of Apparitions*. His works include *Toleration Disapproved*, *Danger of Hypocrite*, and *The Certainty and Eternity of Hell Torments*. His scheme of insurance for the clergy may be said to be the forerunner of present-day life insurance methods.

Assideans, see CHASSIDIM.

Assiento, or *Asiento*, from the Spanish, contract or convention between the King of Spain and other powers for supplying slaves for the Sp. dominions in America. A similar treaty was entered into by Charles V with the Flemings, the

first of its kind. Similar agreements were concluded with the Genoese, Fr. Guinea Co., and England. Out of the disagreement over the A. between England and Spain concerning privileges granted to the S. Sea Co. arose the war of 1739. In 1748 4 years still were due to lapse, but at a cost of £100,000 the British abandoned the A.

Assignment, see ASSIGNMENT.

Assignats and Mandats. A. were bonds issued by the Constituent Assembly during the Fr. Revolution on the security of the confiscated landed property of the clergy. These bonds were called A., as they represented land assigned to the holders of these bonds. The first issue of the bonds amounted to 400 million francs (£16,000,000), and was generally in notes of 100 francs (24) each, though many of them were for lower sums. The object in issuing A. was not only to obtain the full value of the confiscated lands, but also to supply the deficiency of coin in circulation. Shortly after the first issue another 800 million in addition were issued, but without the liability to pay interest. At the beginning of 1791, the Legislative Assembly sequestered for the benefit of the state the property of all the wealthy *émigrés*, and in due course the Crown estates. On these more A. were issued, and by Sept. 1792 the total amount issued was by a fresh issue of 200 million brought up to 2700 million. Towards the end of this year, the double effects of the general insecurity of property and person, and of the depreciation of A. caused by their over-issue, caused a general rise in prices, with its natural concomitant, distress and pillage of shops. To counteract this distress the most extreme measures were taken by Convention, and laws fixing a maximum price to bread and other necessaries of life were enacted. Refusal of the A. was made punishable by death, but even this was not sufficient to ensure acceptance of a depreciated currency. In Aug. 1793 there were in circulation 3776 million A.; but by a forced loan of 1000 million, and by the collection of a year's taxes, this amount was reduced to less than two-thirds. Later the wants of the gov. led to a fresh issue of A. Eventually the enormous sum of 45,500 million francs in face value was in circulation, and the value of A. sank almost to nil, and early in 1796 a louis d'or (24 francs) was considered worth 7200 francs in A.

Under the Directory recourse was had to a new kind of paper-money, the mandat. These mandates were to enable any person who was willing to pay the estimated value of any of the national lands to enter into possession. They furnished, therefore, a somewhat better security than the A., as they could only be offered in payment at sales by auction. The estimate of the value of the lands was that of 1790, and in many cases this had considerably depreciated by 1795. The mandat of 100 francs at its first issue was worth only 16 francs in silver, and soon fell to a seventieth of its nominal value. The gov. were soon

forced to abandon the mandates and declare that they should be received only in payment of taxes and for land. The last issue of paper-money was in 1797, and from then to the outbreak of the First World War, 1914, the legal currency of France was purely metallic.

Assignees in Bankruptcy, person officially appointed on behalf of the creditors to manage a bankrupt's estate and now termed a *trustee*. See BANKRUPTCY.

Assignees, see ASSIGNS.

Assignment, in Eng. law, is the name given to a deed or an instrument of transfer which transfers both real and personal property. In Scots law the word *assignment* is used in conveyancing, and corresponds to the Eng. law term A., but in some instances, where statutes employing the phraseology of the Eng. law have been extended to Scotland, the word A. has necessarily obtained a partially technical use. Thus property in copyright, patents, registered vessels, all of which is transferable, is in Scots law also referred to as being assignable. The prin. interests in land to be assigned are estates for life or for any definite period of uncertain duration, and a statute of Charles II (Statute of Frauds and Perjuries) requires such A. to be in writing. An A. differs from a lease in being a transfer of the entire interest of the lessor; whereas a lease is an estate for years taken out of a greater estate, creates the relation of landlord and tenant, and reserves to the lessor a reversion. With regard to personal property, A. of goods and chattels in possession is made by bill of sale (q.v.). According to the Eng. common law a chose in action (q.v.) is not assignable. A common example of a chose in action is the right to sue for a debt, a legacy, damages, etc., and the idea underlying the prohibition to assign these choses in action was to discourage litigation. The rigour of such a state of affairs was mitigated by the old equity courts, which, on grounds of expediency, sanctioned the transfer of such property, and even in the courts of common law the ancient principle was often evaded. Since the Judicature Act, 1873, every legal chose in action is assignable provided that the debtor be served with a notice of such A. In general it may be said that any form of property is now assignable with perfect freedom, if we except a few cases which are considered contrary to public policy, such as the A. of pensions and the salaries of civil servants. Mortgages can be, and frequently are, assigned, and bills of exchange (q.v.) are assignable on indorsement.

It follows from the definition of *assignment* as the conveying of the right to a thing and not the thing itself, that in Scots law, in the case of movable property, A. can only take place when that property is in the hands of a third party. To make the transaction complete formal notice must be given the third party, and until such an intimation has been made the cedent's creditors may attach the property in the hands of the holder. This intimation is an important part of the

transfer, for though as between the parties mere knowledge of the transaction is sufficient, in the case of a competition for preference in payment the assignation first intimated will have preference over others which may be prior in date, but of which intimation of assignation has been received later.

A. of property is void if it be with intent to defeat or delay creditors, unless the transfer is made for valuable consideration and the assignee has no reasonable grounds for suspecting fraud.

Assigns in Eng. law and **Assignees** in Scots law is the name given to the parties in whose favour a deed of assignment or assignation is made or property assigned.

Assiniboia, name previously applied to 2 dists. of Canada, but now not held by either. The derivation of the word

stands on a foothill of the Apennines, overlooking the valley of the Tiber (q.v.). It is famous as the bp. of St Francis (q.v.), who founded here in 1209 the order of friars which bears his name (*see* FRANCISCANS). The first Chapter General of the order was held at the 'Portiuncula' 3 m. SW. of the tn, where the basilica of Santa Maria degli Angeli now stands; here St Francis is said to have d., and here is his original oratory. In A. itself is the great friary of San Francesco, which has two splendid Gothic churches (13th cent.) containing, amongst other works of art, frescoes by Cimabue and Giotto (qq.v.). The medieval windows are particularly fine. Beneath, in a crypt, is the tomb of the saint. A. has also a 13th-cent. cathedral, a castle, and sev. palaces. The church of Santa Chiara

E.N.A.

ASSISI: THE UPPER AND LOWER CHURCHES OF ST FRANCIS

is from the Ojibway *assini*, meaning stone, and the termination meaning to cook. The first dist. was formed in 1835 by the Hudson's Bay Co., and ceased to exist in 1870 on the transference of Rupert's Land to Canada. The second region was created by Act of Parliament in 1882 as a provisional dist. within the N-W. Ters., becoming part of the prov. of Saskatchewan in 1905. The name is perpetuated in a tn (pop. 2012) and an electoral dist.

Assiniboine, riv. of Canada, rising in 51° 40' N. lat. and 105° E. long., and joining the Red R. at Winnipeg. Its course measures about 400 m., and its tribs. are the Little Souris, Qu'Appelle, Rapid R., White Sand R., and Beaver Creek. A tribe of Indians takes its name from the riv. Steam communication existed between Winnipeg and Fort Pelly, about 400 m. distant, during the period of settlement in the late 19th cent.

Assinie, seaport at mouth of A. R. in the Fr. colony of the Ivory Coast. Exports groundnuts. Pop. 700.

Assisi (anc't *Assisium*). It. tn in Umbria (q.v.), 13 m. ESE. of Perugia (q.v.). It

(1260) contains the body of St Clare (q.v.), foundress of the order of Poor Clares. The tn is much frequented by pilgrims, and has had a considerable influence on the hist. of It. art. Metastasio (q.v.) was b. here, and so, probably, was Propertius (q.v.). Pop. (tn) 9100; (com.) 21,900.

Assize. This word, like so many other legal terms, came into the Eng. language from the Latin via the Norman-French. It is derived from the O.F. *assis*, and comes ultimately from the Latin *assideo*, to sit by. It is possible that the word A., where it signifies an ordinance, a decree, or an assessment (in which sense it is derived from another Lat. word, *assido*, to assess, fix, or ordain), may in anc't times have been confused with the former word. In the latter sense the word was used for sev. ordinances, chief among which are those known as A. of Bread and Ale, the A. of Clarendon, 1166, and the A. of Northampton, 1176. By the first the price of bread, ale, fuel, and other necessities of life was fixed. The A. of Clarendon was an important ordinance of Henry II reforming the administration of justice; it contained the beginning of

the system of trial by jury. The A. of Northampton still further removed administrative machinery from the control of the barons. The A. of Jerusalem were a code of feudal laws formed in 1099 for the new Christian kingdom of Jerusalem founded by the Crusaders.

The most common connotation of the term A., and that in which it is almost exclusively used at the present day, is that which denotes the session of High Court judges held periodically in each of the cos. of England and Wales. Their origin is to be found in articles 22 and 23 of Magna Carta, which provided that judges should visit each co. to take A.s of *novel disseisin* and *mort d'ancestor* (abolished in 1835), i.e. to settle disputes about the possession of land. Prior to this, by the common law, the administration of justice was confined to the judges sitting in term at Westminster and to justices in eyre (i.e. itinerant judges), whose circuits sometimes took 7 years to complete. The Statute of Westminster II, passed in the thirteenth year of Edward I, enacted that the justices should be 2 sworn judges, and that they should hold court in each shire not more than thrice a year. Since the passing of 1 William IV, c. 70, these courts have been held generally twice, but sometimes thrice, a year on a regular system, the country being divided for this purpose into *circuits* (q.v.). London and Middx do not come within the circuit system, the administration of criminal justice being at the Central Criminal Court (q.v.). Judges in the A. courts are as fully qualified to deal with all questions of law and fact as are those of the High Court, and in practice are always judges of that court. Their powers are now derived from 4 authorities: firstly, a commission of the *peace*; secondly, a commission of *oyer and terminer* (q.v.); thirdly, a commission of *jail delivery* (q.v.); and, fourthly, a commission of *nisi prius* (q.v.). The Scottish courts of judiciary are circuit courts somewhat similar in their function to the A. courts of England, but in civil causes they are practically limited to hearing appeals from the small debt courts. Only occasionally is a civil trial by jury transferred from the court of session to the court of judiciary. There are 3 circuits, N., S., and W. (the court of session being at Edinburgh in the E. of Scotland), in which courts are held twice a year, but owing to pressure of work Glasgow, Perth, Dundee, and Aberdeen have additional courts.

Assmannshausen, Ger. vil. in the *Land* of Hessen (q.v.), on the Rhine (q.v.), 18 m. W. by S. of Wiesbaden (q.v.). It is known for its wines. Pop. 2000.

Associated Press of America. This is an Amer. body, which claims to be the largest co-operative news organisation in the world, and in support of this claim points to the fact that it represents 1750 daily and Sunday newspapers in the U.S.A., has bureaus all over the world, and provides its members with 'spot' news, objectively presented. Its rival is the United Press of America.

Associated Society of Locomotive Engineers and Firemen, trade union of railway engine drivers and firemen, electric train drivers, and engine cleaners employed on the railways of the U.K. and Ireland; the great majority of the staff in these grades are its members. The society, which is the oldest of the three railway trade unions, is a party to the National Machinery of Negotiation for Railway Staff. It is in affiliation with the Trades Union Congress, the Labour party, and the International Transport Workers' Federation. The A.S.L.E. and F. believes that no change in railway organisation can affect the essentially craft nature of the work performed by the men at 'the front end.' On this basis the society founds its claim to be the appropriate trade union for railway staff employed in the line of promotion to driver or motorman.

Associates, term applied to clerks of the Crown office, who were once 'associated' with the judges of the commission of assize. They are officials of the Bench and Probate, Divorce, and Admiralty Divs. of the High Court. Their duties include keeping the records of the court, the preparation of the cause lists, attendance on the judge in court, and the entering up and delivering to the right quarter of the verdict and record of the case.

Association, Articles of, see COMPANY AND COMPANY LAW.

Association, The, league, the full name of which was 'The National Association for King William,' formed by Parliament in 1696 to protect the king against popish plots, as a result of a recent assassination plot against him.

Association Football, see FOOTBALL.

Association of Ideas, important term in the hist. of philosophical psychology, of considerably diminished importance in modern scientific psychology. Aristotle enumerated 3 principles of A.: similarity, coadjacency (or contiguity), and contrariety (or contrast). Thus the idea (or the actual experience) of a field of poppies may call up the idea of blood because it is similar in colour. The idea or the experience of a jug may call up the idea of milk because the jug and the milk have previously been experienced together either in place or in time. This is the principle of A. by contiguity in place and in time. The third principle (of contrast) was that the idea or experience of white might call up the idea of black because these ideas are opposites; later exponents of the principles of A. have, however, generally considered that such cases are better explained as particular examples of A. by contiguity.

The associationist school is the name given to those psychologists who tried to explain all processes of thought by reference to the A. of I. This school was mainly Brit., although it included the Fr. philosopher Condillac. Hobbes, Hartley, and Hume may be regarded as the founders of this school. It attained its climax in the writings of James Mill and of his son, John Stuart Mill, and it continued through Herbert Spencer and Bain.

The rise of experimental psychology in the last half of the 19th cent. caused the eclipse of the associationist school of psychology. While it is not denied that the principles of A. provide some of the more mechanical links in thought, they are no longer regarded as useful principles for the understanding of thought in its more practical applications, such as problem-solving. The weakness of Associationism was that it treated all thought as reproductive and neglected the educative (or creative) aspects of thought. It was not an accident that the Associationists very commonly took as their example of thinking the by no means typical activity of learning by heart. In solving a problem the sequence of thought is determined not by the strength of the A.s formed between the thoughts that occur but by their relevance to the needs of the problem in hand. The number most strongly associated with 33 is, no doubt, 34, but, if the problem is to multiply 33 by 3, the answer is not 34 but 99. The latter is a more typical thought process than that of learning by heart the sequence of numbers, and the succession of ideas is not to be explained by the laws of A. See articles on the writers above mentioned, and PSYCHOLOGY.

Assoilzie (O.F. *assoiler*, and Lat. *absolvere*, to absolve), term in Scots law meaning to absolve from a claim, to acquit, to pronounce not guilty.

Assonance (Lat. *ad*, to; *sonare*, to sound), correspondence of vowel sounds but not of consonants, as in 'slumber,' 'blunder'; it is illustrated in the vowel rhymes of this stanza from *The Spanish Gipsy*, by George Eliot:

Maiden, crowned with glossy blackness,
Lithe as panther forest-roaming,
Long-armed naiad, when she dances,
On a stream of ether floating.

It is a popular poetic device in the Romance languages, particularly Spanish, but not in the Teutonic, one reason being that the harsher and more discordant consonants of the Teutonic tongue have a more distorting effect upon their vowels. See also FIGURE OF SPEECH.

Assos, or **Assus**, tn on the gulf of Adramyttium (Edremid), Mysia. It is in ruins, and expeditions for the purpose of excavation have unearthed a bath, a theatre, a senate house, and 7 Christian churches. Its site is now occupied by the Turkish vil. Behram.

Assuan, see **ASWAN**.

Assumpsit (past tense of Lat. *assumo*, barbarously signifying 'I undertake'), old form of action under the common law so called because the defendant was said to have taken upon himself (*super se A.*) to pay the plaintiff so much money. It was used to recover damages for breach of a simple contract, i.e. a contract not made under seal, but in form the action was similar to an action for trespass. The action could not be sustained unless the promise to pay had been expressly made, either by an actual written instrument, such as a promissory note, or implied, as

when a householder receives goods delivered by a tradesman, or an innkeeper undertakes, by his action of receiving a traveller, the responsibility for the security of the goods of his guest. Like so many other common law forms of action, the action for A. has been superseded by such statutes as the Common Law Procedure and the Judicature Acts.

Assumption, Paraguay, see **ASUNCION**.

Assumption, Feast of, festival of the Christian Church celebrated on 15 Aug. to commemorate the taking up into heaven of the mother of Christ in body and soul, at the end of her earthly life. The earliest extant written evidence for the belief is in apocryphal writings. It was defined as a *de fide* dogma of the Rom. Catholic Church by Pope Pius XII in 1950. The festival was first instituted by the Emperor Maurice in AD 582. The Oriental Church observes it as the Feast of the Falling Asleep (Dormition) of our Lady. It still appeared as a feast of the Anglican Church in the Oxford Univ. Calendar in the 17th cent.

Assur, or **Ashur**, legendary founder of Assyria, and probably identical with the A(s)shur of Gen. x. 22, son of Shem. He gave his name to the country of Assyria and to its cap. A. was above all a god of war, and his symbol—the figure of a god in the act of shooting an arrow from the bow, enclosed in a circle—appears on Assyrian reliefs. See **ASHUR** and **ASSYRIA**.

Assur, see **ASSYRIA**.

Assur-bani-pal, see **ASHURBANIPAL**.

Assurance. This term is often applied specially to life as distinct from fire and other classes of insurance, but A. and insurance are practically identical. The term is also frequently applied to grants or conveyances of interests in land. See **INSURANCE**.

Assyat, **Loch**, freshwater lake of SW. Sutherland, Scotland. It is 215 ft above sea level, 6 m. long, and 1 m. in breadth.

Assyria (Assyrian **Assur** or **Ashur**, Persian **Athura**), anct state in Mesopotamia between the Zagros, Armenian-Taurus, the Hamrin Mts, and the Middle Euphrates. Although bounded on the N. by Urartu (Armenia) and S. by Babylonia, the ter. of A. varied, according to its political power, between the area bounded by the oldest and chief cities of Assur, Nineveh, Calah (Nimrud, q.v.), and Erbil and the whole of the tribute-paying lands at the height of its power in the 7th cent. BC. These included Babylonia, N. Arabia, Upper Egypt, Palestine, Syria, Cilicia, and S. Armenia. A. was inhab. from prehistoric times, though the origin of the Assyrians themselves is obscure. The earliest inhab. may have come from Sumer (Gen. x. 11) or the E. hills. Throughout the third millennium A. was dominated by Sumer, from whom it took over the cuneiform script, as well as religious and artistic ideas. A. was the seat of a vigorous Semitic power which displaced the Mitanni (q.v.) who had encroached upon the local kingdom of Shamshi-Adad I (c. 1750 BC). Tiglath-pileser (q.v.) I (1100 BC) and his successors extended

the influence of A. westwards to the Mediterranean during what has sometimes been called the 'First Assyrian Empire.' Adad-nirari II (911-890 BC) maintained control by a policy of transporting rebels from the subjugated lands. The most flourishing period of A. followed the refounding of Calah (Nimrud, q.v.) by Ashurnasirpal II (883-859 BC). A series of sustained military campaigns pushed the boundaries of A. to their furthest extent (for relations with the S. see BABYLONIA).

In the W. Shalmaneser (q.v.) III clashed with a coalition under Hadadezer and Hazael of Damascus, and though

British Museum

ASSYRIAN MAN-HEADED LION

checked at the battle of Qarqar in 853 BC, he received tribute from Jehu of Israel and the rulers of other city-states. Tiglath-pileser III (Pulu) developed a system of prov. gov. incorporating Damascus (732) into the Assyrian Empire. He received payment from Menahem of Israel to avoid the occupation of that land by A. forces. In 734 Tiglath-pileser captured Gaza and intervened on behalf of Judah by replacing Pekah by Hoshea on the throne at Samaria. A. also received tribute from (Jeho)ahaz. Shalmaneser V. besieged Tyre and Samaria, which fell to his successor Sargon (q.v.) II in 722 BC. Sargon II estab. a new cap., Dur-Sharrukin (Khorsabad), 10 m. N. of Nineveh, but this fell into disuse after his death in 705 BC. His son Sennacherib (q.v.) was active on the N. border but also campaigned in the W., where he unsuccessfully besieged Hezekiah in Jerusalem

after he had captured nearby Lachish (701 BC). After a long struggle with Marduk-apal-iddina II (Merodach-baladan, q.v.) he sacked Babylon. Sennacherib was an active builder and with his wife Naq'a (see SEMIRAMIS) re-planned Nineveh and was responsible for extensive irrigation works on which A. depended at all periods. Esarhaddon (q.v.) followed his father, who was murdered in 681. He invaded Egypt as far as Memphis and Thebes and subdued the hill tribes to the E., making treaties with the Medes. Although his son Ashurbanipal (q.v.) continued his father's policy, A. was already under pressure from the Medes and Scythians and weakening economically. In 648 BC Ashurbanipal sacked Babylon, which had rebelled under his brother Shamash-shum-ukin. He appointed a native, Kandalanu, to rule the S., but in 626 a Chaldaean dynasty under Nabopolassar (q.v.) gradually recovered Babylonian independence and the Assyrians withdrew. First Ashur (614) and then Nineveh (612) fell to the Babylonians and Medes, aided by Umman-manda (Scythians). For a while the last king (Ashur-uballit) reigned in Harran, but by 608 A. was controlled by Babylonia and henceforth lost its independence. With the fall of Babylon to the Medes (639) A. (with Babylonia) became a prov. of the Achaemenids, Greeks, and in turn the Seleucid, Parthian, and Sassanid empires, and eventually of the Caliphs. Throughout this later period A. was ruled from Babylon, Seleucia, Ctesiphon, and Bagdad (from AD 762). After a period of Turkish rule (1638-1917) and A. (now known as northern Iraq) was absorbed in the administrative dist. of Mosul and Erbil.

Our knowledge of A. has been growing continually following the excavations and researches at Nineveh, Ashur, and Nimrud (q.v.) conducted from 1845 to the present. The finds can be roughly classified as belonging to the realms of art and literature.

Art. From at least the time of Tukulti-Ninurta I, who built a palace at Kar-Tukulti-Ninurta near Ashur (c. 1100 BC), the kings of A. erected massive palaces of sun-dried brick with the interior decorated with painted frescoes using bright colours to outline symbolic patterns. To these were added sculptured slabs of stone depicting religious scenes such as eagle-masked priests or 'sacred trees.' Ashurnasirpal II in his NW. Palace at Nimrud, opened in 879 BC, lined the walls of the main reception rooms with reliefs on massive slabs showing his warlike operations. Across these was cut a long cuneiform inscription summarising his victories and lauding the national god Ashur. He also depicted scenes from the lion hunt and erected colossal winged bulls at the main doorways. Shalmaneser III added the artistic record of his wars on stele, on a black obelisk (showing the submission of Jehu and other kings), and on bronze gates found at Balawat, all now in the Brit.

Museum. The style of carving changed with Sennacherib, when more detail and an attempt to show perspective were crowded into the same type of warlike scene, such as his capture of Lachish. With Ashurbanipal the art of A. was at its peak, the liveliness and careful detail of the scenes from the lion hunt which decorated his palace at Nineveh being of the finest 'pre-classical' workmanship. In his reign the tendency to show non-war subjects was stronger. Excellent examples of enamelling and frescoes come from this same period. Ivory was worked to decorate thrones, couches, and other furniture and, with bronzes, has been found in large quantities, as also have jewellery and seals of fine workmanship.

Literature. The basis of the knowledge of the history of A. is thousands of documents written on stone or, more frequently, on clay. Inscribed clay prisms or cylinders mark the foundations of main buildings. Inscribed slabs, pavements, obelisks, and bricks record the royal building and war operations. These, and contemporary documents, including letters and accounts, enable a general picture of events throughout most periods of the history of A. to be reconstructed after the time of Shamshi-Adad I. However, the discovery of the Royal Library of Nineveh has done more than all else to provide detailed information of every aspect of Assyrian life and thought. Ashurbanipal was himself a scholar and sent scribes to temple libraries throughout the country to copy or collect texts of every type to add to the documents already amassed by his predecessors. The discovery of these tablets by Layard and Rassam has proved of prime importance for the development of Assyriology. About 20,000 tablets, some copies or originals going back to Sumerian times, include scientific works and cover the whole range of Assyrian learning. Medical treatises, including prescriptions and diagnosis, prognosis, and treatment of all manner of diseases; mathematics (tables of multiplication, square and cube roots, and geometric problems); laws and lists of plants, stones, cities, and objects are a tribute to the careful observation which is the first step in scientific work. These lists were also used as reference and school text-books. Other library tablets outlined grammatical forms or were dictionaries giving the Sumerian equivalents of Assyrian words, thus greatly aiding the decipherment and understanding of Sumerian which is based on these texts. Astronomical or astrological omen series, in as many as seventy tables, are supplemented by astrological reports presented to the king. Prayers and hymns addressed to the king or to the prin. gods, and numerous omens, incantations, and homerologies, reveal the religious beliefs and superstitions in the daily life of A. Perhaps the best-known Assyrian texts are the epics, which include a seven-tablet story of Creation, called after its first words, *Enuma Elish*, and the sagas of the hero Gilgamesh, a pre-Flood

King of Erech (see also GILGAMESH EPIC). The discovery of the eleventh tablet of this series by George Smith in 1872 did much to rouse popular interest in Assyriology. It was a poetic account of the Deluge, copied from texts going

British Museum
BLACK OBELISK OF SHALMANESER III

back to Sumerian originals of at least c. 1800 bc. The Flood narrative was told to Gilgamesh in response to an inquiry concerning eternal life. The unprecedented Deluge was a punishment for evil-doing; the survivor Ut-napishtim, warned by the god Ea, built an ark and took animals into it during the rains and floods which lasted seven days and caused the ark to drift northwards to Mt Nisir. On

emerging from the ark after having assured himself of the abating waters by the release of birds, the hero sacrificed to the gods and was rendered immortal. The similarities to, but not always the many differences from, the Genesis account have often been stressed.

The religion of A. was an adaptation from the Babylonian and thus ultimately of the Sumerian. It was polytheistic, the national god being *Assur* (q.v.), who absorbed most of the attributes of *Marduk* (q.v.). *Assur* was linked with a triad of deities: *Anu*, the heavenly father of the gods; *Bel*, ruler of the earth; and *Ea* (qq.v.), god of the deep and wisdom. Another triad was *Sin* (q.v.), the moon god; *Shamash*, god of the sun and universal judge; and *Adad* or *Addu*, the storm-god (formerly read Rimmon or Ramman). Other important deities were *Ishtar*, goddess of love and war (Venus); *Nabu* (q.v.), a son of Marduk, the scribe and messenger of the gods, father of learning and of the scribal arts, to whom many inscribed clay tablets are dedicated; and *Nergal* (q.v.), a solar deity, god of war, hunting, and king of the lower regions. All gods had their own symbols, shrines, and attendants. Constant appeal by prayer and incantation was made to all these gods and to the spirits which were thought to animate every object and phenomenon in nature. The principal religious festival was that of the New Year when the gods went in procession outside the cap. to the *akitu*-house where the destiny of the following year was decided by the assembled gods. The king as representative of both the gods and the people is often depicted drawing life for his people from the 'sacred tree.'

For the excavations of sites in Assyria from 1845 to the present time see the articles on the chief cities: *ASHUR*, *NINEVEH*, and *NIMRUD*, and on the excavators who have worked there: *LAYARD*; *RASSAM*; *RAWLINSON*; *LOFTUS*. See also *BABYLONIA* and *SUMER*. See A. H. Layard, *Monuments of Nineveh*, 1849, *Nineveh and its Remains*, 1849, and *Nineveh and Babylon*, 1853; A. T. Olmstead, *History of Assyria*, 1923; Sidney Smith, *Cambridge Ancient History*, vol. iii, 1925, and *Early History of Assyria*, 1928; Sir E. W. A. Budge, *Rise and Progress of Assyriology*, 1925; C. J. Gadd, *The Stones of Assyria*, 1936; S. H. Hooke, *Religion of Babylonia and Assyria*, 1953; Seton Lloyd, *Foundations in the Dust*, 1955; M. E. L. Mallowan, *Twenty-five Years of Mesopotamian Discovery*, 1956.

Assythment, in Scots law, is an obsolete form of reparation exacted when death resulted from crime and the criminal was not executed. It was also payable when the homicide was unintentional and was due even in cases of accidental death.

Ast, Georg Anton Friedrich (1778-1841), great Ger. scholar and teacher, was b. Gotha and d. Munich. He went to the univ. of Jena in 1798, where he studied philosophy and philology. In 1802 he became an academical lecturer at Jena; and in 1805 was appointed prof. of ant.

literature in the univ. of Landshut, which institution was transferred to Munich in 1812. He wrote many philosophical and philological works, and during the latter part of his life gave most of his time to the study of Plato. His *Platons Leben und Schriften* (1816) was an important work. In 1809 he began to edit separate dialogues of Plato; and from 1819 to 1832 he pub. a complete ed., with a Lat. trans. and a commentary. His *Lexicon Platonicum* was pub. 1834-9.

Asta, see **ASTI**.

Astacus, genus of decapod crustaceans. *A. serratus* is an Australian crayfish; *A. gammarus* (or *Lomarus vulgaris*) is the lobster (q.v.). An astacian is a member of the family, and an astacite is a fossil crayfish.

Astaire, Fred (1900-), Amer. dancer and actor, b. Omaha. With his sister Adèle A. he formed a brother-sister dancing team, 1907. After numerous Broadway successes the team dissolved in 1932 and a series of brilliant motion pictures in partnership with Ginger Rogers followed, of which the best known were *The Gay Divorce*, *Roberta*, and *Top Hat*. Since the dissolution of this partnership A. has had many different leading ladies, including Judy Garland (*Easter Parade*) and Audrey Hepburn (*Funny Face*). A. was given a special Academy Award for 'raising the standards of all musicals,' 1949.

Astapa, see **EESTPA**.

Astarabad, see **GORGAN**.

Astarte, **Ashtoreth** (the latter a form produced by inserting the vowels of *bosheth*, 'shame'), anct Semitic goddess of sexual passion, the Canaanite and Syrian equivalent of the Babylonian *Ishtar*, and associated (as goddess of maternity and fertility) with *Tammuz* (q.v.), or *Adonis*, who represented (like the Gk Persephone) the passage of the seasons. *Phoenicia* was the special centre of her worship (she is 'the goddess of the Sidonians' of 1 Kings x. 5); but as the consort of the local baals (see **BAAL**) she was also worshipped throughout Canaan, her image in the form of a wooden totem called the *Asherah* standing in each of the sanctuaries. W. F. Albright (*Archaeology and the Religion of Israel*, 1926) suggests that *Asherah* was originally a distinct goddess of the sea, and her name often occurs in the Ras Shamra tablets. It seems certain, however, that *Asherah* was identified with A. A.'s priests were eunuchs; temple prostitution was a regular feature of her cult, fiercely attacked in the Bible (2 Kings xxiii. 13). The fish and the dove were sacred to her. She was also a warrior goddess.

Astatic Couple, 2 magnetised needles mounted one above the other, and parallel, but with the poles reversed. If the magnetic moments of the 2 magnets are nearly identical, the couple will show little tendency to set N. and S., but will still be sensitive to a magnetic field set up by an electric current in a surrounding coil. Hence A. C.s are used in astatic galvanometers.

Astatine, symbol At, atomic number

85, a member of the halogens (q.v.). It was obtained as an artificial product of the nuclear bombardment of bismuth with α -particles of 32 million electron volts energy. Its name is from the Gk *astatos*, meaning unstable, since A. is the only member of the halogens having no stable isotope. Although a non-metal, it has a marked electropositive character. Its similarity to iodine is shown by the observation that A. concentrates in the thyroid gland of animals. There are five isotopes of atomic weights 211, 214, 215, 216, and 218.

Astbury Ware, name derived from John Astbury (1686-1743), potter, which is given to a type of red earthenware (q.v.) made in Staffordshire, of remarkable thinness, decorated with white pipe-clay stamped relief and covered with a lead-glaze, under which the body seems a dark brown. See H. Hagger, *Staffordshire Chimney Ornaments*, 1955.

Astell, Mary (1668-1731), authoress, b. Newcastle upon Tyne. Her uncle educated her in Latin, French, logic, mathematics, and natural philosophy. She finished her studies in London, and pub. in 1697 *A Serious Proposal to the Ladies, wherein a Method is offered for the Improvement of their Minds*. It advocates the estab. of a kind of Protestant nunnery.

Aster, family Compositae, genus of about 250 species, mostly perennial herbs, some shrubs and annuals, that includes species grown as Michaelmas Daisies in gardens (*A. amellus*, *A. novi-belgii*, etc.). *A. tripolium*, Sea A., is a native of Brit. coasts. The China A. is *Callistephus chinensis*.

Asterabad, see GORGAN.

Asteria, or **Asterie**, mythical daughter of the Titan Coeus and Phoebe, sister of Leto, mother of Hecate. To escape the embrace of Zeus she took the form of a quail (*ortyx*) and threw herself into the sea, where she was changed into the is. A. or Ortygia (later Delos).

Asteria, or **Star-stone**, name applied to a stone which, when cut in the form of a dome, shows a star of 6 rays. The term is specially used of an imperfect variety of sapphire, which is bluish-grey in colour and milky or opalescent. Asterism is the name given to the optical phenomenon of a star-shaped figure which is exhibited by some crystals. Asteriated sapphire gives rise to this phenomenon by reflected light, and some forms of mica by transmitted light. Asterism is also the name of any group of stars smaller than a constellation.

Asterias (Gk *astér*, star), name of a genus of starfishes, phylum Echinodermata. *A. rubens*, the 5-rayed starfish, is common in the N. Sea, *A. glacialis* in other European seas. Starfishes are found throughout the world.

Asterisk: 1. (from Gk *astér*, a star). In typography, the sign *.

2. Cover for the paten in the Eucharistic rite of the Oriental Church; made in the form of a star-cross, it supports the veil over the sacred host. One is still used in the W. by the Pope.

Asteroids, name given by Sir Wm Herschel in 1802 to what should more

properly be termed planetoids. These planetoids, now usually known as minor planets, are a numerous group of very small planets not visible to the naked eye, situated in the solar system between Mars and Jupiter. The discovery of Uranus by Herschel in 1781, which first broke through the old opinion that the number of planets was complete, and the gap between Mars and Jupiter which Bode's law (q.v.) indicated should be filled by some planet, gave an impetus to the search for a new planet, which resulted in the discovery by Piazzi at Palermo on 1 Jan. 1801 of the first and largest of the A., Ceres. On 28 Mar. of the next year Olbers at Bremen discovered Pallas; on 1 Sept. 1804 Harding of Göttingen found Juno; and on 29 Mar. 1807 Olbers found the fourth planetoid, Vesta. It was not till 8 Dec. 1845 that Hencke at Briessen discovered Astraea, and he added a sixth to the list in Hebe, found on 1 July 1847. Since that date no year has passed without the addition of some A. to the list, and at the present time over three thousand have been discovered and about sixteen hundred orbits have been computed; apparently there is no limit to their numbers.

The introduction of the photographic method by Dr Max Wolf (q.v.) in 1891, now exclusively used for detecting these bodies, has enormously accelerated their discovery. The photographic plate is fixed to a telescope worked by a mechanism which follows the apparent motion of the 'fixed stars.' If the plate be long exposed, any heavenly body with a proper motion will be detected owing to the fact that its image on the plate will be a short streak instead of a round disk. The 4 largest A. are Ceres, Pallas, Vesta, and Juno, whose diameters are respectively 480, 306, 241, and 121 m.: the diameters of the majority of the A. are considerably less than 50 m.; and Shapley and Nicholson have detected and measured one whose diameter is 3 m.; this is, therefore, the smallest planet whose dimensions have been ascertained.

The total mass of all the A. has been estimated as about 1/4000 of the mass of the earth and in any case must be less than that of Mars, for otherwise noticeable perturbations of Mars in its orbit would be detected. There appears to be no lower limit to the size of the A., a fact which indicates that they may be meteoric rather than planetary bodies. This is supported by the fact that their orbits are often very eccentric and steeply inclined to the ecliptic, e.g. that of Pallas is inclined at 35° to the ecliptic. It is significant that all A. so far discovered have direct motion, which is not favourable to a meteoric origin.

Most of the A. are fainter than the tenth magnitude, and it is surmised that they are irregular masses of rock, and no asteroid appears to possess an atmosphere.

Eros makes the nearest approach to the sun, and is of great importance for determining the solar parallax.

After the discovery of the larger A. it was suggested that they had their origins

in the breaking up of a larger planet. A later suggestion was that the A. were originally distributed in a ring round the sun (cf. Saturn's rings), and that perturbations by the planet Jupiter broke up the ring, giving rise to the present A., but it is not possible to state whether either theory is correct, and there may be some other explanation.

Asthenopia, weakness of the ciliary or external muscles of the eye or of visual power, due to over-use, errors of refraction, or incapacity for bifocal fixation owing to the deviation of one eye.

Asthma, paroxysmal affection of the bronchial tubes characterised by cough, laboured breathing, and a feeling of suffocation. *Bronchial A.* is a manifestation of an allergic sensitivity to some sensitising agent (or allergen). This may be demonstrated in many cases, and A. due to certain dusts, pollens (see HAY FEVER), animal danders, foods, bacterial proteins, and drugs, or a mixture of these, is well known. In other cases the allergen cannot be identified. Once estab. there is no doubt that attacks of A. may be conditioned by psychological influences. Thus fear of an attack can bring one on, and an asthmatic temporarily separated from means of relief may well have an attack merely because he knows he is cut off from relief. Furthermore, the feeling of suffocation in an asthmatic attack brings fear, which, in its turn, aggravates the attack and sets up a vicious circle. Needless to say, as in any condition for which there is no certain cure, the remedies for A. are legion and all have their devotees. One asthmatic will swear by one remedy, another will have no use for it. Removal from contact with the allergen is, of course, the most fruitful form of treatment, but in the nature of things this is often difficult or even impossible. Desensitising vaccines have been used with success, but not universally so. The anti-histamine drugs, by breaking the chain of the allergic reactions, have been successful in some cases. Cortisone offers relief in serious cases, but owing to dangers in its use it is not suitable for general administration. *Cardiac A.* is the name given to A. which occurs when the left ventricle of the heart fails, leading to engorgement of the lungs.

Asti: 1. Prov. of Italy, in central Piedmont (q.v.). It is generally mountainous, with foothills of the Maritime Alps (see ALPS) and the Ligurian Mts (see APENNINES), but has a fertile central plain, watered by the Tanaro, a trib. of the Po (q.v.). Area 596 sq. m.; pop. 222,000.

2. (anc. *Asta* or *Hasta*) It. tn, cap. of the prov. of A., at the confluence of the Tanaro and the Bormore, 28 m. SE. of Turin (q.v.). It is of remote origin; its pottery (examples of which are preserved in the museum) was praised by Pliny (q.v.). There are Rom. remains and many fine medieval buildings, including a Gothic cathedral. The wine of A. is famous, and there are metallurgical,

glass, chemical, and foodstuff industries. *Alfieri* (q.v.) was b. here. Pop. 53,000.

Astigl, see ECLJA.

Astigmatism, condition of the eye in which rays of light from an object are not brought to a focus at one point. It is usually due to inequality of curvature of the meridians of the cornea. This may be caused by imperfections in the lens, unequal contraction of the muscles, or a defect in the curvature of the retina. The condition is treated by the use of cylindrical glasses with the axes arranged as determined by an oculist's test. See REFRACTION, ERRORS OF.

Astilbe, genus of perennial herbs, about 12 species, family Saxifragaceae; *A. japonica* and many hybrid forms are grown in gardens.

Astley, Sir Jacob, Baron (1579-1652), Eng. soldier, a Royalist commander in the Civil war. He came from a Norfolk family and served with distinction as a soldier of fortune in the Thirty Years War. He took part in sev. Civil war battles, including those of Edgehill and Naseby. He is said to have been the author of the prayer (which he delivered before battle) 'O Lord, Thou knowest how busy I must be this day. If I forget Thee, do not Thou forget me.'

Astley, Philip (1742-1814), b. Newcastle under Lyme and d. Paris. He was well known as a horse-tamer. He began life as a cabinet-maker, but soon joined a regiment of light horse in Holland. He finally settled in London, and developed a prosperous business as circus proprietor. The estab. was known as 'Astley's.' Dickens mentions it in *The Old Curiosity Shop*. A's Royal Circus, as he called it, stood on the S. side of the Thames near the end of Westminster Bridge; the site is now covered by flats. His arena had a stage at one end, where plays were performed in which horses were largely used. This type of entertainment became known as the Equine Drama and was very popular. A's shows were without equal of their kind and he maintained a very high standard. See CIRCUS.

Astolf, Astolphus, see AISTULF.

Aston, Sir Arthur (d. 1649), Eng. general. In his youth he fought against the Turks, with Gustavus Adolphus in Germany, and in Scotland. During the Civil war he fought as a Royalist at Edgehill and defended Reading. In 1646 he fought in Ireland, and was killed by Cromwell after the capture of Drogheda.

Aston, Francis William (1877-1945), chemist and physicist, b. Harborne; educ. at Malvern and Birmingham Univ. Worked for a few years as a research chemist in a brewery. In 1910 he went to Cambridge to work under Prof. Sir J. J. Thomson, and during the First World War he was Thomson's assistant in the analysis of positive rays. In 1913 he achieved the first artificial separation of isotopes. His interest was now aroused in considering how to determine accurately the masses of atoms constituting the positive rays. But this stage in his strictly scientific work was suspended during the war period, when he worked at Farnborough on

chemical problems relating to dopes for aeroplane fabrics. Later he conceived the idea of his focusing method, on which foundation his subsequent success was built in measuring atomic masses and determining the prin. isotopes of all the permanent gases and the other elements which can be introduced into a gaseous discharge. These results induced chemists everywhere to reconsider the fundamental determinations of atomic weights, and honours soon followed: Mackenzie Davidson medal of the Röntgen Society, 1920; Hughes medal, Royal Society, 1922; Nobel prize for chem., 1922; Paterno medal, Rome, 1923. Later he constructed a new mass-spectrograph, in which the focusing of the rays was greatly improved. Final measurements of the desired accuracy were announced in 1927. A's curve of deviation from the whole number rule immediately became the basis for speculation on the structure of the atomic nucleus. In 1935 A. described researches by himself and other physicists which led to the discovery of 'heavy water,' which is used in the production of atomic energy. In 1938 he was awarded the Royal Medal of the Royal Society for his discovery of the isotopes of non-radioactive elements. Pubs. include *Isotopes*, 1922, and *Mass-spectra and Isotopes*, 1933, and numerous papers contributed to scientific magazines.

Aston Manor, see BIRMINGHAM.

Astor, John Jacob (1763-1848), Amer. merchant, b. near Heidelberg, Germany. During his early years he assisted his father, who was a butcher, later earning a living by working in his brother's musical instrument house. He emigrated to America in 1784 and settled in New York. Acting on the advice of a fur trader, he embarked on the fur trade. He gradually enlarged his business, and amassed an enormous fortune. In 1811 he founded a settlement at the mouth of Columbia R. for the purpose of establishing a central depot. It was seized by the English in 1813, an event which forms the theme of Washington Irving's *Astoria*. The A. library was given by him, and forms to-day part of the New York Public Library.

Astor, John Jacob (1864-1912), Amer. capitalist, soldier, and inventor, the fourth of the name, b. Rhinebeck, New York. He served on Gen. Morton's staff (1894-6) and in the Sp.-Amer. war during the Santiago campaign (1898). He lost his life in the *Titanic* disaster of 1912. He pub. *A Journey in Other Worlds: A Romance of the Future*, 1894.

Astor, Nancy Withers, Viscountess (1879-), Anglo-Amer. politician, wife of the 2nd Viscount A. of Cliveden (d. 1952) (q.v.), whom she married in 1906. A daughter of Chiswell Dabney Langhorne of Virginia, she was b. at Mirador in that state. She was the first woman to sit as a member of the Imperial House of Commons (though not the first to be elected, that being Countess Markievicz, a Sinn Féiner who never appeared at Westminster), being returned for Plymouth in 1919 and at every general election

subsequently, until her retirement from Parliament in 1945. She has always been a keen champion of women's rights, social reform, and temperance movements. She assisted Margaret McMillan in founding the Rachel McMillan Training College. Pub. *My Two Countries* in 1923.

Astor, Waldorf, 2nd Viscount (of Cliveden) (1879-1952), politician, educ. at Eton and New College, Oxford. He was Unionist M.P. for Plymouth 1910-19. He held many subordinate ministerial posts, and did useful work as chairman of the Parl. Committee on the Prevalence of Consumption, one outcome of which was the estab. of sanatoria under the Insurance Acts. He was also interested in social reform and agriculture, and had a famous racing stud. On his succeeding his father as Viscount A. his wife Nancy (see ASTOR, NANCY WITCHER, VISCONTRESS) was returned for Plymouth. He controlled the Sunday newspaper, the *Observer*.

Astor, William Backhouse (1792-1875), eldest son of John Jacob, the merchant, the greater part of whose fortune he inherited and increased by real property investments. The building for the A. library, to which he gave over half a million dollars, was erected under his direction. Sometimes known as the 'Landlord of New York.'

Astor, William Waldorf, 1st Viscount (1848-1919), capitalist, b. New York. Assumed management of the A. estates in 1871. He was elected to the New York Assembly in 1877, and to the Senate in 1879. From 1882 to 1885 he was a minister to Italy. In 1890 he succeeded to an estate valued at \$200,000,000. In 1893 he bought the *Pall Mall Gazette*, and founded the *Pall Mall Magazine*. In 1899 he became a Brit. subject. A. subscribed large sums to various war funds. He was created a peer in 1916, and viscount in 1917.

Astors, Ashtaro, see ASTARTE.

Astorga, Emanuele d', Baron (1680-1757), amateur singer, harpsichordist, and composer of high artistic merit. After a quarrel with his father he led a precarious and romantically adventurous life in various cities of Italy, as well as Vienna (c. 1710-14) and Sicily, where he married a girl of 15 in 1717; he left her in 1721, going to Portugal, perhaps to London, and apparently to Spain in the end, for he seems to have d. in Madrid. His masterpiece is a *Stabat Mater*, which is still famous. Composed (especially) chamber cantatas (*cantate da camera*).

Astorga (Rom. *Asturica Augusta*), Sp. tn in the prov. of León. It is walled, has a 15th-cent. cathedral, and is famous for its cakes (*mancuadras*). Pop. 11,500.

Astoria, tn in Clatsop co., Oregon, U.S.A., at the mouth of the Columbia R. It is the oldest Amer. settlement in the Columbia valley, and takes its name from its founder, John J. Astor. Salmon tinning and lumbering are the prin. industries. Was seized by Brit. in 1813, but restored 2 years later. Pop. 12,330.

Astraea, the Gk star-maiden, daughter of Zeus and Themis. The last of the

goddesses to leave the earth, which she did at the advent of the Bronze Age, she is immortalised among the signs of the zodiac as Virgo.

Astragal (from the Gk *astragalos*), moulding used in architecture, and usually applied to the upper end of the shaft of a column, and to its base. It is also used in the entablatures of all the Rom. orders. In Gk architecture an example is found in the base of the Ionic temple of Minerva Polias at Priene.

Astragalus, family Leguminosae, genus of over 1000 ann. or perennial herbs, sometimes called milk-vetch. *A. tragacantha* is an evergreen shrub, yielding gum tragacanth, of S. Europe; *A. alopecuroides* and *A. monspessulanus* are good garden perennials; *A. danicus* is the native purple milk-vetch.

Astrakhan: 1. Oblast in European Russia, on the Lower Volga, adjacent to the Caspian Sea, in semi-desert lowland with an extreme continental climate. There are salt deposits in Lake Baskunchak. Area 29,400 sq. m.; pop. (1956) 666,000, mostly Russian (until 1914 partly Kalmyk, q.v.). It has a fishing industry, agriculture on the Volga-Akhtuba flood plain (melons, vines, cotton), and cattle and sheep raising for meat and wool.

2. Cap. of the above, in the Volga delta, economic and cultural centre of the N. part of the Caspian Sea area. It is the biggest port on the Caspian Sea (transfer of Baku oil to Volga ships) and the foremost fishing centre of the U.S.S.R.; it has large fish canneries. Pop. (1956) 276,000 (1860, 45,000; 1914, 150,000). Founded by the Tatars near the site of Itil (q.v.), it became the cap. of the Astrakhan' Khanate (q.v.); in 1556 it was conquered by Ivan the Terrible and transferred to its present site. Until 1917 it was the centre of a flourishing trade with Persia, Khiva, and Bokhara.

Astrakhan' Khanate, Tatar state formed in middle of 15th cent. upon break-up of the Golden Horde (q.v.), comprising the steppes astride the lower Volga, with Astrakhan as cap. It was annexed to Russia by Ivan the Terrible in 1556.

Astral Spirits, animating principles of the heavenly bodies according to anct E. belief. The doctrine was accepted by many Jews, Greeks, and Romans, though such beliefs were always looked upon with suspicion. In medieval times this doctrine became widespread. A. S. were then conceived to be fallen angels, or, at least, powers less akin to heaven than to hell, intimately concerned with the affairs of mortals, and able to be bound by magic to their service.

Astringents, remedies which cause contraction of muscular fibre and condensation of the tissues, mostly by coagulating albumin. They are used to check haemorrhage, externally or internally, and diarrhoea. The most important are tannic acid and gallic acid, the mineral acids and most metallic salts.

Astrolabe (Gk *astēr*, star; *labein*, to take), instrument used by astrologers for

taking the altitudes of the heavenly bodies. A.s were not only used by astrologers, but also in portable form by travellers for astronomical and topographical calculations. Chaucer in 1391 wrote a prose treatise on the A. for the use of his son. There was also another species of A. for marine calculations of the lat. Columbus used such an instrument on his voyage of discovery. See R. T. Gunther, *The Astrolabes of the World*, 1932.

Astrolabe Bay, large bay on the NE. coast of New Guinea (q.v.).

Astrology, pseudo-science concerned with the heavenly bodies; in modern times it has been confined to the art of divination from the position of celestial bodies, but in anct times it embraced also what is now called astronomy. Formerly the 2 depts of the subject were distinguished thus: (1) Natural A., consisting in the calculation of the movements of the heavenly bodies; (2) Judicial A., consisting in the study of the supposed influence of the stars, etc. on human life and destiny. A., therefore, was a curious mixture of science and quackery, or rather A. was the pseudo-science out of which the science astronomy evolved. A curious parallel is seen in the research of the medieval alchemists, out of whose pseudo-chem. true chem. evolved. A. reached its zenith among the Babylonians—so much so that subsequently Chaldaean became a synonym for astrologer. Babylonian life was in early times nomadic, and the environment afforded the people an unobstructed view of the heavens. From the elementary observation that the sun sustains life throughout the world developed the belief that the other heavenly bodies, too, governed nature, and were the abode of the divine element. Just as A. was being superseded by astronomy in Babylon, its influence spread westward. Among the Greeks judicial A. was never so popular as it became at Rome. The mathematici, or Chaldaean astrologers, were always a source of annoyance to the Rom. authorities, and in Tacitus we read that though they were repeatedly expelled from Rome, they always returned. The nucleus round which A. grew was the belief that the divine energy was manifested in the movements of the sun and the planets. The correct interpretation of the position of these was a key to the will of heaven. Gradually the system was enlarged. The relative positions of the planets and their positions relative to the fixed stars and constellations gave more information. As the field of observation widened, the amount of information derived widened with it, until it embraced every experience of human life. This information was augmented by the theory of repeated omens, e.g. the postulation that if a certain event happened while a certain planet occupied a certain position, the recurrences of that position of the planet would also foreshadow a recurrence of the event. The reaches of astrological information were also extended by the association of ideas. The divers planets

were associated with various passions and things, and the positions of the planets would therefore denote a state of the passions, etc. with which they were associated. Moreover these planets were associated with the various parts of the human body; hence medicine became a dept of A. Mars, for example, being the tempestuous planet, became associated with the bile. Again, not only the position of the planet was important, but which particular sign of the zodiac it occupied, or, in other words, which house of heaven. The days of the week were assigned to the various bodies in the solar system—Sunday to the sun, Monday to the moon, Tuesday to Mars, Wednesday to Mercury, Thursday to Jupiter, Friday to Venus, Saturday to Saturn. (These relations are more immediately apparent from the Fr. names of the days of the week.) In the Middle Ages the astrologer was considered by many people of learning and dignity, as well as by the uneducated, as being almost omniscient. He could foretell the destiny of the individual by calculating which star was in the ascendant at the time of his birth. The ascendant was that sign of the zodiac which was nearest the E. horizon at the time of the event, and that star was most important which rose at that precise moment, i.e. was in the ascendant. Limitless information could thus be derived from these details regarding the character, physique, and destiny of the individual. See also DIVINATION. See M. Graubard, *Astrology and Alchemy*, 1953.

Astronomer Royal, head of Royal Greenwich Observatory, appointed by the Prime Minister under the royal sign-manual. The office was estab. in 1675. The present A. R. is Richard van der Riet Woolley (q.v.).

Astronomy (Gk *astrōn*, star; *nomos*, law), science which treats of the heavenly bodies and all phenomena therewith connected. Such phenomena include their movement in the sky, eclipses arising therefrom, their influence on the earth and on each other, and changes in their appearances. A. is the oldest, most exact, and most widely embracing of all the sciences, and, as the great Laplace truly said, presents the longest chain of discoveries. A., rising in the mists of antiquity, attained to the position of an exact science under the Greeks, but during their time, and for many cents. after, it was closely allied to, if not almost overlaid by, the pseudo-science of astrology. However, with the revival of learning in the 16th cent. and the crowding discoveries which resulted from the invention of the telescope at the beginning of the 17th, A. was able to slough its astrological covering even as chem. arose from alchemy. A. in modern times has been generally divided into 3 main divs., known as (1) practical, (2) theoretical, and (3) physical. The first deals with the observation of the celestial objects, and necessarily therefore concerns itself with the instruments and observatories used in this work. The second, or theoretical A., is practically a branch of

higher mathematics, and is the application of the fundamental laws of gravitation to the observations of the practical branch. The third branch of the science, the physical, trenches on the domain of chem. and physics, and is the application of the terrestrial sciences to the heavenly bodies. This branch of the subject is the most recent in date, but of great and increasing importance, and serving to weld into one harmonious whole all the sciences. Each of these 3 main divs. has its subdivs. according to the nature of the celestial object observed, or the instrument used. The known heavenly bodies are the sun, the moon, the planets, the satellites (or moons) of the planets, the asteroids (small planets), meteors (shooting stars), and comets, all of which belong to what is known as the solar system, and the bodies immeasurably more remote, the stars and nebulae. The 4 chief instruments used in observations are: (1) a transit instrument which can be moved only in the meridian and is used to determine the exact time of transit of a heavenly body; (2) equatorially mounted and movable telescopes, capable of following the movements of the heavenly objects and determining their co-ordinates; (3) an altazimuth mounting in which the telescope can be moved only in azimuth and altitude. This form of telescope is more suitable for amateurs and is limited to the smaller ones; (4) the spectroscope, for ascertaining the physical composition of the body observed; and (5) the photographic camera for securing a permanent and trustworthy record of celestial objects too faint to be perceived by even the optically assisted human eye. These subdivs. have their special names and their practical, theoretical, and physical sides. What is known as solar physics is the study of the sun's physical condition; the mapping of the moon's surface is known as selenography; and the name sidereal A. attaches to the special study of nebulae, clusters, and the so-called fixed stars.

From the foregoing paragraph it will be seen how vast is the subject we have to deal with. It is impossible in this article to give more than an outline of the science and, in the main, a chronological record of discoveries. For details the reader is referred to the articles on the different categories of heavenly bodies, the instruments used, and the names of constellations and astronomers. The prin. articles are as follows: ALTITUDE; ASCENSION; RIGHT; ASTEROIDS; AZIMUTH; BRAHE; CONSTELLATION (see also various names); COPERNICUS; DAY; EARTH; ECLIPSES OF THE SUN AND MOON; ECLIPTIC; EQUIINOXES; GALAXY; GALILEO; GRAVITATION; HERSCHEL; HIPPARCHUS; HORIZON; KEPLER; LAPLACE; LATITUDE AND LONGITUDE; LIGHT; MERIDIAN; METEOR; METROLOGY; MOON; NEBULAE; NEWTON; OBSERVATORY; OCCULTATION; OPTICS; ORBIT; PARALLAX; PERTURBATIONS; PHASES; PHOTOGRAPHY; PHYSICAL CONSTANTS; PLANET (see also various names); POLES; PRECESSION; PTOLEMY; REFLECTION; SATELLITE; SEASON; SEXTANT; SOLAR SYSTEM; SOLSTICE; SPECTRUM AND

SPECTROSCOPE; STAR; SUN; TELESCOPES; TIDES; TRANSIT INSTRUMENT; YEAR; ZODIAC.

Before turning to the hist. of A. it will be well to take a brief glance at the position of the earth in the solar system, and of that system in the universe. In the course of the last 20 years our knowledge of the universe has been enormously increased, especially with regard to the origin of the stars, their composition, their hist., their sizes, and their temps. The science of astrophysics has brought about this enlightenment, and an attempt is made, in what follows, to describe the results of the recent progress, made possible only by new methods of attack and by great improvement in the design and technique of astronomical instruments. The centre of research has shifted from the solar system, but we must briefly remark on that system, and refer the reader for further details to the articles on PLANET, COMET, and METEOR. The solar system was once supposed to have had its origin in the approach of another sun to our present sun: the gravitational attraction between 2 such bodies would be enormous, and just as our small satellite, the moon, causes tidal waves in our oceans, so the approaching sun caused great tidal waves in our sun, and streams of matter were ejected from it. This matter rotated round its parent and in the course of time condensations took place which served as nuclei for the building up of the planets, which continued, and still continue, to revolve round the sun at different distances from it. This theory is no longer held, and though many others have been suggested, there is no consensus regarding the origin of the solar system. Kepler and Newton (q.v.) studied the orbits of the planets and pronounced the laws which govern their motion.

There are 9 major planets, and about 3000 known minor planets or asteroids (q.v.), of which more than 1500 orbits have been computed. The solar system consists of the central star or the sun, with the planets and their attendant satellites, and in addition to these, there are meteors and comets. In order of their distances from the sun, the major planets are Mercury (nearest), Venus, the Earth, Mars, Jupiter, Saturn, Uranus, Neptune, Pluto; the asteroids lie between Mars and Jupiter. The Greeks gave planets the name wanderers (*Gk planets*, a wanderer). All the planets shine by the light they reflect from the sun, and they describe approximately circular orbits about it. Their orbits are really elliptical and the sun is in one focus of the ellipse. They revolve in the same direction round the sun, and their orbits lie in approximately the same plane. The period of revolution—the planet's year—varies, Mercury's being only 88 days as compared with our 365½ days and Pluto's 248 years. In addition to this revolution the planets turn on their axes, and it is this rotation which causes their days and nights.

The mean distance of the Earth from the sun is 93,000,000 m.: Mercury is about 37,000,000 m. from the sun, while the

furthest planet, Pluto, is 3,660,000,000 m. from its parent. Conditions such as temp. and the nature of the atmosphere of the planets depend on their hist. as well as on their positions with respect to the sun; there is a possibility of life such as we know it only on the planet Mars: the remaining planets are either too hot or too cold or devoid of an atmosphere capable of supporting life.

The Earth is approximately a sphere nearly 8000 m. in diameter; the sun's diameter is more than 100 times as great. It is our nearest star and yet it is exceedingly small in comparison with the giant stars known to us. The giant star Betelgeuse, the bright red star in the N.E. of the constellation of Orion, is so great that if it replaced our sun it would fill the whole of the space between the earth and the sun. Its diameter varies between 210 and 300 times the sun's diameter, the variation being due to a continuous expansion and contraction. Even with the smaller diameter a bullet travelling at 1000 ft a sec. would take 90 years to travel round its equator. Its apparent size is small because it is so far away from the earth, namely 190 light-years away. Light travels at 186,283 m. per sec. and takes rather more than 8 min. to travel from the sun to us; by 1 light-year we mean the distance that light would travel in 1 year, i.e. nearly 6 billion miles. When we look at Betelgeuse we see it as it was 190 years ago: we are, as it were, looking back into the past, but it is less irksome to think of the distances of the stars in terms of light-years. There are at least 80,000 million stars in our galaxy alone, and, with the exception of the sun, which is about 8 light-min. away, the nearest one is Proxima Centauri, 4.1 light-years away, while we know of globular clusters of stars which are 220,000 light-years away from the Earth.

Modern A. has realised that what the ancients called the fixed stars are not fixed, but many of them have velocities much greater than that of our sun: though the constellation of Orion and many other constellations appear to the naked eye to be in the same positions they occupied 1000 years ago, the stars are really moving quickly, and it is merely because they are so very far away from us that they appear to be fixed. In addition to the stars, there are nebular regions in the stellar universe (on which see NEBULAE); it is sufficient to point out here that the present view is that the evolution of the star begins in some nebula and the star that condenses from the nebula is a diffuse mass of gas of low density and comparatively low surface temp. (3000° C.). According to the classification of the Harvard Observatory, the star is then a red giant of type M, e.g. Betelgeuse. The evolution of the star through the successive stages known as M, K, G, F, A, B, and characterised by typical differences of spectra, is accompanied by increase of temp. and a contraction of vol., so that when type A is reached, e.g. Sirius, the surface temp. is about 10,000° C., the density still being somewhat less than that of water. The giant

has now entered dwarfdom, and it begins to cool as it contracts further, and it goes through the same spectral stages in the reverse order, though it is now called a dwarf, because it is much smaller than the giant which emits the corresponding type of spectrum. Our sun is a dwarf star of type G, with a surface temp. of 6000° C. It has still to pass through the K and M stages before its life as a star is completed. The density of a dwarf increases with its age, and there are stars so dense that a tiny portion of no more than the bulk of a match-box weighs as much as a ton. The evolution of the stars is a slow process, and we cannot accept anything less than 3 or 4 thousand million years for the age of the sun. About three-quarters of the stars are dwarfs, and one-quarter are giants, progressing towards their maximum temp. This surface temp. is very small by comparison with the star's interior temp., which is about 20,000,000° C. towards the central regions of our sun, but much lower, and also much higher, for many other stars.

Binary stars and pulsating stars. Many stars which appear single to the naked eye are found to be double stars when examined in a telescope or by the spectroscope. These stars are known as binaries, and consist of 2 stars revolving in orbits about their common centre of gravity. Although Michelson in 1920 constructed his telescopic interferometer, and by means of it measured the diameter of Betelgeuse, few stars appear large enough to the terrestrial observer to be measured in this way, and much of our recent knowledge of the stellar universe is due to the pulsating stars known as Cepheid variables. The star δ Cephei is a prototype of these stars, that occur in all parts of the universe. They are globes which swell and contract in a period of 5½ days, and their pulsations are made known by the corresponding changes in their luminosities. Now, as Eddington points out, the note of a tuning-fork is characteristic of the fork, and in a similar way the period 5½ days is characteristic of stars of identical structure and luminosities. The Cepheid variables therefore serve to measure the distances of various parts of the stellar universe, by comparing the apparent luminosity of any Cepheid star with that of a near star of the same type whose distance can be measured by finding its parallax (q.v.). The realisation of this fact has enabled astronomers to 'measure up' the universe.

We have had, so to speak, a bird's-eye view of the solar system, and have the universe in perspective. We are now in a position to appreciate the hist. of astronomical discovery, which, as has been indicated, is also largely the hist. of the invention of the instruments used and the progress of mathematics. We cannot here make more than a passing allusion to the influence of the discoveries of the astronomer on the mind of man and their reaction on philosopher, theologian, geologist, physicist, and chemist, and must content ourselves by observing that their effect has been profound.

A. is, as we have said, the most ancient of the sciences. Nations who are known to have cultivated it before the Christian era are the Chinese, Hindus, Chaldeans, Egyptians, and Greeks. The Chinese made it a matter of politics, the next 3 of religion, and all, except the Greeks, applied it to astrology. With the Greeks A. was treated merely as any other science, and for this reason, perhaps, it made a more rapid advance with them than among their contemporaries. Which nation was the first to study A. will perhaps never be finally determined: all we can say is that wherever a people emerged from savagery traces can be found of astronomical observations. For each of the above-mentioned nations the claim is made for the honour of being the first to study the science. The Chinese annals go back as far as 2857 BC, but of astronomical phenomena they record hardly anything except the eclipses of the sun and the appearance of comets. The fact of the motions of the planets was known to the Chinese, as was also the Metonic cycle, but not the precession of the equinoxes till about AD 400, or about 550 years after its discovery by the Gk astronomer Hipparchus. A record of the conjunction of 5 planets shows that observations were made by the Chinese at about 2500 BC. The burning by order of the Emperor Tsin-Chi-Hong-Ti (221 BC) of all scientific books may have destroyed evidence of still further astronomical observations. Neither the Hindus nor the Egyptians contributed to A. anything of outstanding importance, but from the accuracy with which the Great Pyramid of Cheops faces the cardinal points it is clear that the Egyptians possessed, even at the most remote period, no little astronomical knowledge. But it is probable that the Chaldeans were the nation which, next to the Greeks, made the most extensive study of the heavens. Certain it is that they had the Metonic cycle, and it is thought that Meton, the Gk astronomer of the 5th cent. BC, who gives his name to this period, may have obtained the cycle from them. They had quite early in their hist. measured the celestial sphere and portioned out and named the sections (signs) of the belt of the heavens through which the sun, moon, and planets apparently move, a belt known as the zodiac. Though their observations never attained to the accuracy of the Greeks, being, in fact, of the roughest kind (the time of eclipses, for instance, being given only in hours, and the part of the diameter eclipsed only within a quarter), they were, nevertheless, the earliest trustworthy observations, and in the hands of Hailey, an Eng. astronomer, led to the discovery of the acceleration of the moon's mean motion. Besides Meton's, these Babylonian astronomers also discovered other cycles, among them being the Saros, i.e. the period of 18 years 11 days after which interval eclipses of sun and moon will again occur at the same intervals. It is not certain when the Saros was discovered, but it is probable that it was some cents. before the Christian era, and the earliest

eclipse (excluding doubtful Chinese accounts) is one referred to on a Babylonian tablet as having occurred in 1062 B.C. Simplicius, a commentator on Aristotle, tells us that Alexander the Great found records in Babylon containing observations of eclipses for nearly 2000 years prior to the conquest of that city by him. These he transmitted to his former tutor Aristotle, but Ptolemy, the great astronomer of the Alexandrian school, mentions only a few of them, and none prior to 720 B.C. But undoubtedly among the Chaldeans A. was gathering a definite shape, and among the instruments they used we find the clepsydra (water clock) and the gnomon as measuring solstices. See HOROLOGY.

To the Greeks, who took the lead in the ancient world in so many other matters, must go the honour of raising A. to the dignity of an exact science. From Thales (640 B.C.) to Hipparchus (190-120 B.C.) was built up a wonderful body of exact astronomical knowledge which for 15 cents. was not appreciably added to. Thales, founder of the Ionian or physical school of philosophy, and one of the Seven Wise Men, predicted the eclipse of the sun which happened in 584 B.C. in the reign of Alyattes. He may be said to be the founder of Gk. A., but for many reasons we shall reserve for Hipparchus the title of Father of A. It is probable that Thales in predicting the solar eclipse did so by means of the Chaldean Saros (mentioned above). He also held, and is the first of whom we have record of so holding, that the earth was a sphere, that the stars were fiery bodies, and he also taught his countrymen how to steer their vessels by means of the Little Bear, an asterism nearer the Pole star than the Great Bear, which the Greeks had hitherto been satisfied with as an indication of the N. Anaximander, his successor, is credited with asserting that the earth rotated on its axis, and that moonlight was but reflected sunlight. Pythagoras (500 B.C.) promulgated the idea, which was not generally accepted till many cents. afterwards, that the earth and other planets circulated round the sun. He also was probably the first to teach that the evening and morning stars were the same planet. Meton (432 B.C.), already mentioned, introduced the cycle bearing his name, which Calippus, 100 years later, improved. Eudoxus of Cnidus (370 B.C.), according to Pliny, brought the year of 365½ days into Greece, and wrote some astronomical works. Aristotle (384-322 B.C.), perhaps the greatest all-round scientist among the ancients, wrote on A., but his works were lost. We know, however, that he gave a correct interpretation of the phases of the moon. The 4th cent. B.C. saw the foundation at Alexandria of the school of that name. The Alexandrian astronomers were encouraged in their task by the Ptolemaic dynasty. Their work was characterised not so much by new theories or discoveries, as by a long series of painstaking, connected, and accurate observations. They no doubt owed much to Euclid of Alexandria (300

B.C.), who did so much to advance the trigonometrical science by which astronomical calculations are made. Among the more distinguished representatives of this school were Timocharis and Aristyllus (c. 300 B.C.), who made observations which enabled Hipparchus to discover the precession of the equinoxes (q.v.). Eratosthenes, who was librarian at Alexandria (276-196 B.C.), attempted to ascertain the size of the earth—and roughly succeeded—by means of measuring an arc of the meridian between Alexandria and Syene in Lower Egypt, which he found to be 7°2'. He made other useful observations, such as the determination of the value of the obliquity of the ecliptic, a value adopted by his 2 great successors, Hipparchus and Ptolemy.

Hipparchus was not merely the greatest of the Gk. astronomers, but one of the greatest of all astronomers. He was b. at Nicaea in Bithynia about 190 B.C., lived at Rhodes, and d. 120 B.C. In his youth he wrote a commentary on a poetical description of the stars by Aratus, and this is the only direct knowledge we have of him. To his great successor and only rival in fame among the ancients, Ptolemy, we are indebted for what we know of his discoveries. As said above, he discovered the precession of the equinoxes by a comparison of his own observations with those of Timocharis and Aristyllus. He was a great mathematician, and it was he who first employed processes analogous to those of plane and spherical trigonometry, for which he constructed a table of chords. He determined the mean motion of the sun and of its apogee, the inequality of the sun's motion, and the length of the year to greater exactness than his predecessors. He found the mean motion of the moon, of its nodes, and of its apogee; its parallax, the eccentricity and inclination of its orbit, and the equation of its centre. His observations also led him to suspect another inequality in the moon's motion. This was the 'evection' (q.v.) afterwards discovered by Ptolemy. He made one of the first steps towards the correct representation of astronomical phenomena, by supposing the sun to move round the earth in a circle, the earth not being at the centre (see PTOLEMAIC SYSTEM). He was, of course, incorrect as to which body moved round the other, but he was reaching forward to the correct description of celestial motion, i.e. the ellipse. He made a catalogue of 1081 stars, giving their lat. and long. We can judge of the value of his work by the statement which has been made that had Hipparchus possessed the pendulum and the telescope, 50 years might have enabled his successors to place A. in the state in which it stood at the birth of Newton (1642). Considering his means, his observations are perhaps unequalled, and he well earns the title of Father of A. After the death of Hipparchus there is no astronomer of eminence till Ptolemy. Probably there were many observers, but the loss of even their names, and the silence of Ptolemy himself, make it clear that no discovery of

any importance was made. It is not a little remarkable that Rom. civilisation, which was at its height in the period between Hipparchus and Ptolemy, should have failed to produce, then or at any time, any astronomers of more than mediocre quality. One must, however, mention the name of Sosigenes of Alexandria, who advised and assisted Julius Caesar to reform the calendar, the calendar which, after being slightly revised under Pope Gregory XIII, is in use to-day.

We now come to the second great name among ancient astronomers, Ptolemy, who fl. in Alexandria towards the middle of the 2nd cent. of our era. Next to Hipparchus he was probably the greatest of the ancient astronomers, and with his death the epoch of ancient astronomy terminates. Just as Aristotle in natural science and philosophy dominated learning during the Middle Ages, so Ptolemy in A., and incidentally, we may say, in geography, held supreme sway over scientific men from his own time down to the 16th cent. Further, although he did not originate it, he was the chief exponent of and gave his name to the system of planetary motions known for cents. as the Ptolemaic system. His chief title to fame is that he corrected and improved on the work of his predecessors, particularly Hipparchus, but he made several original discoveries of very great importance. A voluminous writer on many subjects, his astronomical work, the *Almagest* (q.v.), summed up practically all the astronomical knowledge of the ancients, and it is, in fact, practically our chief source of information on this subject. The prin. discovery of Ptolemy is that of the 'evection' of the moon, an inequality such as would be caused by an alternate increase and diminution of the eccentricity of the moon's orbit. He also discovered the refraction, and made some tolerably correct experiments to determine its law, explaining the apparent enlargement of the disks of the sun and moon when near the horizon. The projection of the sphere of Hipparchus he extended, and, in fact, he entered into the investigation of every point which Hipparchus had touched, verifying or altering. He attempted to account for the motions of the planets by supposing them to move uniformly in circles, the centres of which circles themselves moved uniformly round the earth. The whole Ptolemaic system is now on the scientific scrap-heap, but for his painstaking work as an observer and as the historian of A. the name of Ptolemy will always be honourably remembered.

With Ptolemy the originality of the Gk school ends, as indeed does all of ancient astronomical science. With the rise of Christianity and the descent of the N. barbarians on the shores of the Mediterranean, civilisation suffered an eclipse. A dense pall of scientific ignorance hung over Europe, and in such congenial environment the bastard sciences of alchemy and astrology flourished. But in its darkest hour science has never lacked devotees, though for a while it may harbour in strange households. The sacred

torch of scientific truth was kept alight by the Arabs—an Asiatic and non-Christian people. It is no part of our duty here to animadvert on the dislike, to put it mildly, of A. evinced by the more fanatical of the Christians from the time of Hypatia (end of 4th cent AD) to that of Galileo (17th cent.). We mention these 2 cases in passing because the first-named lived in the period immediately succeeding Ptolemy, and is, moreover, worthy of mention as being the first woman astronomer and mathematician on record. With Galileo the Dark Ages ceased and practical modern A. commenced. But of him we will speak later.

The E. and Cordova caliphs were for the most part generous patrons of learning. By their encouragement of original scientific research and of trans. into Arabic of the works of the old Gk authors, and by, in some cases, actual personal labour in this field of knowledge, the caliphs have earned an honourable position among enlightened princes. The line of Arabic astronomers may be said to have begun in the reign of Al-Mansur, the caliph who built Bagdad, in the year AD 762. In his reign were begun trans. of the Gk writers, and with nearly the same instruments, and the same theory, as Ptolemy commenced a period of 4 cents. of astronomical observation. In the reigns of the great caliph Harun al-Rashid and his son Al-Mamun, both of whom were students of the science, great encouragement was given to A. The most illustrious of this school was Albategini, or Al-Battani (AD 880), and he is, beyond all doubt, the only distinguished observer of whom we know anything between Hipparchus and Tycho Brahe. He discovered the motion of the solar apogee, and corrected the value of the precession, the solar eccentricity, and the obliquity of the ecliptic. He pub. tables, was the first to use sines (instead of chords) and versed sines, and found the length of the year more accurately. The influence of the Arabian school spread to Persia, Turkestan, China, and Spain as Islam advanced on its conquering mission in these countries. In Persia in the 11th cent. fl. the famous astronomer-poet, Omar Khayyam. He suggested a reformation of the calendar which, though not adopted, would, it has been asserted, have made it more accurate than that of Pope Gregory XIII. Ulug Beg (1433), a prince at Samarcand, pub. the most correct catalogue of stars known till his day, but on the whole, though they were assiduous observers and great mathematicians, there was little constructive work in the Arabian school.

The names of 4 great men will be for ever associated with the beginnings of modern A.: Copernicus and Tycho Brahe (16th cent.), Kepler and Galileo (17th cent.). The achievements of these 4 men stand up like peaks, and dwarf all the efforts of their immediate predecessors. With these predecessors we have not space to deal, so must content ourselves with remarking that with the Renaissance, A. was reintroduced into Europe. The Gk

writers were trans. direct, but more often than not their writings filtered through trans. from the Arabic. The first trans. of the *Almagest* of Ptolemy was made under the auspices of the Emperor Frederic II, about AD 1230, and many original Arabic works on mathematics were trans., the latter introducing into Europe algebra and the decimal fractions.

Nicolaus Copernicus, sometimes called the founder of modern A., was b. on 19 Feb. 1473, at Thorn in W. Prussia. In his almost posthumously pub. book, *De Revolutionibus* (it appeared a few hours before his death), Copernicus laid down 2 propositions. With the anc. Greeks of the Pythagorean school he asserted that the diurnal movement of the stars, etc., was apparent only, and resulted from the rotation of the earth about its axis in the opposite direction. He also held that the earth was one of the planets, and, like them, revolved round the sun. These, of course, are to-day the commonplaces of A., but in his time practically every scientific man believed that the earth was the hub of the universe. Copernicus was in error in describing the motion of the planets as circular, instead of elliptical, as Kepler later found to be the case, and his book is a curious mixture of his own original and sagacious notions and of the old philosophy, such as that the planets moved in crystal spheres. His system, to which his name is attached, did not at first make great headway. It encountered the *odium theologum* of his immediate successors, and it needed the thought of Kepler and the application of the newly invented telescope to A. by Galileo, added to the discovery, still later, of the laws of gravitation by Sir Isaac Newton, to estab. finally the Copernican system. What perhaps hindered the general acceptance of the Copernican system more than theological dislike or the inertia of the human mind was the fact that the second of our quartet of giants, Tycho Brahe (1546-1601), the greatest practical astronomer of his time, constructed yet another planetary system, a blend of the Ptolemaic and Copernican, which held together against the weak and ineffective criticisms of the Copernicans better than the Ptolemaic system. The system of Tycho consists in supposing (1) that the stars all move round the earth as in the Ptolemaic system; (2) that all the planets, except the earth, move round the sun, as in the Copernican system; and (3) that the sun, and the imaginary orbits in which the planets are moving, are carried round the earth. From his observation of comets he pointed out that the spheres of the planets could not be solid, since they were cut in all directions by the orbits of comets. And Tycho was the first to prove that comets had such a parallax as precluded their being atmospheric or even sublunary bodies. By his demolition of the crystal planetary spheres he dealt a severe blow, the first decisive blow, to received notions, and at the same time that he damaged the Ptolemaic structure he weakened the

Copernicans' arguments, for the Copernicans of that time, having no inkling of the law of gravitation, had adopted the anc. idea of crystal spheres, in which the planets were embedded, revolving round the sun. Tycho has been reproached for not adopting the more simple Copernican system, but it must be remembered that the Tyconic system explained all appearances as well as that of Copernicus, and, in fact, while it seized by far the greater proportion of the advantages of the latter, it was not open to the most material objections. We must also bear in mind that Tycho was the last great astronomer without the help of the telescope, and that the other confirmatory sciences were in his day most crude. The most stupid general can win a battle if his opponent be more stupid, and of all the inconclusive arguments of that day, the reply of the Copernicans to Tycho was the most inconclusive. The Copernican system appears a premature birth; the infant long remained sickly and would certainly have died if it had not fallen under better management than that of its own parents.

But this aberration apart, the work of Tycho Brahe was of a most solid and accurate nature, and furnished the means by which the Ptolemaic and Tyconic systems were finally destroyed. He made a catalogue of the fixed stars, more accurate than any which preceded, and he greatly improved and extended the instruments in use as well as all methods of observation. The celebrated Kepler, who helped to demolish Tycho's system, was for the last 2 years of Tycho's life his colleague in his work. It was with Tycho's accurate observations to work upon, and following Tycho's much-needed advice to apply himself to the deduction of causes from phenomena, that Kepler made his marvellous discoveries.

Unlike his master, Kepler (1571-1630) was a Copernican. In addition to A. he studied and made some discoveries in optics and physics, but it was chiefly as a mathematician that Kepler excelled. Too much importance cannot be attached to his 3 laws of planetary motions, laws which, though not proved till Newton's *Principia* appeared many years later, laid securely the foundations of modern A. Like all great things, Kepler's laws are in essence marvellously simple, and, like simple fundamentals, are beautiful. As the geometrician derives pleasure from the contemplation of, say, Euclid's 47th proposition (Bk 1), 'Theorem of Pythagoras,' so the astronomer feels a pleasurable emotion by allowing his mind to dwell on Kepler's third law. The first 2 laws were announced in Kepler's work, *The Motions of Mars*, pub. in 1609, and the third in his *Harmonice Mundi*, 1619. The laws are as follows: (1) *The planets move in ellipses, having the sun in a focus.* (2) *The imaginary straight line joining a planet to the sun (radius vector) sweeps out equal areas in equal times.* (3) *The square of the time of revolution of any planet about the sun is proportional to the cube of its mean distance from the sun.*

In the hands of Galileo Galilei (1564-1642), or, as he is more generally known by his Christian name alone, Galileo, the telescope settled the problem of the planetary system. Galileo, a great astronomer, was nevertheless more than an astronomer, and may be said to have invented the science of dynamics. Quite early in life (1581) he discovered the isochronisms of the pendulum, an invaluable principle which led to the more accurate construction of clocks. In 1609 Galileo made a telescope from a general description of a magnifying instrument made by one Jansen in Holland. He was indubitably the first to apply the telescope to A., and on the very first time that he used it he discovered 3 of the satellites of Jupiter (7 Jan. 1610). A few nights later he discovered a fourth moon to Jupiter. In the same year he saw spots on the moon (mts, etc.), resolved the Milky Way into stars, discovered the rings of Saturn and the phases of Venus. The following year he observed sun-spots, and from them concluded that the sun rotated on its axis. None of these observations required a great amount of skill, and all the phenomena mentioned may be easily observed by any amateur with a small telescope, but they served to bring down with a run the fast crumbling fabric of the Ptolemaic system. For it was an obvious analogy to make, that if the sun rotated on its axis, why not the earth? If Jupiter could carry its 4 moons along with it round the sun, why could not the earth carry its moon? And, moreover, the resemblance between the phases of Venus and the moon was yet one more argument in favour of the Copernican theory. For further details of the life and discoveries of this most interesting man the reader is referred to the article GALILEO.

It will not be necessary to emphasise the profound change that came over A. with the introduction of the telescope (q.v.). Even with the small light-grasping power of the primitive instrument of Galileo the whole face of the heavens was altered, and it was only a matter of time before the continued improvement of this wonderful instrument would, as it were, induce the universe to yield up more and more of its secrets. But for a long while the telescope was a small instrument and suffered from the defect of being chromatic. This defect was remedied by Dollond, an Eng. optician, in 1758, but till his day the largest *refracting* telescope did not have an object glass of a greater diameter than 3½ in., a size which scores of astronomical amateurs possess to-day. The search for a form of telescope that would obviate the drawbacks of chromatic light led to the invention of the reflecting telescope: the Gregorian by Gregory in 1663, and the Newtonian by Sir Isaac Newton in 1669. As the mirror of the reflecting telescope offered less difficulty in construction, and was consequently cheaper, for a long time much more progress was made with the reflector than with the refractor. In 1723 Hadley had made a reflector with a

mirror of 5½ in. diameter, and Sir Wm Herschel (1738-1822) made telescopes with mirrors ranging from 6 in. to 4 ft. The progressive increase in the size of the telescope has enabled the surfaces of the sun, moon, and planets to be surveyed in a more and more detailed manner. It enabled Gassendi in 1631 to observe for the first time the transit of Mercury over the sun's disk, and to measure the diameter of Mercury. Eight years later Horrocks and Crabtree first observed a transit of Venus over the disk of the sun, and the former ascertained the diameter of that planet. The telescope enabled Cassini in 1665 to determine the time of the rotation of Jupiter, and in the following year he determined the time of rotation of Mars and made a first approximation to that of Venus. In 1675 Roemer discovered the velocity of light from observations of Jupiter's satellites (a discovery since confirmed by other means in the physical laboratory), and the same year saw the founding of the world-famous Greenwich Observatory, with Flamsteed as first astronomer royal. The first transit telescope was used by Roemer in 1689, 2 years after the pub. of Newton's *Principia*. In this epoch-making work Newton provided the mathematical proof of Kepler's laws and laid down the law of gravitation. It is, of course, too technical a matter to enter into here. In 1705 Halley first predicted the return of the comet to which his name has been given, and it duly turned up again in 1758, the year predicted. Flamsteed's great work, *Historia Coelestis*, issued in 1725, made a great step forward in sidereal A., giving a catalogue of the stars such as had never before been pub. Sir Wm Herschel is, however, generally spoken of as the founder of sidereal A., his motto being 'Whatever shines should be observed.' With his giant reflecting telescopes he undertook a complete survey of the stars in the N. hemisphere, in the course of which he found the planet Uranus, 1781. The story of the observation of the stars in the S. hemisphere is bound up with that of his son, Sir John Herschel, and his son's forerunner, Lacaille. The latter, a Fr. astronomer, went to the Cape of Good Hope in 1750, and he remained there 4 years. He observed nearly 10,000 stars and formed 14 new constellations. Sir John Herschel, carrying on the work of Lacaille, did for the S. hemisphere what his father had done for the N., and pub. in 1847 a complete survey of the S. heavens. The first few minor planets (asteroids) were discovered in the first decade of the 19th cent., and the planet Neptune in 1846.

By the middle of the 19th cent. the position of A. stood thus. The whole surface of the sky had been carefully surveyed, and catalogues prepared giving thousands of stars and scores of nebulae. The solar system was known as we now know it except for the discovery of a few small satellites and additions to the swarm of minor planets. The motions of all heavenly bodies were referable to the laws of gravitation, enunciated by Kepler

and elaborated by Newton and Laplace. Large and accurate telescopes were in existence for examining the surface of sun, moon, and planets, and many of their features had been recorded. Observational A. was beginning to yield fewer results. How great a progress had been made in telescope construction may be judged from the statement of a former astronomer royal (Sir Frank Dyson's *Astronomy*) that the moon could be seen through modern telescopes as it would appear to the naked eye at a distance of 200 m., and the distance is considerably less now with the modern giant telescopes. At this distance a circle a mile and a half in diameter would appear as large as the whole moon does to the naked eye at its distance of 240,000 m., so that tns, lakes, etc., if they existed on the moon, could be distinguished. What, then, would be the line of advance for the latter-day astronomer? The answer is that he turned his attention to the sidereal universe and to an examination of the composition of the heavenly bodies.

The dictum of the biologist, 'Want creates organ,' applies here. The need for instruments to aid man in his self-appointed task of plumbing the universe resulted in the application of the spectroscopic and the photographic camera to astronomical uses. The chemist came to the aid of A. with his sensitive photographic plates and knowledge of the spectra or earthly elements, and the astronomer repaid his brother scientist by his discovery of new elements in the sun—elements unknown to mundane chem. For a more detailed account of celestial and terrestrial spectroscopy the reader is referred to the article SPECTRUM AND SPECTROSCOPE: it will suffice here to explain the principle of the spectrum. Light is capable of being split up into component parts in the same way as sound. If we hear a band playing, our ears are able to distinguish the notes of the trumpet, horn, bassoon, violin, double bass, clarinet, and so forth, though all these instruments are being played simultaneously. In like manner, a beam of light if passed through a glass prism will be split up into a band of multi-coloured light, ranging from violet at one end to red at the other, the colours shading into each other by insensible gradations. These colours correspond to the length of the vibrations of the light waves and the time of vibration, and as these different vibrations are produced by the light emitted by the various chemical elements in a state of combustion, we are enabled by this means to tell roughly the composition of the luminous body. If we still further expand the band of light by passing it through one or two more prisms, we find on careful examination that it is generally crossed by a number of bright or dark lines. Each of these lines stands for an element in combustion, and the lines produced by that element are always in the same position on the spectrum. Thus the spectrum of common salt shows 2 bright yellow lines, and, no matter in what part of the universe (sun, earth, or

stars), common salt, if in a state of combustion sufficient to produce light, will always show these 2 bright yellow lines in the same position, or, what amounts to the same thing, 2 dark bands in the same position. The discovery of this fact by Fraunhofer and the development of this discovery by Kirchhoff laid the basis of solar and stellar chem. By this means we can tell the physical construction of every luminous body in the universe, whether it be sun, star, comet, nebula, or meteor. And as the spectrum is susceptible of being photographed, and as the photographic plate can record the ultra-violet light not visible to the human eye, great accuracy can be observed in these observations.

Another remarkable result is obtained from spectrum analysis. We have seen how the lines on the spectrum show the composition of the body emitting light, but another feature of the spectroscopic of equal, if not surpassing, importance to the astronomer is that known as Doppler's principle. This principle enables the motion and direction of the light-emitting body to be measured. According to the number of light vibrations per sec. the position of a line in the spectrum is determined. If the light-giving object approaches the spectroscopic, or vice versa, more than the usual number of vibrations will reach the observer in each sec. On the other hand, if either the source of light or the spectroscopic recedes from the other, the number of vibrations will be less than the normal. This departure from normality is shown by a shifting of the lines (not in relation to each other, but of the whole lot) on the band of chromatic light: on approach the lines shifting towards the violet end; when receding towards the red end. Sir Wm Huggins was quick to see how this principle could be utilised in A., and was the first so to apply it. The principle has enabled us to tell whether stars are approaching or receding from the sun; at what rate they are doing so; and to detect the rotation of the sun on its axis, and the rotation of Saturn's rings. And as the spectrum can be photographed a permanent and accurate record can be made, and, as above mentioned, part of the spectrum invisible to the human eye can be recorded on the photographic plate.

Astrophysics, armed with the spectroscopic, made great strides during the latter part of the last cent., when it was discovered how to analyse spectra. Since 1895 atomic physics has produced epoch-making results, and as one of the most striking advances, made in 1913, was the interpretation of the spectra of the element, it may be imagined that astrophysics, too, received a new interpretation, and the present cent. may be called the golden age of physics and A., for a knowledge of the atom is invaluable in interpreting the physics of the stars. As in physics, so in A., the recent progress has been due to a large number of learned astronomers, and for details of the hist. of A. during the present cent.

the works mentioned in the following brief bibliography should be read. Mention must be made of the Californian observatories, which are modern observatories containing the finest instruments in the world, and, in particular, the Mt Wilson Observatory, which contains Michelson's famous telescopic interferometer, with which he first measured (in 1920) the angular diameter of a star; and of the 200-inch telescope set up on Mt Palomar, which, with its reflector, weighs 1,000,000 lb. and is able to photograph light sources 1,000,000,000 light-years distant; and also of Eddington (q.v.), the Eng. astronomer, whose work on *Stars and Atoms* has estab. him as not merely one of the greatest of Eng. astronomers, but one of the greatest of physicists.

See Sir H. Spencer Jones, *General Astronomy*, 1922; H. Macpherson, *Modern Astronomy*, 1926, and *Makers of Astronomy*, 1933; A. Eddington, *Stars and Atoms*, 1927; Sir J. Jeans, *The Mysterious Universe*, 1931; E. A. Milne, *The White Dwarf Stars*, 1932; J. Stokely, *Stars and Telescopes*, 1936; Sir F. Dyson and R. Woolley, *Eclipses of the Sun and Moon*, 1937; R. Waterfield, *A Hundred Years of Astronomy*, 1938 (useful to the astronomer and intelligible to the general reader); F. W. Merrill, *The Nature of the Variable Stars*, 1938; W. T. Skilling and R. S. Richardson, *Astronomy*, 1939; E. A. Beet, *A Text-book of Elementary Astronomy*, 1945; M. Davidson (ed.), *Astronomy for Everyman* (2nd ed.), 1955 (a symposium by experts in their various fields). See also COMET and ROCKETS AND SPACE TRAVEL.

Astrophel, see SIDNEY, SIR PHILIP.

Astrophysics, branch of astronomy which relates to the physical composition of the stars and their atmospheres, to their temps., light-power, etc. See ASTRONOMY and SPECTRUM AND SPECTROSCOPE.

Astruc, Jean (1684-1766), Fr. physician, b. Sauve in Languedoc. In 1711 he was prof. of anatomy at Toulouse, and from 1716 until 1726 prof. of medicine at Montpellier, when he was appointed prof. of medicine at the Collège de France, Paris. Of his numerous medical works his most famous deal with sexual disorders and kindred subjects, e.g. *De morbis veneretis libri sex* (1736). Besides being a physician, he was also a philosopher and wrote on the dual sources of the book of Genesis.

Astura, lt. vil., in Lazio (q.v.), 39 m. SE. of Rome (q.v.). It is on a peninsula, once an is., at the mouth of the R. A., and has interesting Rom. remains. Cicero (q.v.) had a villa here, to which he retreated after his daughter's death; Augustus and Tiberius (qq.v.) both frequented it, and according to Suetonius both here contracted their fatal illnesses. On the site of the villa there is now a tower.

Asturias, anct monarchy of N. Spain, the first king of which was Pelayo (q.v.). It is now a prov., generally called the prov. of Oviedo (q.v.). The inhab. of the region strenuously resisted the Romans, and, at a later date, maintained their

independence against the Moors. They consequently regard themselves as the purest Sp. stock. The heir to the Sp. throne bore the title Prince of A. See also LEÓN.

'Asturias', The, name of a Brit. hospital ship which the Germans attempted to torpedo off Havre on 2 Feb. 1915. Later the Germans issued an apology to appease hostile judgment of neutrals.

Asturia Augusta, see ASTORGA.

Astyages, last king of Median empire (c. 584-550 bc). He was the son of Cyaxares and, according to Herodotus, grandfather of Cyrus by whom he was dethroned. Polyhistor (Eusebius) wrongly attributes the fall of Nineveh to A.

Astyanax, son of Hector and Andromache, sometimes called Scamandrius. At the sack of Troy he was cast from the ramparts, that he might never restore his grandfather's kingdom.

Astylar (Gk a, without; *stulos*, pillar), architectural term signifying without columns. Thus A. lt. buildings are in contradistinction from those buildings which are decorated with columns. A. design was introduced into England by Barry in the Travellers' clubhouse (1829) and Reform clubhouse (1837), London.

Asunción, or **Assumption**, cap. of the rep. of Paraguay, S. America. The city takes its name from the feast of the Assumption in 1537, which was the date of its foundation. The port, which is 950 m. from the sea, and is the country's prin. commercial, industrial, and cultural centre, has communication with Buenos Aires by steamers. There is a Brit.-owned railway (the Paraguay Central Railway) from A. to Encarnación, on the Alto Paraná. There is a wireless station. The climate is hot, but is not unhealthy. The city was once the seat of the Sp. gov. of the region, and contains the National Univ., important libraries, an airport, and many fine churches. The seat of the Paraguayan Rom. Catholic archbishopric is at A. Pop. (1955) 207,350; (with suburbs) 144,330.

Aswân (or **Assuan**), tn of Upper Egypt, on the Nile. It is the cap. of the most southerly prov. of Egypt, bearing the same name. It is popular as a health resort and tourist centre. Some remains of the anct city still exist in the form of granite columns and portions of the ruins of a temple. The once considerable trade in the products of the Sudan and Ethiopia has almost entirely ceased since the construction of the railway to Port Sudan. The granite quarries from which the anct Egyptian builders and sculptors drew their supplies are situated in the hills to the S. An unfinished obelisk 137 ft long and 14 ft thick is there. Blocks were detached by boring holes, driving wedges into them, and then wetting the wedges. On the is. of Elephantine is an anct Nilometer, and the A. Museum, containing objects found in Lower Nubia. The rock tombs of Elephantine of the princes and grandees are to be found in the hill on the opposite side of the riv. The ruined Coptic monastery of St Simeon is also in the

neighbourhood. During the Mahdia (1884-98) A. was strongly garrisoned by Egyptian and Brit. troops, but since a defeat of the khalfā the fixing of the Egyptian frontier farther S. lessened its military advantages. At A. is situated one of the greatest dams on the Nile.

On 19 July 1956 the U.S.A. informed the Egyptian Gov. that the financing of the High Dam at A. was 'not feasible in present circumstances.' A loan had been offered in Dec. 1955 in which the U.K., the U.S.A., and the World Bank offered to assist Egypt in this project, which was to have taken from 10 to 12 years to complete at a total cost of \$1,300,000,000. The U.K. associated itself with the U.S.A. in the withdrawal of the offer on 20 July 1956. The Suez Canal 'crisis' quickly followed.

results. Such reception is properly conditioned, in the case of land forces, upon an agreement by the fugitives to undergo disarmament on crossing the frontier, and internment within the neutral ter. as long as hostilities last.

Asymptote (Gk *a*, not; *sun*, together; *piplein*, to fall), straight line which a curve approaches nearer and nearer but never reaches. A familiar example is the ordinate of a hyperbola (q.v.).

Asyndeton (Gk *a*, not; *sun*, with; *dein*, to bind) is the omission for effect of connectives or conjunctions, as in Tennyson's line: 'Ah, miserable, false, unkind, untrue.' See also FIGURE OF SPEECH.

Asyūt, cap. of prov. of same name, Upper Egypt, near W. bank of R. Nile, 248 m. S. of Cairo. Area of prov. 812 sq. m. It is the residence of the governor.

THE DAM AT ASWÂN

Asylum, see INSANITY.

Asylum, *Right of*, a right, once familiar to students of international law, but now rare in Europe, which makes an ambas.'s house a sanctuary or 'city of refuge,' whether for himself and his household or for refugee criminals. As regards the last named, the claim has long been generally abandoned in practice, and to-day an ambas.'s house is no longer accurately described as part of the ter. of his own country. A criminal who takes refuge there can now be surrendered without formal extradition process, though whether an embassy can be entered without the ambas.'s permission is open to doubt. Entry and search are probably justifiable in those extreme cases which justify the arrest of the ambas. himself. The R. of A. was exercised in Greece in 1862 and in Spain in 1875. In Nov. 1956 Mr Nagy, a former Hungarian Prime Minister, sought sanctuary in the Yugoslav embassy. R. of A. has not entirely disappeared in S. America.

In another sense the R. of A. means that a neutral, consistently with his continuing friendship with both belligerents, is allowed to receive their troops or vessels within his ter. in circumstances which ensure that the use of his hospitality will not be aggressive in its

and is the largest tn and the most important commercial centre in Upper Egypt. The handicrafts for which it was formerly noted (pottery, inlaid wood, ivory carvings, leather and woven goods, and tulle shawls) are being rapidly ousted by European factory-made goods. The Mohammedan A. Institute was founded in 1915. Near by are the rock tombs of anct A. It is the chief seat of the Amer. Presbyterian Mission. One of the Nile dams has been constructed here. Pop. (prov.) 90,378 (1947).

Atabapo, riv. of Venezuela, joining the Guaviare at San Fernando de A., just before it enters the Orinoco after a course of 140 m. It forms part of the boundary between Colombia and Venezuela.

Atacama, prov. in N. Chile, area 30,843 sq. m., with a pop. of 76,360. There are some of the world's most valuable silver and copper mines in the prov. Salt is exported in large quantities. The A. desert is a vast stretch of barren country extending S. from Peru over the provs. of A., Antofagasta, and Tarapacá.

Atacamite, rare mineral originally found in the desert of Atacama, in S. America, and occurring in Saxony and on the slopes of Vesuvius and Etna. It is a copper oxychloride, $\text{CuCl}_2 \cdot 3\text{Cu}(\text{OH})_2$, crystallises in the orthorhombic system,

is usually green in colour, hardness 3, sp. gr. 3.7, and is worked as a copper ore.

Atafu, see TOKELAU.

Atagartis, see DERETO.

Atahualpa, son of Huayna Capac of Peru and 'last of the Incas.' He was deprived of the throne of Peru by the illegitimacy of his birth, as he was of the blood of the Incas only on his father's side, his mother being a captive princess of Quito. His father therefore was obliged to leave his throne to his legitimate son Huascar, but to his favourite son A. he left the newly conquered kingdom of Quito. A quarrel sprang up between the 2 brothers, and A. was victorious, but at the moment of his victory Pizarro, the Sp. pioneer, landed in Peru. On 15 Nov. 1532 he requested A., now Inca, to pay him a friendly state visit, but took him prisoner by a horrible massacre of his bodyguard. Treachery was followed by treachery, and after A. finally professed himself Christian he was strangled in 1533.

Atalanta, Arcadian huntress, daughter of Iasus and Clymene. Her father, desiring a son, exposed her in infancy, but she was reared by a she-wolf. She became a votary of Artemis (q.v.) and took part in the hunting of the Calydonian boar, when her father once more recognised her as his daughter. She was urged to marry, but being warned against it, and knowing that she was peerless in running, she made all suitors race her. He who lost must die; he who won would be her lord. Milanion won by a ruse. Aphrodite gave him 3 golden apples, which he let fall during the race, and A., overcome with their beauty, stooped to pick them up.

Ataman, see HETMAN.

Ata-Melik, whose complete name was Ala-eddin-ata-Melik al-Jowaini (c. 1227-1282), b. Jowain, near Nishapur, Khorasan. He became the confidant of Mangu Khan, and afterwards of Hulagu, by whom he was made prefect of Bagdad 1258. He was accused of peculation, and put into prison by Abaka Khan, the successor of Hulagu. He was, however, released by Sultan Ahmed, the successor of Abaka Khan. Ahmed was soon afterwards defeated by Argun, the son of Abaka Khan, and this news no doubt brought about the death of A.-M. He was the author of *Jehankushais* (The Conquest of the World), a hist. of the Moguls, and a MS., said to contain the greater part of it, is in the Royal Library at Paris.

Atanajua, see JAUA.

Ataroth, in E. of the Jordan, rebuilt by the tribe of Gad (Num. xxxii) and taken from the men of Gad by Mesha, King of Moab, c. 853 BC (2 Kings iii. 5-8). Generally identified with the ruins of Attarus, on the W. slope of Jebel Attarus, 7 m. NW. of Dhiban, where the famous Moabite stone of Mesha, recording the campaign, was found in 1869; it is now in the Louvre. Also the name of a tn on the border of Ephraim, not far from Jericho, but unidentified.

Atatürk, Mustafa Kemal (1880-1938), first president of the Turkish Rep., and

the maker of modern Turkey, b. Selanik (Salonica) of middle-class parents. He entered the army as an officer, and apart from some involvement in the Young Turk movement of 1908 pursued a normal military career until the First World War, when he was prominent as a div. commander in the Gallipoli campaign, as commander of the Turkish Second Army in the Caucasus, and for a time as commander in the Mesopotamian campaign. In 1919, during the allied occupation, he was appointed inspector of the army in E. Anatolia and there organised and led the nationalist movement which eventually turned the Greeks out of Smyrna and replaced the imperial gov. of the Sultan. He was elected President in 1923 and thereafter ruled Turkey as an all-powerful but benevolent dictator until his death. His main concern was the modernisation of Turkey, and to this end he introduced a number of social and administrative reforms which affected religion, justice, economy, education, language, the status of women, and dress. Considering the extent of the prevailing ignorance and prejudice his reforms met with surprisingly little opposition and were widely imitated in other under-developed countries. In foreign affairs he pursued a conciliatory policy, which contributed greatly to Turkey's prosperity and enabled her to maintain an honourable neutrality in the Second World War. His countrymen preserve his memory with a respect and gratitude amounting to veneration.

Ataulphus, or **Ataulf** (d. 415), King of the Visigoths and brother-in-law of Alaric I, whom he succeeded in 410. He invaded Gaul, and married Placidia, sister of the W. Emperor Honorius, in 414. He was assassinated in Spain.

Atavism (Lat. *atavus*, a great-great-grandfather), biological term used to denote a reversion to some remote ancestral type. It is a species of heredity common to animal and plant life, where some old family characteristic may make a sudden reappearance. Pure breeds may occasionally produce a common type or in horticulture cultivated species may revert to the common type. It is difficult to decide whether this is due to a concealed genetic factor, or whether (as in the appearance of coloured blood in species evolved through those with colourless blood, but with primitive ancestors of the coloured type) this merely implies a biochemical potential to produce the type of blood appropriate to the biology of the species.

Atbara, most N. trib. of the Nile. The A. was the scene of a battle fought between a Mahdist army under Mahmud and a Brit. army under Lord Kitchener (1898). The battle resulted in the capture of Mahmud and the rout of the Mahdists. This victory was followed by the decisive battle of Omdurman.

Atchafalaya River, in Louisiana, U.S.A., south-westerly distributary of the Red R. (q.v.), the one to the SE.—to the Mississippi R.—being the Old R. The A. R. starts 7 m. W. of the Mississippi and

winds 220 m. S. and SE. past Simmesport and Morgan City to Atchafalaya Bay of the Gulf of Mexico. Extensive guide-levée systems make it a run-off for flood waters of the Red R. and the Mississippi. The Gulf Intracoastal Waterway intersects it at Morgan City; above this it broadens into Grand Lake, c. 35 m. long and 2-6 m. wide.

Atchin, see **ACHIN**.

Atchison, **Topeka**, and **Santa Fe Railway**, U.S.A., a railway system extending through Missouri, Arkansas, Texas, Kansas, Colorado, New Mexico, Oklahoma, and Arizona. The system has now a total mileage of 9106.

Atē, daughter of Eris (Strife) and Zeus, Gk goddess who represents the infatuation that leads men to ruin. In tragedy her mission is moral, as the personification of retribution rather than of destruction.

Atel Crown, form of head-dress worn by Egyptian deities, consisting of a tall white cap, with a plume on each side, often with horizontal ram's horns at the base.

Atelectasis, see **COLLAPSE**, **PULMONARY**.

Ateles (Gk *atēls*, imperfect), genus of Central and S. Amer. primates known as spider-monkeys. They belong to the family Cebidae. The thumb is absent or vestigial (hence their name), the limbs long and very flexible, the tail long and much used in climbing. *A. paniscus*, the coaita, inhabits Brazil; *A. belzebuth*, the marimonda, Guiana.

Atellanae Fabulae, in anc. Rome, a sort of farce, Oscan in origin and so called from Atilla, near Capua. They were improvised burlesques from low life; but during the last cent. bc it became fashionable to present them after the performance of tragedies, and for this purpose they were given literary form by L. Pomponius and others. Certain stock characters appeared, e.g. Maccus the glutton, Bucco the fool, Pappus (Pantoloon), and Dossenus (Punch). A. F. were gradually superseded by the mime and disappeared about the time of Tiberius. See O. Ribbeck, *Comicorum Romanorum Fragmenta* (3rd ed.), 1898, and G. E. Duckworth, *The Nature of Roman Comedy*, 1952.

Ateshgah (place of fire), place of worship among the Guebres or Persian fire-worshippers, about 1 sq. m. in area, from the soil of which issues natural gas.

Atessa, It. tn in Abruzzi e Molise (q.v.), 24 m. SE. of Chieti (q.v.). It has a fine collegiate church. Pop. (com.) 10,000.

Ateste, see **ESTRE**.

Atfih (anc. **Aphroditopolis**), Egyptian tn situated on the R. b. of the Nile, in the gov. of Ghizeh. Pop. about 3000.

Ath (Flem. **Aat**), tn on the R. Dender in the prov. of Hainaut, Belgium. It was once a fortified stronghold but the fortress was dismantled in the 19th cent. and its ramparts superseded by boulevards. An 11th-cent. tower is now the sole medieval relic. Pop. 10,500.

Athabasca: 1. Before 1905 a great dist. in Canada was known as A. It covered an area of 251,000 sq. m. and was situated

in the NW. Ters. In 1905 parts of it were given to Saskatchewan and Alberta and in 1912 the rest became part of Manitoba.

2. Riv., affluent of the Mackenzie (also named the Elk or Reindeer R.), and likewise a lake in the prov. of Alberta, Canada. A. is a Cree Indian name, meaning 'where there are reeds,' referring to the muddy delta of the riv. where it falls into A. Lake. The source of the riv. is a small lake at the base of Mt Brown in the Rocky Mts, called the Committee's Punch-bowl. The A. flows from the mts in a N.-eastward direction, receiving many affluents and the drainage of the Lesser Slave Lake. An interesting feature of the riv. is the point where it takes the 'Great Rapids,' a long slope where the water flows steadily and without cascades. After a course of 550 m. the A. enters Lake A. The lake is shaped like a great bow with the horns pointing southward. The main affluent of the A. lake is called the Great Slave R., and is formed by the union of the A. and Peace R.s. The Great Slave R. in turn flows into the Great Slave Lake, and takes the name of the Mackenzie R. The A. (lake and riv.) are thus part of a great system which drains and waters a vast tract of Canada. The A.-Mackenzie, whose united length is 2700 m., together with the recipient lakes, provides most valuable transportation facilities.

3. Tn (incorporated 1911) of Alberta, Canada, 97 m. N. of Edmonton, and N. terminus of the Canadian National Railway on the A. branch. The tn was first visited by David Thompson in 1799 on his way from Lesser Slave Lake to Ile à la Croix Fort. In 1884 the Hudson's Bay Co. estab. a fort at A. Landing. Before the coming of the railways A. Landing was the last stopping place on the route to the far N.; transportation beyond the Landing was mostly by water. Gas was first discovered in the area in 1897, and the tn's gas wells were developed between 1911 and 1914. Industries are trapping, mixed farming, fur trading, brick making, grain growing, and legume crops. A. is the see of the Anglican diocese of A. Pop. 1220.

Athaliah, daughter of Ahab, King of Israel, and Jezebel, and wife of Jehoram, King of Judah. She inherited her mother's evil instincts, and under her the cult of Baal spread in Judah. On the death of her son Ahaziah, after a massacre of all her grandchildren except Joash, who escaped, she reigned in Israel for 6 years (841-836 bc). Joash deposed her.

Athamas, son of Aeolus, King of Thebes, married Nephele, and by her had Phryxus and Helle. He forsook Nephele for Ino, who bore him Learchus and Melicerta. Ino persecuted the children of Nephele, and Juno in revenge visited A. with madness, in which he slew his son Learchus.

Athanagild (d. 457), captain of the Sp. Goths. With the help of a Rom. force sent from Gaul by Justinian, he defeated and killed King Agila near Seville in 534.

A. then became King of the Goths in Spain, and endeavoured to drive his Roman allies out of Spain. He was unsuccessful, but reigned 14 years over that part of the country occupied by the Visigoths. Brunehaut, one of his two daughters, married Sigebert, King of Metz.

Athanaric (d. 381), Prince of the Visigoths. He engaged in a long unsuccessful campaign with the Emperor Valens, and had to make peace in 369. In 376 he was defeated by the Huns and took refuge with the Emperor Theodosius at Constantinople, where he d.

Athanasian Creed, see **ATHANASIUS** and **CREED**.

Athanasius (c. AD 296-373), saint and doctor of the Church, b. in Alexandria, led the resistance to the heresy of Arius (q.v.). He was prominent at the Council of Nicæa (325), and in the year following he was made patriarch of Alexandria and primate of Egypt. Arius had been banished after the Council of Nicæa; but the favourite sister of Constantine had leanings towards Arianism, and he was soon restored to favour. A. was urged to restore Arius to Christian communion, but refused. For this and for his treatment of 6 Arian bishops, especially Arsenius, he was tried and condemned at Tyre. He appealed to Constantine, but was banished for a little over 2 years to Trèves, whence he was restored by the younger Constantine on his accession (338). At a synod at Antioch it was decided that a bishop deposed by one synod could only be restored by an equal synod, and A. was again driven into exile. Part of this exile was spent in Rome, where he quickly gained the sympathies of the W. Church, and his innocence was upheld by the It. bishops in council. At a synod at Sardica, where representatives of the E. and W. met, an angry controversy occurred, and the beginnings of misunderstanding between E. and W. Churches are obvious for the first time. Constantine, Emperor of the W., under threat of a religious war, secured his restoration by Constantine in 349. In 351, however, Constantine was assassinated, and A. was again condemned in the Councils of Arles (353) and Milan (355). In 356 he was expelled from Alexandria, which was plundered by the imperial army. A. sojourned for 6 years in the deserts of Upper Egypt among the solitaries, who regarded him with the greatest respect and refused to betray him. In 362, under Julian the Apostate (q.v.), A. returned; but Julian hated him, and, in his own words, desired his death. A. eluded capture, and again took refuge in the monasteries of the Upper Nile. He returned in 363 under Jovian, and (save for a short break under Valens) remained to carry out his work in Egypt until 373. His death was the signal for the outbreak of religious persecution. He had been primate of Egypt for 43 years, and in exile 4 times. He led the Church during one of its most dangerous periods, and set an example of firmness. The so-called Athanasian creed embodies his

doctrines and beliefs, but was not heard of until some centuries after his death.

Athapasean, or **Athabasean**, linguistic family of N. Amer. Indians, inhabiting Canada, California, and the Rio Grande dist. It may be divided into 3 main branches: the N., originally not over 30,000 strong, in Alaska and Canada; the Pacific, originally about 20,000 strong, in Washington, Oregon, and California; and the S., at present about 30,000 strong, in Arizona, New Mexico, Texas, and parts of Mexico.

Athboy, mkt tn of co. Meath, Rep. of Ireland, on the Athboy R., 7 m. NW. of Trim. Pop. 500.

Atheism, denial of the existence of a god. A sect is very apt to charge its opponents with A. merely because their doctrines are not understood. Thus Xenophanes, who rejected the gods of the popular Gk religion, incurred the charge of A., though his attitude was almost monotheistic. Socrates, too, was charged with A. because he did not believe in the gods that the city worshipped. The early Christians were called atheists by the Romans, because they denied their gods and were at variance even with Judaism. Philosophic A. fails to find evidence of a god manifest in the universe. In Greece positive atheists were the followers of Democritus, Leucippus, and the materialistic schools. In Rome there were very many sceptics, but very few atheists. Lucretius was unique, standing apart from his age and from his race. His books *De Rerum Natura* (On the Nature of Things) is one of the most fervent denials of the divine ever penned. 'Gods' there are, but these 'gods' are not immortal, according to Lucretius, but only beings endowed with a happier and longer life than ordinary mortals. Lucretius had no followers at Rome, and his book was ignored for many generations. Modern A. falls into three classes: (1) **Dogmatic A.**, which positively asserts there is no God. The most active and widespread form of A. the world has ever known is the dogmatic A. of Communism, based on the Dialectical Materialism of Karl Marx (q.v.) and violently attacking religion for political and social-economic reasons as 'the opium of the people.' (2) **Sceptical**, which maintains that the finite mind of man is incapable of asserting whether God is or is not and so in practice ignores Him. Agnosticism (q.v.) may take this form, if it is radical. (3) **Critical**, which holds that the evidence for Theism is inadequate, and therefore rejects it as unproven. Rationalism is generally of this kind, though it is often combined with secret dogmatic pre-suppositions that are hostile to religion. Plato asserted that no one after adopting in his youth the doctrines of A. persisted in such doctrines in old age. In India the disbelief in the existence of God is common from very early times. Notably atheistic are the Sankhya system and the more modern Jainism. A. as a system did not have many adherents among the Jews. Still, there are traces of it, e.g. Jer. v. 12, 'They denied the Lord and

said, He is not'; and Ps. x. 4, 'The wicked in the haughtiness of his countenance says, "He will not require"; all his thoughts are, "There is no God."' See also RELIGION.

Atheists, Militant, in Soviet Russia, see MILITANT ATHEISTS.

Atheling, A.-S. title of nobility, confined in use by the 8th cent. to members of the royal family, i.e. kings and brothers and sons of kings.

Athelney, marsh at the junction of the Tone and Parrett, formerly an is., in Somerset, England. Here Alfred fled (AD 878) after being defeated by the Dan. invaders. On regaining his throne he founded a Benedictine monastery on the is. in commemoration of his retreat, and portions of it have been excavated. A jewel was found (1693) bearing Alfred's name, and is now preserved in the Ashmolean Museum (q.v.).

Athelstan (c. 895-939), Eng. king, son of Edward the Elder, and grandson of Alfred the Great. He succeeded to the thrones of Wessex and Mercia in 924, not without opposition. He annexed the kingdom of Northumbria, and then made tributary to himself the kings of Wales, Cumbria, and Scotland. These dependent kings later conspired with the Norsemen against him, but the battle of Brunanburh (937), a signal victory for A., put an end to the opposition. A. was the first king to unite England under one ruler and to establish a connection with Europe by marrying the female side of his line with European princes. The development of the king's council is an important feature of A.'s reign.

Athena, Gk goddess, frequently called Pallas A. or simply Pallas. Traditionally she was the daughter of Zeus by Metis (Wise Counsel), and sprang fully armed from Zeus's head after he had swallowed her mother. The theory of her origin now generally accepted is that of Nilsson. She was the pre-Hellenic patroness of Minoan and Mycenaean princes in their fortress palaces; and her later association with the snake and the olive is derived from the anct worship of a snake goddess and the tree cults of Minoan-Mycenaean religion. The Athenian acropolis was the site of a Mycenaean palace, and the invading Greeks adopted the goddess, together with the conquered citadel. It is possible that they identified her with a warlike virgin goddess of their own, from whom the name Pallas was derived. The chief characteristics of A. may be summarised as follows. (1) Under the titles *Polias* and *Poliuchus* she was patroness and defender of Athens, a natural consequence of her position in Mycenaean days. (2) She was the personification of wisdom, as expressed in the myth of her birth. From Mycenaean times she was probably thought of as protecting and guiding the handicrafts carried on in the royal palace; but with the increasing industrialisation of Athens her functions tended to embrace every kind of skill, and lastly the purely intellectual activities of her citizens. (3) She was a virgin goddess, despising love

and marriage; yet as guardian of the state she was concerned for the fertility of animal and vegetable life. (4) She was a goddess of war, a position due almost entirely to the Gk invaders and the fusion of A. with their national goddess. Her prin. festival at Athens was the *Panathenaea* in the Aug. of every fourth year; and her temple the Parthenon, the most celebrated in the world. The Romans identified A. with their goddess Minerva.

Athenaeum: 1. In general a place or temple sacred to Athena. The name was especially given to a literary and scientific school founded by Hadrian at Rome c. AD 133.

2. A similar institution founded at Rome by Hadrian in 135, chiefly for instructional courses in law, rhetoric, and philosophy. Afterwards known as the *Schola Romana*, it lasted into the 5th cent. AD. The name thus came to be applied through the ages to various academies and learned societies.

'Athenaeum', literary weekly jour. started by James Silk Buckingham in 1828. Two years later it passed to the sole control of Charles Wentworth Dilke, who in 1831 successfully reduced the price from 8d. to 4d. Hogg the Ettrick Shepherd, Leigh Hunt, and Wm Roscoe were among the contributors. Dilke also tried to revolutionise journalistic principles, asking no favour of any publisher and refusing to allow his criticisms to be biased. He resigned the editorship in 1846. The A. was 'the first literary paper to make honesty its aim.' After nearly a century of existence it was incorporated in the weekly *Nation* (1921), later called the *Nation and A.* The paper was amalgamated in 1931 with the *New Statesman* (q.v.).

Athenaeum Club, famous institution in Pall Mall, founded in 1824 'for the association of individuals known for their literary or scientific attainments, artists of eminence in any class of the Fine Arts, noblemen and gentlemen distinguished as liberal patrons of Science, Literature, and the Arts.' Membership is attained by the vote of the committee. The club consists of 1750 members, who pay a yearly subscription of 21 guineas, with an entrance fee of 40 guineas. Attached to the club is a fine library. See CLUB.

Athenaeus, Gk writer, probably contemporary with Archimedes. A work by him on engines of war (*Peri Mēchanēmōnōn*) is extant, and printed in the collection of Thévenot. This work is addressed to M. Marcellus, supposed to be the conqueror of Syracuse.

Athenaeus (fl. AD 200), Gk writer, b. at Naucratis in Egypt; studied at Alexandria and Rome. He wrote a miscellany called the *Banquet of Sophists* in the form of conversations of learned guests at a prolonged feast. The book is full of valuable information concerning Gk letters and science, and is one of the best sources for fragments of lost comedies, etc. Of the original 30 books only 15 and an abridgment have survived; these have been ed. with a trans. by C. B. Gulick (1927).

Athenaeus of Attalia, physician who fl.

in Rome about the middle of the 1st cent. of our era, and estab. the Pneumatic school in medicine. A few fragments of his writings are preserved by Oribasius and Aetius, and allusions are made to his opinions in the writings of Galen. His theory, adopted by sev. other distinguished physicians (e.g. Aretaeus), derived its name from the *pneuma*, or spirit, a notion of which these physicians made frequent use in their explanation of life and disease. This *pneuma* formed an important principle in the physical science of the Stoic philosophers, from whom the Pneumatists seem to have derived it. The very scanty remains of the Pneumatic doctrine do not enable us to judge whether its *spirit* resembled the *vital principle* of some modern physiologists; nor can we appreciate in what manner the Pneumatists conceived the efficacy of this *spirit* as connected with those principles which they admitted in common with other anc. schools, the elementary qualities, heat and cold, which they called active principles, and dryness and moisture, which they termed passive principles.

Athenagoras, Gk Christian apologist, who fl. in the 2nd cent. AD, b. Athens, and taught there and at Alexandria. Best known by his *Legatio pro Christianis*, addressed to the Emperor Marcus Aurelius. He also wrote a treatise on the resurrection of the body. Works trans. by Humphreys, 1714.

Athenais, see EUDOCIA.

Athenion, Sicilian slave-leader in the second Servile war, 102 BC. He assumed the title and state of a king, and told his followers that he was destined to reign over Sicily. He laid siege to Lilybaeum, but failed in his attempt. He then joined Salvius, another slave-leader, who had assumed the name of Tryphon. The Senate sent Lucullus to subdue them, and although he was at first successful he was defeated when he laid siege to Triocala. Tryphon d., and A. succeeded him, but was defeated and slain by the consul Marius Aquilius in 101 BC. Aquilius ended the war in 99 BC.

Athenion (1st cent. BC), son of a Peripatetic philosopher of the same name, by an Egyptian slave. He was set free, opened a school in Athens, and ultimately became tyrant of that city. He helped Mithridates in his wars against the Romans, and with Archelaus, the general of the King of Pontus, held Athens against Sulla, who afterwards put him to death.

Athenodorus, Gk sculptor, who executed the statues of Apollo and Zeus commemorating the battle of Aegospotami.

Athenodorus, Rhodian sculptor of 1st cent. BC. He was one of the three who produced the famous 'Laocöon,' the others being Hagesandros and Polydorus.

Athenodorus, of Tarsus, a Stoic philosopher surnamed Cordylion, was keeper of the library at Pergamum; afterwards removed to Rome, where he lived with M. Cato, at whose house he d. c. 45 BC.

Athenodorus, of Tarsus (74 BC-AD 7), also a Stoic philosopher, surnamed

Cananites from Canana near Tarsus in Cilicia, the bp. of his father. Taught at Apollonia in Epirus, where the young Octavius (later the Emperor Augustus) was one of his disciples. St Paul must have been acquainted with his teaching, to which we may perhaps attribute a number of striking resemblances between the Apostle and Seneca.

Athenry, par. and mkt tn of Rep. of Ireland, in Galway co., 10 m. NW. of Loughrea. Friday is the market day. Pop. 1200.

Athens, cap. of anc. Attica and modern Greece, situated on the Attic plain, 44 m. from its harbour, Piraeus, on the gulf of Aegina. The plain is surrounded by hills: Mt Hymettus lying to the E., Pentellicus to the NE., Parnes to the NW., and Aegaleus to the W. and sloping SW. to the Saronic Gulf. It is crossed by sev. lower ridges, partly occupied by the city itself. The greatest height of these, Mt Lycabettus, directly overhangs the city, within which are the rocky masses forming the Acropolis and Areopagus. The plain is watered by the Ilissus and Cephissus, both irregular mt streams. A. is approached on the W. by the 'Sacred Way,' over the plain of Eleusis, and on the SW. from Piraeus, over what was formerly a swamp, and there are railways to Piraeus, Laurium, and Corinth and a tram-line to Phaleron. This last was the first harbour of A., but, together with Munychia and Zea, it was early replaced by Piraeus, now one of the chief ports of the Mediterranean. The city was connected with the ports by the famous 'long walls.'

The original site of the city was undoubtedly the Acropolis, on the summit of which have been found traces of a prehistoric wall. Buildings soon extended to the S. and W. of the hill, and this city, the foundation of which is ascribed to Theseus, was enclosed by a strong wall with 9 gates, portions of which still remain. There can also be traced the course of the great wall of Themistocles, built immediately after the Persian wars, 479 BC, and the gate of Hadrian probably marks the limit of the extension to the E. made under the Emperor Hadrian. The modern city lies mainly to the N. and E. of the Acropolis, in the depression between it and Mt Lycabettus. But the increase in pop. during the present cent., owing to some extent to the arrival of refugees from Asia Minor, has led to the building of many suburbs, Mt Lycabettus being now almost surrounded by buildings. Approaching the Acropolis the streets become narrow and cobbled, and open drains run down the middle of some of them. A. has been almost entirely rebuilt since it became the cap. of the new kingdom of Greece on the withdrawal of the Turkish garrison in 1834, and is now a regular and attractive city, extending in the form of a semicircle, and divided into 6 dists. It is connected with the older part by the 2 main thoroughfares of Hermes Street and Aeolus Street, intersecting at Constitution Square the site of the royal palace,

1834-8. Omonia Plateia (Place of Harmony) is the business centre, but it belies its name, for it is the noisiest spot in the city. The square is surrounded by cafés which usually remain open all night. Here, too, is the entrance to the underground station, and 7 streets run into the square. Numerous wide boulevards, the most important of which are Piræus Street, Athens Street, Stadium Street, and Univ. Street, radiate from the central Place de la Concorde, and contain fine gov. and univ. buildings, and the offices of the many archaeological and other societies for which A. is famous. There are 2 univs. at A., the National and the Capodistria. It is the see of a metropolitan, and possesses an ugly cathedral built in 1855. Before the capture of A. by the Turks,

Pnyx, also near the Acropolis. Just outside the city to the SE. are the ruins of the temple of Olympian Zeus, begun by Pisistratus, and completed by Antiochus Epiphanes and under the Emperor Hadrian. The Stadium, on the banks of the Ilissus, was built by Lycurgus, 330 BC, rebuilt by Herodotus Atticus, AD 140, and after being largely destroyed in the Middle Ages was restored in 1905. Thanks to the archaeological societies which have made A. their H.Q., the Acropolis has been entirely cleared of Turkish and medieval remains, and many of the anc. buildings have been restored as nearly as possible to their former state. The Agora has been completely excavated by the Amer. School of Classical Studies.

ATHENS FROM THE ACROPOLIS

E.N.A.

the Parthenon was the cathedral. The Theseum and Erechtheum were also converted into churches in the Middle Ages.

The antiquities of A. are probably unequalled in the world. The most famous is the Parthenon, dating from the reconstruction of A. after the Persian wars. It is built of white marble, 228 ft long and 100 ft wide, ornamented by Phedias, and surrounded by 46 Doric columns. Even in its ruins it is the most perfect specimen of Gk architecture extant. To the N. of the Parthenon is the Erechtheum, which contained the statue and sacred olive of Athena, and had a wonderful portico of Caryatides. At the W. end of the Acropolis, just above the great gateway (the Propylæa), stands the temple of Athena Nike, or Apteros Nike (Wingless Victory). At the foot of the hill to the N. is the so-called Theseum, actually a temple of Hephaestus, dating from the time of Pericles, and in excellent preservation, and to the S. the temple of Dionysus and the Odeon of Herodes Atticus. The Areopagus, or Mars's Hill, was the meeting-place of the great council of that name, and popular meetings were held on the mound of the

The early hist. of A. is very obscure. It seems to have been originally one of numerous petty states, but early emerges as the cap. of Attica, traditionally united under Theseus. The earliest form of gov. was a monarchy, but the powers of the king were gradually limited by the nobles (Eupatridæ), and the rule of archons (q.v.) represents a period of 'aristocracy.' The citizens seem to have been divided into 4 tribes, each consisting of 3 brotherhoods. The growth of the democracy was gradual, being assisted by the legislation of Draco, 621 BC, Solon, 592 BC, and Cleisthenes, c. 500 BC. A. took a leading part in repelling the Persian invasion of 490 BC, and in the final defeat of Xerxes, 480-479 BC, and after this, by the estab. of the Delian League, became mistress of the whole of the Gk states. The golden age of Athenian power and culture, 480-430 BC, which reached its highest point under Pericles, witnessed the production of its finest buildings, its most perfect sculpture, by Phedias, and the poetic drama of Aeschylus, Sophocles, and Euripides. Its prosperity began to decline from the end of the Peloponnesian war, 403 BC, when

Sparta became the premier state of Greece, and suffered still further by the victories of Macedonia, culminating in the battle of Chaeronea, 338. Its intellectual supremacy, however, long outlived its temporal power. In 146 BC A., together with the rest of Greece, became part of the Rom. Empire. Under Rom. rule it fl., and became a great educational centre, declining, however, with the spread of Christianity. At the fall of the empire it passed under Byzantine rule, and early in the 13th cent. became the seat of a Frankish duchy. In the mid 15th cent. A. was captured by the Turks, and practically disappeared from European hist. for cents. Except for a brief period of Venetian rule, 1687-1690, it remained in the hands of the Turks till its capture by the Gk patriotic party in 1822. It was retaken by the Turks, 1826-7, but became cap. of the new kingdom in 1834. A. has become a centre of archaeological research, the chief institutions being the Fr. School of Archaeology, 1846; the Ger. Imperial Archaeological Institute, 1874; the Amer. School of Classical Studies, 1882; and the Brit. School of Archaeology, 1883. The pop. of anc't A. in its time of greatest prosperity was about 300,000; in the 16th cent. it is said to have fallen to 12,000. In 1955 it was about 565,000 (est.). Public works of importance include the A.-Piraeus electric light and power scheme and the A.-Piraeus water supply scheme. As to the former, the Gk Gov. concluded a contract in 1925 with an Anglo-Hellenic group for operation of power by various transport services in the A.-Piraeus dist. The question of an adequate water supply for A. had been discussed for some 40 years, when, in 1926, the Gk Gov. decided in favour of a scheme for a dam near Marathon to hold up the waters of the Charadros and Varnava R.s; and eventually a contract was given to an Amer. company, the Ulen Water Co. The dam is nearly 300 yds long and the reservoir holds over 40 million cub. ft. of water. A tunnel over 13 m. long leads the supply as far as Chelidono, where the dam station is estab. In the sphere of education, the A. Academy was inaugurated in 1926; the statutes of the Academy provide for instruction in letters and fine arts, moral and political sciences, and positive sciences. Recently the A.-Piraeus electric railways, which have now been extended to Perama, were taken over by the Hellenic Electric Railway Co. Some quarters of A. became considerably extended after 1922 owing to the large immigration of refugees from Asia Minor following the Gk debacle in the war against Turkey, 1921-2. The quarter especially affected was Patesia. In the Second World War the Germans entered A. on 27 April 1941. Brit. forces entered the city on 14 Oct. 1944. On 5 Dec. fighting began in A. between E.L.A.S. troops and Brit. and Gk regulars and the city was not out of danger for 3 weeks. On 25 Dec. Mr Churchill and Mr Eden arrived for political discussions and 5

days later the Archbishop of A. became regent of Greece. There was little further fighting in A. itself. Superficially there is now little trace of war damage, but A. still includes appalling slums.

See E. Abbott, *Pericles and the Golden Age of Athens*, 1891; Sir J. G. Frazer, *Pausanias* (trans.), 1898; E. A. Gardner, *Ancient Athens*, 1902; C. H. Weller, *The Monuments of Athens*, 1913; W. S. Davis, *A Day in Old Athens*, 1914; T. G. Tucker, *Life in Ancient Athens*, 1930; W. Judeich, *Topographie von Athen*, 1931; R. J. Bonner, *Aspects of Athenian Democracy*, 1933; and bibliography for ACROPOLIS.

Athens: 1. Cap. of Clarke co., Georgia, U.S.A., 60 m. ENE. of Atlanta. It is the seat of the univ. of Georgia, and an important cotton market and manufacturing centre (textiles, tyre fabric, fertiliser, cotton-seed oil, metal and wood products, canned foods). Pop. 28,180.

2. City of A. co., Ohio, U.S.A., on Hocking R., 40 m. W. of Marietta. It is the seat of Ohio Univ. and the site of a state hospital for the insane. Pop. 11,700.

Atherfield Clay, stratigraphical name of beds of clay forming the base of the Lower Greensand, of Lower Cretaceous age. Exposed in the Weald, Dorset, and the Is. of Wight. Named after Atherfield in the Is. of Wight. Average thickness is 60 ft.

Atherstone, Edwin (1788-1872), poet, b. Nottingham. His works were planned on an imposing scale, his chief poem, *The Fall of Nineveh*, consisting of 30 books, and appearing by instalments from 1828 to 1868. He also wrote 2 novels.

Atherstone, tn of Warwickshire, England, 7 m. SE. of Tamworth. The prin. industry is hat-making. Close by are the ruins of the Cistercian abbey of Merevale, founded 1149. The tn stands on the Rom. Watling Street, equidistant from London, Liverpool, and Lincoln. Pop. 5824.

Atherton, Charles Gordon (1804-53), Amer. politician, b. Amherst, New Hampshire; graduated at Harvard, 1822. After serving in the state legislature and as speaker of the Lower House, he was elected to Congress, 1836. In 1838 he introduced the famous resolution, 'That all petitions relating to slavery, or its abolition, be laid on the table without debate,' which was passed by 120 to 78. He was elected to the Senate in 1843 and in 1852.

Atherton, Gertrude Franklin (1857-1948), novelist, b. San Francisco. Her maiden name was Hunt, and she was a great-grandniece of Benjamin Franklin (q.v.). In 1876 she married George H. B. A., and on his death 4 years later she started a writing career. She lived for 7 years in England and for 6 in Munich, and was made a Chevalier of the Legion of Honour. Among her best-known novels are *The Conqueror*, 1902, *Rezánov*, 1906, *Tower of Ivory*, 1910, *Black Ozen*, 1923, *The Immortal Marriage*, 1927, and *Dido, Queen of Hearts*, 1929. *Adventures of a Novelist*, 1932, is autobiographical.

Atherton, tn of Lancs, England, 13 m.

NW. of Manchester. Contains large cotton spinning factories, iron foundries, and collieries. There were formerly many silk-weaving mills. The nonconformist chapel is famous for its minister, 'General' James Wood, who raised a troop against the Pretender, 1715. Pop. 20,600.

Athesis, see ADIGE.

Athi River, see SABAKI.

Athias, Joseph ben Abraham, Jewish printer at Amsterdam, who *d.* in 1700. With the help of the most distinguished scholars at Amsterdam, he compared the old eds. and MSS. of the Heb. Bible, and pub. a new ed. in 1661, the summaries and preface of which were written by Jan Leusden. A second ed. was pub. in 1667, with many corrections.

Athletics in the form of public games date from the earliest civilisations. The anc. Greeks held 4 great festivals at which athletic contests were prominent. (1) The *Olympic Games*, held every fourth year, were of unknown antiquity, but were reckoned in much later times to date from 776 BC. The most important contests were the foot-race, a wrestling match, the pentathlon (leaping, running, throwing the discus, throwing the spear, and wrestling), boxing, and the chariot race. The festival was abolished by Theodosius in AD 394. (2) The *Pythian Games* took place at Delphi, first at 8-yearly intervals and afterwards at the end of every fourth year. They dated from before the 6th cent. BC. (3) The *Nemean Games*, at Nemea in Argolis, were biennial, dating from 516 BC. Finally, (4) the *Isthmian Games*, held near Corinth in the first and third year of each Olympiad, began not later than the early 6th cent. BC, and perhaps earlier. The first and third of these festivals were in honour of Zeus, the second and fourth in honour of Apollo and Poseidon respectively.

The Romans, a coarser and more cosmopolitan people, found their chief pleasure in those disgusting spectacles of the amphitheatre which cannot be described as A. Athletic contests, however, took place at the following festivals: (1) *Ludi Magni*, of early republican origin; (2) *Ludi Apollinares*, instituted in 212 and subsequently ann.; (3) *Ludi Megalenses* (in honour of Cybele), first held in 204 and ann. from 191 BC; (4) *Ludi Saeculares* at the beginning of each *saeculum*, which was interpreted variously as 100 or 110 years; and (5) *Ludi Augustales* (see AUGUSTALES), instituted in 11 BC.

Public games in the Middle Ages took the form of tournaments (q.v.), but archery and wrestling were the sport of the people, as the lists were the pastime of the nobility. Henry VIII, however, did not disdain to excel at hammer-throwing or 'casting the barre,' but under Edward III weight-putting was forbidden as interfering with archery. Later under Charles II professional races for wagers began to be popular, and this aroused amateur enthusiasm, leading to the renaissance of amateur A. in the 19th cent. In 1850 a movement was started to organise sports meetings at the colleges of the univs. of Oxford and

Cambridge. As a result of this the first inter-univ. contest took place in 1864, each side winning 4 of the 8 events. Meanwhile the London Athletic Club and others had been formed, and finally in 1880 the need for a central authority gave rise to the Amateur Athletic Association. Since then the A.A.A. has organised a yearly championship, now held in London.

As regards modern A., we must confine ourselves under this head to the track and field sports. Cricket, football, etc., will be found dealt with under their various heads. Modern A. may be said to have begun with the revival of the Olympic Games (q.v.), celebrated at Athens in 1896 as the result of the activities and enthusiasm of the Baron Pierre de Coubertin. One ideal of his was to promote through sport an international good feeling, but, the First World War having interrupted the quadrennial succession of the games, it was only in the ninth Olympiad of 1928 that Coubertin's idea had begun to be realised. This aim was subordinated in the eleventh Olympiad at Berlin in 1936 to the propaganda of National Socialism; but a welcome return to the true spirit of the games was a feature of the 1948 Olympiad at London (the first to be held in Great Britain since 1908) when public interest and enthusiasm brought one and a half million spectators.

The eighth Olympiad at Paris in 1924 was remarkable for the performances of Paavo Nurmi, the great Finnish runner. He won 4 titles during these Olympic Games. In the course of his career Nurmi set up world records for every distance from 1500 metres to one hr, yet none stands to-day.

It was not until the Olympic Games were held in Nurmi's native city of Helsinki in 1952 that another great distance runner, Emil Zatopek, Czechoslovakia, emerged. He won the 5000, 10,000 metres, and marathon in the space of 8 days. Four years later in Melbourne V. P. Kuts, U.S.S.R., won the 5000 and 10,000 metres, but did not run in the marathon.

America has produced the majority of the world's great athletes and their most famous Olympian is Jesse Owens, who won gold medals in the 100, 200 metres, long jump, and 4×100 metres relay at Berlin in 1936. His long-jump performance of 26 ft 8½ in. in 1935 has stood as a world record longer than any other in track and field. The creation of new world records is a great stimulant in A. and there is no sign of a barrier being reached, although they naturally become more difficult over shorter distances.

S. Iharos, Hungary, estab. new times at 5 distances between 1500 and 10,000 metres in 1955 and 1956, yet many of these were broken within months of being set up.

A. is divided into track and field events and it is easier to deal with them separately.

Track events. World records are in metres and yds. Here are the metric times first: 100 metres: 10.1 sec., W. F.

Williams, L. King, I. Murchinson (all U.S.A.), 1956; 200 metres: 20 sec., D. Sime (U.S.A.), 1956; 400 metres: 45.2 sec., L. W. Jones (U.S.A.), 1956; 800 metres: 1 min. 45.7 sec., R. Moens (Belgium), 1955; 1000 metres: 2 min. 19.0 sec., I. Rozsavolgyi (Hungary), A. Boysen (Norway), 1955; 1500 metres: 3 min. 40.6 sec., I. Rozsavolgyi, 1956; 2000 metres: 5 min. 0.2 sec., I. Rozsavolgyi, 1955; 3000 metres: 7 min. 52.8 sec., D. A. G. Pirie (Great Britain), 1956; 5000 metres: 13 min. 36.8 sec., D. A. G. Pirie, 1956; 10,000 metres: 28 min. 30.4 sec., V. P. Kuts (U.S.S.R.), 1956; 20,000 metres: 59 min. 51.8 sec., E. Zatopek (Czechoslovakia), 1951; 25,000 metres: 1 hr 16 min. 36.4 sec., E. Zatopek, 1955; 30,000 metres: 1 hr 35 min. 3.6 sec., A. Viskari (Finland), 1956; 3000 metres steeplechase: 8 min. 35.4 sec., S. Rozsnyoi (Hungary), 1956; 100 yds: 9.3 sec., M. E. Patton (U.S.A.), 1948, H. D. Hogan (Australia), 1954, J. J. Golliday, 1955; L. King, D. Sime (both U.S.A.), 1956; 220 yds: 20 sec., D. Sime, 1956; 440 yds: 45.8 sec., J. G. Lea (U.S.A.), 1956; 880 yds: 1 min. 47.5 sec., L. V. Spurrier (U.S.A.), 1955; 1 m.: 3 min. 57.2 sec., D. Ibbotson (Great Britain), 1957; 2 m.: 8 min. 33.4 sec., S. Iharos (Hungary), 1955; 3 m.: 13 min. 14.2 sec., S. Iharos, 1955; 6 m.: 27 min. 43.8 sec., S. Iharos, 1956; 10 m.: 48 min. 12 sec., E. Zatopek (Czechoslovakia), 1951; 15 m.: 1 hr 14 min. 1.0 sec., E. Zatopek, 1955; 1 hr: 12 m. 810 yds (20,052 metres), E. Zatopek, 1951.

The mile has always been the Blue Riband race in A. As the world record crept down to near 4 min. the publicity which attended every mile event where top-class performers competed was tremendous. This feat was often described as the Everest of A. Roger Bannister (q.v.) was the first man to break the barrier at Oxford on 6 May 1954, clocking 3 min. 59.4 sec. In less than 3 years 9 other men beat 4 min. for the mile, so proving once again that every record is only made to be broken.

W. G. George, the famous Brit. runner of the last cent., was credited with the first accepted mile record when he ran the distance in 4 min. 18.4 sec. (1884). This stood until T. P. Conneff (U.S.A.) covered the distance in 4 min. 17.8 sec. The gradual succession of records since then is shown in the following list (which is not exhaustive, because the previous record may have been beaten more than once in any given year): F. E. Bacon (Great Britain), 4 min. 17 sec. (1895); T. P. Conneff (U.S.A.), 4 min. 15.6 sec. (1895); J. P. Jones (U.S.A.), 4 min. 15.4 sec. (1911); J. P. Jones, 4 min. 14.4 sec. (1913); N. S. Taber (U.S.A.), 4 min. 12.6 sec. (1915); P. Nurmi (Finland), 4 min. 10.4 sec. (1923); J. Ladoumègue (France), 4 min. 9.2 sec. (1931); J. E. Lovelock (New Zealand), 4 min. 7.6 sec. (1933); G. Cunningham (U.S.A.), 4 min. 6.8 sec. (1934); S. G. Wooderson (Great Britain), 4 min. 6.4 sec. (1937); G. Haegg (Sweden), 4 min. 4.6 sec. (1942); A. Andersson (Sweden), 4 min. 2.6 sec. (1943); A. Andersson, 4 min. 1.6 sec. (1944); G.

Haegg, 4 min. 1.4 sec. (1945); R. G. Bannister (Great Britain), 3 min. 59.4 sec. (1954); J. Landy (Australia), 3 min. 58 sec. (1954); D. Ibbotson (Great Britain), 3 min. 57.2 sec. (1957).

Landy has broken the 4-min. mile 6 times and Bannister twice. Others who have achieved a time under the magic 4 min. include C. J. Chataway, B. S. Hewson, D. Ibbotson (Great Britain); I. Rozsavolgyi, L. Tabori (Hungary); R. Delaney (Ireland); G. Nielsen (Denmark); J. Bailey (Australia).

Brit. running records (i.e. records made in Great Britain by athletes of any nationality): 100 yds: 9.6 sec., D. Conwell (U.S.A.), E. McDonald Bailey (Trinidad), 1947; L. Remigino (U.S.A.), 1954; 220 yds: 20.9 sec., H. H. McKenley (Jamaica), 1952; 440 yds: 46.8 sec., V. G. Rhoden (Jamaica), 1952; 880 yds: 1 min. 48.6 sec., B. S. Hewson (Great Britain), 1955; 1 m.: 3 min. 59 sec., L. Tabori (Hungary), 1955; 2 m.: 8 min. 33.4 sec., S. Iharos (Hungary), 1955; 3 m.: 13 min. 23.2 sec., C. J. Chataway (Great Britain), 1955; 6 m.: 28 min. 13.6 sec., K. L. Norris (Great Britain), 1956; 10 m.: 49 min. 53.2 sec., P. Norris (Great Britain), 1956; 15 m.: 1 hr 17 min. 25 sec., J. C. Heywood (Great Britain), 1956; 1 hr: 12 m. 69 yds, P. Norris (Great Britain), 1956.

Hurdling. The U.S.A. again proved their domination of the hurdling events by placing the first 3 men in both the 110 metres and 400 metres events at the Melbourne 1956 Olympic Games. Earlier in that year 2 Americans, G. A. Davis and S. E. Southern, became the first men in hist. to break 50 sec. for the 400 metres event. This ended a short reign of supremacy enjoyed by Russian athletes in an event often described as the 'man killer' of the track. World records: 110 metres and 120 yds (3 ft 6 in.): 13.4 sec., J. W. Davies (U.S.A.), 1956; 200 metres and 220 yds (2 ft 6 in.): 22.2 sec., D. W. Sime (U.S.A.), 1956; 400 metres (3 ft): 49.5 sec., G. A. Davis (U.S.A.), 1956; 440 yds (3 ft): 51.3 sec., Y. Lituyev (U.S.S.R.), 1954. Brit. hurdling records (all comers): 120 yds: 13.9 sec., W. F. Porter (1948), H. Dillard (1952) (both U.S.A.); 220 yds (bend): 23.7 sec., P. A. L. Vine (Great Britain), 1955; (straight course): 23.3 sec., P. B. Hildreth (Great Britain), 1955; 440 yds: 51.3 sec., Y. Lituyev (U.S.S.R.), 1954. See also OLYMPIC GAMES and RUNNING AND HURDLING.

Field Events. Track racing will always be the most popular section of A. with spectators but field events are rapidly gaining their own audience. This is partly due to the better technique of many athletes, which has brought about spectacular improvements, and to the better planning of stadiums. Already the 15-ft pole vault, 7-ft high jump, and 200-ft hammer throw have been achieved.

World records: high jump: 7 ft 0½ in., C. E. Dumas (U.S.A.), 1956; pole vault: 15 ft 7½ in., C. A. Warmordam (U.S.A.), 1942; long jump: 26 ft 8½ in., J. C. Owens (U.S.A.), 1935; hop, step, jump: 54 ft 4 in., A. F. da Silva (Brazil), 1955; shot putt

(16 lb.): 63 ft 2 in., W. P. O'Brien (U.S.A.), 1956; discus throw (4½ lb. brass plate): 194 ft 6 in., F. E. Gordien (U.S.A.), 1953; hammer throw (16 lb. chained ball): 224 ft 10½ in., H. V. Connolly (U.S.A.), 1956; javelin throw: 281 ft 2½ in., E. Danielsen (Norway), 1956; decathlon (ten events in two days): 7985 points, R. Johnson (U.S.A.), 1955.

In 1912, 1920, and 1928 cross-country racing was included in the Olympic Games, but thereafter was omitted as unsuitable for a summer programme.

Walking has always been a controversial event owing to the number of disqualifications in international tournaments. This is the reason why the 10,000 metres track event is no longer included in the Olympic Games. Instead both walking races—20,000 and 50,000 metres—are on the road. The most successful world walker in recent years is V. Hardino (Sweden). G. E. Larner has held the Brit. record for 2 m. (13 min. 11.4 sec.) since 1904.

The tug-of-war is still a popular event at the A.A.A. championships but is seldom performed outside Britain.

Paper-chases were the origin of *cross-country running* (q.v.), but are nowadays rather falling out of favour except with schoolboys. Cross-country races have increased in popularity with athletes realising all-the-year-round competition is essential. The sport is governed by the National Cross-country Union and the season lasts from Sept. to Mar. See also **CABER; DISCUS; HAMMER; OLYMPIC GAMES; PUTTING THE WEIGHT.**

Women's Events. The ninth Olympiad at Amsterdam will be remembered as the first to include events for women athletes. They included the 100, 800 metres, 4 × 100 metres relay, high jump, and the discus. Since then the 800 metres has been eliminated, but the 200 metres, long jump, 80-metre hurdles, shot putt, and javelin have been added. Women now play an important role in the games. They have produced a number of great athletes through the years. The most famous is Fanny Blankers-Koen, 'the flying Dutchwoman,' who won the 100, 200 metres, 80 metres hurdles, and was a member of Holland's victorious relay team at London in 1948. Her 2 Olympic sprint titles were won by the Australian Marjorie Jackson-Nelson at Helsinki in 1952. Four years later another Australian girl, Betty Cuthbert, aged 18, won the 100 and 200 metres. Record breaking is as much a feature with the women as with men. Women's world records are as follows: 60 metres: 7.3 sec., S. Walasiewiczówna (Poland), 1933; 100 metres: 11.3 sec., S. Delahunty-Strickland (Australia), 1955; 200 metres: 23.2 sec., B. Cuthbert (Australia), 1956; 800 metres: 2 min. 6.6 sec., N. Otkalenko (U.S.S.R.), 1954; 100 yds: 10.4 sec., M. Jackson-Nelson (Australia), 1952; 220 yds: 23.6 sec., M. Itkina (U.S.S.R.), 1956; 880 yds: 2 min. 6.6 sec., N. Otkalenko (U.S.S.R.), 1956; high jump: 5 ft 9½ in., M. McDaniel (U.S.A.), 1956; long jump: 20 ft 10 in., E. Krzesinska (Poland), 1956; N. Dvalishvili (U.S.S.R.), 1956; shot putt: 54 ft 11½ in., G. Zyblina (U.S.S.R.), 1956;

discus throw: 187 ft 1½ in., N. Dumbadze (U.S.S.R.), 1952; javelin throw: 182 ft 0 in., N. Konyayeva (U.S.S.R.), 1954.

France gave the lead to women's A. when the Federation Sportive Féminine Internationale was formed in 1921. A year later the Women's Amateur Athletic Association was founded. Under the auspices of the F.S.F.I. the first women's world championships were held in Paris in 1924. In those early days women taking part in A. were severely criticised in some quarters.

See H. M. and A. Abrahams, *Training for Athletes*, 1928; D. G. A. Lowe, *Track and Field Athletics*, 1947; F. A. M. Webster, *Great Moments in Athletics*, 1947, and *Athletics: Teaching and Training*, 1948; Franz Stampfl, *On Running*, 1955; members of the Achilles Club, *Athletics*, 1955.

Athlone, Alexander Augustus Frederick William Alfred George Cambridge, 1st Earl of (1874–1957), administrator, b. Kensington Palace, third son of the Duke of Teck. Queen Mary, wife of George V, was his sister. He married Princess Alice, daughter of Prince Leopold, youngest son of Queen Victoria. After passing out at Sandhurst, he was commissioned to a Hussar regiment, the Royal Horse Guards, and the 2nd Life Guards, and served with distinction in Matabeleland in 1896 and in the S. African war, 1898–1900. Appointed Governor-General of the Union of S. Africa from 1925 till 1931. Governor-General of Canada, 1940–6.

Athlone, Godart Ginkell, Earl of, Dutch general (1630–1703), accompanied Prince of Orange to England, 1688; fought in battle of Boyne, 1690, and was made Commander-in-Chief in Ireland, 1691, when he took A. and defeated the Irish. Received his title, 1692. Commanded Dutch in Flanders, 1695–6, and Dutch troops under Marlborough, 1702.

Athlone, tn of co. Westmeath, Rep. of Ireland, on the R. Shannon, an important road, rail, and canal junction, the 'cap. of the midlands.' Since Brian Boru's hosting there in 1001, A. has been the scene of constant struggles for possession. The castle, founded in John's reign, was besieged by William III in 1688, and finally taken by Gen. Ginkel in 1691. The modern Shannon bridge, replacing the old bridge which was the scene of Sergeant Custume's heroic defence, is fine bow-string and lattice iron work; the 3 prin. churches are St Mary's, St Anthony's (Franciscan), and SS. Peter and Paul's, and the schools of the Sisters of Mercy and the Marist Brothers are supplemented by a modern technical college. A. to-day is a progressive modern tn, prin. industries being cotton and woollen goods, and there are military barracks. Pop. 9015.

Atholl, Forest of, dist. in the N. of Perthshire, Scotland, on the S. slopes of the Grampians. Its chief tns are Blair Atholl, Pitlochry, and Dunkeld; its lakes, Loch Rannoch and Loch Tummel, are famous for their beauty.

Atholstan, Sir Hugh Graham, 1st Baron, of Atholstan, Quebec (1848–1938), Canadian newspaper owner, founder and

president of the *Montreal Evening Star*. He was knighted in 1908 for his public services, and was most zealous in connection with the dispatch of the Canadian contingent in the Boer War. Canadian delegate to the Imperial Conference in 1909. Raised to the peerage as a baron of the U.K. in 1917, and took his seat in the House of Lords, 1920.

Athos, mt. of Greece, at the extremity of the most E. of the 3 tongues of the Chalcidice Peninsula, on the Aegean Sea. It is 6670 ft high. The name is also applied to the whole tongue of land, which is connected with the mainland by an isthmus just over a m. broad. The peninsula is about 30 m. long and 3-6 m. wide. There are still traces of a canal cut through the isthmus by Xerxes to avoid the dangerous promontory. Since the Middle Ages Mt A. has been the seat of an autonomous monastic community, and a centre of theological learning; the remains of magnificent libraries exist. There are now 20 Orthodox monasteries and numerous chapels and hermitages on the peninsula, with a pop. of about 4000 monks. See R. M. Dawkins, *The Monks of Athos*, 1936.

Athy, tn of co. Kildare, Rep. of Ireland, at the junction of the R. Barrow and the Grand Canal, 40 m. SW. of Dublin. It was the site of a great Irish tribal battle in the 3rd cent. The tn grew up round the monasteries of the Crutched and Dominican friars; it was plundered by the Scots after the battle of Ardsall (1315). There are manufs. of bricks and tiles, asbestos cement, and hardboard. Pop. 3800.

Athyrium, genus of ferns, family Polypodiaceae, about 200 species, including *A. filix-femina*, the cosmopolitan Lady Fern.

Atikokan, tn of Ontario, Canada, 90 m. W. of Port Arthur, with large iron ore development. Pop. 4577.

Atitlan: 1. Lake of Solotl dept, Guatemala, Central America. It is c. 4500 ft above sea level, 16 m. long and 11½ m. wide, with a circumference of 64 m., surrounded by mts, very deep, and with no visible outlet. It has been called 'more beautiful than Lake Como.' There is a tn A., or Santiago A., on the S. shore of the lake (pop. 7200), and other villages of tourist interest.

2. Nearby volcano of same name; 11,500 ft.

Atlu, one of the S. Cook Is.

Atfeh, see ACHIN.

Atkins, Tommy, see TOMMY ATKINS.

Atkinson, Sir Harry (1831-92), politician, b. Cheshire. He went to New Zealand in 1855 and soon distinguished himself. He became captain in the Waitara war, 1860-4, and minister of defence in the Cabinet of Sir Frederick Aloysius Weld, 1864-5. He was 3 times prime minister of New Zealand, and 4 times colonial treasurer, thanks to his insatiable capacity for work and great power of concentration which more than balanced his lack of the arts that win easy popularity.

Atkinson, John (1835-97), Amer. Methodist Episcopal preacher, b. Deerfield, New York. He wrote the well-known

hymn 'We Shall Meet Beyond the River,' and historical works on Methodism.

Atkyns, Richard (1615-77), typographical writer. Famous for *The Origin and Growth of Printing*, 1664, in which he tried to estab. that printing was a Crown monopoly, and endeavoured to secure the office of patentee for himself.

Atlanta, cap. city of Georgia, U.S.A., and co. seat of Fulton co., in the NW. part of the state. It is the seat of Clark College, Morehouse College, part of Emory Univ., Georgia Institute of Technology, Oglethorpe Univ., the Morris Brown College, Gammon Theological Seminary, the John Marshall Law School, the S. College of Pharmacy, A. Law School, the Woodrow Wilson College of Law, and A. div. of the Univ. of Georgia. While it has developed considerably as an important manufacturing city, it is even more important as the distributing centre for the S. Many of the great industries of the N. have depots here, and it is also a kind of insurance cap for the S. As a consequence it is a city of skyscraper office buildings. It manufs. mattresses, clothing, textiles, furniture, pencils, paint, cotton-seed oil, asphalt and foundry products, machinery, electrical goods, paper, and shoes; printing and publishing, meat packing, and car assembling are also important. It is a port of entry. Settled in 1840, it was besieged and captured by the Union troops under Gen. Sherman in the Amer. Civil War, and the business section was destroyed. Its growth at the end of the 19th cent. was rapid. With the near-lying tns, which are really its suburbs, greater A. had a total pop. of 331,314 in 1950.

Atlantes, in architecture, male figures used as columns to support cornices, architraves, etc.

Atlantic, **Battle of**, the name given to the Ger. U-boats' assault, in the Second World War, on Brit.—and later, allied—sea power and its defeat. It was a long-drawn-out battle, fought with skill and determination on both sides, and it is described in a comprehensive account issued in 1946 by the Admiralty and the Air Ministry entitled *The Battle of the Atlantic*. This account distinguishes 8 separate phases of the struggle, taking in the Indian as well as the A. Ocean. In the first phase, from the beginning of the war to June 1940, sinkings of Brit. ships were not very numerous. The sinkings were scattered off the W. approaches to the Eng. Channel and Bay of Biscay, with a few in the N. Sea, while but few U-boats were sunk. In the second phase, June 1940-Mar. 1941, things became rapidly worse; for U-boats were swiftly increasing in numbers, and Britain was very short of escort craft, while the Germans were using long-range aircraft in collaboration with submarines. The area of destruction shifted to the N.-westward of the Brit. Isles. Air escort, however, was being developed by Britain and in the third phase, up to the end of 1941, Ger. submarine losses were very great. The fourth phase (Jan.-July 1942) saw America's entry into the war, with consequently

high losses among the dense sea traffic of the Caribbean and U.S. seaboard, where full defence was yet to be organised. The whole area of Ger. submarine activity now shifted to the W. half of the A., leaving the E. half almost free. But there were sinkings in the Arctic, on the convoy route to Russia, in the S. A., and in the Indian Ocean. In the fifth phase, Aug. 1942–May 1943, the Amer. E. coast had been cleared, though there were still substantial losses in the Caribbean, the chief source of allied fuel supplies. With the allied landing in N. Africa Ger. U-boats came into the Mediterranean, where an increasing number of them were destroyed; while the development of air collaboration in convoy defence had driven U-boat A. activity out into the gap that could not be covered by air patrols from Britain, Iceland, or Newfoundland. The introduction of escort carriers, however, had an immediate effect which is obvious in the sixth phase, June–Aug. 1943: for there were now hardly any sinkings of ships in the N. A., while the approaches to the Bay of Biscay were studded with the destruction of U-boats, aircraft of Coastal Command (q.v.) taking heavy toll of the enemy as they tried to pass through to the operational bases in France. In this phase for the first time in the battle more Ger. submarines were sunk than merchant ships; the tide of battle had turned. In the seventh phase, in which Italy had surrendered, and the Mediterranean route was reopened, the N. A. was thickly studded with U-boat sinkings, while merchant vessels were sunk only in the outer oceans. But the enemy was now pinning his faith on the new devices already in preparation. The eighth and last phase began with the allied invasion of Normandy. The Germans placed great reliance on the ability of their submarines to impede the Channel crossing, but they were forestalled by the massive air offensive against them, by which the Channel approaches, through which their submarines had to pass from their bases on the Fr. A. coast to reach the place of the allied landing, were so closely patrolled by Coastal Command aircraft and escort groups co-operating with them that not a U-boat got through. See also NAVAL OPERATIONS IN SECOND WORLD WAR.

Atlantic Cable. Although a transatlantic cable was projected about 1843, the first A. C. was not laid until 1857. This broke, and further attempts in 1858 and 1865 were also unsuccessful. The first successful A. C. was laid in 1866. The first telephone cable was laid in 1956. See CABLE.

Atlantic Charter (or **Eight Points**), popular name given to a joint declaration of peace aims by Winston Churchill, Brit. Prime Minister, and President Roosevelt in Aug. 1941. The declaration opened with the general statement that the signatories 'deem it right to make known certain common principles in the national policies of our respective countries on which we base our hopes for a better future for the world' and then proceeded

to specify the principles as follows: *First*, their countries sought no aggrandisement, territorial or other; *second*, they desired to see no territorial changes that did not accord with the freely expressed wishes of the peoples concerned; *third*, they respected the right of all peoples to choose the form of gov. under which they would live; and they wished to see sovereign rights and self-gov. restored to those who had been forcibly deprived of them; *fourth*, they would endeavour, with due respect for their existing obligations, to further enjoyment by all states, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which were needed for their economic prosperity; *fifth*, they

President Roosevelt and
Winston Churchill.

desired to bring about the fullest collaboration between all nations in the economic field, with the object of securing for all improved labour standards, economic advancement, and social security; *sixth*, after the final destruction of Nazi tyranny, they hoped to see estab. a peace which would afford to all nations the means of dwelling in safety within their own boundaries, and which would afford assurance that all the men in all the lands might live out their lives in freedom from fear and want; *seventh*, such a peace should enable all men to traverse the high seas and oceans without hindrance; *eighth*, they believed all of the nations of the world, for realistic as well as spiritual reasons, must come to the abandonment of the use of force. Since no future peace could be maintained if land, sea, or air armaments continued to be employed by nations which threatened, or might threaten, aggression outside of their frontiers, they believed, pending the estab. of a wider and permanent system of general security, that the disarmament of such nations was essential.

The significance of this declaration lay in the fact that belligerent Britain and

non-belligerent America found themselves identically minded about the principles that must determine the peace and the shape and structure of the world which that peace would largely re-create. It is interesting that the A. C. contains many of the principles set out in President Wilson's Fourteen Points (q.v.) of Jan. 1918.

Atlantic City, co. seat of A. co., New Jersey, U.S.A. One of the most celebrated seaside resorts in the U.S.A., it is situated on a 10-m. sandbar 60 m. SE. of Philadelphia. Its close proximity to this city and to New York and its splendid railroad connections with the rest of the U.S.A. assure it an enormous all-the-year-round patronage. It has one of the finest bathing beaches in the world. Its boardwalk is 7 m. long. This walk, which is a very extensive promenade, is fenced on one side by the sea and on the other by many magnificent seaside hotels, some of which are of skyscraper size. A. C. has a naval air station and manufs. confectionery, paint, glassware, hosiery, furniture, and boats; it has dairy, poultry, and fruit products, and ships seafood. Pop. 61,650.

Atlantic Flights. The N. Atlantic was first flown in 1919, both by aeroplane and by airship. A gallant but unsuccessful attempt was first made in a Sopwith-Rolls-Royce plane. Harry C. Hawker, pilot, and Cdr Mackenzie Grieve, R.N., navigator, started from St John's, Newfoundland, on the evening of 18 May 1919, the proposed route being to a point on the Galway coast, a distance of 1880 m. No news reached England of the progress of this flight for a week, and it was assumed that it had ended fatally. But on 25 May a Dan. steamer, *Mary*, which had no radio, reported that she had picked up the crew of the machine, who had been in the water for about 90 min. before rescue. The plane was 1100 m. from Newfoundland and 750 from Ireland, the engine having failed through mechanical defect. Simultaneously with this attempt, 3 Amer. seaplanes, *N.C. 3*, *N.C. 4*, and *N.C. 1*, started from Trepassey Bay, Newfoundland, on 15 May at 11 p.m., the proposed route being via the Azores to Lisbon and thence to England, a distance of 3368 m. The only machine to complete the distance was *N.C. 4*, piloted by Lt.-Cdr Read, U.S. Navy, who reached the Azores at 2.25 p.m., 16 May, but remained some time there, only reaching Plymouth on 31 May. The third attempt, which proved entirely successful, was begun 14 June at 4.28 p.m. by Capt. John Alcock, pilot, and Lt. Whitten Brown, navigator, in a Vickers-Vimy machine, and the journey from St John's to Clifden, Galway, about 1880 m., was accomplished in 16 hrs 12 min., the plane landing in a bog at 8.40 a.m., 15 June. The mean speed was somewhat over 120 m.p.h. This was the first direct Atlantic crossing by an aeroplane. In the same year the Brit. airship *R. 34* made a double crossing of the Atlantic from E. Fortune (Scotland) to New York, and back to Pulham (Norfolk).

Other competitors were forthcoming for the prize of £10,000 offered by the *Daily Mail* for a transatlantic flight, but mishaps or bad weather prevented them from starting. The flight of the Amer. seaplanes which was organised by the U.S. Navy administration did not come within the conditions of the newspaper prize competition: the prize eventually went to Capt. (later Sir J.) Alcock; but it was organised with precision and was most useful as pioneer work. No other attempts were made to cross until the year 1927, when, on 20 May, Capt. (later Col.) Charles Lindbergh, an Amer. air-mail pilot, left Long Is. alone at 12.31 p.m. in his monoplane *Spirit of St Louis*, and landed at Le Bourget aerodrome near Paris at 10.22 p.m., 21 May, having crossed in a little over 33 hrs, covering about 3000 m. Just prior to this success Capt. Nungesser, the Fr. aviator, with a fellow countryman, Capt. Coll, attempted the flight from E. to W. in a Levasseur biplane, but no trace was afterwards found of them. In June 1927 2 other Americans, Mr Chamberlain, an airman, and Mr Levine, left New York in a Wright monoplane of 200 h.p. and crossing the ocean alighted at Elsieben, Germany, a distance of about 3900 m. in just over 42 hrs. These successes acted as a spur to many subsequent aspirants, but it is evident that insufficient regard was paid to the vagaries of wind and weather, for many perished. In the late summer of 1927 Col. B. Minchin, Capt. L. Hamilton, and Princess Löwenstein-Wertheim tried to cross from E. to W., but were lost. Cdr (now Rear-Adm.) Byrd (q.v.), with 4 passengers, flew from New York to Ver-sur-Mer, France, 29 June-1 July 1927, a distance of 3744 m., in 46 hrs 6 min., coming down safely near the coast after flying many hrs over France in a fog. The earliest successful E. to W. flights were those of W./Cdr Kingsford Smith, who, with companions, crossed from Portmarnock, Dublin, to Newfoundland in June 1930, and of Capt. Coste and M. Bellonte, who in Sept. of the same year flew from Le Bourget to New York. Thereafter a considerable number of men and women flew the Atlantic, both in large and even in light aircraft.

The first transatlantic flight with a full complement of passengers was made by the Boeing flying-boat of Pan-Am. Airways, the *Yankee Clipper*, which left Baltimore Harbour on 26 Mar. 1939 on a survey flight, and arrived at Horta, Azores, on 27 Mar., covering the distance of 2448 m. in 17 hrs 32 min. The flying-boat carried a crew of 11 and 10 passengers.

Negotiations for the long-projected air-mail service across the Atlantic between the U.K., U.S.A., and Canadian Govs. were completed in 1935. Trial flights were made by the U.K. flying-boat *Caledonia* in 1937 and by the *Cambria* later in the same year. This Imperial Airways boat averaged 190 m.p.h. for the whole journey, her flying time from Botwood, Newfoundland, to Foynes, Ireland, being 10 hrs 33 min. Further

experimental flights were made in 1939
See AERONAUTICS and AIR MAIL.

Atlantic Monthly, an Amer. review, founded at Boston in 1857. Its contents were somewhat similar to, though rather more purely literary than, those of its famous and older rival the *North American Review*. James Russell Lowell was its first editor, and the magazine was directed by Wm Dean Howells, 1865-81, while among the most famous 19th-cent. contributors were Longfellow, Oliver Wendell Holmes, and Whittier.

Atlantic Ocean, one of the 5 great hydrographical divs. of the world, named after either Mt Atlas or the mythical Atlantis, and, lying as it does between Europe and Africa on the E. and N. and S. America on the W., dividing the Old and New Worlds. It stretches from about 70° N. to 40° S., from the Arctic to the Antarctic Ocean, and is usually taken as being divided by the Equator into the N. Atlantic, with an area of about 14,000,000 sq. m., and the S. Atlantic, with an area of about 10,100,000 sq. m. The breadth varies from 4500 m. between the Saharan coast and Florida to 16,000 m. between the Guinea coast and Brazil. It communicates with the Baltic and Mediterranean Seas, and among the smaller seas and gulfs forming part of it are the N. Sea, the Irish Sea, the Caribbean Sea, the Bay of Biscay, the Gulf of Guinea, the Gulf of Mexico, and the Gulf of St Lawrence. Continental is. are numerous, including the Brit. Isles, the W. Indies, Newfoundland, and the Falklands; among the comparatively few oceanic is. are Iceland, the Azores, St Paul's Rocks, Ascension, Tristan da Cunha, Jan Mayen, the Bermudas, the Canaries, the Cape Verdes, Madeira, Fernando Noronha, Trinidad, and St Helena. The A. O. receives the drainage of almost all W. Europe, most of Africa, N. America E. of the Rockies, and S. America E. of the Andes, the chief riv. systems flowing into it being those of the Rhine, Loire, Tagus, Senegal, Niger, Congo, St Lawrence, Mississippi, Orinoco, Amazon, and La Plata.

The average depth of the A. O. is 1800 fathoms; the greatest depth is approximately 4600 fathoms. A low submarine ridge runs approximately down the centre from N. to S. There is a considerable E. to W. extension of this ridge between Ireland and Newfoundland, along which the chief cables have been laid, and on both sides of the main elevation are to be found the greatest depths, often between 3000 and 4000 fathoms, while the Nares Deep, N. of the Virgin Is., reaches 4561 fathoms. There are sev. large sandbanks rising to within a few fathoms of the surface, the chief of these being the Newfoundland, the Dogger, and the Agulhas Banks. The continental shelf all round the A. O. is narrow and falls away in a steep slope. The surface temp. varies from about 85° F. at the Equator to 40° F. in the N. and S. temperate regions, and the bottom water temp. averages about 35° F. The water is most salt (density over 1.0275) in

the trade-wind regions, and least in the belt of equatorial calms, always increasing in salinity below the surface.

The trade winds, which determine the course of the ocean currents, have their origin in high-pressure areas in the middle of both N. and S. Atlantics. The SE. and NE. trades produce the warm equatorial current, which divides at Cape St Roque and flows S. as the Brazil current and N. through the Caribbean Sea and Gulf of Mexico, emerging as the Gulf Stream, which has an enormous influence on the climate of NW. Europe. A cold current flows S. from the Arctic Ocean and, as the Labrador current, passes beneath the Gulf Stream off the Newfoundland Banks. The N. Atlantic current leaves a patch of central calm, between 40° and 75° W. and 20° and 35° N., which is occupied by the Sargasso Sea, in which are enormous floating banks of gulf-weed. The surface waters teem with animal and vegetable life, which decreases in mid ocean and at great depths. It is rich in edible fish, and herring and cod fishing form important industries on both the Amer. and European shores of the N. Atlantic.

The Atlantic is the great commercial highway of the world, its shores being inhabited by the most civilised nations in existence. The chief danger to navigation is the presence of floating ice, which is carried N. from the Antarctic to 38° S., and S. from the Arctic to 40° N., thus interfering with the great steamship route between England and N. America. This crossing can now be made in under 4 days, indicating the enormous progress in navigation since 1620, when the *Mayflower* took 106 days for the journey. There are now numerous transatlantic submarine cables and others along the shores connecting important ports. See *Reports on the Scientific Results of the Voyage of H.M.S. 'Challenger'*, ed. by Sir Wyville Thomson and Dr John Murray (37 vols.), 1880-9, and *Results of a Deep-Sea Sounding Expedition in the North Atlantic during the Summer of 1899*; Royal Geographical Society, *Supplementary Papers*, 1910; J. Murray and J. Hjort, *The Depths of the Ocean*, 1912; C. C. Howell, *Ocean Research and the Great Fisheries*, 1921; F. C. Bowen, *Century of Atlantic Travel, 1830-1930*, 1932; G. Schott, *Geographie des Atlantischen Ozeans*, 1942.

Atlantic Pact, see NORTH ATLANTIC TREATY and EUROPE. History.

Atlantic Passage Records. The first recorded crossing by a sailing vessel was that by Christopher Columbus who, in 1492, reached Guanahani in 70 days. The first crossing by a steamboat was made by the *Sirius* in 1838 in 19 days. The *Great Western* was the first steamboat built for a regular transatlantic service, and indeed only failed by a few hours to forestall the *Sirius*. The fastest crossings to date are those of the Amer. S.S. *United States* in 1952 (3 days 12 hrs 12 min. and 3 days 10 hrs 40 min.). Other fast crossings were *Mauretania*, 4 days 10 hrs 41 min. in 1909; *Europa*, 4 days 17 hrs 6 min. in 1930; *Bremen*, 4 days 15 hrs 56 min. in 1932; *Bremen*,

4 days 17 hrs 43 min. in 1933; *Empress of Britain*, 4 days 6 hrs 58 min. in 1934; *Normandie*, 4 days 3 hrs 2 min. in 1935; *Queen Mary*, 3 days 23 hrs 57 min. in 1936; *Normandie*, 3 days 23 hrs 2 min. in 1937; *Queen Mary*, 3 days 21 hrs 45 min. and 3 days 20 hrs 42 min. in 1938. The record crossings by the *Queen Mary* in 1938 and that of the *Normandie* in 1937 were all made from Bishop Rock to Ambrose Light—a distance of 2907 m. The *Queen Mary*'s second 1936 voyage was 2938 m. The *United States* record crossings in 1952 were from Ambrose Light to Bishop Rock, 2949 m., completed 7 July, and from Bishop Rock to Ambrose Light, 2906 m., completed 14 July. See also SHIPS and SHIPBUILDING, *The Blue Riband of the Atlantic*.

Atlantic Shipping Trust, or 'Morgan Combine,' popular expression for the International Mercantile Marine Co., organised in 1902 by Mr J. Pierpont Morgan to control the chief Brit. and Amer. N. Atlantic steamship companies. In 1902 provisional agreements were entered into for the acquisition before the end of the year of the White Star Line, the Dominion Line, and the Leyland Line (British), and the Amer. Line and Atlantic Transport Line (American), by a corporation of which the total capital stock amounted to £120,000,000. By this agreement Brit. ships were to sail with Brit. registers and have Brit. officers and crews. The combination was incorporated at Trenton, New Jersey. The Brit. Gov. also entered into agreements with Mr Morgan by which it was secured that Brit. companies in the combination should remain British. The agreements were to hold good for 20 years, and were finally ratified in 1903. In 1927, during the great post-war slump in shipping, the International Mercantile Marine Co. decided to dispose of part of their holdings. The White Star Line and the Shaw, Savill & Albion Co., together with the Aberdeen Line, were sold to the great Brit. combine headed by Lord Kylsant.

Atlantic Star, Brit. decoration to commemorate the battle of the Atlantic, designed primarily for convoys and their escorts and anti-submarine forces, as well as for fast merchant ships that sailed alone. The ribbon is blue, white, and sea-green, shaded and watered. The star is granted for 6 months' service afloat in the Navy in the Atlantic and home waters after 3 Sept. 1939, and before 8 May 1945. The Merchant Navy is awarded the star under the same conditions as the Navy, except that 6 months' service anywhere at sea qualifies, provided that one or more voyages were made in the defined area. Air crews of the R.A.F. are also eligible for the award.

Atlantic Transport Company Limited, founded in 1889, now a subsidiary of United States Lines (q.v.) The company acts as steamship operators and agents; originating from the combination of the National Steamship Co., the Wilson Line, and the Furness-Leyland Line, the company formerly owned and operated Brit. flag passenger and cargo vessels.

Atlantis, anct mythical is., supposed to lie in the Atlantic, W. of the Straits of Gibraltar, described by Plato in the *Timaeus* and the *Cratylus*, where it is stated that Solon was told of its existence by an Egyptian priest, and that it had been submerged 9000 years previously in punishment for its impety in waging war against Athens. A shoal of mud still marked its site. It has been identified with the Canaries, America, and Scandinavia, but is probably only a Gk form of the fabled Celtic Is. of the Dead, always placed in the W. Ocean.

Atlas, son of Iapetus and Clymene, one of the mythical Titans, whom he led against the gods, and was therefore condemned to stand near the Hesperides and bear the heavens on his shoulders. In another legend, he was turned into Mt. A. by Perseus with the Gorgon's head. The name is given to the highest vertebra of the spine, and to a collection of maps, having been first used in this latter sense by Mercator in the 16th cent.

Atlas Mountains, great mt system of NW. Africa, stretching N.E. from Cape Nun in Morocco to Cape Bon in Tunis. For the most part there is no continuous chain, but an irregular mass of mountainous land, including vast plateaus and highlands. They may be roughly divided into (1) the Moroccan Atlas, and (2) the Tunisian and Algerian Atlas, both containing numerous minor divs. In (1) there are 4 main chains: (a) the Great Atlas, containing the peaks of Tizi Likumpt (13,151 ft), Tizi Tamjurt (14,500 ft), and Miltain (11,430 ft); (b) the Middle Atlas, to the N. of (a); (c) the Anti-Atlas, connecting with (a) near the peak of Sebel Ayashin (12,000–14,000 ft); (d) the Jebel Bane, to the S. of (c). In (2) there are 2 main ranges: (a) the Great Atlas, containing the peak of Sheliya (7760 ft), and (b) the Little Atlas, containing the peak of Leila Khedija, the two being separated by a plateau. The A. M. are non-volcanic, and only very few summits are perpetually covered with snow. The valleys are very fertile, and the lower slopes covered with forest. The dist. is difficult of penetration, except in Algeria, where there are some excellent military roads. The geological formation of the mts is crystalline rocks and schist, with flanking of limestone. The mineral wealth is as yet practically unworked.

Atlixco, city of Mexico, 8 m. SW. of Puebla, situated at an altitude of 6000 ft in a dist. noted for grain and fruit. A. is a rail junction, and has an airfield. Pop. 17,000.

Atmolysis, method of separating gases of different densities by passing them through a porous tube or diaphragm. Let a tobacco-pipe stem be cemented into an outer glass tube so that its ends project, and let the outer tube be exhausted by an air-pump. If a slow current of air be passed through the pipe, the nitrogen diffuses through the porous clay quicker than the heavier oxygen, so that the air emerging is richer in oxygen than ordinary air. By repeating the process with the

same gas a number of times, a fairly pure supply of oxygen is obtained.

Atmometer, instrument used to determine the amount of water passing into the air by evaporation. It consists of a hollow ball of unglazed clay fitted with a narrow glass tube. The instrument is filled with water and inverted with the glass tube dipping into a mercury bath. As the water percolates through the porous clay and is evaporated into the atmosphere, the mercury rises in the glass tube, and the level of the mercury gives a rough indication of the humidity of the atmosphere.

Atmosphere, gaseous covering or envelope of the earth or any other planet, extended to mean the somewhat indefinable influence surrounding a person or thing. The earth's A. is the remainder of the collection of gaseous matter, part of which has cooled down to form the earth and sea. The gaseous constituents still unliquefied are a mixture of gases comprising about 21 per cent of oxygen, 78 per cent of nitrogen, 1 per cent of argon and other gases, and a slight trace of carbon dioxide. If the air is moist, it contains aqueous vapour to a limit of about 3 per cent. Other ingredients are found in particular localities: gaseous compounds of sulphur and nitrogen in fens, salt at the seaside; and everywhere dust composed of inorganic particles, decaying organic matter, tiny seeds and pollen from plants, and countless bacteria of all sorts.

The oxygen of the A. is breathed into the lungs of animals and enters the gills of fishes after absorption by the water, and it is constantly entering into combination with other substances by combustion or the slower processes of oxidation, as in rusting iron. The animals breathe out carbon dioxide, and combustion of carbon compounds sets free a great amount of the same gas, so that if there were no opposing influences at work the air would quickly become too much vitiated to sustain life. All plants with green colouring matter, however, are able to absorb carbon dioxide, utilising the carbon to build up their tissues, and setting free most of the oxygen to preserve the balance in the A. Carbon dioxide is also more soluble in water than oxygen, so that any greater pressure of the former gas causes increased absorption by all water surfaces, thus tending to keep the proportions constant. Nitrogen serves as a diluent for oxygen in breathing, and is converted by lightning flashes, and to some extent by certain bacteria in the roots of leguminous plants and in the soil, into compounds necessary for most forms of plant life. Argon (q.v.) is a remarkably inert gas, discovered in 1894, and is accompanied in the air by smaller quantities of similar gases, viz. helium, neon, krypton, and xenon.

The A. has no definite upper boundary and extends, in a very rarefied state, to several hundred m. above the earth's surface. Because of its weight it exerts a pressure of about 14.7 lb. on every sq. in.

of surface. Our bodies have an internal pressure which in ordinary circumstances exactly balances atmospheric pressure, and is therefore not felt by us. The heating of land and sea by the sun ultimately causes variations in pressure and, in time, weather (see METEOROLOGY).

Atmosphere, Standard, a hypothetical A. in which the relation between pressure, temp., air density, and height is given by a mathematical formula. Such specified A.s are required for aircraft design and in ballistics. In the International S. A. used for graduating aneroid altimeters the sea-level values of pressure and temp. are 760 mm. (1013.2 mb.) and 15° C. respectively, and the fall of temp. with height is 6.5° C. per km. up to 11 km., and thereafter constant at -5.65° C., but other values are used for other purposes. When the sea-level values of pressure and temp., and the rate of fall of temp. with height, are known, the pressure and density at any height can be calculated from the so-called hydrostatic equation of physics. In the real A. the variation of temp. with height is too irregular and variable to be represented by a simple formula.

Atmospheric Railway, see RAILWAYS.

Atmospherics, or Static, clicks or crackling noises in the output of a radio receiver, usually due to thunderstorms or other disturbances in the electric field of the atmosphere. The energy distribution covers the whole range of frequencies used in radio communication. The pulses are propagated as ordinary signals and conditions that favour the normal transmission also favour the occurrence of A. Similar noises are produced by interference from power lines, ignition in internal-combustion engines, and other electrical apparatus.

Atoll, type of coral is. consisting of low circular coral reefs, which form a ring of land around a central lagoon. Their origin was for long an enigma, as they rise abruptly from ocean floors of a depth far exceeding that at which the coral polyp can live. They are found in the tropical Indian and Pacific Oceans. It was formerly thought that the A.s were so shaped because they had grown upon the ruins of submerged volcanic craters. Darwin's explanation is now generally accepted. A.s, according to him, are due to the upgrowth of coral reefs over is. that have gradually subsided at a rate no greater than the upward building of the coral. Thus the A. began as a fringing reef, and then became a barrier reef as the land slowly subsided. See CORAL ISLANDS.

Atom and Atomic Theory. *Atom* (Gk *atomos*, undivided) is the name given to the smallest particle into which a chemical element can be divided. Among the ancients there were 2 theories as to the nature of matter, or substance. Some, such as Anaxagoras and Aristotle (4th cent. bc), held that matter was infinite and continuous, and that therefore any substance could theoretically be divided and subdivided to an infinite extent. Others, such as Democritus and Epicurus (5th

cent. BC), taught that matter was *grained*, that is, consisted of minute particles which could not be divided. Both theories were based on naturally slender experimental evidence. The question has its interest in the domains of chem. and physics, and different conceptions of the nature of the smallest particles of matter have arisen to explain chemical and physical phenomena.

Atomic theory. Towards the end of the 18th cent. the development of experimental chem. led to a desire for greater quantitative exactness. The theory of 'phlogiston' had been held to explain many chemical changes. In combustion, for example, the burning body gave forth 'phlogiston,' which was regarded as an element and therefore as transferable from one body to another. The effect of weighing the products of combustion was, however, to show that weight was gained and not lost. About this time Priestley discovered oxygen, and a new light was thrown on the phenomena of combustion. The idea gradually prevailed that the combined weight of the substances concerned in chemical change was not altered at any stage of the process; that is, if all the substances are weighed before the action, and all the products collected and weighed, the 2 results will be found to be equal. This was known to be true with regard to simple actions where there is no change from gas to liquid or solid, or vice versa, and other experimental evidence caused the principle of the 'Conservation of Matter' to be extended to all cases. The value of this principle has been enormous, particularly in the direction of detecting new elements.

John Dalton, in the tradition of Galileo, Descartes, Bacon, Boyle, and Newton, believed that gases consisted of particles, or 'corpuscles.' He appears to have reasoned that, as all the particles of the same substances are alike, any chemical action between 2 substances means a similar change in the individual particles of the substances concerned. The particles, therefore, must be chemically divisible, the particles of a compound into 'A.s' of the elements combined. Dalton enunciated the law of *constant proportions*, which states that when 2 elements unite to form a compound the weights that combine are in an invariable ratio, a ratio that is characteristic of that compound. When, for instance, oxygen and hydrogen combine to form water, as all oxygen A.s are of the same weight, and the weight of hydrogen A.s likewise constant, and as each molecule of the resulting water contains the same proportion of hydrogen and oxygen A.s, it follows that the weights of the quantities concerned will be proportional to the weights of the A.s. Dalton considered that a molecule of water consisted of 1 A. of hydrogen and 1 of oxygen. As it was necessary to have 8 times as much oxygen by weight as hydrogen to produce water, it was calculated that the weight of an A. of oxygen was 8 times that of an A. of hydrogen. Other

reactions, however, modified this view. For example, marsh gas consists of carbon and hydrogen. From the constitution of carbon monoxide (CO) it was found that a weight of 6 units of carbon combined with 8 units of oxygen. On the assumption that the atomic weight of oxygen was 8, hydrogen as the lightest gas being 1, the atomic weight of carbon must be 6. In forming marsh gas 6 units of carbon combine with 2 units of hydrogen. This gives CH_2 as the formula for marsh gas. It was found, however, that a quarter of the hydrogen could be replaced by half an equivalent of chlorine, giving $\text{CH}_{1\frac{1}{2}}\text{Cl}_{\frac{1}{2}}$, which is absurd. This must therefore be read as $\text{C}_2\text{H}_3\text{Cl}$, which means that the formula for marsh gas must be revised to read C_2H_4 . But if the atomic weight of carbon is 6 it always appears in organic reactions in even numbers; therefore the probability is that the atomic weight is 12. This necessitates again revising the marsh gas formula, which now reads CH_4 . Therefore from the formula CO the atomic weight of oxygen is 16. Besides, if oxygen were 8, other formulae would appear with O as an even number. Therefore formula for water = H_2O .

The above is an example of the reasoning by which the relative proportions of the A.s in molecules were arrived at, and each result helped to confirm or revise previous determinations. It was known that the same elements combined in different proportions to form different substances; carbon, for instance, forms 2 oxides, CO and CO_2 . The relations between such substances are expressed by the law of *multiple proportions*, which asserts that if 2 elements form more than 1 compound, then the weights of the 1 element which are found combined with unit weight of the other in the different compounds must be in the ratio of 2 or more whole numbers.

Shortly after Dalton's atomic theory had been enunciated, Gay-Lussac investigated the volumetric conditions of gases in combination, with the result that he discovered and pub. the law that when gases combine together they do so in vols. which bear a simple ratio to one another and to that of their product (if gaseous). In 1811 Avogadro pub. his hypothesis on the molecular constitution of gases, which asserts that under the same conditions of temp. and pressure equal vols. of all gases contain the same number of molecules whether those molecules consist of single A.s or are composed of 2 or more A.s of the same or different kinds. Both hypotheses were well supported by experimental evidence, and form in combination an interesting corollary to Dalton's atomic theory. It was found that 2 vols. of hydrogen united with 1 vol. of oxygen at the same temp. and pressure to form 2 vols. of water vapour under the same conditions of temp. and pressure. From Avogadro's hypothesis it follows that there must be the same number of molecules of water vapour as there were of hydrogen. Therefore each

molecule of water contains just as many A.s of hydrogen as a molecule of hydrogen. As the formula for water is H_2O , it follows that a molecule of hydrogen contains 2 A.s. If the molecular weight of hydrogen be taken as 2, the molecular weight of any vapour can be obtained by comparing the weight of an equal vol. of hydrogen at the same conditions of temp. and pressure. If the molecular weight of all compounds of oxygen be found in this way, and if each compound be decomposed and the weight of oxygen determined with relation to the rest of the constituents, the weight of the A.s of oxygen in the molecules of its compounds can be calculated. These weights will bear a simple relation to each other, and the least is taken as the atomic weight, for it is assumed for this purpose that an element enters into at least one compound as a single A.

In this and other ways the atomic weights of all the elements have been determined and tabulated. At first it appeared as if they would all bear a simple relation to one another, but this proved to be illusory, and many of the early atomic weights which were relied upon on account of their simplicity have been superseded by more accurate determinations. The whole mechanism of formulae and equations is based on atomic weights, so that the progress of chem. may be said to be determined largely by the atomic theory. In considering organic compounds we find no such simple procedure as in inorganic substances; some of the molecules, such as that of sucrose, $C_{12}H_{22}O_{11}$, contain a surprising number of A.s, and the molecules are credited with a certain structure in which the various A.s have characteristic tendencies and affinities. On the whole, however, it may be said that the atomic theory provides a good foundation for the theory of organic chem., and a number of interesting syntheses have been made possible through its instrumentality.

Atomic structure and atomic energy. Until near the close of the 19th cent. it was possible to regard the A.s of the various known elements as completely stable particles, and although A.s of different elements have different properties and must therefore have diverse internal structures, little or nothing was known of these. It was found, however, that certain of the heavier A.s, such as those of uranium, thorium, and radium, emit continuously certain types of radiation which came to be known as alpha, beta, and gamma rays (q.v.). Rutherford and Soddy were able to show in 1902 that such radioactive A.s are unstable and break up spontaneously to form A.s of a different chemical and physical nature, and the alpha rays themselves are found to consist merely of charged helium A.s travelling at very high speeds. By studying the collision of alpha particles with other A.s Rutherford (1911) showed that practically the whole mass of any A. is concentrated in an extremely small central nucleus bearing a charge of

positive electricity, the magnitude of the charge being characteristic of the element to which the A. belongs. It was proposed by Bohr (1913) that around the nucleus, and at relatively great distances from it, revolve a group or groups of electrons in number sufficient to counter-balance the positive nuclear charge and render the A. as a whole neutral. These ideas of structure were further developed by Bohr, Sommerfeld, and others, using quantum theory, and proved extremely fruitful in explaining the properties of different A.s, and hence of matter in bulk. A more sophisticated treatment in terms of wave mechanics has been even more successful.

Since the electrons surrounding a nucleus shield the latter from the action of other A.s the chemical and physical properties of an element are determined, in the main, by the number and grouping of the electrons, and the similarity in this respect of A.s of the same element explains why they behave in the same way in chemical reactions. Many elements, however, are found to be made up of A.s which differ from one another in that, while they possess equal nuclear charges, they have nuclei of differing masses. Such differing A.s are called isotopes. In hydrogen, 2 isotopes are found whose masses are in the ratio of 2 to 1, and these differ somewhat in their physical and chemical properties. In general, however, the percentage differences of mass of the isotopes of an element are small and it is practically impossible to separate them by taking advantage of the very slight differences of their chemical behaviour. Very minute quantities of isotopes may be separated readily from a mixture of them by allowing the A.s to pass, while electrically charged, through suitably arranged electric and magnetic fields, and considerable progress has been made in increasing the amounts so obtainable. Another method of separation makes use of the fact that, in a gas, the speed at which A.s wander from point to point, i.e. rate of diffusion, depends upon their masses.

The alpha particles from radioactive A.s are emitted at very high speeds, and Rutherford showed that if they collide directly with the nuclei of other A.s which are normally stable ones, these can sometimes be transformed into A.s of a different element. During its passage through matter, however, an alpha particle loses speed through interactions with electron groups surrounding nuclei and by 'glancing' collisions with nuclei, and as the nuclei themselves are extremely minute the usual fate of an alpha particle is for its speed to be reduced in this way to a low value before a direct collision occurs. As a result, the transmutation of an A. to one of a different type by an alpha particle collision is a very rare event. Atomic transmutation on a larger scale was produced in 1932 by Cockcroft and Walton when they bombarded lithium A.s with high-speed hydrogen nuclei and obtained helium, but the amounts of the product were still extremely small.

The natural and artificial disintegrations of atomic nuclei are not only of interest from the point of view of transmutation, but also because of the enormous amounts of energy involved. The source of the high speed of alpha particles is found in the transformation of a small fraction of the mass of the A. that disintegrates. As a deduction from his theory of relativity Einstein showed in 1905 that there is no essential difference between mass and energy, and that the transformation of a very small mass would result in the production of large quantities of energy. Since the complete transformation of 1 oz. of matter releases an amount of energy comparable with that obtained by the combustion of 100,000 tons of coal, even the small mass transformation which accompanies certain nuclear transmutations can be of immense practical importance. Until recent years, however, the release of energy in considerable amounts had not been achieved, owing to the difficulty of bombarding nuclei by particles which could not, except in rare instances, penetrate within them. Alpha particles, as well as the nuclei used in such experiments as those of Cockcroft and Walton, are positively charged and so are repelled by the positive charges of other nuclei, with the consequence that only a very small fraction of the bombarding particles approach sufficiently closely to cause nuclear changes. A much more potent bombardment would obviously occur if the bombarding particles carried no charge. In 1932 such neutral particles, called neutrons (q.v.), were shown by Chadwick to result from the bombardment of beryllium by alpha particles, and streams of neutrons produced in this and other ways were soon shown to be very efficient agents for producing nuclear changes.

The methods of obtaining streams of neutrons involve the expenditure of considerable amounts of energy, and since many neutrons are necessarily slowed down and lost by absorption in atomic nuclei, the bombardment of most substances does not result in the production of a useful balance of energy. It is found, however, that if the rare isotope of uranium known as U235 is subjected to bombardment by neutrons of a suitable speed the uranium nuclei disintegrate into 2 fragments of approximately equal mass with the simultaneous production of further neutrons and release of large amounts of energy. Since the neutrons so produced are themselves capable of causing the disruption of other uranium nuclei, the process can, in a mass of U235 of suitable size, rapidly develop and release enormous amounts of energy, as in an atomic bomb (q.v.). The size is of importance since the neutrons produced in a small mass of U235 can escape from it without colliding with nuclei, and so without producing other neutrons. By the admixture with U235 of other A.s capable of retarding and capturing neutrons the rate of release of energy can be slowed down and controlled, to be used

for industrial purposes. The more abundant isotope of uranium, U238, if bombarded with neutrons of a suitable speed, is transformed into plutonium, an element which is not found in nature. This element, like U235, has potentialities as a source of atomic energy. Apart from the immense technical difficulties of using U235 as a source of industrial power, the separation of this isotope from U238 is both expensive and difficult. To overcome this, nuclear piles or reactors have been constructed from ordinary uranium metal, which is a mixture of U238 and U235 in the proportion of 140 to 1. The

U.K. Atomic Energy Authority

WINDSCALE PILE UNDER CONSTRUCTION

uranium metal is made into cylindrical slugs, spaced to form a lattice in a matrix of another material such as graphite. This latter acts as a moderator and is not mixed homogeneously with the uranium. The moderator slows down the fast neutrons emitted in the fission of U235 atoms. Some of these slow neutrons cause fission of other U235 atoms and some are captured by U238 atoms which ultimately form plutonium. This helps to maintain the reaction whilst the U235 is used up, as plutonium and U235 have similar fission properties. The reaction can be shut down after a time and the plutonium so formed can be chemically extracted from the slugs. The moderator may be dispensed with when enough U235 or plutonium has been obtained and a chain reaction with fast neutrons started. Either U235 or plutonium may be used in a bomb or used for enriching ordinary uranium metal in slow neutron

reactors. The latter must not be allowed to run unchecked as they would probably wreck themselves. Control of reactivity can be effected by insertion of cadmium rods in the neutron reactor. They absorb neutrons and are adjusted to control the intensity of the reaction. See also NUCLEAR POWER and PHYSICAL CONSTANTS. See H. D. Smyth, *Atomic Energy*, H.M.S.O., 1945; *Statements relating to the Atomic Bomb*, H.M.S.O., 1945; P. B. Moon, *Atomic Survey*, 1946; L. Kowarski, 'Atomic Piles,' *Discovery*, vol. vii, 1946; M. Atomic Bomb. Scientific research dating from the close of the 19th cent. showed that particular types of atoms are unstable and disintegrate spontaneously to form atoms of other types, with the simultaneous release of large quantities of energy. In the period 1934-1939 a new type of atomic disintegration was found to occur when certain atoms—in particular those of uranium—were bombarded by neutrons (see ATOM AND ATOMIC THEORY). These atomic changes are known as nuclear fission. They differ from ordinary radioactive ones not only in the production of much larger amounts of energy, but also because they may, under certain circumstances, form a chain reaction. During nuclear fission other neutrons are set free, and these, by collision with atomic nuclei, generate further supplies of energy, and still more neutrons. The result of this chain reaction is that, if the mass of material is of sufficient size for more than a certain fraction of the secondary neutrons to undergo nuclear collisions before they escape into the surrounding space, an enormous amount of energy is released in a very short time, and the material acts as an immensely powerful explosive. Since sufficient neutrons are always present to initiate the chain reaction, any mass of the material greater than a certain critical one is self-detonating, whereas smaller masses, from which neutrons can escape without nuclear collision, are not explosive.

A committee was set up in Great Britain in 1940 to investigate the possible use of atomic fission in a bomb, and similar work was undertaken about the same time in the U.S.A. It soon became apparent that such a weapon was a possibility, and after the U.S.A. entered the war the scientists of the 2 countries collaborated closely in its development. Owing to the greater facilities available in America the large-scale work of production was undertaken there. Among the problems to be solved were: (a) the isolation in considerable quantities of the rare isotope of uranium, U235, which is present in ordinary uranium to the extent of 0.7 per cent

only. The commoner isotope, U238, is unsuitable; (b) the measurement of the distances neutrons travel in U235 without collision with nuclei, and of the number and speeds of neutrons set free during fission. These factors determine the critical mass, above which the bomb will be explosive; (c) the design of the bomb itself. Owing to the peculiarities of U235 as an explosive, the bomb must be carried to its destination in parts the union of which causes it to explode. If, however, the parts are brought together slowly they will be driven apart again as the reaction is initiated, and it will cease before it has proceeded far. To permit more than a negligible fraction of the available energy to be released the 2 parts of the bomb must collide at a speed comparable to that of a high velocity shell from a gun.

The solution of such problems and the production of sufficient quantities of the atomic explosive had been achieved in 1945, and 2 A. B.s were dropped on the Jap. cities of Hiroshima and Nagasaki. The enormous devastation caused, and the knowledge that they were powerless to prevent further attacks of a similar nature, were important factors in influencing Jap. leaders to sue for peace, and Japan surrendered shortly afterwards. In 1945 an Atomic Energy Research Estab. was set up at Harwell, and 2 years later Britain's first atomic pile, GLEEP (Graphite low energy experimental pile), started operating for the production of pure graphite and uranium. In 1948 the second atomic pile, BEPO (British experimental pile), started working at Harwell for the production of plutonium from irradiated uranium. In 1949 an atomic estab. was constructed in Cheshire whose purpose was the separation of U238 from the rarer U235 atoms by gaseous diffusion. In 1950 the Atomic Weapons Research Estab. was constructed in Berkshire and in 1952 Britain's first test of an atomic weapon took place at Montebello Is., Australia. A year later 2 further similar tests took place at Emu Field on the mainland of Australia. See ATOM AND ATOMIC THEORY; HYDROGEN BOMB; THERMONUCLEAR REACTIONS.

Atomic Clock, device for the calibration of standard clocks and proposed as a basis for a new standard of time, the 'physical second.' A resonant frequency of the caesium atom is detected by very high frequency radio waves, and has been found to be at 9,192,632,050 cycles per sec. by Essen and Parry (1955) at the National Physical Laboratory. This is known to 1 part in 10^9 , and is much more stable than the best quartz controlled oscillators. The accuracy is the highest ever achieved in the measurement of a physical quantity in terms of a definitive standard. See HOROLOGY; METROLOGY; PHYSICAL UNITS.

Atomic Energy, see NUCLEAR POWER.

Atomic Energy Commission, United States. Estab. by the Atomic Energy Act of 1948, the commission's purpose was to serve as a national control body, with 6 divs. of activity: research,

production, engineering, military application, reactors, and biology and medicine. There was much controversy over the question of whether the commission should be a civilian or a military organization; but when it was set up it was predominantly civilian. The 5 members were appointed by the president, with the advice and consent of the Senate. David E. Lillenthal was the first head of the commission.

Atomic Heat, capacity for heat possessed by the atoms of different elements. Dulong and Petit, by a careful determination of the specific heat of 13 of the solid elements in 1819, showed that the product of atomic weight and specific heat was constant. Its value is about 6.2 ± 0.4 calories per degree. They therefore concluded that the specific heat of the substances varies inversely with the atomic weight and proposed to adopt as the atomic weights those numbers which, multiplied by the specific heat, gave a constant product. Within certain limits of temp. the theory is true for the greater number of elements in the solid state. Thus if we take a number of grammes of an element equal numerically to the atomic weight, as, for instance, 35.5 grammes of chlorine, 12 grammes of carbon, we find that they require approximately the same amount of heat to raise their temp. 1°C . The theory has been useful in determining the atomic weight in doubtful cases.

Atomic Number, number of positive elementary charges on the nucleus, i.e. number of protons in the nucleus, and therefore the number of electrons surrounding the nucleus of a neutral atom. It is the property of the atom (q.v.) which mainly determines its spectroscopic and chemical characteristics. See NUCLEUS and ISOTOPES.

Atomic Power, see ATOMIC BOMB and NUCLEAR POWER.

Atonality, style of musical composing without conscious reference to any scale or tonic. The desire to elude a fixed tonality (key) is as old as Mozart, but the term was first applied—wrongly—to the work of Arnold Schoenberg (q.v.). The sources may be traced through the chromatic harmony of Wagner's *Tristan*. A. also came about through building up dissonances on every degree of the chromatic scale, so that each degree gains the function of a dominant. Debussy achieves atonal effects often through the use of the whole-tone scale.

Atonement, derived from the phrase 'at one,' and used to translate the Heb. *kippur* and the Gk *katalage* (which occurs only once in the N.T., at Rom. v. 11), a word which expresses the idea of a reconciliation between God and man. It implies that an otherwise amicable or benevolent relationship has been interrupted by some fault on man's part, whether the offence is purely ceremonial, or moral. The concept of A. covers all forms of ingratitude, reparation, satisfaction, expiation, and propitiation. These activities are common to all religions, and indeed to all personal relationships between man and man, as well as between man and God. The richest and most dramatic embodiment of them, in religion, is the act of sacrifice. The final and perfect A. was effected by Jesus Christ; His death and Resurrection made Him the Sacrifice that puts an end to all others. This fact was a central feature of the Apostolic preaching from the start. There was, however, no single consistent and systematic explanation given of the way in which the A. worked, what it has actually done, and how and why.

No really systematic theory of the A. in fact was produced until the time of St Anselm, who in his treatise *Cur Deus Homo?* explained the A. as necessary to satisfy the honour of God, and the offering of Christ as of sufficient value to outweigh man's sins. This is sometimes referred to as the commercial theory. In St Anselm's belief A. was necessary; but this was controverted by Abélard, who held that God could have forgiven sin without requiring equivalent satisfaction. St Bernard held to the old idea of the A. as a ransom from the devil, necessary for man's redemption, an opinion adopted by St Thomas Aquinas, admitting, however, only a conditional necessity for the A. by Christ's death. The chief teaching at the Reformation was on the substitutionary basis, holding that, to satisfy the divine justice, Christ bore a punishment equivalent to that deserved by man. Later theories were that of Socinus, teaching that the Crucifixion was an assurance of God's love and an example of obedience, and the governmental theory of Grotius, to the effect that the A. took place to further the divine gov. of the world by exhibiting God's hatred of moral evil.

See H. N. Oxenham, *The Catholic Doctrine of the Atonement* (3rd ed.), 1881; A. Ritschl, *The Christian Doctrine of Justification and Reconciliation*, trans. 1900; R. C. Moberley, *Atonement and Personality*, 1901; J. Denny, *Death of Christ*, 1903; G. B. Stevens, *Christian Doctrine of Salvation*, 1905; H. Rashdall, *The Idea of the Atonement in Christian Theology*, 1919; L. W. Grensted, *A Short History of the Doctrine of Atonement*, 1920; J. K. Mozley, *The Heart of the Gospel*, 1925; R. S. Franks, *The Atonement*, 1934; G. Aulen (W. Hebert), *Christus Victor*, 1936; L. Hodgson, *Doctrine of the Atonement*, 1951.

Atossa, Queen of Persia, daughter of Cyrus. and wife successively of Cambyases,

Smerdis the usurper, and Darius Hystaspis, to whom she bore Xerxes and 3 other sons, and whom she influenced to invade Greece. She is mentioned by Herodotus and is a prominent character in the *Persae* of Aeschylus.

Atrato, riv. of Chocó dept in W. Colombia, rising in the W. Cordilleras, at an elevation of over 10,000 ft. It flows almost due N. for 400 m. into the Gulf of Darien, forming a large but not navigable delta.

Atreabates, anct tribe of Belgic Gaul, whose cap. was Nemetacum. They formed a confederacy with the Nervii against Julius Caesar, by whom they were utterly defeated on the Sambre. A branch of them settled in Britain, in the area of the modern Berks. From their name came the modern Artois (prov. of France) and Arras.

Atrek, or **Attrek**, riv. in the N. of Persia, flows partly along the frontier, then into the S.E. corner of the Caspian Sea. It is 250 m. in length, and almost dry at the mouth during the summer.

Atreus, legendary son of Pelops and Hippodamia, and brother of Thyestes. For the murder of their step-brother Chrysippus, A. and Thyestes were forced to flee to Mycenae, where A. became king. Thyestes seduced Aërope, his brother's wife, and was driven from the country. To avenge himself he sent Pleisthenes, a son of A. by his first wife, to kill his father, but A. slew him without recognising him. It was now the turn of A. to plan vengeance. He pretended reconciliation with Thyestes, and having slain his 2 sons served them up to him at a banquet. Thyestes fled in horror. Later A., ignorant of her family, married Pelopia, the daughter of Thyestes, and adopted Aegisthus, her son by Thyestes. Agamemnon and Menelaus, the son of A. by Aërope, found Thyestes and took him to their father. Thyestes was imprisoned, and A. sent Aegisthus to kill him. But Thyestes recognised his son by the sword with which the latter intended to slay him, and having made himself known to Aegisthus, he and his son decided to kill A. They did so, and seized the throne. There are numerous variants of the story.

Atri, It. in Abruzzi e Molise (q.v.), 14 m. S.E. of Teramo (q.v.). It has a fine Gothic cathedral. Pop. 13,200.

Atria, see **ADRIA**.

Atriplex, genus of herbs and shrubs, family Chenopodiaceae, 110 species. *A. hortensis*, known as Orach, is an ann., grown as a vegetable, and substitute for spinach.

Atrium, in a Rom. house, was usually a central open court around which the various rooms were grouped, but the name seems to have been occasionally applied to the prin. room. In early basilican churches, the enclosed courtyard in front of the church is generally called the A.

Atropa, genus of Solanaceae, of two species. *A. belladonna*, deadly nightshade or Dwale, grows in thickets and hedges of Britain, and has a purple bell-shaped flower. It contains *atropine*, from which belladonna is made; the drug

is used in medicine in cases of nervous diseases, and when dropped in the eye causes a dilatation of the pupil. The berries are poisonous, as are the roots and leaves.

Atropatene, anct name of S. Azerbaijan (see **AZERBAIJAN**).

Atrophy, diminution in the size of a tissue or organ, the result of degeneration of the cells or a decrease in the size of the cells. The immediate cause of degeneration is the cessation or diminution of the supply of nutriment to the part. The opposite condition is *hypertrophy* (q.v.) when increased nutrition causes an enlargement of the tissues. A. may be due to loss of functional activity when such activity has become unnecessary, as in some embryonic appendages, the shrivelling of the ovaries after the child-bearing period, etc. It thus plays an important part in the process of evolution, procuring that a part which is no longer used gradually passes out of existence. A. occurs when the normal blood supply is obstructed by accident, disease, or deliberate constriction. Yellow A. of the liver is an acute disease of doubtful etiology. It is characterised by increasing jaundice, vomiting, the presence of a large amount of bile, with leucine and tyrosine in the urine, and is almost invariably fatal.

Atropine ($C_{17}H_{23}NO_3$), alkaloid obtained from belladonna leaves or root. It is used in medicine as a sedative and local anodyne. In large doses the drug is a powerful poison, producing hallucinations, delirium, and a marked stimulation of the heart, which ultimately becomes paralysed. It lessens secretions, especially the saliva, bronchial secretion, and gastric fluid. When dropped into the eye A. causes marked dilatation of the pupil. It is used externally to relieve neuralgia, and in small doses as an antidote to opium poisoning.

Atropos (Gk. for 'implacable'), the eldest of the Fates, cut the thread of human life, measured by Clotho and drawn out by Lachesis. In art she bears scissors, scales, or a sun-dial. See **MOIRAE**.

Attaché (Fr. 'attached'), subordinate attached to the suite or company of a commanding officer. In practice the term is restricted to military or naval A.s, who are young diplomatic officers attached to an embassy or a legation, or travelling with an ambas. to a foreign country. It is their duty to make themselves familiar in an honest fashion with the naval and military condition of the country they are in, and to report on all matters likely to be of interest and value to the home gov. In time of war there are various A.s at the H.Q. of each army. This post is then generally conceded to the envoys of those foreign powers who need representatives at the seat of war.

Attachment, legal process by which a defendant may be brought before a court by the taking of his person or his goods. The writ is issued to the sheriff. It is a process properly applicable to the offence

of contempt of court, and therefore is not necessary where the offence has been committed in open court, for the offender is then present, and can be dealt with without the necessity for A. It differs from arrest in that it can be effected on a man's goods as well as his body, and also that the person attached is kept till the day appointed and not brought before a court at once. It differs from distress in that it is not applicable to lands, but only to goods. County courts can only punish for contempt in presence of the court, and therefore cannot issue writs of A.

Attachment of debts. By the Common Law Procedure Act, 1854, and Judicature Act, 1873, a creditor, after obtaining judgment against a debtor, and after affidavit that the debt is not paid and that debts are owed to the debtor by a third party, may attach all such debts and issue execution if the third party does not dispute the debts. Wages of a servant, labourer, or workman (Wages Attachment Abolition Act, 1870), and of a seaman or apprentice (Merchant Shipping Act, 1894), are not open to A.

Foreign attachment. A legal process peculiar to the Mayor's Court in London and also in Bristol, Exeter, and Lancaster, by which a creditor may, before judgment, attach money owed to the debtor or property belonging to him in the hands of third parties. *See also* GARNISHMENT.

Attainder (Norman-Fr. *ataindre*; Lat. *attingere*, to reach, to touch upon). The erroneous derivation of the word from the Lat. *tingere*, to dye, to taint, had far-reaching consequences on the Eng. common law, giving rise, as it did, to the doctrine of corruption of blood. A. was the consequence which followed the passing of sentence of death upon a criminal, or of outlawry in capital felonies, outlawry in these cases being equivalent to a sentence of death. By the sentence the prisoner became *attainted*, that is to say he lost all power over his property, and was incapable of performing any of the duties, or enjoying any of the privileges, of a freeman. The blood of the prisoner was said to be corrupt or tainted, neither land nor titles descending to his heirs. By an Act of 1870 A. was abolished in the U.K. In Eng. hist. there have been frequent instances of A.s by express legislative enactments providing for the attainder and punishment of persons held to be guilty of offence against the peace and security of the State; they were known as Bills of A., or Bills of Pains and Penalties. The effect of such a Bill was to supersede the ordinary process of law, and although the imprisonment and execution of persons by this means were entirely legal (as coming from the source of law, Parliament), yet in both its employment and its administration it was quite arbitrary. Persons were attainted upon mere hearsay evidence, and some upon no evidence at all, without being heard in their defence. The practice of introducing Bills of A. into Parliament arose in the reign of Richard III, somewhere about

1477, and by the end of the reign of Henry VIII scarcely a year passed without persons of the highest rank being brought to the scaffold by this means. Under the Stuarts recourse was seldom had to this proceeding, but it was adopted by the Long Parliament against Strafford and Laud. The last execution to take place by means of an Act of A. was in 1697.

Attaint, writ, which formerly lay to inquire whether a jury had given a false verdict. It was first introduced by Henry II at, it is said, the instance of the Justiciar Glanville. At first it only lay on the trial of writs of assize, but it was extended gradually, and by the reign of Edward III it applied to all pleas whatsoever, whether real or personal, except writs of right, where the issue was joined on the *mere right*. If the jury on the A., who were 24 in number, found that the verdict was false, the judgment against the jury who found the false verdict was very severe. But more moderate judgment was introduced in the reigns of Henry VII and Elizabeth I. So ineffectual, however, was this proceeding that in the time of James I it gave place to the now existing practice of setting aside verdicts on motion and granting new trials. By 6 Geo. IV. c. 50, which consolidated the laws relating to juries, proceedings by way of a writ of A. were abolished.

Attalea, family Palmaceae, genus of tropical Amer. palms; *A. funifera*, Pissaba palm, yields very strong, fine fibres for ropes and brooms.

Attalla, or **Attaleia**, anct seaport on the coast of Pamphylia, near the mouth of the R. Catarrhaetes, and about 15 m. distant from Perga. It was built by Attalus II (159-138 bc) and subdued by the Romans under P. Servilius Isauricus. It is now named Adalia (q.v.). The place was visited by Paul on his first missionary journey (Acts xiv. 25).

Attalus, general under Philip II of Macedon, and uncle of Cleopatra, whom Philip espoused c. 337 bc. At the wedding he offended Alexander, son of Olympias, whom Philip had repudiated, by expressing a wish for a *legitimate* successor to the throne. After the death of Philip he opposed Alexander, but his soldiers deserted him and he was slain.

Attalus, name borne by 3 Kings of Pergamum:

1. Surnamed Soter, reigned 241-197 bc, became an ally of Rome in that city's struggle against Philip of Macedon and the Achaeans. He was wealthy, just, and wise, and a liberal patron of literature.

2. Surnamed Philadelphus, son of the foregoing, reigned 159-138 bc, succeeded his brother Kumenes II. Like his father, he was an ally of Rome and a great patron of the arts.

3. Surnamed Philometor, nephew of the foregoing, reigned 138-133 bc; by his will left Pergamum to the Rom. people. There are conflicting accounts of his life.

Attalus, Rom. senator and prefect of the city in ad 409, when he was appointed emperor by Alaric in opposition to

Honorius. He was soon afterwards deposed by the Goth, to whose successors he attached himself; but when Vallia concluded a peace with Honorius, A. was banished to Lipari after having the fingers of his right hand cut off in order to prevent him writing. He d. some years later in obscurity at Rome.

Attar of Roses, essence or oil of the red *Rosa damascena* or the pinkish *Rosa centifolia*, produced from the petals of these flowers by distillation in water stills heated either by open fire or by steam. The distillate flows from the condensers into the receivers (Florentine flasks) where the oil separates on the surface, being removed either by pipette or spoon and collected in glass bottles. The condensed rose water, which contains the major portion of the oil dissolved or in suspension, is transferred to other stills for redistillation. The yields from the first and second distillations are mixed and constitute the Rose Oil of commerce. About 3500 kilos of rose blossoms yield 1 kilo of oil. The bulk of the world production is prepared in Bulgaria, yearly about 700 kg., exported in officially sealed 1-kg. copper flasks. Small quantities are distilled in France, Turkey (Anatolian oil), Persia, Tunis. The perfume is very costly, and is in itself too strong to be at all pleasant. It is sparingly used as an ingredient in luxury perfumes, a few drops of it scenting a great quantity. It is also known as Otto of Roses.

Attempt, technical term in criminal law applied to an act done with the intent to commit a crime. In England any act which if uninterrupted and successful would have been a crime is regarded as an A., even if the accused of his own free will decides not to carry out his original intent. Attempts are generally misdemeanours, although by statute attempts to murder or commit arson are felonies.

Attention. In psychology two kinds of A. are recognised: (1) The passive, being the concentration of the consciousness upon a definite object or objects by isolating the perception from other objects. As all consciousness depends upon a certain degree of isolation, such passive A. may ultimately be regarded as the necessary condition of consciousness. (2) The active, being the voluntary act of fixing the mind upon a definite object or objects. The force of this act of volition varies with the individual, and is capable of development.

Attenuation, the relative decrease in power of a signal with increasing distance from the input. If V_1 and V_2 are the input and output voltages in a network, the A. in decibels is given by $D = 20 \log_{10} (V_1/V_2)$.

Atter, Lake, see SALZKAMMERGUT.

Atterborn, Per Daniel Amadeus (1790-1855), Swedish poet and critic, b. Åsbo. He studied at the univ. of Upsala, where he founded the Aurora League, a society for the reform of Swedish literature and the propagation of the new romantic ideals. The best known of his works are two poetic dramas, *Fädjel Blå* (incomplete)

and *Lycksalighetens Ö*, 1824-7, and the series of lyrics entitled *Blommorna*, 1812-1836, which introduced the sonnet to Sweden. His works are marred by a tendency to introduce philosophic and religious meditations and obscure allegory. In 1835 he was made prof. of literature at Upsala. See C. Santesson, *Atterborn Studier*, 1932, and H. Frykenstedt, *Atterborns Lycksalighetens Ö*, 1951.

Atterbury, Francis (1662-1732), Bishop of Rochester, distinguished as an Eng. man of letters, a bishop, and a politician, was b. at Middleton Keynes in Buckinghamshire. He was educ. at Westminster School, from which he proceeded to Christ Church, Oxford. He took holy orders in 1687, and readily swore allegiance to William III after the revolution. He won great fame as a preacher, and became in 1691 lecturer of St Bride's, chaplain to William and Mary, and minister to Bridewell Hospital. In 1698 appeared the Hon. Charles Boyle's attack on Bentley's *Dissertation on the Epistles of Phalaris*, an attack which was mainly from the pen of A., who was Boyle's tutor. He distinguished himself also by his defence of the rights of convocation against the prevailing Erastianism. In 1701 he became an archdeacon, a prebendary of Exeter Cathedral, and a D.D. In 1704 he became dean of Carlisle, in 1709 preacher at the Rolls Chapel, in 1712 dean of Christ Church, in 1713 bishop of Rochester and dean of Westminster. He was probably instrumental in the drawing up of Sacheverell's defence. He took part in the coronation of George I, but his influence was destroyed, since his leanings towards Jacobitism were known. In 1717 he held direct communication with the Pretender. In 1721 he was arrested for participation in a plot to proclaim King James, and in 1722 imprisoned in the Tower. In 1723 he was deprived of his titles and banished. He entered the service of the old Pretender and d. in France in 1732. He was buried secretly in Westminster Abbey. He numbered amongst his friends and correspondents all the great literary men of the period.

Attercliffe, formerly a township in the par. of Sheffield (q.v.), with its vil. on the R. Don, now a ward of the city. Here are the steel-works for which the city is famous. Pop. 16,450.

Attestation. Most important legal documents, especially wills and deeds (q.v.), require to have the signature of the person making the instrument attested by one or more witnesses or 'attesters.' All deeds are required by Scots law to have 2 witnesses, unless there is special statutory exemption, and in England wills and grants of land to charities must have 2 attestors. In Scotland no deed is valid if written by another than the party making the deed unless the testing clause (q.v.) is regular. One witness is necessary to a bill of sale, and to witness a warrant of attorney or a cognovit (i.e. an admission by a defendant of the justice of the whole or part of a plaintiff's claim) the signature of a solicitor is obligatory.

Atthis, genus of small humming-birds found in SW. U.S.A. and elsewhere.

Attico. In classical architecture, a low storey or stage above the main entablature, in the elevation of a building. In modern architecture, a room in the roof. Used as an adjective, the 'A. base' is found in the Ionic and Corinthian Orders, and consists of two convex toruses separated by a concave scotia, resting upon a plain square plinth.

Attic Dialect. The language of Athens was originally a subdivision of the Ionic dialect, which was one of the 8 main dialects of anct Greece. These dialects are distinguished into 4 groups: Ionic, Arcadian-Cypriote, Aeolic, and Western. When Athens became the spiritual cap. of Greece, and particularly from the early 4th cent. BC onwards, the A. D. became the lingua franca of the Ionic cities, and with the conquests of Alexander the Great it became the *koiné* of the Hellenistic world, though only by about AD 500 were all the other dialects extinct.

Attica, one of the divs. of anct Greece, of which Athens was the cap.; bounded on the N. by Boeotia, on the W. by Megaris and the Saronic Gulf, on the S. by the Aegean Sea. It was a fertile and prosperous state, and sent out many colonies. Striking features of the country are the mts of Hymettus and Laurium, the latter of which contained silver mines.

Atticism, elegant and classic phrase, characterised by brevity and intellect. Attica was the dist. round Athens, and the Attic dialect was the purest and most literary of the Gk dialects. *Attic sail* signifies a poignant and delicate wit peculiar to the refined Athenians and foreign to the blunter Romans.

Atticus, Quintus Caecilius Pomponianus (109-32 BC), Rom. *eques*, patron of letters, and financier. His original name was **Titus Pomponius**. Leaving Rome in 86, shortly before the outbreak of civil war, he settled at Athens, earning by his long residence there, and by his profound knowledge of Gk literature, the name **Atticus**. On his return to Rome in 65 he took possession of an estate bequeathed him by his uncle Q. Caecilius and assumed the name Q. Caecilius Pomponianus. He refused to take sides in the war between Caesar and Pompey, remaining on friendly terms with the leaders of both parties. A. is best known for his friendship with Cicero and ed. that section of the orator's letters called *Ad Atticum*. Believing himself to suffer from an incurable disease he starved himself to death. See also BOOKSELLING. See G. Boissier, *Cicéron et ses Amis*, 1888.

Atticus Herodes, Tiberius Claudius (c. AD 101-77), Gk rhetorician, b. Marathon. His fame as a teacher of rhetoric was equally known at Rome and at Athens. Among the more famous of his pupils were the future emperors Marcus Aurelius and L. Verus. He became consul in the year 143. He was exceedingly wealthy, and spent a great part of his riches in beautifying Athens and Corinth.

Atticus, Titus Pomponius, see ATTICUS, QUINTUS CAECILIUS POMPONIANUS.

Attidian Brethren, body of 12 priests with wide authority in Umbria. The Eugubine Tablets are the records of their acts.

Attila (the Scourge of God) (c. AD 400-453), King of the Huns, succeeded his uncle Rua or Roua with his brother Bleda in 434. He claimed for himself divine origin and descent, and the dominion of the whole world. Bleda was put to death in 445, and A. proclaimed himself King of the Barbarians from the N. Sea to the boundaries of China. He ruled over the Vandals, Ostrogoths, and Gepidae. In alliance with Genseric he invaded Moesia and defeated the forces of Theodosius II. He devastated the whole of the E. portion of the empire; the emperor was forced to pay him tribute and to cede him ter. (447), and Constantinople only saved itself by means of its impregnable fortifications. The whole of the Balkan Peninsula was at his mercy. In 450 A. prepared to invade Gaul. He laid siege to the tn of Orleans in 451, but an alliance of the Romans and Visigoths forced him to raise it and decisively defeated him at Chalons. But the victors allowed A. to retreat unhindered into Hungary. He reorganised his forces, and invaded Italy in the following year, place after place falling into his hands. He took and completely destroyed Aquileia (q.v.) in 452, after a siege of 3 months. Rome itself was only saved at huge expense—though according to one tradition A. did not attack Rome in consequence of his interview with Pope Leo the Great. In the next year he d. suddenly, possibly by poison, and with the death of A. his empire fell to pieces. See life by M. Bison, 1929, and E. A. Thompson, *A History of Attila and the Huns*, 1948.

Attis, see ATYS.

Attis, see ACCIUS.

Attie, miner's term for dirt or rubbish left over after the ore is worked. Originally a Cornish term.

Attleboro, tn of Bristol co., Massachusetts, U.S.A., 32 m. SW. of Boston. A. manufs. jewellery, silverware, and cotton goods, and has bleaching and dyeing, paper and metal specialities, optical goods, tool, and machinery industries. Pop. 23,810.

Attleborough, mrik tn in Norfolk, England, 15 m. SW. of Norwich by rail. In the 14th cent. it had a college of the Holy Cross, and its par. church contains some interesting remains. A disastrous fire destroyed much of the tn in 1559. Turkey-rearing and elder-making are carried on. Pop. 2600.

Attlee, Clement Richard, 1st Earl (1883-), statesman, b. Putney, and educ. at Haileybury and Univ. College, Oxford, where his politics were Conservative. After leaving Oxford his experiences working in an E. End of London social settlement, coupled with his reading of the works of Morris and Ruskin, converted him to Socialism. He was called to the Bar, 1905, and was secretary of Toynbee Hall, 1910. He lectured on social science, London School of Economics, 1913-23, and served in the First

World War, retiring with rank of major, 1919. Mayor of Stepney, 1919-20. He was elected M.P. (Labour) for the Limehouse div. of Stepney in 1922, retaining this seat until 1950. From 1950 to 1955 he represented W. Walthamstow. Member of India commission, 1927-30; under-secretary for war, 1924. Chancellor of Duchy of Lancaster, 1930-1; postmaster-general, 1931. In the crisis of 1931 he stayed out with Arthur Henderson, J. R. Clynes, and George Lansbury, preferring the political wilderness and his friends to the high places with Ramsay MacDonald and J. H. Thomas, and in the ensuing

Karsh, Ottawa

EARL ATTLEE

general election his group suffered a heavy defeat. However, Lansbury came back and A. became deputy leader of the parl. Labour party. He succeeded George Lansbury as leader of the Labour party, 1935. Privy councillor, 1935. A. was leader of the Opposition when the Second World War broke out and he joined Churchill's coalition Gov. in May 1940 as lord privy seal and leader of the House of Commons. From 1942 to 1943 he was dominions secretary; lord president of the council, 1943-5; and deputy prime minister, 1943-5. In the general election of 1945 A. fought on a programme of extensive social reform and nationalisation. The Labour party gained an overwhelming victory and A. became prime minister. He carried out the promises of his election programme with vigour, pursuing a foreign policy which was the logical development of his predecessor's, involving close contacts with W. Europe and the U.S.A., while attempting to maintain friendly relations with Russia, a course which became increasingly

difficult. His premiership covered a period of great economic crisis. A. showed great force of character and a drive and leadership which amazed even his closest supporters; in the past he had been thought of primarily as a capable administrator. He remained prime minister after the general election of 1950, but his party's majority had dropped considerably. At the election 18 months later the Conservatives returned to power and A. became once again leader of the Opposition. In 1955 the Conservatives retained and increased their parl. majority. In Dec. 1955 A. resigned from leadership of the parl. Labour party and from the House of Commons. He was granted an earldom, 1955, and created K.G. in 1956. Since then he has only spoken infrequently on political affairs, but has lectured, both at home and abroad, on social questions.

Attock, tn and fort of Pakistan, in the Punjab. It is situated on the l. b. of the Indus, 45 m. ESE. of Peshawar, and was founded in 1581 by the Emperor Akbar. It is an important strategic position, as here is the chief bridge over the Indus. It has been the route by which almost all the invaders of India by land—Alexander, Tamerlane, etc.—have made their approach.

Attorney, 'one substituted' (from *atourné*, *atournatus*, respectively derived from the Fr. *atourner* and the Lat. *atournare*, to substitute), signifies in its widest sense one put in the place or *turn* of another to manage his affairs. For its use in this general sense see article POWER OF ATTORNEY. In the narrower sense A., or more properly attorney-at-law, was the name given prior to the Judicature Acts, 1873-5, to those members of the legal profession who represented litigants in the courts of common law and briefed counsel on their clients' behalf. The equivalent term for those who practised in the chancery or equity courts was solicitor. Since the enactment above referred to, which extended equity to all courts, the title of solicitor is applied to both solicitors and A.s. See, therefore, article SOLICITOR. In the U.S.A. the term A. includes both barristers and solicitors.

Attorney, Letter or Power of, see POWER OF ATTORNEY.

Attorney-General. The A.-G. is the chief law officer of the Crown and chief legal adviser of the gov. He is appointed by letters patent, and his office is in many respects similar to that of the lord advocate of Scotland (q.v.), though less extensive and more clearly defined. Originally he was simply the king's attorney, and stood in the same relationship to the king as any other attorney does to his client. The additional term 'general' probably arose from the need of differentiating him from attorneys appointed to act for the Crown in particular courts, such as the attorney for the courts of wards, or the 'coroner and attorney for the king,' the official name for the master of the Crown office in the King's Bench Div. The origin of the

office is obscure, the first mention of the title being in the reign of Edward I towards the end of the 13th cent., when the holder of it is called the *attornatus regis*. Gradually the office has become one of great dignity and importance. The king's serjeant was at one time the chief officer of the Crown in criminal proceedings. A dispute between this officer and the A.-G. as to precedence was settled in 1811 by George IV, then prince regent, declaring by a special warrant that the A.-G. and the solicitor-general should have precedence over all other members of the Eng. Bar. A similar problem as to precedence between the lord advocate of Scotland and the A.-G. arose in 1834, and was decided in favour of the latter. The A.-G., like his confrère the solicitor-general, is always a member of Parliament and a member of the ministry. He is paid £10,000 a year, and receives fees for Crown business, but he has not now the right that he formerly enjoyed of engaging in private practice. Till 1912 the A.-G., though a member of the ministry, was not a member of the Cabinet or of the Privy Council, but in that year Sir Rufus Isaacs, M.P. (later Lord Chief Justice), was given a seat in the Cabinet. The duties of the A.-G. are to represent the Crown in criminal prosecutions, particularly in those heinous misdemeanours that tend to disturb or endanger the State, and in civil cases to conduct suits and prosecutions relating to public questions of professional etiquette. The duchies of Cornwall and Lancaster and the co. palatine of Durham each have their A.-G. The A.-G. of the U.S.A. Gov. differs in some respects from his Eng. prototype. The lawyer chosen for this post is always a lawyer of eminence, though not necessarily in the front rank of the Bar, political considerations having, as in England, much to do with determining the President's choice. The A.-G. exercises a general supervision over the Federal judicial departments, and more especially over the district attorneys (see STATE ATTORNEY) and those executive court officers called U.S. marshals. Further, he is a fully fledged member of the President's Cabinet, and is the regular legal advisor of the President, a function of especial importance in all those difficult questions which arise as to the constitutional limits of the executive power of the President, and the relations of Federal to state authority. In England the A.-G.'s opinions are treated as confidential, but those of the Amer. A.-G. are often pub. officially, not only in justification of any particular line of action taken by the President, but to inform the world of the view which the executive takes of its legal position and duties in any matter of moment. These opinions have a quasi-judicial authority although they are only of 'persuasive' and not 'authoritative' efficacy, inasmuch as the Federal Court can override them. See J. Bryce, *American Commonwealth*, 1890.

Attracted Disk Electrometer, see ELECTROMETER.

Attraction, condition of stress such that two bodies tend mutually to approach one another, and to resist separation. There are various kinds of A., such as the universal gravitational A. which regulates the movements of all the heavenly bodies, molecular A., electrical A., magnetic A., etc. The laws of gravitation (q.v.) were first formulated by Newton, and can be expressed in the simple formula $F = \frac{Gmm'}{r^2}$, where F is

the force of A. between two particles of masses m and m' , r their distance apart, and G the constant of gravitation.

Attrek, see ATREK.

Attribute, in painting, an A. is a conventional symbol added to identify the personage represented.

Atwood, Thomas (1765-1838), organist and composer, son of a coal merchant. He was sent by the Prince of Wales to study music in Italy, and he also visited Vienna in 1785, where he was a pupil of Mozart. On his return he became organist of St Paul's, and composer to the Chapel Royal.

Atur, Aturis, or Aturus, see ANOUR.

Atwood, George (1746-1807), mathematician and physicist, was b. in London. He was educ. at Trinity College, Cambridge, and having graduated with high honours was elected a fellow of the Royal Society in 1776. He wrote various papers for *Philosophical Transactions*, and among his other works may be named his *Treatise on the Rectilinear Motion and Rotation of Bodies, with a Description of Original Experiments Relative to the Subject*, 1784, which described the apparatus known as A.'s machine, to demonstrate the laws regulating falling bodies.

Atwood's Machine, apparatus designed to study the motion of a falling body. It consists essentially of a wheel over which 2 masses are suspended, weighing respectively, say, 49½ grammes and 50½ grammes. The total mass is therefore 100 grammes, and the force acting upon the machine is due to the excess in weight of one body over the other, that is, 1 gramme-weight. Let this gramme be a piece of wire which can be removed by a plug on one of the supports of the wheel. A pendulum is provided which regulates a timepiece. The heavier weight is supported by a plate which can be dropped as the pendulum ticks. The position of the ring is adjusted so that the weight takes exactly 1 sec. to reach it, which can be arranged after some trial by making the click of the wire on the ring and the tick of the pendulum coincide. The weight, relieved of the wire, still travels downwards until it is stopped by a plate arranged as before to catch it at the end of 1 sec. This plate will be found to be about 9.81 centimetres below the ring. That is to say, the weight of 1 gramme, acting for 1 sec., has imparted to the whole mass of 100 grammes a velocity of 9.81 centimetres per sec. This additional velocity is a measure of the acceleration due to gravity. The

force due to gravity acting on 1 gramme may be measured in dynes by multiplying the total mass by its acceleration, thus: $F = ma = 100 \times 9.81 = 981$ dynes. Many other experiments can be carried out with A.'s M., which are explained in text books on dynamics. See M. Davidson, *Introduction to Dynamics*, 1949.

Atya, name give by Leach to a genus of long-tailed decapodous crustacea. They have forceps ending in 4 claws; these are cleft as far as the base and thus appear to be composed of 2 fingers, or lashes, which are joined at their origin.

Atys, or **Attis**, deity of vegetation originally worshipped in Phrygia, consort of Cybele. His death, according to a widely accepted version, from the wound of a wild boar, was annually mourned, and his resurrection was celebrated by the priests of his cult.

Aubagne, Fr. tn in the dept of Bouches-du-Rhône, on the Huveaune. It has jade and pottery industries, and is an important market (pigs, fruit). Pop. 6600.

Aubaine, anct Fr. right by which the property belonging to strangers (not naturalised) or to Frenchmen who left their country became on their decease the property of the lord of the dist. or of the king. It was abolished in 1819.

Aubanel, **Théodore** (1829-86), Fr. author, b. Avignon. In collaboration with Mistral and Roumanille he devoted himself to the work of reviving and carrying on the native Provençal dialect and literature. He kept up, however, his family trade of printing and editing. His best-known poem is *La Miougrano entreduberto*, 1860. One play of his, *Lou pan dou pecat*, 1878, was acted in Provençal and in French.

Aube, dept of NE. France, bounded N. by Marne, NW. by Seine-et-Marne, W. by Yonne, S. by Yonne and Côte-d'Or, and E. by Haute-Marne. It is formed of the S. part of the old prov. of Champagne and part of Burgundy. Its E. part is watered by the A. and its W. by the Seine, to the basin of which the dept belongs. The climate is moist and mild, and the chief industry is agriculture. The NE. is chiefly pastoral, but the SW. is fertile, and here wheat, oats, vegetables, etc., are extensively cultivated. Chalk, potter's clay, building-stone, and limestone are among the minerals, while cotton-spinning and weaving are the chief industries. Prin. exports, timber, cereals, wine. Troyes (the cap.), Bar-sur-Aube, Nogent-sur-Seine, Arcis-sur-Aube, Romilly-sur-Seine (qq.v.) are the prin. tns. Area 2326 sq. m.; pop. 235,000.

Aube, trib. of the Upper Seine, rises in plateau of Langres. Length 150 m.

Auber, **Daniel François Esprit** (1782-1871), Fr. composer of operas, b. Caen in Normandy. His father, a print-seller, sent him to London to acquire a knowledge of business methods, but the young man was already deeply imbued with a passion for music, to indulge which he returned to Paris in 1804. After producing 4 concertos for the violoncello and 1 for the violin he reser the comic opera *L'Erreur d'un moment*. Intending

to study music seriously, he now put himself under the tuition of Cherubini, and after writing a mass, part of which he later utilised in *La Muette de Portici*, he produced a one-act opera, *Le Séjour militaire*, 1813, which failed miserably. This failure led him to write nothing more until he was compelled by the death of his father in 1819 to make music his means of livelihood. After a half-success in *Les Testaments et les billets-doux*, he scored a brilliant success in 1820 with *La Bergère châteline*. In 1822 he began his association with E. Scribe, the libretto-writer, and the two began a series of popular and successful productions, among which may be named *Le Maçon*, 1825, *Fra Diavolo*, 1830, *Le Cheval de bronze*, 1835, *Le Domino noir*, 1837, *Les Diamants de la couronne*, 1841, *La Part du Diable*, 1843, and *Manon Lescaut* (after Prévost), 1856. *La Muette de Portici* (*Masanillo*), 1828, is a landmark in operatic advance and *Gustave III*, 1833, is an earlier treatment of the subject of Verdi's *Un ballo in maschera*.

Aubergine, or **Egg Plant**, fruit o *Solanum melongena* var. *ovigerum* and var. *esculentum*, of Africa and S. Asia; grown under glass in Britain for its egg-shaped edible fruits. Also known as Bringall, Jew's Apple, Mad Apple.

Aubervilliers, Fr. tn in the dept of Seine, on the St-Denis canal. It is a NE. suburb of Paris. Formerly there was a pilgrimage in honour of Notre-Dame-des-Vertus. There are oil refineries and numerous chemical manufs. Pop. 52,800.

Aubignac, **François Hédelin**, **Abbé d'** (1604-76), Fr. author and critic, b. Paris. He was tutor to the nephew of Richelieu, who conferred on him the abbey of A. His best-known work is a tragedy, *Zénobie*, 1647, written in prose as an exemplification of critical rules, and he later arranged these in his *Pratique du théâtre* (4 vols.), 1657. He was the first to throw doubts on the existence of Homer.

Aubigné, **Françoise d'**, see MAINTENON.

Aubigné, **Jean Henri Merle d'** (1794-1872), Swiss historian of the Reformation, b. Eaux-Vives, Geneva. He studied there and at Berlin until, in 1818, he became pastor of the Fr. Protestant church at Hamburg. Five years later he removed to Brussels, where he was appointed court preacher. In 1830 he returned to Geneva and became prof. of church hist. in the newly founded theological school there. He visited England on sev. occasions, where he was warmly welcomed, the univ. of Oxford conferring the D.C.L. degree on him. His best-known work is *Histoire de la Réformation au XVI^e siècle*, 1835-53.

Aubigné, **Théodore Agrippa d'** (1552-1630), Fr. soldier and scholar, b. Pons in Saintonge. He early showed a remarkable talent for languages, especially for the classics, but his attachment to the Huguenot cause made him spend the early part of his life in the military profession. He rendered good service to Henry of Navarre, whom he later criticised with freedom and candour. After

Henry's assassination he retired to Geneva and resumed his literary studies. His best-known work is his *Histoire universelle*, 1560-1601, 1616-19, which for its indulgence in satire was officially burnt in France. His poems, *Les Tragiques*, 1577-1616, are full of emotional force and religious zeal, and undoubtedly rank with the great Fr. poems. See J. Plattard, *A. d'Aubigné*, 1935.

Aubin, Fr. tn in the dept of Aveyron, on the Enne. It is in a coal and iron mining dist. Pop. 4600.

Aubonne, Baron d', see TAVERNIER.

Aubrey, John (1626-97), antiquary, b. Easton Percy in Wilts, and educ. at Malnesbury Grammar School, under Robert Latimer. In 1642 he entered Trinity College, Oxford, and in 1646 became a student of the Middle Temple, though he was never called to the Bar. Only one of his works, the *Miscellanies*, was pub. in his lifetime (1696), but he left a large mass of material which was ed. by others. His *Lives of Eminent Men*, given to Anthony a Wood as material for his *Athenae Oxonienses*, appeared in 1813, and his *Remains of Gentilisme and Judaïsme* in 1881. His *Natural History and Antiquities of the County of Surrey* had already appeared in 1719. The *Miscellanies* (stories about dreams, ghosts, and visions) are full of interesting chatter, but A.'s extreme credulity and his appetite for folklore and gossip sometimes make them unreliable. His valuable and entertaining *Brief Lives of Contemporaries between 1669 and 1696* was ed. in 1898 by Andrew Clark from the MSS. in the Bodleian.

Aubriet, Claude, Fr. artist, b. Châlons-sur-Marne c. 1655. He succeeded Jean Joubert in 1700 as painter for the Jardin du Roi. He is noted for his beautiful illustrations of natural hist. on vellum, and many of his works are preserved in the National Library.

Aubrieta, family Cruciferae, genus of trailing evergreen plants, of which *A. deltoidea* and varieties are most commonly grown under the popular name of Aubrietia.

Aubry de la Boucharderie, Count Claude Charles (1773-1813), general of artillery, was b. at Bourg. He fought in several campaigns, of which the chief was the expedition to Moscow, during which he constructed the famous bridge over the Beresina. He was slain at Leipzig in 1813.

Aubry de Montdidier (fl. c. 1370), nobleman at the court of Charles V of France, assassinated in 1371, it is said, by his companion Richard Macaire. A.'s dog afterwards showed the most determined animosity to Macaire, and the king, his suspicious being roused, ordered a combat between the two. The dog, says the popular story, was the victor, and Macaire, having confessed to the murder, d. on the scaffold. The story is almost certainly legendary, since similar versions occur at a much earlier date, one in Plutarch.

Auburn: 1. Co. seat of Cayuga co., New York, U.S.A., situated at the N. end

of Owasco Lake; has manufs. of wool, silk, car accessories, plastics, textiles, surgical instruments, chemicals, boots, paper, etc., and also makes agric. machinery on a large scale. There is a state prison here, founded in 1816, which accommodates over 1000 prisoners. Pop. 36,720.

2. Co. seat of Androscoggin co., Maine, U.S.A.; it manufs. boots and shoes, and has canneries. Pop. 23,134.

Auburn, or Lissoy, vill. of co. Westmeath, Rep. of I., 6 m. NE. of Athlone, is Goldsmith's boyhood home, and the 'Sweet Auburn' of *The Deserted Village*.

Aubusson, Pierre d' (1423-1503), grand master of the order of St John of Jerusalem. He served under the Emperor Sigismund and the Dauphin, afterwards Louis XI. He joined the order of the Knights at Rhodes, was signally successful against the pirates of the Levant, and successfully resisted Mohammed's siege of Rhodes in 1480. He perfidiously kept captive Jem, one of the brothers claiming Mohammed's throne, until the other brother, Bayezid, was successful, when he handed Jem over to Pope Innocent VIII in 1489. He was rewarded by being made a cardinal.

Aubusson, Fr. tn, cap. of an arron., in the dept of Creuse, in the gorge of the R. Creuse. It is celebrated for its carpets and tapestry, and has a small metal industry. Pop. 5000.

Aucaners, see NETHERLANDS GUIANA. 'Aucassin et Nicolette,' medieval romance (Arabic in origin and Provençal in setting), in mixed prose and verse, of the 13th cent. It resembles the story of the much more popular *Floire et Blanchefleur*. A. was the son of the count of Beaucaire; N., though looked upon as a slave, was in reality the daughter of the King of Carthage. In a simple and touching narrative the story of their vicissitudes, their long separation, and their final happiness is realistically told. Sedaine wrote the libretto for an opera by Grétry, which was first performed in 1779. Other composers, including Enna, the Dane, have set versions of the story. See *Aucassin and Nicolette* (Everyman's Library).

Auch (Rom. Augusta Auscorum), Fr. tn, cap. of the dept of Gers, on the Gers. It was the ant. cap. of Gascony, and of Armagnac (qq.v.). It is the seat of an archbishop, and has one of the finest Gothic cathedrals in France. It has textile manufs., and a trade in brandy, horses, and poultry. Pop. 11,500.

Auchel, Fr. tn in the dept of Pas-de-Calais. It has coal-mines and brickworks. Pop. 10,600.

Auchenia (Gk. *auchēn*, neck), scientific name of the llama (q.v.), a ruminant of the family Camelidae and order Ungulata. It is smaller than the camel, has woolly hair, no hump, and is very vicious.

Auchinleck, Sir Claude John Eyre (1884-), soldier, b. Ulster, son of Col. John Claude A., R.A., educ. at Wellington College. Served in Egypt, 1914-15, and elsewhere in the Middle E. during the First

World War. Mohmand operations, 1935. Deputy Chief of General Staff Army H.Q., India, 1936-8. G.O.C. Southern Command, 1940. Earned the reputation of an expert in mountain warfare before the outbreak of the Second World War. Was Commander-in-Chief in India in the early part of the war; in July 1941, when Gen. (later F.M.) Wavell relinquished the chief command in the Middle E., A. succeeded to that command, and at a time when the Brit. forces were still inadequately equipped. On 18 Nov. 1941 A. launched a new offensive. It snatched victory at Sidi Rezegh, relieved Tobruk, and, on 24 Dec., recaptured Benghazi; but it failed before the lines at El Agheila, and a Ger. counter-offensive threw it back to Gazala in the middle of Cyrenaica. After some months' quiescence, Rommel (q.v.) attacked; Tobruk fell, and the Brit. retreat continued to El Alamein, when Gen. (later F.M.) Montgomery succeeded A. A. then became Commander-in-Chief in India for the second time, and it is probable that his greatest service in the course of the war was that he rendered in India when the whole responsibility for the administrative background to the campaign in Burma lay upon him. He won the confidence of the Indian Army, and his flair for the political work which fell to him made him equally successful in council. Promoted to field marshal, 1 June 1946. Commander of the combined force operating in the Punjab, 1947. Retired soon after the declaration of Indian independence.

Auchinleck, tn in Ayrshire, Scotland, 15 m. E. of Ayr. In the par. is A. House, the seat of the Boswell family. Pop. (tn and par.) 6800.

Auchterarder, royal burgh (c. 1200) in Perthshire, Scotland, 14 m. SW. of Perth. It was the opposition to the presbiter to the church of A., in 1839, which began the contest leading to the formation of the Free Church of Scotland. A. manufs. tweeds and tartans, angora wool, and cashmere. Pop. 3100.

Auchtermuchty, royal and police burgh of Fifeshire, Scotland, 9 m. from Cupar, and native tn of John Glas, founder of the sect of the Glasites in 1725. Iron-founding, beam and scale manuf., and hosiery-making are carried on. Pop. 1350.

Auckland, George Eden, 1st Earl of (1784-1849), Brit. statesman, son of the first Baron A. In 1835 he was made Governor-General of India. The successful beginning of the Afghan war, 1838-9, won him his earldom.

Auckland, William Eden, 1st Baron (1744-1814), statesman, educ. at Eton and Christ Church, Oxford. He was chief secretary to the Irish viceroy, and in charge of a commission which treated with the Irish insurgents. As minister plenipotentiary to France he concluded a commercial treaty in 1786, and was afterwards ambas. to Spain and Holland, and postmaster-general. He was created Baron A. in 1789.

Auckland, name of a prov. dist. of New Zealand and also of the chief tn of that

dist. 1. A. prov. dist. (area 25,400 sq. m.) includes practically half of the N. Is., being 400 m. long and 200 m. wide at its greatest breadth. The heavily indented N. peninsula was the site of the earliest mission settlements and the cradle of civilisation in New Zealand. Christened by enthusiasts 'the winterless north', its almost sub-tropical climate has attracted many Brit. settlers after service in tropical countries. The Waikato area to the S. of A. city includes some of the world's finest grasslands and is a prin. centre of the country's dairy industry. Soils in the prov. dist. range from a light volcanic loam to a stiff yellow clay. Great progress has been made in bringing into production, by the introduction of cobalt and other means, the pumice-lands in the Rotorua area. Minerals found in the prov. dist. include coal, gold, copper, tin, and iron, and an oil survey is proceeding. The kauri pine, of which the fossil gum is exported, once fl., but only remnants of the great kauri forests now remain, notably in the Waipoua National Reserve. The thermal wonderland of the S. part of the prov. dist. is world-famous and Lake Taupo in the centre of the N. Is. is renowned for its trout-fishing. Pop. of prov. dist., about 850,000.

2. The city of A., on the E. coast, lies in lat. 36° 51' S. and long. 174° 45' E., having mean temps. (summer) 65·2, (autumn) 60·5, (winter) 52·2, and (spring) 57·1; mean annual rainfall is 43·09 in. A. was founded in 1840 by the first governor, Capt. Wm Hobson. It remained the cap. of New Zealand until 1865. It has splendid wharves and graving docks on Waitemata Harbour, and a second harbour in Manukau on the W. coast, only 6 m. distant. It has an international airport, with Tasman Empire Airways and other services linking New Zealand with the rest of the world. A bridge is being built across the harbour. The value of exports from the port of A. in 1953 was £85 million, some £40 million more than from the next largest port, Wellington. Imports were valued at £67 million in the same year, about £8 million more than Wellington's total.

The city, fortunate in its benefactors, has some fine libraries, art collections, parks, and homes for crippled children and the blind. The War Memorial Museum is one of the best in the S. hemisphere. A. Univ. College, a constituent college of the univ. of New Zealand, is centrally sited. A.'s main industries include sugar refining, ship and boat building, ammunition manufacturing, fruit canning, freezing works, boot and shoe factories, breweries, pottery, brick, tile, and varnish works. Pop. of urb. area, 380,412.

Auckland Isles, group of is. situated 180 m. S. of New Zealand, were discovered by the whaler *Bristow* in 1806. Enderby, Adams, and Auckland are the chief is. They are valuable as whaling stations, but have no settled inhab.

Auction, method employed for the sale of property, which derives its name from the Lat. *auccio*, an increase, because the

property was publicly sold to him who would offer most for it. The usual form of A. is to offer the property at a low figure, and by the competition of the various bidders, each offering a little more than the predecessor, to raise the price to that point beyond which the bidders refuse to go. The goods are then 'knocked down' to the highest bidder. The Dutch A., originating, as its name indicates, in Holland, is the reverse of this, and is a method generally employed by the cheap-jack. The property is offered at a higher price than is likely to be paid for it, and the price is gradually lowered till somebody bids for it. The first person to bid gets the property. The mere offer of a bid does not bind the bidder until the auctioneer brings down his hammer, which is the equivalent of accepting it. Until such time a bidder may, if he chooses, withdraw his bid. It has been laid down that the buyer of goods at an A. is not bound to perform his contract if he was the only bona fide bidder at the sale, and if public notice was not given of the intention of the vendor to bid. This applies even though his agent was authorised to bid only to a certain sum. This rule is to protect purchasers against the practice of employing persons to make mock biddings with a view to raising the price by their apparent competition. The acceptance of a bid is generally indicated by the auctioneer striking his rostrum with a small hammer (wooden), but sometimes lighted candles are employed to measure the time during which bids will be entertained. The length of candle generally employed is 1 in., and the last bidder before the light expires is the purchaser. Yet another method employed is the running out of sand in the sandglass. Formerly excise duties were payable on sales by A., being first imposed during the Amer. war of Independence, in 1777. As much as \$329,000 was raised by this means in one year, but in 1845 the duty was repealed. In 1927 Parliament, feeling the need for further control of A.s, passed the Auctions (Bidding Agreements) Act, 1927. This was directed against the evil of the 'knock-out'; in other words, the prior agreement between a ring of possible bidders that one only of their number should make a bid and that the advantage gained by this course of action should be shared by the members of the ring. The Act directs that, under penalty of £20 for non-compliance, the name and address of the auctioneer, together with a copy of the Act, shall be exhibited before and during the sale.

Auctioneer's powers and duties. The auctioneer's duty is previously to the commencement of every sale to intimate to intending purchasers the conditions under which the sale takes place, but for the purposes of the Act it is considered sufficient if these conditions are posted up in the A. room. Every auctioneer is required by the Auctioneers' Act, 1845, to take out an ann. licence, which expires on 5 July, and for which £10 is paid, but the same statute specifically exempts

certain sales. Such sales include goods sold under a distress for rent when the amount does not exceed £20. In such cases the sale may be conducted by the bailiffs without a licence. The penalty for selling goods by A. without a licence is £100, but the lack of a licence does not render such a sale nugatory. The ordinary licence entitles the holder to act as an appraiser also, but for the sale of dutiable goods an additional licence is required. An auctioneer has certain statutory exemptions and liabilities. Thus he is held responsible for the safe custody of goods entrusted to him for sale, and he is liable to an action for selling goods to which the person who employs him has no title, though in this matter he is afforded some relief by the Factors Act. He is debarred from purchasing for himself the property he exposes for sale. On the other hand, the auctioneer himself has power to sue the bidder for fulfilment of contract, and has a lien on the vendor's goods for his commission and expenses. If the vendor sells the goods by private sale after the auctioneer has unsuccessfully exposed them for sale, then the auctioneer is entitled to a commission as if he himself had sold them. He is also not liable to the vendor for the price bid for the goods until he has received it. The number of licensed auctioneers in the U.K. exceeds 8000, about three-quarters of whom are members of the Auctioneers' and Estate Agents' Institute, London. The institute, which watches carefully all legislation affecting its members, was founded in 1886.

Auction Bridge developed from bridge and became popular about the year 1911. The prin. innovation was the introduction of competitive bidding. At bridge (q.v.) only the dealer or his partner had the privilege of determining whether the hand should be played in a trump suit or at no trumps; in A. B. the final declaration was put to auction between the four players. The dealer either bid or passed, thus opening the auction; each player in succession to the left then called until the final call determined the contract, which could be doubled by the opposing side and re-doubled by declarer or his partner. On the completion of the auction, the player who originated the contract played his own and his partner's hand (dummy).

Various modifications in scoring were introduced between 1911 and 1929. The advantage of playing at no trumps owing to its higher score led to a change in the valuation of the suits, clubs counting 6, diamonds 7, hearts 8, spades 9, and no trumps 10. A further step towards levelling the suit values was the introduction of 'majority calling' which was later adopted in Contract Bridge. By this law the number of tricks contracted for, irrespective of the suit, and not their value, decided the higher bid. All points scored in fulfilment of a contract counted towards game; failure involved penalties scored by the opponents 'above the line,' which were graded in proportion to the declarer's degree of success. Thirty points constituted game and 250 points

were added for the rubber. *See also* CONTRACT BRIDGE.

Aucuba, genus of Cornaceae, a dioecious plant native to Asia. *A. japonica*, the Japan laurel, is cultivated in Britain as a hardy evergreen shrub.

Aude, dept. of S. France formed from part of the anct prov. of Languedoc. It is bounded on the E. by the Mediterranean. In the S. the spurs of the Pyrenees reach 4037 ft in the Pech de Bugarach, while the offsets of the Cévennes in the N. reach 4018 ft. The greater part of the dept. lies in the valley of the lower A. The wine-producing dist. of the Narbonne in the E. is bordered by a flat, sandy coastal belt in which are sev. lagoons, rich in fish. Cereals, olives, almonds, and vegetables are produced, livestock is raised, and there are splendid vineyards. Iron, lead, cobalt, and arsenic are mined, and there are textile, foodstuff, and hydro-electric industries. There are sev. spas. The prin. tns are Carcassonne (the cap.), Limoux, and Narbonne (qq.v.). Area 2448 sq. m.; pop. 268,250.

Audebert, Jean Baptiste (1759-1800), Fr. artist and naturalist, b. Rochefort and studied at Paris. Having attained a reputation as a painter of miniatures, he turned his attention to natural hist., and in 1800 produced a hist. of the apes beautifully illustrated in colour. Two other works, on the humming-birds and the birds of paradise, the latter left unfinished, were pub. after his death. He was the originator of the method of using gold-leaf to depict the plumage of birds. *See* his *Oiseaux dorés ou à reflets métalliques*.

Auden, Wystan Hugh (1907-), poet, b. York, son of a doctor. Educ. at Gresham's School and Christ Church, Oxford, he was a schoolmaster in this country for a short time. His first pub. work, *Poems*, 1930, was followed by *The Orators*, 1932, *The Dance of Death*, 1933, and *Look, Stranger*, 1936. Though not a Communist, he became the leader of a new school of Leftist poets who were prominent in the decade before the Second World War, and whose work shows the influence of T. S. Eliot (q.v.). In 1937 he served as a stretcher-bearer in the Sp. Civil War, wrote a poem, *Spain*, and was awarded the king's medal for poetry. He was co-editor of an anthology, *The Poet's Tongue*, 1935, based on the principle that poetry is 'memorable speech,' and editor of the *Oxford Book of Light Verse*, 1938. He married Erika Mann, daughter of the Ger. novelist, and in 1938 moved to the United States, adopted Amer. citizenship, and taught in a number of Amer. colleges and univs. In 1956 he was elected prof. of poetry at Oxford. His later vols. of verse include *Another Time*, 1940, *New Year Letter*, 1941, *For the Time Being*, 1945, *Nones*, 1952, and *The Shield of Achilles*, 1955; in collaboration with Christopher Isherwood (q.v.) he wrote three verse plays, *The Dog Beneath the Skin*, 1935, *The Ascent of F6*, 1936, and *On the Frontier*, 1938. Though often very close to conversational

speech, A.'s poetry does not always escape the obscurity common among poets of his period. His work is difficult to assess because he has no definite style, but his influence on contemporary writers was considerable. *See* F. Searle, *Auden and After*, 1942, and *W. H. Auden*, 1949.

Audenarde, *see* OUDENARDE.

Audenshaw, tn of Lancs, England, 4 m. E. of Manchester. Pop. 13,000.

Audhumla (Audumbia), the cow made by Surt, whose milk fed the first created being, the giant Ymir (q.v.), and his race in Scandinavian mythology.

Audians, or **Audeans**, sect of heretics founded by Audius or Audeus (4th cent.). He attacked the clergy and the gov. of the Church, and when he assumed the episcopal office was banished by Constantius to Scythia. The opinions and practices of Audius and his followers were: the celebration of Easter after the usage of the Jews; the admission of all persons indiscriminately to the Lord's Supper; the doctrine of the eternity of fire, water, and darkness, and especially that of anthropomorphism, or the resemblance of the Deity to the human form.

Audincourt, Fr. tn in the dept of Doubs, on the Doubs. It has an iron-works, and manufs. machinery and textiles. Pop. 8700.

Audiometer, adaptation of the telephone designed to measure the acuteness of hearing.

Audio-typist. With the extensive introduction into offices of recording machines into which letters are dictated and subsequently transcribed by a typist it has become necessary to make a distinction between typists carrying out this type of work and those who copy from manuscript (copy typist) or transcribe from shorthand (shorthand typist or stenographer). Because transcription from recording machines is done direct from the spoken word through headphones connected to the machine the typist is called an A. *See also* DICTATING MACHINES.

Audiphone, instrument for transmitting sound vibrations to the bones of the head. It consists of a plate of thin vulcanite, bent and kept by strings under a certain degree of tension. The edge is placed in contact with the front teeth, by which means sound is rendered audible to those whose auditory ossicles fail in their functions.

Audit Ale, strong ale brewed for use at Oxford and Cambridge colleges on A. day.

Audita Querela, form of action allowed to a defendant, against whom judgment has been entered and is about to be enforced, which enables him to obtain a stay of execution, if he can show that some matter has occurred since judgment which amounts to a discharge. In some of the states of the U.S.A. it has been superseded by the granting of summary relief upon motions.

Auditor, person appointed to examine the accounts of the State, a public body or corporation, a company, or of a private person, and to certify that they are correct and properly kept. The duties of an A. are those of an accountant, and are in all

cases of importance performed by a professional accountant. All payments and receipts must be proved by vouchers, but A.s must also certify to the accuracy of balance sheets and of the statements as to revenue, etc. (See ACCOUNTANT.) In the Companies Act, 1900, incorporated in the Act of 1908, strict provisions are made for the appointment and remuneration of A.s, and their rights and duties are clearly laid down. The latest provisions are embodied in the Companies Act, 1948. Before 1900 regulations as to the audit of company accounts were left to the articles of association, except in the case of joint-stock banks. The Society of Accountants and A.s was incorporated in 1885. In the Brit. civil service the exchequer and audit dept plays an important part. The comptroller and A.-general in 1866 replaced the comptroller-general of the exchequer and the commissioners for auditing the public accounts. As comptroller he authorises issues from the exchequer in accordance with accounts that have received parl. sanction, and authorises borrowings to meet deficiencies; he examines the daily accounts furnished by the Bank of England as to the payments paid to the exchequer account; as A.-general he ascertains whether money expended has been applied to the purpose for which it was granted, and generally verifies the public accounts and reports to Parliament (see also LOCAL GOVERNMENT, AUDIT OF ACCOUNTS OF). In the U.S.A. the federal and state gov.s., together with the municipalities, have their accounts submitted to public A.s. The accounts of the Federal Gov. are audited by a comptroller-general, who is the chief official of the general accounting office. The comptroller-general operates through an audit div., which is quite independent of the executive gov., being solely responsible to Congress direct. With the exception of the accounts of the post office, which are audited by their own A.s, the post office div. (co-ordinated with the audit div.), all the central gov.'s accounts are submitted to the comptroller-general's dept. The Fr. public audit dept is styled *Cour des Comptes*; the Ger. *Rechnungshof*. In Scotland an A. of the court is equivalent to the Eng. taxing-master. See also COMPANY AND COMPANY LAW.

Auditory Nerves, special nerves connected with the sense of hearing. They rise from the *medulla oblongata* as the eighth pair, or, according to some anatomists, the *portio mollis* as the seventh pair, of cranial nerves, and pass downward to the ear. See BRAIN AND EAR.

Audley, Sir James (d. 1386). Eng. soldier, one of the original knights of the order of the Garter, founded in 1344 by Edward III. He greatly distinguished himself at the battle of Poitiers, was governor of Aquitaine in 1362, and great seneschal of Poitou in 1369.

Audley, Thomas, Baron Audley of Walden (1488-1544), lawyer, native of Essex. He studied at Cambridge and the Middle Temple, and afterwards became a member of Wolsey's household. In 1529

he became Speaker of the House of Commons and was made chancellor in 1533. A. was created a peer in 1538. He supported the annulment of Henry VIII's marriage to Catherine of Aragon; presided at More's and Fisher's trials; and passed judgment on Anne Boleyn and Catherine Howard. He founded Magdalene College, Cambridge.

Audley, par. of Staffs, England, 4½ m. NW. of Newcastle under Lyme. Pop. 10,000.

Audley End, see SAFFRON WALDEN.

Audouin, Jean Victor (1797-1841). Fr. entomologist, b. Paris. He began to study law, but his strong natural inclination led him to the study of the natural sciences, and of medicine. He was made prof. of entomology at the Jardin des Plantes in 1833. He made the study of insects his speciality, and wrote on this subject and on the natural hist. of the coasts of France. His chief work, *Histoire des insectes nuisibles à la vigne*, was continued after his death by Milne-Edwards and Blanchard and pub. in 1842.

Audran, Edmond (1840-1901). Fr. musical composer, b. Lyons. He was originally intended to enter the Church, but his tastes were for the musical profession, and he became a church organist at Marseilles. He was first brought to the popular notice by his operetta *L'Ours et le Pacha* in 1862. He afterwards produced a number of melodious, light, and graceful operettas and comic operas, such as *La Mascotte*, 1880, *La Cigale*, 1886, and *La Pouppée*, 1896.

Audran, Gérard (1640-1703). Fr. engraver, b. Lyons and studied in Rome. He obtained considerable fame by his portrait engravings, including that of Pope Clement IX, and was appointed engraver to Louis XIV.

Audubon, John James (1780-1851), celebrated Amer. ornithologist, b. Louisiana. He was educ. at Paris, and studied drawing under David. His father estab. him on a plantation in Pennsylvania, and in 1808 he married the daughter of a farmer, Miss Lucy Bake-well. His ardour for the study of natural hist. was indomitable. Annually for 15 years he explored the primeval forests of America, and as he was able to transfer the results of his labours to paper with a spirited hand, his works have great value. His *Birds of America* (1827-38) was praised in enthusiastic terms by Curvier. He was of an unassuming and deeply religious nature, handsome in form and feature, and of a keen and clear-sighted intelligence. See life by Buchanan (Everyman's Library); C. Rourke, *Audubon*, 1936; G. C. Fisher, *Life of Audubon*, 1949.

Aue, Ger. tn in the dist. of Karl-Marx-Stadt, in the Erzgebirge (q.v.), on the Zwickauer Mulde, 20 m. SSW. of Karl-Marx-Stadt (q.v.). It is in a uranium-mining dist., and has textile, machinery, and chemical industries. Pop. 26,000.

Auenbrugger von Auenbrugger, Leopold (1722-1809). Austrian physician, b. Graz in Styria. He became physician to the Sp. Hospital at Vienna. His *Inventum*

Novum, 1761, gave an account of his application of the laws of acoustics to the investigation of the phenomena or action of the internal parts of the body; his work first introduced percussion (q.v.) as a means of detecting chest diseases. Although trans. into French by Rozière de la Chassagne in 1770, it was almost completely ignored until J. N. Corvisart (q.v.) adopted the method and pub. his classical trans. (1808). Eng. trans. by J. Forbes, 1824.

Auer, Väinö (1895-), Finnish scientist, internationally known for his geological research work in Patagonia and Canada on land erosion.

Auerbach, Berthold (1812-82), Ger. author of Heb. extraction, b. Nordstetten in the Black Forest. He originally studied theology, but later turned to law, and from law to hist. and philosophy, making a special study of Spinoza. He made his name in 1843 with a vol. of vil. stories, *Schwarzwälder Dorfgeschichten*. His later philosophical novels, such as *Auf der Höhe*, 1885, mostly concerned with the evolution of the thought of individuals, are clever, but tedious. He is at his best in his vil. stories, which had a considerable influence on European literature. His *Gesammelte Schriften* were pub. in 22 vols. in 1863-4.

Auersperg, Anton Alexander, Count of (1806-76), Austrian poet, b. Laibach. He was elected a member for life of the Upper House of the Austrian Reichsrath in 1861. In political affairs he was distinguished by his liberalism and his Ger. leanings. It is, however, under his *nom de plume* of Anastasius Grün that he is best known. He wrote patriotic verse full of idealism, the most famous being his *Spaziergänge eines Wiener Poeten*, 1831, and also humorous poems, as *Der Pfaff vom Kahlenberg*.

Auerstädt, Duke of, see DAVOUT.

Auerstädt, Ger. vil. in the dist. of Halle, 30 m. SW. of Halle (q.v.). The French under Davout (q.v.) routed the Prussians with heavy loss here in 1806. Pop. 900.

Auffenberg-Komarov, Moritz, Freiherr von (1852-1928), Austrian field-marshal (1905), and war minister (1911-12); b. Troppau, son of Hofrath Auffenberg. Took part in occupation of Bosnia, 1878; in charge at Sarajevo, under Archduke Franz Ferdinand (q.v.). With the Fourth Army he was victorious at Komarov, Sept. 1914; but his force proved unable to cope with superior numbers of Russians at Lemberg later. In 1915 tried for alleged irregularities as war minister, and acquitted.

Aufrecht, Theodor (Simon) (1822-1907), Sanskritist and linguist, b. Leschnitz in Upper Silesia. 1852, assistant at the Bodleian Library, Oxford; 1862, prof. of Sanskrit and comparative philology at Edinburgh Univ.; 1875-89, at Bonn Univ. With A. Kuhn he founded the *Zeitschrift für vergleichende Sprachforschung* (1851). Pub. *De accentu compositorum Sanscriticorum*, 1847; (ed. with Kirchhoff) *Die umbrischen Sprachdenkmäler* (2 vols.), 1849-51; *Die Hymnen des Rigveda* (2 vols.), 2nd ed., 1877;

Aitareya Brāhmaṇa, 1879; and other works. His chief works are scientific catalogues of Sanskrit MSS.: *Catalogue Catalogorum* (3 vols.), 1891-1903, *A Catalogue of post-Vedic codices*, 1859-64, and *A Catalogue of Sanskrit MSS. in the Library of Trinity College, Cambridge*.

Augean Stables. Augeas, King of the Epelans in Elis, was an Argonaut, and owned 30,000 head of cattle, including 12 white bulls sacred to the Sun. Their accumulated dung Heracles cleared from the A. S. in a day, as required by Eurystheus, diverting the R. Alpheus into them. The term is now used metaphorically. See HERCULES.

Auger, Athanase (1734-92), Fr. classical scholar. He early applied himself to the study of the Gk and Rom. writers, and was appointed prof. of rhetoric in the college of Rouen. Besides translating sev. classical and patristic authors, A. wrote an essay on the constitution of Rome; *Projet d'éducation publique, précédé de quelques réflexions sur l'Assemblée nationale*, 1789; and *Catéchisme du citoyen français*, 1791.

Auger, boring tool with a centring point, one or two radial cutting edges, and an Archimedes screw for removing material as the tool advances. It may be with or without a handle; earth A.s may be driven either by two men on a transverse handle or by a power attachment on a truck. The small carpenter's A. is used for boring wood.

Augereau, Pierre François Charles, Duke of Castiglione (1757-1816), marshal of France, b. Paris. He served in the Neapolitan army till 1787, and volunteered for the Fr. army in 1792. His conduct in Vendée and the Pyrenees was so brilliant that he was general of div. in 1793. Sent to the It. army, he highly distinguished himself at Lodi, Castiglione, and Bologna. He took part in the *coup d'état* of Fructidor 18 (4 Sept.), and was a member of the Council of Five Hundred in 1799; in 1804 he was created marshal of the empire and grand officer of the Legion of Honour. He submitted to Louis XVIII on Napoleon's abdication, and was created a peer.

Aughrim: 1. Vil. of co. Galway, Rep. of Ireland, 5 m. SW. of Ballinasloe, where the famous battle of A. was fought on 12 July 1691, between the armies of James II under the Irish Gen. St Ruth, who was killed, and those of William III under Gen. Ginkel.

2. Vil. of co. Wicklow, Rep. of Ireland, in the mt valleys which culminate in Lugnaquilla (3039 ft), the bp. of Anne Devlin. Garrett and Wm Byrne, '98 leaders, were b. at Ballymanus House.

AUGER

A. has granite quarries and flour mills. Pop. 350.

Augier, Guillaume Victor Émile (1820–1889), Fr. dramatic poet, b. Valence. He was educ. as a lawyer, but soon turned his attention to literature. Among his plays are *Le Pils de Giboyer*, 1863, *Contagion*, 1866, and *Les Effrontés*, 1893, all satires on avarice, social demoralisation, and lust of power; *Marriage d'Olympe*, showing the unidealised courtesan, 1855; *Jean de Thommeray* (with Jules Sandeau), 1873, sounding the note of patriotism, following Fr. reverses in 1870; and *Les Fourchambault*, 1878, on the Dumas model. His *Le Gendre de M. Poirier*, 1854 (prose), also with Sandeau, still holds its place. A. defended the common-sense view against sophistry. He did not, however, take up the attitude of a reformer or an apostle. He was made a member of the Academy in 1858, a commander of the Legion of Honour in 1868. See P. Morillot, *E. Augier*, 1901, and H. Gaillard, *E. Augier et la comédie sociale*, 1910.

Augite (Gk *augē*, lustre), important mineral belonging to the pyroxene group. It is often found in volcanic rocks. It is green when in fibrous masses, black when it crystallises, and is distinguished from hornblende by its crystals, which are smaller and thicker.

Augmentation is used with special significance in heraldry, in music, and in Scots law.

In heraldry, an additional charge to a coat-of-arms is known as an **A.** The right to add such a charge is conferred as a mark of honour. A well-known case of **A.** is the Union flag borne by the Duke of Wellington.

In music, especially in counterpoint and fugue, **A.** is the repetition of a phrase or subject in notes of twice the original length.

In Scots law, **A.** is an increase of stipend obtained by a par. minister in the court of teinds by a process of **A.** against the titulars and heritors. See also **BENEFICE** and **TEINDS**.

Augmentation, Court of, court set up by Henry VIII in 1536 to manage the revenues and possessions of all monasteries under £200 a year, which by a previous Act of the same session had been given to the king, and for determining suits relating thereto. The origin of the title of this court is seen by referring to its full title, 'The Court of the Augmentation of the revenues of the King's Crown.' It was a court of record, with one great seal and one privy seal. It was dissolved in 1553.

Augrabies Falls, on the Orange R. in Cape prov., S. Africa, 79 m. W. of Upington. They are 480 ft in height, or about twice as high as the Niagara Falls, though the latter are much wider and have a greater flow of water. **A.** is the Hottentot name for 'The Place of Great Noise.'

Augsburg (anc. *Augusta Vindelicorum*), Ger. city in the *Land* of Bavaria (q.v.), at the junction of the Wertach and Lech (q.v.) R.s, 37 m. WNW. of Munich (q.v.). It was founded in 15 BC and

became an important tn of Rhaetia (q.v.). In the 5th cent. it was laid waste by the Huns (q.v.). In the 6th cent. it was made a bishopric, and in 1276 it was made a free city of the Empire. It reached the summit of its prosperity under the Emperor Maximilian I (q.v.) at the beginning of the 16th cent., when it was the home of powerful merchant families such as the Fuggers (q.v.) and the Welsers. At this period **A.** was also a great art centre: Holbein the Younger was a native of the city, and among the other artists who worked in it were Dürer, Titian, Burgkmair, and Altdorfer (qq.v.). Sev. important events of the Reformation (q.v.) took place at **A.** (see succeeding articles, and see LUTHER, MARTIN). The city was occupied by the Swedes during the Thirty Years War (q.v.), was in Bavarian hands, 1703–4, and finally became part of Bavaria in 1806 on the abolition of the Empire. During the Second World War there was considerable damage from air-raids. The cathedral (10th–15th cents.) has altars by Holbein the Elder, and contains the oldest stained glass in the world (11th cent.). There are other fine medieval and Renaissance churches; a 17th-cent. tn hall, which is one of the most notable Renaissance buildings in Germany; a beautiful Renaissance street, the *Maximilianstrasse*; and a Festive Hall (1770) built to receive Marie Antoinette (q.v.) on her bridal journey to Paris. In the E. of the city is the Fuggerei, a settlement founded by the Fuggers in 1519 for needy citizens. **A.** is an important industrial city with textile, cash-register, Diesel engine, and other engineering manufs. Pop. 200,800.

Augsburg, Confession of, name of the formula, drafted by Luther and modified and revised by Melancthon, which contained the confession of faith presented by the Protestants to the Emperor Charles V at the diet of Augsburg in 1530. The original form was adhered to by the Ger. Reformed Churches. The document presented to the diet is preserved in the Austrian archives.

Augsburg, Interim of, name of a document which Charles V had drawn up by the theologians of both sides at a diet meeting at **A.** in 1548. He hoped by this to restore the unity of the Church, but though the Interim was accepted by the diet, neither Catholics nor Protestants would agree to it.

Augur. The Rom. college of **A.s** foretold events and interpreted the will of the gods from various signs and omens. Such were thunder and lightning, the flight and song of certain birds, the appetites of birds, particularly chickens, the movements and attitudes of beasts and reptiles, and incidents occurring at the moment when a magistrate performed some public act, or during an augural consultation. The answers of **A.s**, as well as the signs governing their utterances, were called *auguria*, *auspicia* being properly confined to divinations from birds. The political importance of the **A.s** was very great, as nothing of any

importance could be undertaken unless they were consulted, and they could postpone business at their pleasure. The number of the A.s. taken from the patrician class only till 307 BC, was 4 until 81 BC. In 81 BC the number was increased to 15, and Augustus appointed A.s as he pleased.

August, originally called Sextilis, 6th month in the pre-Julian calendar. It was named in honour of Augustus (q.v.), many of the most important events of whose life had occurred in that month. The first day of A. is called Lammass Day, and also the Gule of A. The A.-S.s called it *hlafmæsse*, loaf-mass, and it was the feast of thanksgiving for the first-fruits of corn.

Augusta, anct name of a number of tns named in honour of the Rom. Emperor Augustus, or one of his family. Three considerable tns at present are so called:

1. The cap. of Maine, U.S.A., and co. seat of Kennebec co., situated on the W. bank of Kennebec R., 45 m. from its mouth; a dam 17 ft high (built 1837) gives it considerable water power which is utilised in cotton, paper, and pulp mills. Other industries are shoemaking, printing, and the manuf. of wood products. A U.S. arsenal is here. Pop. 20,913.

2. The co. seat of Richmond co., Georgia, U.S.A., and the head of the steamboat navigation on the Savannah R. (212 m. upstream). It is a popular health resort, and is one of the largest cotton markets in the S. Its industries include iron-founding and sash, door, and blind manufs. Here are the univ. of Georgia, School of Medicine, Paine College, and the Haines Institute. The construction began in 1951 of the Atomic Energy Commission's huge Savannah R. plant. Pop. 71,508.

3. (or **Agosta**). Fort. seaport in Sicily (q.v.), 12 m. NNW. of Syracuse (q.v.). It is on the E. coast, on a small is. joined to the mainland by two bridges, and was founded by the Emperor Frederick II (q.v.), c. 1232, on the presumed site of the anct *Xiphonia*. In 1693 it was rebuilt following an earthquake. De Ruyter (q.v.), the Dutch admiral, was killed near here in 1676 during a naval action against the French. There are salt and fishing industries, and a trade in cheese, fruit, and agric. produce. Pop. 23,300.

Augusta Aescorum, see **ATCH**.

Augusta Emerita, see **MÉRIDA**.

Augusta Praetoria Salassorum, see **AOSTA**.

Augusta Suessionum, see **SOISSONS**.

Augusta Taurinorum, see **TURIN**.

Augusta Vindelicorum, see **AUGSBURG**.

Augustales: 1. Games held at Rome and in other parts of the empire in honour of Augustus. By a decree of the senate in 11 BC they were celebrated annually on the birthday (23 Sept.) of Augustus.

2. College of priests founded by Tiberius in order to attend to the worship of Augustus and the gens Julia. It was divided into 2 classes, one at Rome and the other in the municipia. The former class, 21 in number, was selected from the nobility of Rome, and was also augmented

by certain members of the imperial family. The latter class was usually composed of wealthy freedmen.

Augustan Age, term used to describe the flourishing state of Lat. literature under Augustus (q.v.). It is also used of the 'Classical' periods of literature in England under Queen Anne and in France under Louis XIV.

Augustenborg, small seaside tn on Als Is., Slesvig, Dan. since Austria's proposal in 1865 to make the Prince of A. ruler of Schleswig-Holstein was one of the ostensible causes of the Seven Weeks War (q.v.) between Austria and Prussia.

Augusti, Johann Christian Wilhelm (1772-1841), Ger. theologian of Jewish descent, educ. at Gotha and Jena; studied oriental languages and was prof. successively at Jena, Breslau, and Bonn. Later he became chief of the consistorial court at Koblenz. His most important writings deal with Christian archaeology and the exegesis of the O.T.

Augustine (Austin), St (354-430), b. Tagaste, in the prov. of Numidia. His father, Patricius, was a pagan; but his mother, Monica, instructed him in the Christian faith, and her son has given us a magnificent picture of her. As a boy he showed promise; and both his parents took considerable interest in his education, sending him to school at Tagaste and later at Madaura near by until he was 16. In spite of his mother, and at one time of his own desire, A. grew to manhood without baptism. Before he went up to the univ. at Carthage his father d., having at last become a Christian. At Carthage A. took a mistress, by whom he had a son, Adeodatus ('given by God'). This irregular union lasted some 14 years, and A. was always devoted to his son. He became greatly attached to the Lat. poets and writers, but he had so little Greek that it has been doubted whether he could read the original N.T. The *Hortensius* of Cicero gave him a desire for wisdom and showed him the folly of the life he had been leading. Manichaeism (q.v.), a so-called Higher Christianity, was the first philosophy that he embraced. He set up as a teacher of grammar in his native town, but soon returned to Carthage. His study of psychology quickly led him to doubt Manichaeism, and after a brief stay as a tutor in Carthage he set out for Rome, where he had a short illness, became disgusted with the mannerisms of the students, and left to become prof. of rhetoric at Milan. There he began his definite break with the Manichaeans, and for a time he fell under the influence of the Sceptics; but the oratory of St Ambrose, Bishop of Milan, and later his message, began to influence him. A. studied the Pauline epistles, and after a spiritual experience in the garden, which he has vividly described, retired into seclusion, announcing himself as a candidate for baptism. It was the summer of 386, and A. was in his thirty-third year.

He was baptised with his friend Alypius and his son Adeodatus. Soon afterwards his mother, who had rejoined him, d. at

Ostia. A. remained for some time in Rome, but in 388 he returned to his native tn. Here he began to form that rule of life which later developed into the monastic system of A., with a devoted band of followers. He was speedily invited to take a more active share in the work of the Church, but declined until c. 390. He went to Hippo to visit some Christian friends, and was invited to become priest there, later coadjutor to the bishop, and finally bishop of the see. Controversy played an important part in the work of St A. Not unnaturally, his first great attack was directed against Manichaeism, especially in his *Contra*

ST AUGUSTINE
A painting by Botticelli.

Faustum Manichaeum. His second great controversy was against the Donatists (q.v.). Their doctrines had been condemned by the Pope, as well as by the Emperor Constantine; but the party had made great progress, and A. vented his wrath in *The Seven Books on Baptism*. In these and later writings A. was led to make certain statements concerning the use of civil power to control separatism in the Church.

A.'s greatest controversy, however, was against Pelagianism (q.v.). It lasted for many years, and the heretical doctrines were refuted in no fewer than 15 treatises. In these we have the saint's theories of original sin, the need for infant baptism, and the relation of human to divine righteousness. They represent A.'s attempt to express the relations of the human and the divine. Among his greatest works are *De Civitate Dei* (The City of God), a vindication of the Church in face of a threatened collapse of the empire, and his *Confessions*. His *De Opere Monachorum* had great influence

on monastic work. The so-called Rule of St A. was never formally drawn up by him, but was culled from his writings on community life during the monastic revival of the 11th cent. A. d. during the siege of Hippo by the Vandals in 430, before the city surrendered. The Platonist outlook of A. has, since the Middle Ages, been somewhat uncongenial to a Catholic theological system dominated by the Aristotelianism of St Thomas Aquinas; but he had enormous influence on the Protestant reformers, who grossly exaggerated his pessimistic view of fallen human nature and his doctrine of predestination. Jansenism (q.v.) also derived its inspiration from him. He remains, nevertheless, for Rom. Catholics, as for Protestants, the greatest Father of the Lat. Church. See ed. by Pilkington and others, *Select Library of Nicene and Post Nicene Fathers* (vols. i-viii), 1887-92; a trans. of the works by M. Dods, 1871-8; the *Confessions*, trans. E. B. Pusey, 1838, and *The City of God*, trans. J. Healey, 1610 (both in Everyman's Library). See also E. Leigh-Bennett, *Handbook of Early Fathers*, 1920; M. I. Barry, *St Augustine the Orator*, 1924; W. J. S. Simpson, *St Augustine's Conversion*, 1930; E. Przywara, *An Augustine Synthesis*, 1936; S. C. M., *Library of Christian Classics*, 1956.

Augustine, St. first archbishop of Canterbury, was sent from Rome (where he was prior of St Andrew's on the Coelian) by Pope Gregory I to undertake the conversion of the English. AD 596. With 40 monks he landed in the isle of Thanet, and through the influence of Queen Bertha (already a Christian) was well received by King Ethelbert of Kent, who, however, would not at first receive the mission within doors for fear of magical arts. A. gradually won his confidence, and within a year or two Ethelbert and his people were converted. The chief seat of worship was at Canterbury, and the first regular services were held at the church of St Martin, a relic of Rom. Christianity. Other churches rapidly arose, and in 601 A. received from Gregory the pallium as Archbishop of Canterbury and primate of Britain. There was already a Christian community in the W. country, founded by the disciples of St Columba, their prin. church being at Bangor, on the Dee. These declined to acknowledge A.'s authority, and a conference held at A.'s Oak (somewhere near the Severn) failed to convince them; but only a few years later the settlement at Bangor was utterly destroyed by the pagan Ethelfrid. As an administrator A. seems to have been both firm and moderate. The date of his death is uncertain, but was probably between AD 604 and 610. His feast is on 26 May.

Augustine, St. *Canons of the Order of.* Until the Lateran Council in 1059, almost the only religious order in the W. church was the Benedictine. But the canons regular of St A., founded soon after and in consequence of the Lateran synod, made a new departure. Taking for their guidance the rule of St A. of

Hippo, written by him about the end of the fourth cent., they took religious vows and lived in communities, yet they were not monks, but clergy doing pastoral work. Their separate 'houses' soon began to draw together and organise themselves into 'congregations'; among the chief were those of the Lateran, Rome, of St Victor, Paris, and of the Gilbertines in England. These congregations spread all over W. Europe, and were very strong in England. At the dissolution of the greater monasteries by Henry VIII in 1539, no fewer than 60 of them were Augustinian. Only a few houses of canons regular still remain, but of late years there has been a revival of the order in England.

Augustodunum, see AUTUN.

Augustów (Russian Avgustov), tn of Poland, in Białystok prov., 50 m. N. of Białystok (q.v.). It is on the A. canal, which connects the Vistula with the Neman (q.v.). In 1915 (see WORLD WAR, FIRST) the S. wing of the Russian Army was here surrounded by the Germans and forced to surrender. There are cement, brick, and flour manufs. Pop. 15,000.

Augustulus, Romulus, last of the nominal emperors of Rome. He was placed on the throne by the soldiery in AD 475 at the instigation of his father Orestes, but in 476 the Herulian chief Odoacer raised a revolt, slew Orestes, deposed A., and proclaimed himself King of Italy.

Augustus, title borne by all the Rom. emperors from the time when it was conferred by the senate upon Gaius Julius Caesar Octavianus in recognition of his services to the state.

Gaius Octavius was b. at Rome on 23 Sept. 63 BC; his mother was niece of Julius Caesar. In early youth he lost his father, and spent the next years under the control of his stepfather, L. Marcius Philippus. In 44 BC he was studying at Apollonia in Illyria when he heard the news of Caesar's assassination. Urged by M. Vipsanius Agrippa (q.v.), he returned at once to Italy, where he learned of his adoption into the gens Julia (on which account he assumed the name Gaius Julius Caesar Octavianus) and of his appointment as Caesar's heir. His claims in this last respect were ignored by Antony (see ANTONIUS, MARCUS (MARK ANTONY)) and the republican leaders; but he found favour with the veteran troops of Caesar, and made gradual headway by using all competitors for power while helping none. The two triumvirates of 43 and 37, as well as the destruction of Brutus and Cassius at Philippi in 42, led by stages to the victory of Actium (31). Octavian now stood forth before his countrymen, exhausted by years of civil strife, as their deliverer and one hope of peace. He devoted the next 18 months to restoring order and regular constitutional gov.; but although he was in fact absolute master he carefully avoided all forms, titles, and honours suggestive of kingly power. His achievement was acknowledged by

the senate on 17 Jan. 27 BC, when he received from them the title of A. The next step was to reorganise the provs., both with regard to their administration and to their frontiers, a task which occupied him from the end of 27 until Oct., 19 BC. The years 18-17 were spent in domestic reforms, which were marked by the Secular Games in June of the latter year. From then until AD 10 A. was largely occupied with the problem of the succession and with that of securing the Rhine-Danube frontier. The latter was finally accomplished by the campaigns of Drusus and Tiberius (qq.v.), notwithstanding the disaster to Varus (q.v.) in AD 9. After many disappointments, the succession was finally settled upon Tiberius. A. d. at Nola in Campania on 19 Aug. AD 14, and was immediately numbered among the gods. Notwithstanding his earlier faults and crimes, his achievement entitles him to rank among the world's great men. By his first wife, Scribonia, whom he divorced in 39, he had a daughter (married successively to Agrippa and Tiberius). His second wife, Livia, bore him no children. See H. Hammond, *The Augustan Principate*, 1933; J. Buchan, *Augustus Caesar*, 1937; M. Grant, *From Imperium to Auctoritas*, 1946.

Augustus, name of 3 electors of Saxony; 2 of them were also kings of Poland.

Augustus I's (1536-86) chief title to fame was his adoption of the Calvinistic form of religion and his later conversion to Lutheranism. When he became a Lutheran he violently persecuted the Calvinists. To him is due the founding of the great library at Dresden.

Augustus II (1670-1733), elector of Saxony and King of Poland. After the death of Sobieski in 1697 he became a candidate for the kingdom of Poland, which he succeeded in obtaining owing to the lack of opposition from France, whose claimant was the prince of Conti. A. now changed the hereditary religion of his family and became a Catholic. In alliance with Russia he fought Sweden in a vain attempt to win back the provs. which Sweden had previously conquered, and also in an equally vain attempt to make his elective power as despotic as his power in his hereditary dominions. He was defeated, and in 1704 deposed, Stanislas Leszczynski being elected in his place. After the battle of Poltava he marched into Poland with an army and regained the crown, which he kept until his death in 1733. He attempted to make his elective crown of Poland hereditary. His court was the most immoral in Europe, and of his numerous children only one was legitimate.

Augustus III (1696-1763), only legitimate son of A. II, elector of Saxony and King of Poland. On his accession the war of the Polish Succession broke out. The candidates were A. and Stanislas Leszczynski, the deposed king. By the help of Russia A. drove Stanislas out and became sole king in 1734. During the war of the Austrian Succession he was first against Maria Theresa, but

ultimately on her side. He was defeated by Frederick the Great at the battle of Kesseldorf, and the treaty of Dresden was concluded. In 1756 he was driven from Saxony by Frederick the Great, whose raid found its own justification in the archives of Dresden. The treaty of Hubertsburg of 1763 restored Saxony to him. A. III d. in the same year.

GREAT AUK

Auk, family of oceanic birds, scientifically known as the Alcidae, belonging to the Charadriiformes, including the A.s., the razor-bills, the guillemots (*Uria*), and the puffins (*Fratercula*). They have short wings, webbed feet, heavy bodies; they feed on fish, and lay their solitary egg on a rock. *Alca impennis*, the great A., formerly common in Spitsbergen, has been extinct since 1844; *Alca torda*, the razor-bill, most common in Labrador, is killed for its breast-feathers; *Fratercula arctica*, the puffin, is seen round the Brit. coast; *Uria aalge*, the guillemot, is common around the Brit. coasts. The great A. could not fly, but other A.s. use their wings for short-distance flights and also as oars in the sea. See GARE-FOWL.

Auk, Black-billed, see RAZORBILL.

Auk, Little, see ROTCHE.

Aula (Lat., from *Gk. aulê*): 1. Large room in a Gk or Rom. house.

2. The assembly hall in a Ger. univ.

Aula Regis, see CURIA REGIS.

Aulacodus (Gk *aulax*, furrow; *odus*, tooth), genus of rodents of the family Octodontidae, found in S. Africa. It is a ground-rat, about the size of a cat, and is related to the porcupine and guinea-pig.

Aulanko, near Hämeenlinna, Finland, magnificent park containing a modern hotel. Centre of tourism throughout the year.

Aulic Council, legislative and executive body, estab. by the Emperor Maximilian I in 1497, to assist in governing the Holy Rom. Empire. At first its business was very wide, including every question, home or foreign, which might come before the emperor. Its exact powers were defined in the treaty of Westphalia, and

subsequently it functioned principally as a judicial court.

Aulie Alta, see DEZHNEBAL.

Aulls, anct Boeotian seaport on the Euripus, famous as the starting place of the Gk fleet for the Trojan war, also as the scene of the sacrifice of Iphigenia.

Aullagas, see POORO (Lake).

Aulnoy, Marie Catherine, Baronne d' (1650-1705), Fr. authoress. She wrote sev. romances now forgotten, and some lively but untrustworthy memoirs, but her *Contes de fées* (6 vols., 1698), among which may be mentioned 'The Blue Bird' and 'The Yellow Dwarf', have had a lasting success. She conspired against her husband, bringing a false accusation of treason; being detected she fled to Spain, but after some years was allowed to return in reward for secret services rendered to the gov. of Louis XIV.

Aulophyte, plant, not a parasite, that shelters within another.

Aulus Gellius (c. 123-c. 165), Lat. grammarian, b. in Africa. At the age of 16 he came to Rome to study, and among his tutors were Apollinaris and Fronto. His work, entitled *Noctes Atticae*, is a dialogue in which the most varied questions of grammar, philosophy, hist., and archaeology are discussed. It derives its title from the fact that it was composed at Athens and was written during the winter nights. Although the author's style is by no means free from affectations and obscurity, and the work as a whole is most pedantic in tone, it is nevertheless very valuable from the great number of literary quotations and references to personages and customs which are found therein. There is an ed. with trans. by J. C. Rolfe (Loeb Library, 1927-8).

Aumale: 1. Fr. tn in the dept of Seine-Inférieure, on the R. Bresle. It has textile and iron works. Some work in the church is attributed to Jean Goujon. Formerly called Albemarle or Aumerle. Pop. 2200.

2. Fr. military station in Algeria, on the site of an old Rom. settlement, about 80 m. from Algiers.

Aumale, Counts and Dukes of. The co. of A. in Normandy was granted by William the Conqueror to his brother-in-law, Odo of Champagne. Havoise, Countess of A. in her own right, married firstly Wm de Mandeville, Earl of Essex (d. 1189), secondly Wm de Fors (d. 1195), and thirdly Baldwin de Behen (d. 1214). On the death of Baldwin, Count of A. by right of his wife, the co. was claimed by Wm de Fors, son of Havoise by her second marriage, and was confirmed in his possession by King John. But Normandy had in the meantime been conquered by Philip Augustus, and A. was taken by the Fr. Crown. The title of Earl of A. (subsequently Earl of Albemarle) was retained by Wm de Fors. A. was conferred on the son of Philip Augustus. After passing through many hands it came into the possession of Louis XIV, who gave it to the Duke of Maine, and subsequently it came into the hands of the Dukes of Orleans. The title of Duke of A. has

been borne by the sons of dukes of Orleans since the reign of Louis Philippe.

Aumale, Charles de Lorraine, Duc d' (c. 1554-1631), Fr. courtier, a fanatical supporter of the Guises during the religious wars in France. A leader of the league and, together with the Duke of Mayenne, leader of the Catholics on the death of Henry of Guise. After being decisively defeated by Henry IV he went over to the Spaniards, and betrayed sev. places into their hands. He was later sentenced to death but escaped. A. d. in exile in Brussels.

Aumale, Henri Eugène Philippe d'Orléans, Duc d' (1822-97), son of Louis Philippe, King of France. He served with distinction in the Fr. army, and in 1879 became inspector-general of the army. In 1886 he was exiled from France, but the decree was later revoked.

Aumbry (Lat. *armarium*; Fr. *armoire*), cupboard or niche in a wall of a church. It is sometimes written in the form almyry, being confused with almonry and taken to mean a place for alms. This word is usually applied to a locker in churches wherein were placed sacramental vessels, vestments, etc. In its corrupt usage the word was formerly applied to the almonry of Westminster Abbey. See G. Dix, *A Detection of Lumbries*, 1942.

Aumonier, Stacy (1887-1928), novelist, educ. at Cranleigh. Son of a sculptor, he began his career as a landscape painter, but turned to writing in 1913. He served as a private in the First World War, and his best novel, *The Querrils*, tells of a war-time family. As a writer of short stories he was still more successful. Among his books are *Heartbeat*, 1922, *Overheard: Fifteen Tales*, 1924, *The Baby Grand*, 1926, and *Little Windows*, 1931.

Auncel, kind of balance or steelyard formerly used in England. It had a movable fulcrum and fixed weight, and the finger was often used as the fulcrum, which gave great opportunity for cheating.

Aune, or **Aulne**, old European cloth measure (Lat. *ulna*, elbow). It roughly corresponded to the Eng. ell. It is still used in Switzerland where it measures 47½ in.

Aungerville, Richard (1281-1345), bishop, statesman, and author, b. near Bury St Edmunds, and often known as Richard de Bury. Educ. at Oxford, he became tutor to Prince Edward, on whose accession as Edward III he obtained rapid advancement, being sent sev. times on embassies to the pope (then at Avignon) and the Fr. court. In 1333 he became bishop of Durham, next treasurer, and then chancellor of the realm. He is best known to posterity as an ardent book-lover and collector; his authorship of *Philobiblon* is, however, disputed.

Aunis, anct. prov. of France, corresponding to parts of the present depts of Charente-Maritime and Deux-Sèvres. It was united to the Fr. crown in 1271 after having been the property of the Plantagenets (q.v.), and was again in Eng. hands from 1360 to 1373. The cap. was La Rochelle (q.v.).

Aura, in medicine, term applied to the sensation which precedes an epileptic fit (see EPILEPSY). Not all epileptics have an A. preceding their fits, but many do and with experience come to recognise its significance. A.s may be in the form of any kind of sensation from a feeling of heat or cold in the extremities to that of a distinctive smell or a particular sort of noise. As a rule an A. remains true to type in each person.

Aural Diseases, see EAR.

Aurangabad, walled tn in Hyderabad State, India, 67 m. NE. by N. of Ahmednagar. It has the ruins of a palace built by Aurangzebe. It is the most convenient centre for visits to the famous caves of Ajanta and Ellora (qq.v.).

Aurangzeb (1618-1707), third son of Shah Jehan, a Mogul emperor of Hindustan. At an early age he showed great military talent, and was entrusted by his father with the command of sev. expeditions. Shah Jehan being taken seriously ill, his eldest son, Dara, seized the throne, but by a series of crafty negotiations and manœuvres A. made himself master, shut up Shah Jehan in prison, slaughtered his brothers, and so became sole ruler. His reign of 49 years (1658-1707) was a brilliant period of the Mogul dynasty, but his despotic gov., and especially his Mohammedan bigotry, excited intense opposition, and the latter part of his reign was greatly troubled by the princes of Rajputana and the Mahrattas under Sivaji.

Aurantes, see ABRANTES.

Auray, tn in the dept of Morbihan, France, 3 m. up the R. Auray. Famous for the ann. pilgrimage to its chapel of St Anne, called Le Pardon d'A. It has an agric. market, and important oyster beds. Fishing and boat-building are also carried on. Pop. 8600.

Aure, valley in France, in the dept of Hautes-Pyrénées, considered to be one of the most beautiful in the Pyrenees (q.v.). The chief tn is Arreau.

Aureliacum, see AURILLAC.

Aurelian Wall, fortified wall surrounding anct Rome, begun by the Emperor Aurelian (q.v.) in AD 271 and completed by Probus in 280. Its circuit of about 13 m. can still be traced, and much is in an excellent state of preservation. The wall had an average height of 50-60 ft and a width of 12 ft. It was constructed of concrete, with brick facing, with square towers at intervals of 45 ft, and was pierced by 14 gates.

Aurelian Way, anct Rom. road of uncertain date. It ran from the Janiculum gate at Rome northwards to Cosa, but was later extended to Vada Volaterrana. By the construction of the Via Aemilia in 109 BC it was carried to Gensu, Dortona, and (later still) to Arelatum (Arles).

Aurelianus, Caelius, see CAELIUS AURELIANUS.

Aurelianus, Lucius Domitius, Rom. emperor (AD 270-5), b. c. AD 213 of humble parents at Sirnium in Pannonia. After a distinguished military career he was proclaimed by the army as successor to Claudius II (q.v.). Having secured the

Danube and Rhine by driving the Goths from Moesia and by defeating the Alemanni and other Ger. tribes, A. completed his re-unification of the empire by crushing two pretenders to the throne—Firmus in Egypt and Tetricus in Gaul. Next (271) he went E. to quell the revolt of Zenobia (q.v.), Queen of Palmyra, and 3 years later celebrated a magnificent triumph at Rome. Late in 274 A. set out on an expedition against the Persians, but was murdered in Thrace by some of his own officers, at the instigation of a dishonest secretary. A. began the Aurelian Wall (q.v.).

Aurelius, Marcus Antoninus, see **MARCUS AURELIUS**.

Aurelius Victor, Sextus (4th cent. AD), Rom. historian, a favourite of Constantius II. He wrote hist. of Rome before and after Augustus. His work was continued in the next cent. by another writer using the same name.

Aureole, shining cloud surrounding the representation of sacred personages in Christian art. Originally confined to divine figures only, but afterwards more widely used. The A. surrounds the whole figure; a luminous ring round the head only is called a nimbus; the A. is also found in anct pagan art, and is probably of mythological origin.

Aureomycin, see **ANTIBIOTICS**.

Aures Mountains, S. Algeria, one of the Atlas ranges; highest peak, Sheliya, 7760 ft. The dist. was under Rom. rule, and its people, mostly Berbers, are of very mixed descent, showing frequent traces of fair, probably Gaulish or Vandal, ancestry. The A. M. were occupied in 1845 by the French, whose chief settlement, Istata, is near the great Rom. ruins of Lambaesis.

Aureus. The atater A. of anct Greece equalled 25 Attic drachmas of silver, about £1 Eng. The first Rom. A., of pure gold, was struck about the close of the war with Hannibal, and was copied from Gk models. It was worth about 16s. Eng. It did not become a standard coin until the time of Julius Caesar. Later emperors reduced its value.

Aureus, Mons, see **JANICULUM**.

Aurice, Georges (1899–), Fr. composer, b. Lodève (Hérault). He studied both at the Conservatoire and the Schola Cantorum in Paris. Under the influence of Satie he was one of those who formed the group of 'Les Six.' His first success was incidental music for Molière's *Les Fâcheux* (1923), which he turned into a ballet, the first of more than a dozen. After his music for René Clair's film *A nous la liberté* (1932) he was much in demand by both Fr. and Eng. film studios. He has also written a few choral, orchestral, and chamber works, and numerous piano pieces and songs.

Aurich, Ger. tn in the Land of Lower Saxony (q.v.), on the Ems-Jade canal, 117 m. NW. of Hanover (q.v.). Until 1744 it was the seat of the rulers of E. Friesland; the dist. then passed to Prussia (q.v.). There are brewing and paper industries. Pop. 11,000.

Aurichalcite (Lat. *aurum*, gold; Gk

chalkos, copper), amorphous, green, transparent mineral formed of hydrocarbonate of copper.

Auricle: 1. The external ear; its cartilaginous structure acts as a collector of sound. See **EAR**.

2. One of the two upper cavities of the heart. See **HEART**.

Auricle, in botany, small ear-like projections at base of leaves; hence aurioled or auriculate—having ear-like appendages; e.g. grasses.

Auricula (Lat. dimin. of *auris*, ear), genus of univalve-shelled molluscs, which inhabit marshes and their borders. The animals are snails of the Pulmonata and family Auriculidae; they are found in the warmer climates, where they feed on plants. Fossil Auriculæ are found in the Jurassic system, and the shells are long and spiral. *A. midæ*, or Midas's ear, is found in the E. Indies.

Auricula (*Primula auricula*), plant of the family Primulaceæ. It grows abundantly on the Swiss Alps, and has many florists' varieties.

Auriga (Lat. 'the Charioteer'), constellation situated between Perseus and Gemini. It is represented as a man holding a bridle in his right hand and supporting a goat and kids on the left arm. Alpha Aurigæ, in the body of the goat, called Capella (and Alioth by the Arabs), is brighter than the first magnitude, and by it the constellation is most easily found. The neighbouring constellation is Perseus; around it are Taurus and Gemini; and the prin. stars are never below the horizon in the Brit. Isles. The mythology of the figure is uncertain, being attributed by some to the Hærus of the Egyptians, whilst others accord it a Euphratean origin. Capella is the fifth brightest star in the heavens, its magnitude being 0.2, and it has a companion, magnitude 9, at a distance of 158". Its proper motion has been calculated as 44" a cent. In 1900 Prof. Campbell at the Lick Observatory, and Prof. Nowell at Cambridge, found that Capella is a spectroscopic double, the 2 stars revolving about their common centre of gravity in a period of 104 days. A new star, Nova Aurigæ, discovered with the naked eye by Dr Anderson in 1891, then of a magnitude 4.4 and still visible to powerful telescopes, is one from which we have learned much about the various *novæ*, or new stars.

Aurigny, O.F. name for Alderney (q.v.), used by Macaulay in his poem on the Armada.

Aurillac (anct *Aureliacum*), Fr. tn, cap. of the dept of Cantal, on the Jordanne. It had once a great monastic school, and there are many fine, anct buildings and monuments in the tn. Pope Silvester II (q.v.) was b. here. There is a market for livestock, and cheese, umbrellas, and paper are manuf. Pop. 22,000.

Auriol, Vincent (1884–), Fr. statesman, educ. at Paris Univ. A Socialist deputy from 1914, he held office in the Blum and Chautemps govts. before the Second World War. He opposed the decision to surrender to Germany in 1940. Was interned, but escaped to London in

1943. He was president of the constituent assembly in 1946, and in Dec. became president of the national assembly. From 1947 to 1953 A. was the first president of the Fourth Rep. It was a period of considerable political instability in France, and A.'s non-partisan statesmanship played a large part in ensuring continuity of gov. and internal calm despite constant political crises.

Aurispia, Giovanni (c. 1370-1459), It. scholar, patronised by Cosmo de' Medici and Pope Eugenius IV. He visited Constantinople and brought away valuable MSS.

Aurlandsfjord, branch of the Sogne Fjord (q.v.), on W. coast of Norway, being a winding inlet running to the S. of the main fjord.

Aurochs (*Bos primigenius*), anct wild ox of Europe, and a descendant of the gigantic cattle of the Pleistocene period. It was known up to the 16th cent., but is now extinct.

Aurora (Gk *ēōs*), Rom. goddess of the dawn.

Aurora, city in Illinois, U.S.A., on Fox R., 36 m. W. of Chicago, in a dairying and stock-raising area. A. has railway and machine shops, and manufs. aluminium goods and machinery. Pop. 50,600.

Aurora Borealis, see LIGHTS, NORTHERN.

Aurangzeb, see AURANGZEB.

Ausable Chasm, deep gorge, 2 m. long, near Ausable R., New York, noted for its beautiful scenery.

Auschwitz (Oświęcim). The Ger. commandant of the A. concentration camp, Hoess, was tried and executed in Warsaw in 1947 for the murder of 4,000,000 persons in this admittedly the worst of all Ger. death-camps. A. was built in 1941. The figure Hoess gave for those executed by gas was 1,500,000, all Jews, but he admitted under cross-examination that on one night alone train-loads of Jews and gipsies were taken on arrival and thrown into an immense pit and there burnt alive. Witnesses said the number so put to death was 40,000. Such evidence of horrors continued to be given at the trial day by day. The public prosecutor emphasised that at A. executions and torture were carried out on a scale which made it plain that the Nazi aim was total destruction of the Jewish race and total subjugation of the Slavs.

Ausculum, see ASCOLI DI SATHIANO.

Ausgleich, name of a treaty which governed the fiscal, financial, and commercial relations between Austria and Hungary, first concluded in 1867, and renewed in 1878, 1887, 1902, and 1907. Its chief functions were the regulation of the amount contributed by each towards the imperial exchequer, and the proportional div. of the national debt.

Ausonians, name by which Virgil in the *Aeneid* designates the Italians as though they were named after Auson, son of Ulysses. It is also used by Milton.

Ausonius, Decimus Magnus (c. 310-c. 395), Lat. poet, son of a physician of Burdigala (Bordeaux), where he received his education. He first became an advocate, but afterwards a prof. of

grammar and rhetoric. He was so successful that the Emperor Valentinian invited him to Rome to be the tutor of his son Gratian. When the latter came to the throne he bestowed high rewards on his teacher, giving him the prefectures of Gaul and Italy, and afterwards (379) the consulship. At the death of Gratian, 383, A. retired to Burdigala. His contemporary reputation seems hardly justified by his surviving works; he was rather a verse-maker than a poet, and his writings are marred by licentiousness. See the ed. with trans. by H. G. Evelyn-White (Loeb Library, 2 vols., 1919-21).

Auspices, see AUGUR.

Aussee, Bad, Austrian spa in the prov. of Styria, on the Traun. It is in the Salzkammergut (q.v.), and has a 15th-cent. church. There are saline springs and salt mines. Pop. 5700.

Aussig, see ÚSTÍ NAD LABEM.

Aust-Agder, S. co. of Norway, bordering the Skagerrak. Area 3606 sq. m.; pop. 75,800.

Aust Cliff, famous Rhaetic bone-bed in Gloucestershire. The bed is exposed on the bank of the Severn at this locality.

Austen, Charles John (1779-1852), younger brother of Jane A., Brit. rear-admiral (1844). Assisted in the capture of the *Komet*, the *Tribune*, the *Ville de l'Orient*, and the *Scipion*; was wrecked in the *Phoenix* (1816); commanded the *Aurora* in the W. Indies (1826-8), being engaged in suppressing the slave trade; assisted at the bombardment of St Jean d'Acre (1840).

Austen, Sir Francis William (1774-1865), elder brother of Jane A., the novelist, entered the Royal Naval Academy in 1786. Two years later he joined the *Perseverance* brig, thus commencing a long and honourable career. During the great Fr. war he was in constant service, attained post rank in 1801, and was flag-captain on the *Canopus* in 1805. In 1809, for distinguished service in the E. Indies, he was presented by the E. India Co. with £1000. From 1810 to 1814 he served chiefly in the N. Sea and Baltic. Was made K.C.B. in 1837, and admiral of the fleet in 1863.

Austen, Jane (1775-1817), novelist, b. Steventon, Hants, daughter of a clergyman who had been a Fellow of St John's College, Oxford. In 1784 she was sent to a school at Reading, along with her elder sister Cassandra, who was her lifelong friend and confidante, but for the most part she was taught by her father, and thus had a far better education than fell to the lot of the average Eng. girl of her class. She began writing at an early age, *Love and Friendship* [sic] dating from her teens. In 1801 the family moved to Bath, the scene of so many episodes in her books, and, after the death of her father in 1805, to Southampton and then to Chawton, a vil. in Hants where the house in which most of her novels were written is still standing. Apart from occasional journeys to London and holidays at Dawlish, Teignmouth, or Lyme Regis, her life was placid and uneventful. In May 1817 the family moved to Winchester so

that she might have skilled medical attention for the consumption from which she was then suffering, but in spite of every care she d. 2 months later and lies buried in Winchester Cathedral. The chronology of her 6 novels is complicated by the fact that the order of pub. is so different from the order of composition. *Pride and Prejudice*, considered by many critics the best, was begun in 1796, the original title being *First Impressions*; offered to a publisher in the following year, it was rejected, and only appeared at last, after revision, in 1813. *Sense and Sensibility* was pub. 2 years earlier, though it had not been begun till 1797, having been originally planned with the title *Elinor and Marianne. Northanger Abbey*, that satire on the 'horror tales' of the time, also begun in 1797, was sold in 1803 to a publisher who made no use of it; in 1816 the MS. was recovered, but it was not pub. till after the writer's death. The hist. of the remaining 3 novels is more straightforward. *Mansfield Park*, begun in 1811, was pub. in 1814; *Emma*, written in 1815, appeared in 1816, the year after *Persuasion*, the last of the novels, was written, to be pub. posthumously. *Sanditon*, a fragment written in the year of her death, was first pub. in 1925. J. A.'s novels, like her life, are uneventful. Though pub. in the 19th cent. they really belong to the 18th, for there is little passion or romantic atmosphere in any of them. She lived right through the Napoleonic wars, yet no reference is made to the events of the time, even though naval officers (2 of her brothers rose to be admirals) figure so frequently in her pages. But in her own limited sphere, depicting the actions and describing the society of Eng. country families, she is unsurpassed. She herself spoke of 'the little bit (2 in. wide) of ivory on which I work with so fine a brush as produces little effect after much labour.' Her genius was at once recognised by such critics as Coleridge, Southey, and Macaulay; and Walter Scott declared 'she had a talent for describing the involvements and feelings and characters of ordinary life which is to me the most wonderful I ever met with.'

The standard ed. of her works is that of R. W. Chapman, 1923, who also ed. 3 vols. of juvenilia and fragments, 1922-51, and her letters, 1932. See J. E. Austen-Leigh, *A Memoir of Jane Austen*, 1871; C. Hill, *Jane Austen, her Homes and her Friends*, 1901; G. E. Mitton, *Jane Austen and her Times*, 1905; F. W. Cornish, *Jane Austen*, 1913; R. Brimley Johnson, *Jane Austen*, 1930; David Cecil, *Jane Austen*, 1935; M. M. Lascelles, *Jane Austen and her Art*, 1939; R. W. Chapman, *Jane Austen, Facts and Problems*, 1948; C. Austen, *My Aunt Jane Austen*, 1952; M. L. Becker, *Presenting Miss Jane Austen*, 1952.

Auster, in Rom. literature, the S. or SW. wind; referred to by Virgil in his second eclogue, l. 58.

Austerlitz, see SLAVKOV.

Austin, St., see AUGUSTINE, ST.

Austin, Alfred (1835-1913), Poet Laureate, b. Leeds, son of a merchant. He was educ. at Stonyhurst, Oscott, and London

Univ., graduating in 1853. He became a barrister in 1857, but within a few years turned to literature, making his first success in 1861 with a lively satirical poem, *The Season*; this being strongly attacked, he retorted with another satire on his assailants. He pub. many works in prose and verse, including tragedies, lyrics, poems on historical persons and events, and, above all, poetry and prose descriptive of nature, the latter subject being perhaps most congenial to his muse. One of his best-known books is *The Garden that I Love*, 1894, a prose idyll. A. had a considerable place in journalism, as a leader-writer and correspondent, and was for some years editor of the *National Review*. At the death of Tennyson in 1892 everyone recognised that the 2 greatest surviving poets were both unsuitable for the laureateship; and the selection, which aroused much controversy, was left in abeyance until 1896, when A. was appointed. See his autobiography, 1911, and Norton B. Crowell's *Alfred Austin, Victorian*, 1953.

Austin, Herbert, 1st Baron Austin (1860-1941), motor-car manufacturer, b. Little Missenden, Bucks, educ. at Rotherham Grammar School and Brompton College. In 1882 he went to Melbourne where he served his engineering apprenticeship, and later joined Wolseley who was developing a sheep-shearing machine. Having returned to England in 1893 he became manager of the Wolseley Tool and Motor-car Co. in 1901, and in 1905 he founded his own A. Motor Co. He was elevated to the peerage in 1936. His major achievement was the development of the famous 'Austin Seven', an extremely efficient, cheap, light, and economic small car with an amazingly long life—cars of the 1924 model are frequently seen on the roads to-day. The A. Motor Co. merged with Morris Motors to form the Brit. Motor Corporation on 28 Feb. 1952, as a holding company with a share cap. of £5,000,000, controlling 42,000 workers and with an ann. output of 400,000 vehicles.

Austin, Horatio Thomas (1801-65), Eng. navigator and explorer, served under Parry in 1824 in his fruitless attempt to find the NW. Passage. He distinguished himself in the Egyptian expedition of 1840. From 1850 to 1851 he commanded an expedition sent in search of Franklin, in the *Resolute*, *Assistance*, *Pioneer*, and *Intrepid*, to the Canadian Arctic.

Austin, John (1790-1859), writer and authority on jurisprudence; after a short career in the army, during part of which he served in Sicily, he was called to the Bar in 1818. His success as a barrister was indifferent, and in 1825, his health giving way, he retired from legal practice. In 1826 he was appointed prof. of jurisprudence in the newly founded univ. of London. The success of his lectures was not maintained, and in 1832 lack of students induced A. to resign the chair. In 1833 he was appointed a member of the commission on the reform of the criminal law, and in 1836 a member of the Maltese commission. A.'s lectures and writings

on jurisprudence are distinguished by originality and power of expression, and have exercised great influence in modern conceptions of the subject. The philosophical value of his work has been disputed, but in his *Province of Jurisprudence Determined*, pub. in 1832, and treating of the relation between law and ethics, his doctrine of utilitarianism is admirably presented. His *Lectures on Jurisprudence or The Philosophy of Positive Law* was ed. and pub. after his death by his wife, Mrs Sarah A. (q.v.). His collected writings have been pub. under the editorship of his son-in-law, Mr Robert Campbell, and in this form have gone through sev. eds. See Preface by his wife to *The Province of Jurisprudence*, 1861, and the interesting account by John Stuart Mill in his *Dissertations*.

Austin, Sarah (1793-1867), wife of John A., pub. sev. trans. from the French and German, including Guizot's *English Revolution*, 1850, and Ranke's *Popes*, 1850, and *History of the Reformation in Germany*. She was also the author of *Germany from 1760 to 1814*, 1854, and *Letters on Girls' Schools and on the Training of Working Women*, 1857.

Austin, Stephen Fuller (1790-1836), founder of the rep. of Texas, was the son of one of the early settlers in the dist. In 1822 he planted the first Anglo-Amer. settlement, on the Brazos. In 1834, in consequence of his attempts to secure the recognition of Texas as a separate state of the Mexican Rep., he was imprisoned for some months in Mexico City.

Austin: 1. Cap. of Texas, U.S.A., on the Colorado R. and co. seat of Travis co. It was first built and named Waterloo by Amer. settlers in 1838, the Texans having won their independence from Mexico 2 years earlier. It was renamed A. in honour of one of their leaders in 1839 when they made it their cap. It is now a city with considerable trade and manufs., a fine capitol, and a univ. Pop. 132,000.

2. City, cap. of Mower co., Minnesota, U.S.A., in agric. area 35 m. SW. of Rochester near Iowa state line, with railway repair shops. It manufs. food products. Pop. 23,100.

Austin Friars, name of a well-known monastery of the Augustinian order, at one time situated in Broad Street, London. It was founded in 1253 by the Earl of Hereford.

Austral Islands, in the SE. Pacific, are part of Fr. Oceania. They include 5 inhabited and 2 uninhabited is., extending over a distance of 800 m., about 300 m. S. of Tahiti. The inhabited is. are Iturutu, Tubuai, Rimatara, Raiavavae, and Rapa; the uninhabited are known as the Bass Rocks (or Marotiri) and Iuili (or Marla) Is. Total area 63 sq. m.; pop. (1951) 3983. Though volcanic in origin, none of the is. rises to great height. They are fertile, well wooded, and well watered. The natives are handsome and independent; they build and operate their own schooners. Exports include arrowroot, native hats and mats, copra, coffee, oranges, and livestock. No persons, other than natives, may visit Iturutu or Rimatara, the object

of this edict, issued in 1938, being to keep these Polynesian people unspoiled.

Australasia (S. Asia). This term is sometimes used as the equivalent of Oceania, and as such indicates Australia with the neighbouring is.—Tasmania, New Zealand, New Guinea, the New Hebrides, New Caledonia—the Malay Archipelago, the Philippines, and the other is. of the Pacific. Geographically it is most frequently used to denote Australia with Tasmania, New Guinea, New Zealand, New Caledonia, and the Solomon, Bismarck, and New Hebrides groups. It is also popularly used to signify the Brit. Australian possessions.

Australia, continent lying wholly in the S. hemisphere. Its position is between 10° 4' and 39° 8' S., and between 113° 8' and 153° 39' E. Its dimensions are 2400 m. from E. to W., and 1971 m. from N. to S. Approximately the area is 2,974,581 sq. m. Its nearest distance to England is about 11,000 m. Its coastline is 8850 m.

Physical. The whole continent of A. is, roughly speaking, a vast, irregular, and undulating plateau, part of which is below sea level, bounded on the E. by the Great Dividing Range and elsewhere largely by low sandy shores. The noticeable features of the continent of A. are: (1) its comparatively smooth outline; (2) its poverty of water communication with the interior; (3) the absence of active volcanoes and snow-topped mts; and (4) its antiquity. In the question of age, A. is claimed to be one of the oldest existing land masses. Its boundaries are, on the N., the Timor Sea, the Arafura Sea, and Torres Strait; on the E. the Pacific Ocean; on the S. the Bass Strait and the S. Ocean; and on the W. the Indian Ocean. The land surface stands at the top of a series of 3 terraces which rise from the ocean bed. In the Pacific the base of these foundations lies at a depth of 15,000 ft below the sea level. The next layer has a depth of 8000 ft. Where this terrace approaches the coast it becomes a continental shelf, and by it are connected A., New Guinea, and Tasmania. The Great Barrier Reef (q.v.) forms the edge of this shelf as it rounds the Queensland coast. Compared with other continents A. attains a mean altitude lower than them all. Generally the whole continent may be called a plateau whose interior is depressed and barren. The E. half of the continent is occupied by a plain 500,000 sq. m. in extent.

The Australian coasts are singularly free from inlets of the sea, save for the N. coast where the Gulf of Carpentaria forms the chief bay of the entire coast. Tasmania is the only important is. belonging to A.; those of New Guinea, Timor, etc., belong to other systems. There are numerous small is. off the coast, one of the largest being Kangaroo Is. at the entrance of St. Vincent's Gulf, but these are relatively unimportant. The mts of A. may be classed into 3 groups: (1) the E. Cordillera running parallel to the E. shore, (2) the central mts, comprising sev. ranges in S. A. and N. Ter., and (3) those of the

W., close to the shore. The highest point of the continent is Mt Kosciuszko, 7327 ft, in the Australian Alps, New S. Wales. Others which are also prominent are Mt Townshend, 7266 ft, and Mt Twynam, 7200 ft, also in New S. Wales, and Mt Bogong, 6508 ft, and Mt Feathertop, 6303 ft, in Victoria.

It is only within recent times, geologically speaking, that volcanic absence has been a characteristic of A. On some of the mts in W. Victoria the cones are quite intact and beds of scoriac have not yet been affected by denudation. Towards the Tertiary age large beds of lava were poured from sev. points of the Great Dividing Range, and it is worthy of note that volcanic action was confined to a wide region parallel to the coast.

The coastal region, save for the country round the Bight and Spencer Gulf, is well watered. On the E. coast are many large rvs. flowing into the Pacific Ocean, but the majority have short and rapid courses. Of the Queensland rvs., the finest is the Burdekin. It drains an area of 53,500 sq. m. and empties itself into Upstart Bay. Second in size is the Fitzroy, flowing into Keppel Bay. There are sev. important rvs. in New S. Wales, of which the largest is the Hunter, whose course is 200 m. The Murray, c. 1600 m. is the prin. riv. of A.; it passes through Lake Alexandrina, thence into the sea at Encounter Bay, in S. A.; its chief tribs. are the Murrumbidgee, Lachlan, and Darling. The prin. rvs. in the W. are the Swan, Murchison, Gascoyne, Ashburton, Fortescue, and the Fitzroy. There are sev. navigable rvs. in the N. Ter.: the Victoria, the Fitzmaurice, Daly, Adelaide, and Roper. Sev. large rvs., subtropical in character, drain the country around the Gulf of Carpentaria. The Darling is navigable for small steamers in times of freshets as far as Walgett, 1758 m. above its junction with the Murray. For further detail see NEW SOUTH WALES; NORTHERN TERRITORY; QUEENSLAND; SOUTH AUSTRALIA; TASMANIA; VICTORIA; WESTERN AUSTRALIA.

The lake region is a noteworthy feature of the interior. The extent of the lakes varies with the advent of the rains. The largest, Lake Eyre and Lake Torrens, are over 100 m. in length during a flood. During dry seasons their water is brackish and they are little more than salt-encrusted marshes.

Central A. is prolific in its store of subterranean water. Artesian wells have been sunk thousands of feet and much use has been made of this water, particularly in Queensland and New S. Wales. The water is forced to the surface by hydrostatic pressure of accumulated water at a higher level.

The climate of A. varies less than might be expected from its great size. Its distance from the Antarctic circle and from the equator, and, in the great plains, the enormous absorption of heat by day causing its radiation by night, form powerful factors in determining the uniformity of the climatic conditions. Two-fifths of A. receives less than 10 in. of rain

throughout the year, but the rest of the continent may be said to enjoy a fairly good supply. The NW. coast is subject to tropical downpour from Dec. to Mar., while the remaining coasts enjoy a mean rainfall of 50 in. in the E., and much less in the S., on an average 24 in., while part of the S. and W. coasts attains only 10 in. to 20 in. The rainfall throughout most of the country is uncertain, and not infrequently droughts have caused heavy losses to settlers, while, when the season breaks, almost as much destruction has been caused by floods. Much has been

Australian Government

RIBBON OR MANNA GUM (*E. viminalis*)

The ribbons of bark that hang from the trunks are often 15–20 ft long.

done to alleviate this problem by irrigation, especially in the Murray basin, where dams, rvs., locks, and weirs have been constructed. The scarcity of natural water has been mitigated to some extent by borings. The huge Hume reservoir on the Murray near Albury has an area 2½ times that of Sydney harbour and a capacity of 2,500,000 ac.-ft of water; the Snowy R. diversion through the Alps into the Murray and Murrumbidgee will eventually supply an additional 2,000,000 ac.-ft of water a year for irrigation, 5 times the existing amount available.

Geologically, A. seems to consist chiefly of Palaeozoic and Cainozoic or Tertiary formations, though Mesozoic or Secondary deposits have been revealed. The Grampians, Pyrenees, Great Dividing Range, Australian Alps in Victoria, the Blue Mts in New S. Wales, the Dividing Range in Queensland, consist chiefly of Silurian strata interrupted here and there by

granite, syenite, etc. This Silurian character also dominates S. A.; a large area to the S. and W. of W. A. shows igneous rocks, while traces of Palaeozoic elements are found in the Darling Range. There are no Carboniferous rocks at present known in S. and W. A. Metamorphic rocks occur at intervals in Queensland and in the NW. of Arnhem Land. In New S. Wales and the SE. of Victoria sandstone is found among the older substances. A huge area of the continent abounds in Tertiary deposits stated to be Pliocene. These formations include the desert sandstone, coral limestone, and to a large extent the conglomerates and clays of the gold diggings. The earliest discoveries of gold were made in recent and Tertiary alluvia. Quaternary deposits occur in the Upper Macquarie and Upper Murrumbidgee rivers, and they are rich in fossils which supply an illuminating knowledge of the past fauna of A.

The botany of A. contains many characteristics both unique and phenomenal. Its species number many more than are found in all Europe. A feature of the trees growing on the coast highlands is their uniformity of shade. This is a dark olive, and is observed on both the upper and under surface alike. Their foliage extends in a vertical direction, and hence there is a great increase in the amount of available sunlight. In large and monotonous areas is the 'scrub,' a plant of dismal and unbroken appearance. It contains, however, one agreeable type, that of the tea-tree, a flowering shrub and a species of the *Melaleuca*. This is found in nearly every part of the continent. The forests contain many giants, among which is the gum-tree, or *Eucalyptus* (q.v.), attaining a height of 250 ft. with a girth of 12 to 20 ft. while in the S. there are many trees which grow to over 300 ft. high. The valuable she-oaks, beef-woods, or casuarinas are found in the S., W., and interior. They bear no leaves and have at the termination of their branches rigid drooping 'tails.' The jarrah, or Swan R. mahogany, through its power to resist the attack of the white ant, is used for railway sleepers and piles. The most interesting feature is the acacia. It is represented by 300 species, and with their striking yellow blossoms and fragrance provide a great source of beauty. Here and there are spots most luxuriantly vegetated. Palms, Indian figs, creepers, ferns, flame-trees combine to form a harmony of colour. The flame-tree is so named from the effect it presents when in blossom. Its clusters of red flowers, indeed, are sufficiently conspicuous on the mts to act as a signal to ships miles out at sea. Araucarian pines are now confined to A. and adjacent regions. Many European trees have been successfully introduced, and the Scotch thistle, from its readiness to develop, has caused the different municipalities much expense in its extermination.

But if the flora of A. presents strange characteristics, the zoology is even more

striking. The mammals of other lands are absent to a remarkable degree, while the pouch-bearing animals, here so prolific, are only represented elsewhere by the opossums of America. Of these marsupials the largest is the kangaroo, which attains a height of 5 ft. Other varieties are the wallaby, the hare kangaroo, and the rat kangaroo. In New S. Wales and Queensland the fruit-eating bat is found, while seals and sea lions frequent the shores, that of Queensland also abounding in the dugong or sea cow. Phalangers are nocturnal animals,

Australian News and Information Bureau

KOALA BEAR

feeding on leaves and inhabiting the hollows of trees. Flying opossums may be seen at night-time, while the flying mouse, of extraordinarily minute dimensions, is a feature of the continent. Other animals include the tarsipes, a honey-sucker; the wombat, a root and grass feeder; the dingo or wild dog, and the koala bear; native cats; the ant-eater of W. A., and the platypus (q.v.). The introduction of European creatures has proved only too successful. The prolific increase of the rabbit and sparrow has involved the gov. in enormous expense in the attempted suppression of the now-recognised vermin. Originally introduced for the purposes of exploration, the camel is now used with great profit in outlying dists. as a beast of burden. Australian birds excel those of more temperate lands in beauty of plumage and form. Those specially famous for their beauty are the parrot, cockatoo, regent bird, rifle bird, flycatcher, and lyre bird. A scarcity of

fruit and an abundance of flowers cause the prevalence of flower-eating birds, among which are the varieties *Melliphagidae* and *Trichoglossidae*. The emu and cassowary belong to the same family as the ostrich of Asia and Africa. A strange and unsightly bird is the podargus, commonly known as morepork, from its queer cry. There are altogether 650 different species of Australian birds, while Europe can boast only 500. There are many snakes, of which the *Elapinae* (which include the Indian cobra) comprise the majority; the viper is unknown. The bite of 6 of the many kinds of venomous snakes is fatal. Fish teem in rivers and the sea.

Aborigines. The aboriginal inhab. of A. are a distinct species of the human race, probably coming originally from the Malay Peninsula. They are tall and dark-skinned, with black curly hair and wiry physique. In their native, tribal state they are one of the most primitive peoples in existence. They have a complex social organisation, but have no knowledge of metals or agriculture. They lead a nomadic existence wandering in search of game and edible vegetation. Among their weapons is the boomerang (q.v.). Fewer than one-third of the total now live as nomads, mostly in the N. Ter., the N. of W. A., and in N. Queensland. Many live on supervised reservations and others live the ordinary life of the remainder of the Australian community. They are excellent horsemen and many are employed as stockmen on cattle stations. They are remarkably proficient trackers and superb bushmen, and as police trackers have assisted in the arrest of criminals and in the rescue of lost people.

It is believed that at the time of the first settlement in 1788 there were about 300,000 aborigines. To-day there are about 47,000 of full blood and about 27,000 of half aboriginal blood. Of recent years the aboriginal pop. of some areas, notably the N. Ter., has begun to rise slightly. In the early days of colonisation the aborigines, who could offer little resistance to the whites, sometimes suffered at the hands of the settlers, particularly in Van Diemen's Land. On the mainland clashes occurred as the pastoralists moved inland, but the continent provided a refuge until missionaries and humanitarian sentiments were instrumental in securing protection for them. Some states were slow to take action, but by the end of the 19th cent. all had passed legislation making the welfare of the aborigines a public concern. Neglect and misconceived policies rather than ill treatment have led to their decline. In recent years greater efforts have been made to safeguard their welfare, to enable them to take their place as members of the Australian community and to benefit from the social services available in the welfare state. See A. P. Elkin, *The Australian Aborigines*, 3rd ed. 1954.

Population and Products. In addition to a federal gov., A. is divided politically into 6 states, New S. Wales, Victoria,

Queensland, S. Australia, W. Australia, and Tasmania, the la. of Tasmania forming an integral part of the Australian Commonwealth. Added to these are the N. Ter. and Australian Capital Ter. The pop. of the whole continent as at 31 Mar. 1957 was 9,591,437. The people are predominantly of Brit. descent, despite a considerable number of immigrants from other European countries in the years after the Second World War. For the last 10 years natural increase has been relatively high, being about 13 or 14 per 1000 of pop. The total white pop. in 1957 was composed of:

New S. Wales	3,607,698
Victoria	2,659,783
Queensland	1,383,535
S. Australia	868,687
W. Australia	688,132
Tasmania	328,695
N. Ter.	18,254
Australian Cap. Ter.	36,653

For a long time after the colonies were founded they were dependent upon their primary industries, but in recent years industrialisation has made rapid progress, and though primary products still comprise the bulk of exports, they no longer are the greatest source of the national income. Gross value of pastoral production, 1955-6, was estimated at £515,927,000, the greater part of which came from wool (£332,096,000), which has remained the most important single industry in A. Gross value for the wheat crop was £126,091,000. Other important crops are oats, hay, barley, sugarcane, maize, fruit, vines, and potatoes.

Minerals have formed a significant part of A.'s wealth, but in more recent years the value of mineral production has fallen proportionately to that of the great rural industries and is now only about 10 per cent of the net value of production of all primary industries. The discovery of gold was an event of extreme importance in the early economic development of the country; production has since fallen tremendously, though A. remains fourth largest gold producer in the world, value of output in 1956 being nearly £16,345,912. In recent years, with the rapid growth of secondary industries, the output of silver-lead-zinc, iron and copper ores, and coal has increased significantly. Silver-lead-zinc production is now more than 2½ times the value of gold production. Coal deposits are extensive, particularly in New S. Wales, and output in 1956 was 19,290,642 tons of black coal and 10,559,801 tons of brown, mainly from Victoria. Other minerals include tin, sulphur, tungsten, antimony, bismuth, manganese, and uranium. Considerable attention has been paid to uranium since the discovery of the possibility of using atomic energy. Deposits have been discovered in sev. parts of the Commonwealth, and mining has commenced at Rum Jungle in the N. Ter., where deposits are known to be substantial.

A significant feature of the Australian economy in recent years has been the rapid industrialisation. At the turn of

the cent. manufacturing was largely confined to the production of consumer goods and the processing of primary products. After federation a uniform protective tariff provided an incentive to the estab. of new industries, and the fall in imports and the increase in demand during the First World War accelerated industrial development. Iron and steel works and related and subsidiary industries were estab., together with a wide range of high-grade products such as textiles, metal manufs., and electrical goods. Though expansion was checked by the depression, increased protection during the period of recovery and, later, the pressure of demand during the Second World War resulted in further expansion. New industries include the manuf. of motor-cars, tractors, earth-moving equipment, machinery, and machine tools. In 1955-1956 the value of the output of manufacturing industries was £3,761,094, net value being £1,494,790. Manufacturing is now A.'s biggest single economic activity, employing almost double the number of persons engaged in agric., pastoral, and mining industries combined. Primary industries are still of major importance in overseas trade, wool alone accounting for half the total value of exports in 1955-6, and wheat, meats, butter, sugar, and flour are the next in importance. Manufs. comprised only 8.9 per cent of exports, though the proportion had increased since 1938-9 when it was 6.4 per cent. Yet the Australian economy has made remarkable progress towards maturity despite continuing large imports of manuf. goods. See *Year Book of the Commonwealth of Australia*.

Discovery. The actual date of the discovery of A. is doubtful. Various claims are made, among them the sighting of W. A. in 1522 by Magellan's followers. There is no doubt that in the 16th cent. Sp. and Portuguese explorers sailed within sight of the coasts of A. and that Dutch explorers in the first half of the 17th cent. voyaged along stretches of the N. and NW. shores. They were, on the whole, unfavourably impressed and they failed to realise the full significance of the discoveries they had actually made. Belief in the existence of a S. continent gradually strengthened as the trading vessels, on the way from the Cape of Good Hope, touched the W. and NW. shores, and, with the expedition under Tasman, the N. and NW. coasts of A. were accurately charted. See *TERRA AUSTRALIS INCOGNITA*. As far as is known Dampier in 1688 was the first Englishman to sight A., and his report on the NW. coast was not such as to encourage further interest. Tasman had discovered Van Diemen's Land (Tasmania) and New Zealand in 1642, but it was not till 1770, when Capt. Cook explored the entire E. coast of A., that the E. limits of the Australian land mass became known.

Further contributions to the knowledge of the coastline were made by Bass and Flinders, though not till 1843 was the exploration of the whole coastline completed, by Darwin in the *Beagle*. Bass

and Flinders together had circumnavigated Tasmania in 1798. Flinders in 1802 sailed right along the S. coast of the continent, and in the following year circumnavigated A.

Settlement. Cook's discovery of the E. coast of A., and particularly the report by Sir Joseph Banks (q.v.), the scientist, that the land in the vicinity of Botany Bay was fertile and suitable for settlement, encouraged the Brit. Gov. to contemplate the estab. of a colony there for the refugee loyalists of America. The project was abandoned and instead the Brit. Gov. decided to establish a penal settlement. The first fleet, under the command of Capt. Arthur Phillip (q.v.), who was to be the first governor of New S. Wales, as the colony was called, arrived in Jan. 1788. Many difficulties were encountered in the first few years. The land was not as fertile as Banks had anticipated, the convicts were poorly equipped and ill-suited to become settlers, and for some considerable time the colony remained far from self-supporting, and often the whole settlement was placed on short rations. Maintaining discipline was aggravated by the type of man enlisted in the New S. Wales Corps and by the tendency of officers to regard A. as a purely financial speculation. They acquired land, virtually monopolised trade, exploited the colonists to the best of their ability, and finally mutinied against Governor Bligh. This mutiny brought matters to a head in A., and the Brit. Gov. adopted a new policy which was more reasonable. It recalled the New S. Wales Corps, and chose an army officer, not a naval captain, for the next governor.

The arrival of Governor Macquarie (q.v.) accompanied by his own regiment in 1809 inaugurated a period in which the colony ceased to be primarily a jail. Convicts by good conduct might earn their release, and though the support given to emancipated convicts by Macquarie was not always acceptable to free settlers, and the policy was reversed later under Governor Darling, and free settlers who took up land were assigned convicts to work for them, the settlement grew rapidly. The growing proportion of free settlers made the granting of representative and then responsible gov. inevitable.

During the period of Macquarie's governorship the Blue Mts, which had been a barrier to the colony's expansion, had been crossed by Blaxland, Wentworth, and Lawson in 1813. This opened the way for the pastoral industry to spread inland. Already John MacArthur (q.v.), with his experiments in breeding for fine wool, had demonstrated that there was a great future for the wool industry. The crossing of the Blue Mts was the first of a number of endeavours which explored a new land and opened the way for further expansion of the colony. Within 10 years Oxley had explored the headwaters of the inland rivers of New S. Wales; in 1828 Hamilton Hume reached the Murrumbidgee, and 5 years later travelled from Sydney to Port Phillip, crossing the upper

Murray on the way. Sturt (q.v.) in the meantime had solved the problem of where the inland rivers flowed, and Cunningham had pushed N. to the Darling Downs. Later, explorers turned their attention to the centre of A. While Eyre's (q.v.) expeditions in 1840 and 1841, Sturt's journey into the centre in 1844, the ill-fated attempt by Burke and Wills, 1860-1, to cross A. from S. to N., and the more successful expedition undertaken by Stuart in 1862 added greatly to the knowledge of A., they did not have significant effects on settlement because of the barren nature of much of the territory traversed.

When the land was suitable the pastoralists followed close behind the explorers. Between 1820 and 1850 they had occupied 70 million ac., most of the good grazing land in E. A. The expansion was outward from Sydney and, after 1837, from Port Phillip (Melbourne). As early as 1803 two penal settlements had been made in Van Diemen's Land and from there squatters had crossed to Port Phillip. A new settlement was made at Moreton Bay in 1824, but for some years remained primarily a jail. Suspicious of Fr. intentions had promoted the colonisation of Van Diemen's Land and were to influence the settlement of W. A. in 1829. The Brit. Gov. adopted the proposal that 40 ac. of land should be granted to each settler for every £3 or £3 worth of goods he brought with him. Land was granted freely in the first few years but the scheme was not notably successful. Too often large landowners appropriated the best land near the towns, too few labourers were available to work the land, and small settlers often found themselves isolated and far from the towns. The land was not as fertile as anticipated and some years elapsed before the colony became self-supporting. A different experiment had been tried in S. A., where a colony had been founded in 1836 on the principles of Wakefield, that land be sold at a reasonable price and the proceeds be spent on immigration. The new colony also had its difficulties, amongst which was a tendency to speculate in land rather than to develop it, though by the mid 1840's it was prospering and expanding.

Land policy and labour supply were important issues in New S. Wales in this period. Originally convicts or ex-convicts had been the chief source of labour for the colonies, but in the thirties an increasing number of people came to A. as assisted immigrants. As the number of convicts grew proportionately smaller, the agitation for the cessation of transportation gained strength, and in 1840 all transportation to the mainland stopped, though convicts continued to be sent to Van Diemen's Land till 1852. An attempt to revive transportation during the 1840's was defeated. Two issues were involved in land policy. First, there was the question of whether the land should be granted or sold; and, arising from this, the demand that the Brit. Gov. should surrender its control over the alienation of land, a demand which implied self-gov. By 1830 much good

land had already been given to a relatively small number of colonists, and the reversal of the policy in the 1830's, whereby land was to be sold by auction with a fixed minimum price, was bitterly opposed by the squatters. The question was temporarily settled in 1847 when squatters gained the security they sought with the right to 14-year leases and the option at any time of purchasing.

Control over land policy was an important reason for the demand for self-gov.; it also involved a struggle between the squatters and the more democratic section of the community, composed mainly of the assisted immigrants. Since 1823 the Governor of New S. Wales had been assisted by an executive council and a legislative council. The latter was originally nominated but in 1842 became partly elected, though on a franchise such that it was representative of the wealthy landed interests. The Brit. Gov. had conceded in principle responsible gov., and between 1853 and 1859 most of the essential mechanism of parl. democracy had been established in all colonies, except W. A., Queensland being separated from New S. Wales in that year. In the struggle between the two sections of the community, the democratic element had succeeded in defeating the more extreme of the squatters' proposals.

The gold-rushes, which began in 1851 following the discoveries of that year, no doubt hastened the granting of self-gov. and had far-reaching effects on the economic development of the country. Gold trebled the pop. in 3 years, increased trade, and brought enormous wealth to the colonies, but it was not a source of undiluted benefit. Immediate problems were encountered in the administration of the gold-fields, for the miners were lawless and resented the licensing system. Riots were frequent, the most serious developing into the battle of Eureka stockade (q.v.). The rebellion was quickly suppressed but it helped to bring about a number of reforms in the management of the fields.

The prosperity of the early years of the gold-rushes did not last long. The country benefited immensely, but as men began to return from the fields new problems arose. The demand for the opening of the land, which was in the hands of a relatively small number of squatters, resulted in a series of land Acts designed to enable selectors to purchase small holdings for agriculture. Free selection was not notably successful and after 20 years most of the land still remained in the squatters' hands, though they had converted much of it from leasehold to freehold.

This was only one of the problems the states faced during the 50 years after the granting of self-gov., and many of these were problems such as would determine the kind of society which was to emerge in this new country. With some the pattern had been determined by the end of the cent., while others had to await the establishment of the Commonwealth in 1901 for a uniform policy to be pursued. Yet where the states acted independently in many cases

a remarkably uniform pattern emerged. In relation to education and religion, land policy, railways and development, and immigration they pursued policies which were broadly similar. All colonies within a few years of receiving responsible gov. had decided that there should be no state support for religion. In all the trend was to make education free, compulsory, and secular, though this was not done so quickly, nor achieved without bitter disputes. It was, however, a decision which has remained a determining factor in educational policy. Adherents to the Church of England form the largest religious group in the community, twice as big as any other, but the existence of substantial Catholic, Presbyterian, and Methodist minorities has undoubtedly been a major consideration. Theological studies have been excluded from the univs. which have been estab. in each of the cap. cities. In other ways all states progressed in the same direction, undertaking an ever-widening range of activities to assist in the development of the country. They built railways, roads, bridges, telegraphs, constructed irrigation works, hospitals, and schools. All passed legislation to restrict Asiatic immigration. The gold-fields had attracted a large number of Chinese, and as the competition from these began to be felt in the not so prosperous years after the rushes were over, the movement to exclude all who might lower the standard of living gained force. The White A. policy had been determined before federation, and the Commonwealth legislation in the early years of the 20th cent. only made its application uniform. Already by the end of the 19th cent. trade unions were a force in the community, and the political Labour party had been formed.

Protection was one issue where the states adopted divergent policies. The influx of new settlers during the gold-rushes had offered an inducement to manufacturing, and some of the colonies, notably Victoria, sought to stimulate their infant industries with protective tariffs. New S. Wales, preoccupied with questions of land policy, benefiting from large coal resources, and influenced by Parkes (q.v.), a confirmed free-trader, rejected protection. The creation of tariff barriers between the states was a cause of growing friction.

The protection issue provided one of the motives for federation, for the disadvantages and inconveniences of border tariffs were only too obvious. But federation was mooted not only to overcome differences but to give expression and effectiveness to agreed policies. The need for a united voice in external affairs, in providing for the defence of the country, and in dealing with certain social and economic problems, and the advantages of uniform immigration laws, all lent force to the argument for some form of unity. It was, moreover, an expression of the nationalist spirit which had steadily gained strength in the last years of the cent. Throughout the 1890's the issues were debated, and despite some reluctance

on the part of state govts. to surrender their powers, the federation came about, and in 1901 the Commonwealth of A. was estab.

Commonwealth government. According to the Constitution Act of 1900, the gov. of A. comprises the governor-general, representative of the queen, a senate, and a house of representatives. The Senate was to consist of 36 members, 6 from each original state, directly elected for a period of 6 years. The House of Representatives was to consist of 75 members elected for 3 years, proportionate to pop., with a minimum of 5 representatives for each state. Membership of both Houses has since been increased, the Senate to 60 and the House of Representatives to 124, of whom 46 are representatives for New S. Wales, 33 for Victoria, 18 for Queensland, 11 for S. A., 9 for W. A., 5 for Tasmania, and 1 each for the N. Ter. and for Australian Capital Ter., these having limited voting powers.

The div. of powers between state and Commonwealth was made, broadly, on the principle that those powers which were concerned solely with internal affairs should be vested in the states. The restrictions thus imposed on Commonwealth action have at times proved irritating, and on occasions have prevented the gov. from pursuing policies it has considered necessary both for the economic development of the country and for the improvement of social conditions within the community. Frequent attempts have been made to amend the constitution but with little success. Nearly all proposed amendments have been designed to increase Commonwealth powers, but with the exception of 1946, when the Commonwealth was given control of social services, these proposals have been rejected by the electorate. The Commonwealth has desired full powers over trade, commerce, industrial matters, trusts, and monopolies, but though these have been denied it, judicial review and its financial supremacy have enabled it to exert an increasing influence over state policy.

The factors which had induced the formation of a federation, and had helped shape the constitution, largely dictated the problems to which the Commonwealth Parliament first turned its attention. Within a decade legislation had been passed to establish an Australian navy and military force, to impose a protective tariff, and to implement White A., and the first steps towards the social welfare state had been taken with the granting of old age pensions. The Labour Gov. which came into power in 1910 was already beginning to chafe under the limits imposed by the constitution when the outbreak of the First World War over-shadowed domestic affairs, and all parties pledged themselves to support the allied cause to their utmost.

History of Australia during and after the First World War. The solidarity of the Australian people in the crisis of 1914 was an eloquent testimony to the strength of the bonds of the Empire. A div. of troops was immediately placed at the disposal of the Imperial gov., and a small, highly

efficient force was promptly sent to German New Guinea. At no time did A. adopt conscription, though two attempts were made to introduce it. Both times a majority of the people voted against it. The issue roused considerable bitterness, particularly within the Labour party, which, at the cost of some of its ablest members, opposed conscription. This opposition to compulsory overseas service did not mean that most of the people were not sympathetic to the allied cause. Out of 5 million 400,000 enlisted, and total casualties were approximately 220,000, of which the dead amounted to 55,585 and the prisoners of war to less than 200. Sixty-three Australians were awarded the V.C. and 16,814 were awarded other military honours. The Australian war debt was estimated at £300,000,000, the interest on which was £14,000,000, and the ann. charge for pensions was £5,000,000.

Australian troops took part in many of the crucial battles in the war, but it was the Gallipoli campaign that shed an imperishable lustre on their endurance and bravery (see ANZACS and GALLIPOLI CAMPAIGN). They fought also in defence of the Suez Canal and on the Salonika front in the early years of the war, and later in Palestine, Flanders, and France. The Australian soldiers were widely regarded as among the best shock troops in the allied armies. On the Somme, in the Arras area, in the defence of Amiens and the counter-attack, and in the assault on the Hindenburg line the Australians won an enviable reputation as a fighting force. Such battles as Messines, Ypres, Passchendaele, and Mont St Quentin bear testimony to the Australians' valour. Other forces took German New Guinea, Nauru, and the Bismarck Archipelago. These former Ger. possessions were subsequently mandated to the Australian Gov. under the League of Nations. The Australian Navy also served in the war, its most famous feat being the sinking of the Ger. cruiser *Emden* off the Cocos Is. by H.M.A.S. *Sydney* in 1914. See *Official History of Australia in the War of 1914-1918*, ed. C. E. W. Bean.

At the termination of hostilities, A. was represented at the peace conference and became a member of the League of Nations, but while Hughes (q.v.) fought strenuously to safeguard Australian interests in the Pacific and to remove from the covenant any threat to the White A. policy, external affairs quickly faded into the background. Australians were more concerned to get their forces home as quickly as possible and to get back to the problem of developing the continent and improving social conditions. But there was a change in emphasis, in outlook, and in actual policy in the post-war period. Material questions were to dominate the 1920's. Labour had been in the ascendancy before the war but after the split over conscription it lost control, not only in the Commonwealth but in all states except Queensland. By 1924 it had recaptured most of the state govts., but not till 1929 did it regain control in the Commonwealth Parliament. Hughes led a Nationalist

Gov. till 1923, and Bruce (q.v.) a Nationalist Country party coalition till 1929. But the lack of a formative social policy in the 1920's cannot be attributed solely to the loss of Labour leadership. Important, also, was the fact that the arbitration system which had been estab. prewar to regulate wages and working conditions was being seriously challenged, since this undermined the belief in a steady progress towards better social conditions. Throughout the period there were a series of industrial disputes and arbitration seemed powerless to avert them. The situation was aggravated by the div. of the arbitration power between the Commonwealth and the states, with a consequent dual system of regulation, for by 1919 all states had estab. some form of arbitration or wage regulation. The Commonwealth Gov. had tried to make arbitration work, but it failed to persuade the electorate to enlarge its industrial powers and only embittered industrial relations with the introduction of increased penalties for breach of awards. Its subsequent decision to relinquish control of arbitration to the states brought rebellion within its own party and defeat at the hands of the electorate shortly afterwards.

By 1929 the collapse of the defeated gov.'s economic plans was also evident. It had concentrated throughout the 1920's on an attempt to force the pace of economic development, and to this end had generously encouraged immigration and imported capital. Except for a few years before the war there had been no large-scale migration to A. for a considerable time, growth of pop. depending largely on natural increase. The war had helped draw attention to the paucity of A.'s people; the peace brought optimistic estimates of possible expansion. In co-operation with the Brit. Gov., which provided the capital, and the states, which helped settle the migrants, the Commonwealth sponsored ambitious migration schemes, under which £34,000,000 was to be made available for land settlement and for public works associated with this. For despite the development of secondary industries, a development which was assisted during the 1920's by steadily increasing tariff duties, A.'s future was still seen primarily in terms of agric. and pastoral industries. That this scheme was misconceived was soon evident, for even before the effects of the depression began to be felt, inability to sell profitably the primary products from these land settlement areas had become a major problem. In fact the target was nowhere near realised, for only £9,000,000 of the loan money was spent and only 200,000 migrants had arrived when signs of the coming depression brought the scheme to an end. But heavy overseas borrowing in the 1920's and dependence upon primary industries in the export trade left A. particularly vulnerable in the depression. A. was one of the first countries to feel its effects; bad seasons and a disastrous fall in the price of wheat had brought to an end the period of

optimistic expansion by the time of the 1929 election.

The new Labour Gov., under Scullin (q.v.), showed some hesitation in dealing with the situation. Tariffs were raised still higher, but the pursuit of the traditional objectives of economy, retrenchment, and deflation caused dissension in Labour ranks, for it was seen by some to involve greater hardships for workers than for other sections of the community. A compromise policy which called for conversion of loans and a limited amount of inflation was finally evolved, but Labour had been seriously weakened, and, defeated in the 1931 elections, remained in opposition for 10 years. Though economic recovery was comparatively rapid, economic problems continued to preoccupy the gov. throughout the 1930's. The gov. was acquiescent when Britain pursued a policy of appeasement in Europe, and though 1934 saw the beginning of rearmament, it was not until war became imminent that real efforts were made to provide adequate defence.

History of Australia during and after the Second World War. On the outbreak of war the Australian Prime Minister, Mr Menzies (q.v.), took the view that since Britain was at war A. must automatically follow, and accordingly, on 3 Sept. 1939, A. declared war on Germany. A. was in many ways unprepared, and it took some time to organise an effective war effort. Still, from the beginning A. co-operated in the Empire Air Training scheme, compulsory military training was introduced, and before the end of 1939 the second Australian Imperial Force had sailed for the Middle E. Australian troops fought in Greece, Syria, and in N. Africa. The political situation in A. in the early years of the war was unstable. The 1940 elections had resulted in the House of Representatives being evenly divided between Labour and non-Labour, with two independents holding the balance. Menzies remained Prime Minister and the Labour party rejected his repeated proposals for an all-party gov., though consenting to be members of an all-party advisory war council. Labour, with its eyes on the E., had questioned the wisdom of sending Australian forces overseas; the belief that Australian forces in the Middle E. had been used without effective consultation with Australian authorities brought criticism from within the gov.'s ranks. In Aug. 1941 Menzies resigned, and following a brief period when Fadden (q.v.) was Prime Minister, Labour, under Curtin (q.v.), assumed control. Labour had not questioned the participation in the war but merely the disposition of troops, and with the attack on Pearl Harbour (q.v.) in Dec. 1941 the cause of the dispute disappeared. As the Japanese pushed S., the recall of 2 of the 3 Australian divs. in the Middle E. offered little reassurance, for at home there were but 1 armoured div. and 7 skeleton divs. of semi-equipped untrained militia; Britain was obviously too occupied in the European theatre of war to provide effective assistance in the defence of A.; and late in

1941 Curtin made his now famous appeal to America for help, an appeal which was interpreted by some as the severing of the link with Britain, though it was but a recognition of the grave peril in which A. found itself. The rest of the war saw close co-operation between the Amer. and Australian forces. A. became the base for the allied campaign in the Pacific, and under the supreme command of General MacArthur the allied forces halted the Jap. drive in 1942-3, and in mid 1943 began the recapture of the is. and the slow re-conquest of the New Guinea coastline. In 1943 the 9th Div., which had remained in the Middle E. and had assisted in checking the enemy advance into Egypt, had been recalled to join the fighting in New Guinea and the nearby is. The last campaign in which Australian troops fought was the invasion of Borneo in July 1945. *See* PACIFIC CAMPAIGNS IN THE SECOND WORLD WAR.

At home, the impact of the war on the life of the community had been considerable even before the Jap. attack prompted much more extensive gov. controls. At first the gov. showed some reluctance to interfere with traditional economic freedoms, but by 1942 it had rationed a wide range of articles, had pegged wages, controlled prices, and had undertaken the direction of labour. Manpower had become a serious problem as Australian industry expanded under the pressure of the increased demands made upon it, once A. became the base for U.S.A. and Australian forces and a source of supplies. The result was a significant change in the structure of the economy, with the estab. of new 'essential' industries, and the expansion of existing ones. *See* *Australia in the War of 1939-45*, ed. G. Long.

Well before the end of hostilities the gov. had begun to consider the problems which would arise with the return of normal conditions. In 1944 it failed to obtain a constitutional amendment which would have ensured for it, for a period of 5 years, the increased control over the economy which it had enjoyed under its defence powers. It was mindful of the depression which had followed the short-lived boom after the First World War and, intent on avoiding this, it decided that demobilisation must depend upon the rate at which men could be absorbed into the economic life of the community. The maintenance of full employment has been a basic consideration in all post-war policy. The gov. drew up plans for projects which would be undertaken if unemployment threatened, reviving for this purpose, amongst other schemes, that for the unification of railway gauges throughout A. In fact this did not happen; the immediate post-war years were a period of rapid expansion, of rising wages, and overfull employment. The two objectives which have so often shaped Australian gov. policies, the improvement of social conditions of the community and the economic development of the continent, again dominated policy in the post-war period. Even before the end of the war measures had been taken to achieve the

first. Family allowances had been paid since 1941 and in 1945 a comprehensive scheme of unemployment and sickness benefits was introduced. It was some time before the hospital and medical benefits section of the scheme were operating smoothly, but to-day those social services expected in the social welfare state are available to the Australian community.

The two main features of the gov.'s ambitious plans for economic development were immigration and public works. The

1949 was the objective of 70,000 a year achieved, but in the next 3 years it was greatly exceeded. It had been expected that large-scale immigration would relieve the labour shortage, but by creating new demands, notably in housing, schools, and hospitals, it aggravated the situation and was one of the contributing factors to the post-war inflation which reached its peak in 1951. It was by no means the only cause. High wool prices, heavy private investment, home building, and huge public works programmes had also been

Australian Government

Sheep being brought in from the back country for shearing.

war had emphasised A.'s relative emptiness; displaced persons in Europe offered a ready source of migrants and a labour shortage in A. provided an added incentive. Gov.-sponsored migration had been tried before, not always with great success. A significant feature of the post-war policy was the planning before migration started. The key question was how many people could be absorbed without adverse effects on the economy, and it was decided that an intake of 70,000 a year, together with natural increase, would result in a 2 per cent pop. increase annually, this being considered the maximum increase possible without economic strain. Another significant feature of post-war migration was the rejection of the old policies of settling migrants on the land, and of encouraging exclusively Brit. migration. Numerically, the migration programme has been very successful. Since the war over a million people have gone to A. At first the numbers were disappointing, and not till

contributory causes. The Commonwealth Gov. had increasingly taken the initiative in planning projects, in co-operation with the states, for national development, the largest single undertaking being the Snowy Mts scheme for irrigation and hydro-electric works (see above). Through its dominating position on the Loan Council, which determines the amount of loan money to be expended each year, and its exclusive right to impose income tax, the Commonwealth exerts considerable influence over state policy. Since 1950, when it became evident that some measure would be necessary to check the inflation, it has used this influence to cut loan expenditure and works programmes. In 1952 more drastic measures were taken when the Menzies gov. (first elected 1949, re-elected 1954 and 1955) decided it had become necessary to reimpose certain controls, notably import restrictions, if a halt were to be put to inflation. These measures have slowed

the pace of expansion and intake of migrants, but have been reasonably successful in restoring economic stability.

A.'s post-war economic expansion has survived inflationary pressures and periodic waves of acute industrial unrest, in which the extreme Left control of some of the largest unions has played a leading part. Politically, the period is notable as one of great crisis for the Labour party, continuously out of national office since 1949, and since 1954 deeply divided against itself (see EVATT, HERBERT VERE and PETROV AFFAIR). But efforts by the Right (chiefly Catholic) wing to displace Evatt from the party leadership failed throughout 1955 and 1956.

A. has been much more conscious of her relationship with other countries since the Second World War. The danger of invasion had brought forcibly to its attention the need to make adequate defence arrangements, and the search for powerful allies has resulted in an attempt to achieve closer association with the U.S.A., while retaining firm ties with the Commonwealth. Membership of the Anzus pact, a defensive alliance between A., New Zealand, and the U.S.A., and later of S.E.A.T.O., has provided considerable reassurance on this question. But the need of establishing friendly relations with Asian countries has been recognised as equally important. To this end A. has increased her diplomatic representatives to Asian countries, and has made large contributions under the Colombo plan for aid to underdeveloped countries. It has also, through its membership of the U.N., tried to make that organisation an effective force in maintaining world peace. Menzies announced his gov.'s support for Anglo-Fr. action in Egypt Oct.-Nov. 1956, but Evatt led Labour's condemnation of it, and, as in Britain, the action came in for a good deal of criticism from members of all parties.

The Arts. Percy Grainger, the Australian musical composer, has achieved international fame, as have the singers Dame Nellie Melba, Florence Austral, and Peter Dawson. Appreciation of music and drama is stimulated by broadcasts from the national stations of the broadcasting commission and commercial transmitters. In painting a new national school seems in process of evolving. The work of such artists as Tom Roberts, George Lambert, Elioth Gruner, Margaret Preston, and others laid a foundation. In portraiture Wm Dobell is noteworthy, and Will Dyson and Norman Lindsay have gained a reputation for black-and-white art outside their own country. Younger artists show a new 'sense of place.' Among them are Russell Drysdale (1912-), Donald Friend (1914-), and Sidney Nolan (1917-). Every state cap. has its national art gallery and also a state art school. Through the munificent Felton Bequest, the National Gallery of Victoria (now one of the richest-endowed galleries in the world) has laid the foundations of a great collection. Australian literature is dealt with in a separate

article. See P. R. Stephensen, *The Foundations of Culture in Australia*, 1936.

Australia Day, 26 Jan., the anniversary of the foundation of Sydney, New S. Wales, in 1788 by Capt. Arthur Phillip.

Australian Alps, mt range in the E.

highlands of Australia, extending for about 300 m. through Victoria and New S. Wales in a N.E. direction, and forming a continuation of the Great Dividing Range. The chief peaks are Mt Kosciuszko (7328 ft), Mt Townsend (7260 ft), Mt Bogong (6508 ft), and Mts Feather-top and Buller. The mts are mostly well wooded and seldom attain the snowline.

Australian Bight, Great, 1600-m. stretch of ocean S. of Australia and extending from Cape Arid in W. Australia to the Eyre Peninsula in S. Australia.

Australian Commonwealth, federal union of New S. Wales, Victoria, S. Australia, Queensland, Tasmania, and W. Australia, constituted by proclamation on 17 Sept. 1900, under an Act of Parliament dated July 1900, which came into existence on 1 Jan. 1901. See AUSTRALIA.

Australian Literature. The development of A. L. corresponds closely to the social and political hist. of the country and reflects during the first hundred years an uneasy compromise between the traditions of the old world and the conditions of the new. Behind the first settlers lay their homeland 12,000 m. away, around them stretched the inhospitable soil of an alien land. Only time could reconcile them, and only out of acceptance could a native literature emerge. The first writing was descriptive and is found in journals and dispatches of the period, e.g. *A Complete Account of the Settlement of Port Jackson*, 1793, by Capt. W. Tench. Early verse was strongly influenced by Eng. tradition. M. M. Robinson, a convicted blackmailer, composed odes for the king's birthday in 1810 and Mr Justice Field invoked the curious kangaroo in *First Fruits of Australian Poetry*, 1819. Wm Charles Wentworth's ode to *Australasia*, 1823, 'a new Britannia in another world', was the first pub. verse by a native-born Australian, but Charles Harpur (1813-68) was the first poet to show a genuine feeling for the Australian landscape, and Henry Kendall (1839-82) was his direct successor: *Leaves from Australian Forests*, 1869. The first novel, *Quintus Servinton*, 1830-1, by Henry Savery, is a dull convict story full of literary quotations. Of greater interest are James Tucker's *The Adventures of Ralph Rashleigh*, set among convicts, bushrangers, and aborigines in the 1840's, and *Tales of the Colonies*, 1843, by Charles Rowcroft, a Tasmanian pastoralist.

Transportation had ended in 1840, the gold rush of the fifties attracted an influx of new migrants which trebled the pop. in a decade, and the emphasis began to shift from Eng. attitudes to Australian realities. A hard-riding young Englishman, Adam Lindsay Gordon (1833-70), was the first to write in the new spirit. His ballads of *The Sick Stockrider* and *Wolf and Hound* caught the Australian imagination. Other trail-blazing poems are *Convict Once*, by James Brunton Stephens; *An Australian Symphony*, by George Essex Evans; *How He Died*, by John Farrell; and *Where the Pelican Builds*, by Mary Hannay Foott. Four

outstanding novels are *Recollections of Geoffrey Hamlyn*, 1859, by Henry Kingsley (q.v.) (brother of Charles), the first novel of the 'squattocracy'; *For the Term of His Natural Life*, 1874, by Marcus Clarke (q.v.), a powerful, melodramatic convict story; *Robbery Under Arms*, 1888, by 'Rolf Boldrewood' (q.v.) (T. A. Browne), a romantic story of bush-ranging during the gold rush; and *Clara Morison*, 1854, by Catherine Helen Spence, a woman's story of the S. Australia gold diggings written on the spot. Other women novelists were 'Oline Keese' (Caroline Woolmer Leakey), *The Broad Arrow*, 1859; Mrs Campbell Praed, who wrote stories of Brisbane society; Ada Cambridge; and 'Tasma' (Jessie C. Couvreur). John Lang was the first short-story writer: *Botany Bay*, 1859.

In the 1890's the *Sydney Bulletin*, founded to advance the cause of 'Australia for the Australians' and supported by strong national feeling, gave form to a folklore. For half a cent. bushmen in the outback and diggers in the mining camps had yarned around their campfires spinning a folklore of tales and songs in their own humorous, salty idiom. Now, under the vigorous editorship of J. F. Archibald, the *Bulletin* encouraged them to write of their experiences, and A. G. Stephens, an inspired literary editor, trained a new generation of writers. Out of this gathered material there developed the 2 distinctive literary forms of the 1890's, the bush ballad and the short story. 'Banjo' Paterson (1864-1941) (see PATERSON, ANDREW BARTON) collected old bush songs, acknowledging his debt to them in the preface to *The Man from Snowy River*, 1895, and wrote high-hearted ballads of outback adventure that swept through the country. Henry Lawson (1867-1922) (q.v.), with his outback and city ballads full of democratic fervour, and Will Ogilvie, *Saddle for a Throne* (collected 1952), were equally popular. F. J. Brady, *The Ways of Many Waters*, 1899, wrote some of the best sea ballads of modern times, and later came C. H. Souter, John O'Brien, and C. J. Dennis, whose *Songs of a Sentimental Bloke*, 1915, popular verse written in the vernacular, rivalled the ballads in popularity. Henry Lawson (see above) was the first to write about the struggles of bush and city workers in their own language, and his short stories gave a new direction to Australian writing. 'Steele Rudd' (A. H. Davis) created a family of folklore characters in his humorous tales: *On Our Selection*, 1899. Other *Bulletin* writers were 'Price Warung' (Wm Astley), stark convict stories, and Edward Dyson, miners and factory hands. Barbara Baynton, in *Bush Studies*, and Ernest Favenc, in *The Best of Six: Tales of the Austral Tropics*, were both grimly powerful. Louis Becke wrote of the S. Seas, and Randolph Bedford wrote robustly of mining and travel. The first genuinely Australian novel, *My Brilliant Career*, 1901, by Miles Franklin (q.v.), is a bush girl's

spirited protest against her narrow life. *Such is Life*, 1903, by 'Tom Collins' (q.v.) (Joseph Furphy), a rich discursive novel of bullock drivers and outback adventure, has become an Australian classic. In *Jonah*, 1911, Louis Stone broke new ground with a novel of Sydney larrikins.

While the balladists had their heyday, other poets were at work. Of these Bernard O'Dowd (1866-1952) stood nearest to the democratic idealism of the nineties, but his vision was often prophetic rather than poetic. His most famous poem is *The Bush*, 1912. C. J. Brennan (1870-1932), a classical scholar with great beauty of rhythm and language whose predominant mood is despair, is regarded by some as Australia's finest poet: *Poems*, 1914. 'Win Baylebridge' (Win Blocksidge) (1883-1942) was a dedicated poet, but often derivative in style: *This Vital Flesh*, 1939. Two very different lyrists of great beauty are John Shaw Neilson (1872-1942), a simple man and natural singer of spring-like vision (*Collected Poems*, 1934), and Hugh McCrae (1876-), masculine, sensuous, delicate, richly in love with life, his art, and classical fable, the complete antithesis to the aggressive Australianism of the 'Bulletin School' (*Satyrs and Sunlight*, 1928). Other poets of note are Roderic Quinn, James Devaney, Victor Daley, J. le Gay Brereton, David McKee Wright, Louis Esson, Marie Pitt, Dorothea Mackellar, Zora Cross, Nina Murdoch, and Myra Morris. Leon Gellert's *Songs of a Campaign*, 1917, are the finest Australian poems of the First World War.

After federation in 1900 the aggressive Australian note gradually died out of politics and writing, and the First World War finally dispelled the national dream of self-sufficiency. Eng. publishers deluged Australia with popular fiction and many readers became alienated from their own literature. A new generation of novelists achieved little until 1926, when *Working Bullocks*, by Katherine Susannah Prichard, a novel of the W. Australian timber country, heralded a return to genuine Australian writing at a more mature level. Her unself-conscious acceptance of the Australian scene, warm humanity, and literary quality gave great promise which has been fulfilled in a long list of novels and short stories. In 1930 *The Passage*, set in a Queensland fishing community, and in 1934 *The Swappe Family*, brought forward Vance Palmer, novelist, short-story writer, playwright, biographer, and critic. With his wife, Nettie Palmer, critic, essayist, and biographer, he is a major influence in contemporary Australian letters. Australian writers had now begun to turn to the past as though to strike their roots more deeply, and a spate of historical novels began to appear with *The Montforts*, 1928, by 'Martin Mills' (Martin Boyd), a stylish writer whose *Lucinda Brayford*, 1946, and later trilogy all deal with Anglo-Australian squatting families in Victoria. *Uluma Thule*, 1929, the third vol. of Henry

Handel Richardson's (q.v.) trilogy *The Fortunes of Richard Mahony*, a great tragic character novel set on the Ballarat gold-fields, had a spectacular success in England. 'Brent of Bin Bin' (see FRANKLIN, MILES) wrote the first of 3 exuberant chronicle novels of New S. Wales squatting (*Up the Country*, 1928), and Miles Franklin wrote an outstanding New S. Wales pioneering novel (*All That Swagger*, 1937). In 1929 'M. Barnard Eldershaw' (Marjorie Barnard and Flora Eldershaw) began a varied literary career with a tale of old Sydney (*A House is Built*); Brian Penton wrote about Queensland pioneering in *The Landtakers*, 1934, and Ernestine Hill told the story of Matthew Flinders (*My Love must Wait*, 1941). Eleanor Dark had already written sev. contemporary novels, notably *Prelude to Christopher*, 1933, and in 1941 there appeared the first of her impressive New S. Wales historical trilogy, *The Timeless Land*, *The Storm of Time*, *No Barrier*. Two fine novels came out of the war: Leonard Mann's *Flesh in Armour*, 1932, which has been followed by 4 other novels, and *The Wells of Beersheba*, 1933, by F. D. Davison, already author of *Manshy*, 1931, the superbly told story of a red heifer. Norman Lindsay, a brilliant artist and illustrator who has had a great influence on Australian cultural life, wrote *Redheap*, 1930, and *Saturday*, 1933, unconventional novels of life in a Victorian country town, and 2 distinguished expatriate writers pub. Australian novels: *Seven Poor Men of Sydney*, 1934, by Christina Stead, and *Under Capricorn*, 1932, by Helen Simpson. The chief chronicler of the depression was Kylie Tennant with her richly characterised *Tiburon*, 1935, and *The Batters*, 1941. The aborigines were a late subject in Australian writing. Except for Mrs Aeneas Gunn's descriptions of life in the N. Ter. in *The Little Black Princess*, 1905, and *We of the Never Never*, 1908, and poems by James Devaney and Mary Gilmore, there was little of importance written before *Coonardoo*, 1929, by Katherine Susannah Prichard (see above), a sympathetic full-length study of an aboriginal girl, and *Capricornia*, 1938, a brilliant novel by Xavier Herbert which made a scaring attack on their treatment in the N. Ter. Since the war *The Mirage*, 1955, by F. B. Vickers, and *Keep Him my Country*, 1955, by Mary Durack, have presented half-castes and full-bloods with new understanding. Outstanding novels of the war have been *We were the Rals*, by Lawson Glassop; *The Twenty Thousand Thieves* and *The Veterans*, by Eric Lambert; *The Ridge and the River* and *Sowers of the Wind*, by T. A. G. Hungerford; and on the home front *The Fatal Days*, by Henrietta Drake-Brockman; *Come in Spinner*, by Dymphna Cusack and Florence James; and *Southern Steel*, by Dymphna Cusack. Many novelists of the twenties and thirties have continued to write and increase their stature. Other writers of achievement include Patrick White, *The Tree of Man*; Ruth Park, *Harp in the*

South; Eve Langley, *The Peacickers*; Frank Hardy, *Power without Glory*; Robert Close, *Love Me Sailor*; Dal Stevens, *Jimmy Brockett*; Catherine Gaslin, *Sara Dane*; Jon Cleary, *Justin Bayard*; D'Arcy Niland, *The Shiralee*; Gavin Casey, *It's Harder for Girls*; Brian James, *Cookabundy Bridge*; Cecil Mann, *The River*; Judah Waten, *Alien Son*; John Morrison, *Black Cargo*; Alan Marshall, *Tell Me About the Turkey Jo*; Hal Porter, *Short Stories*; and Margaret Trist, *In the Sun*.

Since the First World War Australian poetry has made great progress. 'Furnley Maurice' (Frank Wilnot) (1881-1942) belongs to the period between the nineties and the moderns. His most memorable work is in the fine satiric *Melbourne Odes*, 1935. Mary Gilmore (1865-), a great humanitarian and a spontaneous lyricist of beauty and depth, is still writing (*Selected Verse*, 1948). Three major poets emerged in the 1930's: Robert Fitzgerald (1902-), generally admitted to be Australia's finest living poet, is profoundly thoughtful and a master of the striking image. His famous philosophic poem, *Essay on Memory*, is included in *Moonlight Acre*, 1938. He is now writing narrative poetry based on Pacific hist. and legend (*Between Two Tides*, 1952). Kenneth Slessor (1901-) is the poet of Sydney and its harbour, an intellectual with a rich and vigorous style (*Five Visions of Captain Cook*, 1931, and *Five Bells*, 1939). Douglas Stewart (1913-) (q.v.) is a younger poet of remarkable versatility and originality. He has both dramatic strength and great delicacy (*The Dossier in Springtime*, 1946, and verse dramas: *The Fire on the Snow*, 1943, and *Ned Kelly*, 1943). In 1938 Rex Ingamells (1915-55) founded the Jindyworabaks, a movement to return to the Australian environment for inspiration, which attracted a number of young poets, among them Ian Mudie, W. Hart-Smith, Roland Robinson, Flexmore Hudson, and Gina Ballantyne (*Jindyworabak Anthologies*, 1938-48). In the forefront of post-war lyricists is Judith Wright (1915-), an accomplished poet of original vision and fine invention, a love poet who writes passionately as a woman. Other poets of note are F. T. Macartney, Leonard Mann, T. Inglismore, Ronald McCuaig, and David Campbell, a true singer of the bush; James McAuley, Kenneth Mackenzie, A. D. Hope, J. Blight, Harold Stewart, Rosemary Dobson, Elizabeth Riddell, and Mary Finnin. Among the younger poets are Francis Webb, whose narrative poetry is richly imagined, Nan McDonald, Geoffrey Dutton, Vincent Buckley, and Ray Matthew.

Australians, now largely a nation of city dwellers, still feel themselves strongly tied to bush traditions and adventure, and travel writing flourishes. Among popular writers are Ion Idriess, a prolific spinner of adventure yarns, Francis Birtles, Jack McLaren, Wm Hatfield, Wm Harney, Alan Marshall, Ernestine Hill, and John Ewers. In essay writing Walter Murdoch

is a lonely figure, and in literary criticism the most notable successors to A. G. Stephens are Vance and Nettie Palmer, H. M. Green, A. A. Phillips, and Douglas Stewart. After the First World War Louis Eason and Vance Palmer wrote and worked valiantly to estab. a modern Australian theatre which has been kept alive through the support of the little theatres and broadcasting. The theatre prospect has improved considerably since 1954, when the Elizabethan Theatre Trust was estab. to promote native theatre, opera, and ballet. It has already had an outstanding success with *The Summer of the Seventeenth Doll*, by Ray Lawler. Among contemporary playwrights are, George Landen Dann, Alexander Turner, Sumner Locke Elliott, Henrietta Drake-Brockman, Catherine Shepherd, Dymphna Cusack, Catherine Duncan, Dorothy Blawett, Betty Roland, and Orli Gray. Douglas Stewart's fine verse drama is in a class apart. The Commonwealth Literary Fund helps writers by means of ann. fellowships, subsidised pubs., and univ. lectures. The first chair of A. L. is to be estab. shortly at Sydney Univ. Three quarterly magazines, *Meanjin*, *Southerly*, and *Quadrant*, pub. original prose and verse, and the *Sydney Bulletin* is still the best market for free-lance writers. Two anthologies, *Australian Poetry and Coast to Coast* (short stories), are pub. annually. Although the best Australian poetry is of world standard, it is still chiefly pub. and read in Australia. The novelists, however, are making a name overseas. Having learnt to accept their country unselfconsciously, they have now added a new maturity to their traditional vigour.

Bibliography. E. Morris Miller, *Australian Literature* (a bibliography to 1938, extended to 1950, and ed. by Frederick T. Macartney); H. M. Green, *Outline of Australian Literature*, 1930, and *Fourteen Minutes*, short sketches of Australian poets and their works from Harpur to the present day (revised ed. by Dorothy Green, 1950); M. Barnard Eldershaw, *Essays in Australian Fiction*, 1938; John K. Ewers, *Creative Writing in Australia*, 1945; W. Murdoch and H. Drake-Brockman (ed.), *Australian Short Stories*, 1951; G. Mackenness (ed.), *An Anthology of Australian Verse* (revised ed.), 1952; Vance Palmer, *The Legend of the Nineties*, 1954; D. Stewart and N. Keesing (ed.), *Australian Bush Ballads*, 1954; J. Wright (ed.), *A Book of Australian Verse*, 1956; J. K. Ewers, *Creative Writing in Australia* (revised ed.), 1956.

Australian Magpie, see PIPING CROW.

Austrasia, E. portion of the Frankish kingdom, including Belgium, Lorraine, and the r. b. of the Rhine. The cap. was at Metz. Founded in the early 6th cent., it was ruled until the 8th cent. by the Merovingian kings, and was subsequently merged with Neustria (q.v.).

Austregisille, St (551-624), popularly known as St Austrille or St Otrille. After serving at the court of Gontran, King of Burgundy, he became a monk

(and later abbot) at St-Nizier at Lyons, and subsequently Bishop of Bourges, his native place. His remains, exhumed in 1334, were burnt in the 16th cent. by the Protestants. His feast is on 20 May.

Austreinoine, or **Stremionius**, St (3rd cent.), apostle of Auvergne. He introduced Christianity into Issoire, and the church of St Paul there is on the site of an older chapel built over his tomb. He was the first bishop of Clermont-Ferrand, and founded the abbey of St Allyre. His feast is on 1 Nov.

Austria, **Don Juan d'**, see JOHN OF AUSTRIA.

Austria (Ger. *Österreich*), rep. of central Europe, bounded S. by Italy and Yugoslavia, E. by Hungary and Czechoslovakia, N. by Czechoslovakia and Bavaria, and W. by Switzerland (qq.v.). Area 32,388 sq. m.

Geography. A. is almost completely mountainous: the highest points are reached in the Noric Alps (q.v.), which, with the mts of the Tyrol (q.v.) and the Styrian Alps, extend E. from the main Alpine massif (see ALPS), and gradually slope away towards the Alföld (q.v.) in Hungary. The country lies mainly in the drainage basin of the Danube (which flows W.-E. across the N. provs.) and its tribs., which include the Inn, Enns, Lech, Raab, and Drava (qq.v.). The Rhine (q.v.) flows on the short boundary between A. and Switzerland. The mt and lake scenery of the country is celebrated, and is much visited by tourists. The climate of A. is generally of the central European type with warm summers and cold winters: in dists. above 3000 ft there is usually snow at the end of Dec.; and in Jan. there is usually snow throughout the country. Dists. above 2000 ft have snow until the end of Feb. In the W. mt regions the rainfall is very heavy, but in the E. it averages 20-31 in. A great variety of animals is found, including bears, chamois, and wild goats in the Alpine dists. Colonies of cormorants exist along the banks of the Danube; herons, bitterns, and other water-fowl are found in the Neusiedlersee (q.v.); and in Burgenland (q.v.) is found the curious *Strepensprignaus* (jumping mouse of the Steppes). The flora is equally varied: in the greater part of the country it is central European, with mixed forests; in the S. maize and vines can be grown; on the lower mt slopes spruce and larch are predominant; and in the higher regions, above the firs and rhododendrons, grow the cabbage rose, gentian, blue moonwort, and edelweiss.

Constitution. On 27 April 1945 a Provisional Gov. was set up under Karl Renner (q.v.), and the Rep. of A. was re-established, according to the ideals of the constitution of 1920-9. On 27 July 1955 the rep. became sovereign and independent by the coming into force of the Austrian State Treaty of 15 May 1955 between A. and the occupying powers (Britain, U.S.A., France, and Russia). The last occupation troops left A. in Sept. 1955. The National Assembly is elected every 4 years, and has 165

deputies. The head of the state is called the President, and the gov. is led by a Chancellor.

Local administration and justice. A. is divided into 9 provs.: Vienna (Wien), Lower A. (Niederösterreich), Upper A. (Oberösterreich), Salzburg, Styria (Steiermark), Carinthia (Kärnten), Tirol, Vorarlberg, and Burgenland (qq.v.). In each prov. there is an elected Provincial Assembly. Every com. in the country has a council, by which the burgo-master of the com. is elected. The Supreme Court of Justice (*Oberster Gerichtshof*) is in Vienna. There are 4 higher provincial courts, 20 provincial and dist. courts, and 230 local courts. Trial by jury (abolished in 1934) was reintroduced in 1951.

Population, religion, education, chief towns. The pop., numbering 6,935,000, is almost entirely Ger., but there are small numbers of Czechs and Slavs. In 1951 89 per cent of the pop. was Rom. Catholic, and 6 per cent Protestant. The Rom. Catholic Church has 2 archbishoprics and 4 bishoprics. Education is state controlled for children between the ages of 6 and 14. In 1954 there were 5533 primary schools and 176 secondary schools. There are 3 state univs. (at Vienna, Graz, and Innsbruck), 2 technical colleges (Vienna and Graz), a Rom. Catholic theological faculty (Salzburg), and academies of fine arts, applied arts, and music and dramatic art. The prin. tns are Vienna (the cap.), Graz, Linz, Salzburg, Innsbruck, and Klagenfurt (qq.v.).

Agriculture. Agriculture is restricted by the mountainous nature of the country, but all the available land is cultivated. The chief crops are wheat, rye, barley, oats, potatoes, and sugar-beet. Horticulture is important. In 1954 the numbers of live-stock were as follows: pigs, 2,802,541; cattle, 2,304,350; goats, 280,393; sheep, 277,822; horses, 245,410; and poultry, 9,193,492.

Industry and commerce. The mineral resources of A. are considerable: coal is mined in Lower A., lignite in Styria and Upper A., and iron in Styria, Carinthia, and Salzburg. Lead, zinc, copper, and magnesite are also found, and the country is one of the world's richest sources of high-grade graphite. All oil-producing and refining companies were nationalised in 1946, as were the prin. companies engaged in the following industries: coal mining; non-ferrous mining and refining; iron-ore mining; iron and steel production; the manuf. of iron and steel products (including machinery, railway equipment, and ship-building); electrical machinery and equipment. In 1947 companies supplying electric power were nationalised. Imports into A. in 1954 totalled 8,230,000 metric tons, and exports from A. 5,415,000 metric tons.

Communications. There are about 5000 m. of federal roads, and 13,000 m. of prov. roads. The total railway mileage is 3744, of which some 850 m. are electrified. The country has 6 airports, at Vienna (Schwechat), Linz, Graz, Salzburg, Innsbruck, and Klagenfurt. Itiv. navigation

is important, since there are no sea-coasts: in 1954 2,558,421 metric tons of cargo were carried on the Danube.

Currency, etc. The unit of currency is the *schilling*, which contains 100 *groschen*. The metric system (q.v.) is in use.

History of Austria before 1815. The earliest known inhab. of A. were a Celtic tribe called Taurisci who were succeeded by the Norici. In 14 BC the Romans conquered the Norici, and the ter. N. of the Danube passed into the hands of the Marcomanni, while to the S. were situated Noricum and Pannonia, 2 Rom. provs., in

Leopold of Babenberg with the title of margrave. Under the Babenbergs the dominion received considerable enlargement of ter. and development of its internal strength. Between 1141 and 1177, the E. Mark was united with the Lower Mark, i.e. the ter. lying below the Enns, to form a dukedom under Henry Jasomirgott. To Jasomirgott Vienna owes to a certain degree its re-foundation. The duchy was considerably extended by his successors, the most notable of them being Leopold VI, who campaigned successfully against the Magyars and the

THE ÖTZTALER ALPS, LOOKING TOWARDS SIMILAUM

the latter of which lay Vindobona, now Vienna. At this time Tirol formed part of Rhaetia. An invasion of the Boii in the 5th cent. destroyed these boundaries, and a period of constant warfare and contention saw the succeeding occupations of the Vandals, Goths, Huns, Lombards, and Avars. Subsequently the Lombards formed a div. between the Avars on the one side and the Bavarians on the other. In AD 791-6 Charlemagne conquered the Avars, and in order to hold his position there securely estab. the E. Mark. It is from this ter. that the Austrian Empire definitely traces its origin and development. Shortly, however, it suffered almost complete obliteration at the hands of the Hungarians, but in 955 Otto the Great defeated them at the battle of Augsburg, thus restoring the E. Mark to the Germans. Later, in 973, he invested

Muslims. In 1246 his successor, Frederick, d. in a battle with the Magyars, and the Babenberg dynasty became extinct.

For a time the country was without a ruler, and in the confusion that followed A., which now included Styria and Carniola, was annexed by Ottakar of Bohemia, but he opposed the imperial control of Rudolf I of Hapsburg, and met his death at the battle of the Marchfeld, 1278. The emperor passed the ter. to his 2 sons, Rudolf and Albert, but shortly afterwards it was left in the sole possession of Albert. The great administration of the Hapsburgs now began. It was to last, without a break, from 1282 until 1918.

Albert II, who succeeded in 1330, expanded the duchy considerably. Carinthia was acquired in 1335, and

Tirol in 1363, during the reign of Albert III. Albert V, by marrying the daughter of the Emperor Sigismund, succeeded to Hungary and Bohemia, and became German emperor as Albert II. The Hapsburg rulers of A. were from this time (except, nominally, for the years 1740-5) also Holy Rom. emperors until the dissolution of the Holy Rom. Empire (q.v.); so that the hist. of A. from the time of Albert II is inextricably mixed with that of the rest of the empire, though after Charles V's abdication the empire derived its impetus from the Austrian cap., Vienna, where the imperial court was now centred. Frederick III added to the importance of the country by giving it the rank of an archduchy (1453). The Austrian lands had now passed into Frederick's hands, and in 1493 Maximilian I, his son, succeeded him.

From this reign onwards the Austrian Empire under the Hapsburgs began suddenly and remarkably to gain in power and position. By a series of shrewd marriages the dominions leapt to the position of the greatest empire in the world. Maximilian himself married Mary, daughter of Charles the Bold, thereby acquiring the Netherlands. Philip, their son, married Joanna of Spain. Philip d. in 1506, and his son, Charles V, inheriting the united countries, became Holy Rom. emperor, with possessions ranging from Spain to the Hungarian frontiers; but he passed his Austrian possessions to his brother, subsequently Ferdinand I. Bohemia and Silesia were annexed, and a largely unsuccessful attempt was made to conquer Hungary. Ferdinand succeeded to the imperial title when Charles V abdicated and d. in 1564.

Of his 3 sons, the eldest, Maximilian II, inherited the crown of Germany, together with A., Hungary, and Bohemia; Ferdinand, the second son, received Tirol and Upper A.; Charles, Styria and Carinthia. In 1570 non-Turkish Hungary was acknowledged an Austrian possession. Maximilian was succeeded by Rudolf II, whose rule was both incompetent and marked by bitter religious persecution of the Protestants. Eventually he was compelled to surrender Hungary, Bohemia, and A. to his brother, Matthias, who in turn ceded Bohemia and Hungary to his cousin, Ferdinand, who was the third son of Maximilian II. He was succeeded by Ferdinand II, whose rule was ignored by the Bohemians. Instead they nominated the elector palatine, Frederick V, the chief power behind the Protestant union. The Thirty Years War (q.v.) resulted. At the battle of Prague, 1620, Ferdinand was victorious, and Bohemia was subjected to his rule. A severe and bitter persecution of the Protestants followed. The war ended with the Peace of Westphalia, 1648. The duchy of A. itself had remained staunchly Catholic throughout. The rest of the cent. is notable in Austrian hist. for the conquest of Turkish Hungary, finally acknowledged by the treaty of Carlowitz (1699). Leopold I and Louis XIV now struggled together over their claims to

Spain. The war of the Sp. Succession (q.v.) followed, in the midst of which Leopold d. The war was carried on by Joseph I, who, dying without issue, was succeeded by his brother, Charles VI, in 1711. When the war ended A. had gained the Netherlands, Milan, Naples, Mantua, and Sicily. In 1740 the male line of the Hapsburgs became extinct, the succession being vested in Charles VI's daughter, Maria Theresa (q.v.).

Under the Pragmatic Sanction the other European states had promised Charles to support his daughter's claim to the succession; but on his death Frederick of Prussia immediately claimed Silesia from A. and the war of the Austrian Succession resulted. The elector of Bavaria was crowned King of Bohemia and elected emperor as Charles VII in 1742. Supported by the Hungarians, Maria Theresa, undaunted, managed against her numerous enemies practically to hold her own. At the Peace of Aix-la-Chapelle, 1748, A. remained almost intact, though Silesia was acknowledged as Prussian. Charles VII d. in 1745, and Maria Theresa's husband, formerly the Duke of Lorraine, had been elected emperor as Francis I. In 1756 the treaty of Versailles was concluded in which the long rivalry between the Hapsburgs and the Bourbons came to an end. Chafing at the loss of Silesia, Maria Theresa, with the aid of France, Russia, Saxony, and Sweden, moved against Frederick of Prussia. The Seven Years War ensued, at the end of which the Prussians still held Silesia. Joseph II (q.v.) became emperor on the death of his father, Francis, and in 1780 Maria Theresa d. Joseph's reign was characterised by over-zealous reform. Discontent, roused by the sweeping nature of his sudden changes, fermented in Hungary and the Netherlands, in the midst of which turmoil he d., 1790, after being forced to reverse his entire policy. He was succeeded by his brother, Leopold II, who was successful in restoring peace with the Netherlands and Hungary. But it was becoming increasingly apparent that the empire, centred on Vienna, was finding it more and more difficult to hold together the widely differing elements of which it consisted. The fate of Marie Antoinette, his sister, and her husband, Louis XVI, led Leopold to ally himself with Prussia against France, an alliance which was threatened by his death in 1792. No time was lost, however, for France immediately declared war on his son, Francis II.

During this reign the foreign policy of A. owed most of its effectiveness to Metternich (q.v.), and for sev. decades the actual decline of A. as a great power was successfully concealed. In 1797 France secured Lombardy and the Netherlands. Two years later Francis II united forces with Russia, and the Austrian borders underwent many changes till 1804, when Francis, anxious to prevent an indignity to his country in the event of Napoleon demanding its subordination, abandoned the title of Holy Rom. Emperor, and adopted that of

hereditary emperor of A. as Francis I. The empire was formally dissolved, 1806. In 1809 the Peace of Vienna seriously reduced the Austrian ter., and the emperor's daughter was virtually forced to marry Napoleon.

Austria, 1812-67. In 1812 A. became an ally of Napoleon, without, however rendering him much practical assistance. At the battle of Leipzig, 1814, A., joining the Grand Alliance, assisted in destroying Napoleon's power, and in the following year, at the treaty of Vienna, as a recognition of her struggles and tribulations, she received Venice and Dalmatia, important gains on account of the opening thus afforded for her foreign trade. A long period of external peace followed.

From 1815 onwards internal discontent within the Austrian Empire grew. In Austria itself it was usually constitutional in demand; but in the non-Austrian (majority) sections of the empire it was nationalist as well as constitutionalist in inspiration. The Magyars, Italians, and Bohemians were becoming anxious to govern themselves. In 1848 revolutions broke out over all Europe. In the crisis Metternich fled to England. Austrian power and the A. Gov. lay among the ruins. Chaos followed, the centre of disorder being Vienna. Finally, a check was placed upon the rebellion by Windischgrätz, whose energies in the battlefield crushed an attempt at revolt on the part of the Slavs in Prague.

It was in Italy that A. began first to recover her authority. She regained Lombardy; and the most serious trouble spot, Hungary, was finally subdued in 1849. The Emperor Ferdinand, who had shown little ability during the crisis, then abdicated in favour of the young Francis Joseph (q.v.). Under the direction of Radetzky the reclamation of N. Italy was speedily accomplished, its complete restoration culminating in the surrender of Venice, 1849. Meanwhile A. strenuously opposed a projected confederation of states under Prussia, thereby defeating, for the time being, the Prussian king in his wish to become emperor of Germany.

For the next 10 years a policy of bureaucratic gov. was revived, the constitutions which had been granted in 1849 being destroyed. While there were certain administrative reforms, the nationalist aspirations of the non-Ger.-speaking minorities were vigorously suppressed. Innumerable petty tyrannies only helped to increase the nationalist fervour of the Slavs, Hungarians, and Italians. Moreover, Prussia was becoming increasingly influential in Ger. affairs, though, for the moment, A. was still able to assert her theoretical supremacy there.

The Crimean War indirectly weakened A.'s position in Italy. Sardinia had gained international prestige by joining the Allies in the war. Subsequently, in alliance with Napoleon III, she conquered (1859) all A.'s It. ter. except Venetia.

Prussia was swift to take advantage of A.'s obvious weakness, made very apparent by events in Italy. In 1866 war was declared, and A. suffered heavy defeat at the battle of Sadowa. Prussia now occupied the middle states of Germany which formerly had supported A. At the conclusion of the struggle A.'s

Austrian State Tourist Dept
A ROADSIDE SHRINE

supremacy over Germany was brought to an end, and Sardinia, who had again taken the field against her, demanded and obtained the prov. of Venetia. Austrian influence in the W., so long successfully maintained, was now completely broken.

The Dual Monarchy—Austria, 1867-1914. Hungary's claims to be recognised as a separate and distinct country were now, with great advantage, pressed forward. In 1867, therefore, the Dual Monarchy (q.v.) came into existence. A. and Hungary each obtained separate

constitutions, being linked by the Crown, the Emperor of A. being also King of Hungary. The policy of virtually complete separation was slightly modified after 1907, economic ties after this date being made closer. After 1867 measures towards more constitutional freedom were passed which considerably liberalised political life throughout the empire. The presence, however, of the many nationalities within its borders rendered the task of settling all claims equitably difficult. The Slav element in the pop. throughout regarded itself as being less favourably treated than the Magyars and Austrians, with some justification. The Dual Monarchy, while it made Hungary the most loyal of all the Hapsburg possessions, was in a sense fatal to the Austrian Empire: for, having obtained so much themselves, the Magyars successfully blocked the efforts of other racial groups to gain similar rights.

The foreign policy of A. from 1867 was to create a tangible understanding with Germany and Russia. With Germany the difficulties were not so great, and in 1879 an informal agreement was reached. Bismarck visited Vienna and arranged a treaty by which Germany bound herself to support A. against Russia, while A.-Hungary promised to assist Germany against a combined attack from France and Russia.

During the Russo-Turkish war of 1877-1878 the tension was aggravated by a tendency on the part of the Magyars to sympathise with the Turks. The position was further complicated by the problem of Bosnia and Herzegovina. These 2 states were now (after 1878) under the direct control of A., but A. knew that Russia was fostering Slav aspirations to independence there, in order to extend her own influence in the Balkans.

Austria-Hungary in the First World War. The international solidarity of the Dual Monarchy before the First World War was founded largely on the maintenance of the alliance with Germany, who was by 1914 seeking further excuses for expanding her ter. and influence. A. now had plans for turning the Dual Monarchy into a Triple Monarchy, the third element to consist of the Bosnian Serbs and the Serbo-Croats. But the Serbs in the empire were no longer interested in remaining within it, even on terms of equality with the Magyars and Austrians; their pleas for self-determination were encouraged by Serbia and Russia. When, therefore, the Archduke Francis Ferdinand (a leading supporter of the Triple Monarchy plan) and his wife were murdered in Sarajevo in June 1914 by a Serbian fanatic, it became clear that A.-Hungary would receive the full support of Germany in her hysterical reaction to the assassination—which was an immediate desire to crush Serbia entirely. Germany at once recognised in the situation a favourable combination of circumstances for breaking through the 'iron ring' which she claimed that her neighbours were forging around her. A. was, in fact, a nation urged on to its doom

by the machinations of its far more redoubtable neighbour, who was not really in the least interested in A.-Hungary's own motives in the affair. A.-Hungary sent an ultimatum to Serbia on 23 July, and thereafter events moved rapidly. For though the Serbian Gov. undertook to comply with the demands of A.-Hungary, and offered to refer all disputed points to The Hague or to a conference of powers, the Austro-Hungarian Gov. disregarded the reply and mobilised its army. Germany not only directly promoted the Austro-Hungarian plan of destroying Serbia as an independent nation, but inspired the design of wiping out Russian influence in SE. Europe; and thus within a week of Austria's formal declaration of war against Serbia (28 July) Germany, A., Russia, and France were in a state of war; and this soon involved, through the violation of Belgian neutrality, the intervention of Great Britain. By the end of the first week of Aug. A. had formally declared war against Russia. There being no indication whatever that either of the central powers would make peace separately, the alignment of opposed nations was complete for a general world war (for further details of events leading up to and during the war see WORLD WAR, FIRST).

At the very outset A. had to bear the brunt of the conflict against Russia, and suffered severe defeats in Galicia, 1914-15. A. might in fact have been forced to surrender comparatively early in the war but for the transfer by the Ger. High Command of large forces from the W. to the E. front. In Serbia, however, despite slow initial progress, A. was eventually more successful and overran the country; and though it. intervention on the allied side was a serious strategic blow to her, her armies decisively defeated Italy at Caporetto in 1917.

But within the empire internal discontent among the national minorities, and among Liberal and left-wing elements in A. proper itself, was rising. The war was revealing A.'s serious administrative and economic weaknesses, as well as her political sterility in the light of 20th-cent. development. The allied blockade seriously affected A. early in the war. But while the aged Emperor Francis Joseph lived the empire held together. He *d.* in 1916, and was succeeded by the Emperor Charles.

Charles at first hoped to hold the empire together by converting it into a four-fold kingdom, consisting of A., Hungary, the Serbs, and the Czechoslovaks. But the situation among the Slav minorities had deteriorated too far to allow this to be a practical possibility. The Czechs and Serbo-Croats were now only interested in independence.

In 1917 A. made peace overtures to the Allies, but these were rejected. Meanwhile, attempts at placating the Slavs having failed, Austro-Hungarian dominance was again asserted in domestic affairs. In 1918 A., urged on by Germany, launched a large-scale offensive on the Hungarian front. It was a disastrous

failure. Meanwhile, unrest among the minorities was reaching its climax, and by now the Poles in the empire had joined the Serbs and Czechs in their demand for independence. Very soon national councils of the various subject nationalities were formed in the great allied camps, and in America. Pan-Slavic congresses had been held in Prague and Agram in the winter of 1917-18. These were followed by the historic Congress of Oppressed Nationalities, convened in Rome in April 1918. The Allies now openly took up the cause of these nationalities, and organised armies of Poles and Czechoslovaks were aligned with the allied troops. At a meeting of the Supreme War Council in Versailles in June, the Brit., Fr., and It. premiers adopted resolutions to the effect that a united and independent Polish state was a *sine qua non* of peace. The complete independence of Czechoslovakia was also formally recognised by the prin. allies and by the U.S.A. in the early autumn.

Still the tottering empire survived; but in Oct. 1918 the Italians launched a crushing offensive on a front from the Piave to the Alps. Within a fortnight the Austrians were completely overwhelmed; Trent and Trieste were captured, and 300,000 Austro-Hungarian prisoners, together with nearly all their stores and 5000 guns, were taken. An Austrian mission then came to the H.Q. of Gen. Diaz and offered unconditional surrender, and an armistice was signed on 3 Nov., without awaiting the outcome of the Ger. negotiations. This reverberating disaster to the Austro-Hungarian armies quickly led to the final disruption of the Dual Monarchy. In Oct. Czechoslovakia's independence was declared in Paris, and very soon a constitution was drafted for the new rep., with Masaryk (q.v.) as president, and the first National Assembly was convened in Prague to ratify the new regime. Also in Oct. the Croats formally declared the deposition of Charles, and the separation of their new kingdom of Croats, Serbs, and Slovenes, with King Peter of Serbia as King of Yugoslavia. The other nationalities, Transylvania and Bukovina, then in their turn seceded from A. and Hungary respectively, and negotiated for union with Rumania. It was next the turn of Hungary herself, where liberal elements were now in control. At the end of Oct. Karoly (q.v.) announced that the Magyars were freed from further allegiance to the Emperor Charles, and would be constituted an independent rep. The Dual Monarchy was thus, at long last, at an end. The culminating blow to the 'ramshackle empire' was delivered in Vienna, when a mass demonstration of students and workers called for a democratic administration. Charles abdicated; and in Nov. the National Assembly in Vienna formally declared Ger. A. a rep.

History of Austria from 1918. The Rep. of A. was declared on 12 Nov. 1918, and the gov. assumed by a National Assembly which appointed a provisional cabinet.

A peace treaty signed in Sept. 1919 declared A. an independent state, and gave her an area roughly one-eighth the size of the old A.-Hungary. Early in 1919 the National Constitutional Assembly, consisting of a single chamber, was elected on the basis of universal and proportional suffrage. Under the constitution which came into operation in 1920, a president was chosen for 4 years by both Houses. The Legislature comprised an Assembly, the Nationalrat, and a First Chamber, the Bundesrat, the one elected by popular vote, the other chosen by the provincial diets. The powers of

Austrian State Tourist Dept
GRAPE GATHERING IN CARINTHIA,
LOWER AUSTRIA

the Bundesrat were advisory and negligible.

The political hist. of A. from 1923 was characterised by a bitter struggle between the Social Democrats and the Christian Socialists (who had substantial middle-class support). Socialism, as was to be expected in a state dominated by the city of Vienna, whose workers had played a decisive part in establishing the rep., had great influence in the National Assembly immediately after the overthrow of the Dual Monarchy. The first chancellor was the Socialist leader Renner (q.v.), whose domestic policy it was to establish a working agreement between the Social Democrats and the Christian Socialists. The elections of Oct. 1920 gave a majority, but not a working majority, to the Christian Socialists, and this resulted in the Christian Socialists allying for the next few years with the pan-Ger. party. For a considerable time the chief issues were the Tirol question and the *Anschluss*,

or union, with Germany, the two being, in a manner, allied, as both had relation to pro-Ger. sympathies. The Tirol question concerned the protection of the Ger. minorities in the Tirol—which old Austrian crown land, after the First World War, was divided between A. and Italy, the N. going to A. and the S. to Italy—and was of considerable importance even outside the 2 countries immediately affected, because upon its solution depended the further question whether A. could retain even so much of the crown land as was left to her by the peace treaty. The practical acquiescence of successive Austrian govts. in the Tirol situation as it had been decided in the peace treaty, in spite of Fascist Italy's open policy of forcible 'Italianisation' of her section of the area (an acquiescence made necessary by A.'s strategic helplessness, relative to Italy), drove many moderate but patriotic Austrians into the extreme pan-Ger. camp. A.'s unstable economic position, producing as it did chronic poverty and unemployment, led to the growth of extreme leftist groups in Vienna itself, and this led to equal extremism among the non-Socialists. It also led many thinking Austrians to decide that A. would never have stable gov. until she became more of an economic reality—and this was increasingly considered to mean union, at least economic, with Germany.

In 1927 there was serious Social Democrat rioting in Vienna. One result of this was the formation of the *Heimwehr*, or bourgeois private army, which was designed as a challenge to the activities of the Socialists' illegal armed bands, which, in times of stress, patrolled Vienna in the hope of overthrowing the middle classes. Far from achieving that result, a repetition of the July riots was only narrowly averted in the following Oct., when the Socialists and the *Heimwehr* came into collision at Wiener Neustadt, the recognised H.Q. of the former force. In the elections of 1930 the Social Democrats replaced the Christian Socialists as the largest single party, but they too had to rely on the support of the pan-Ger. group. In 1931, in face of A.'s worsening economic position, caused by the world depression, a customs union with Germany was concluded. Two months later the biggest bank in A. failed: the gov. fell, and the Christian Socialists returned to power. The customs union was immediately renounced.

Internal tension was growing. In 1932 Dollfuss (q.v.), a Christian Socialist, became chancellor. He allied with the *Heimwehr* group to maintain his position, and adopted a line independent of both the pan-Germans (by now Nazi in character) and the Socialists. To do this he had to resort to dictatorial methods. In Feb. 1934 the Socialists rose in revolt against the *Heimwehr* under Stahremberg (q.v.), and for sev. days there was civil war in Vienna and in some of the larger prov. tns. The rising was crushed with heavy loss of life to the Socialists, and

their leaders were executed; but Dollfuss, who had suppressed the rising, now forfeited much of the support he had previously gained in foreign countries for his resistance to the Ger. Nazis, besides driving the Socialists into a conspiracy with the Austrian Nazis to overthrow his gov. Stringent laws against political violence were now introduced, a new constitution proclaimed which made A. a corporative, not a democratic, state, and some of the Nazi conspirators were imprisoned, with the result that in July there was a sudden (unsuccessful) Nazi revolt; Dollfuss was assassinated and succeeded in office by Schuschnigg (q.v.). After 1934 Austrian independence was virtually surrendered, inasmuch as Austrian policy was soon forcibly assimilated to that of Germany under an agreement with the Nazi Gov. of that country. Finally, in 1938, the president was forced to resign; the chancellor, Schuschnigg, was put into prison; the army was incorporated with that of Germany; diplomatic representation abroad was taken over by Germany; the Austrian Diet was dissolved; the Ger. mark substituted for the Austrian schilling; and the country subordinated to the Reich as the Ger. prov. of 'Ostmark', under Hitler's dictatorship. Thus was A. annexed by Germany without resistance and the *Anschluss* had become an accomplished fact.

Though many Austrians originally welcomed the *Anschluss*, serious opposition, though largely unorganised, existed to it from the start, and by 1943 the attitude of the Austrian people generally was anti-German. Sabotage in agriculture was a prominent manifestation of that attitude. Then came opposition by industrial workers, who suffered heavy losses at the hands of S.S. execution squads. But A. was useful to Germany as an air-raid shelter, and well-to-do Germans evacuated their families to A. even before the mass evacuation to the Alpine dists. Hence A. suffered from a shortage of houses and food, and in 1943 the pop. was 10,000,000 compared with 7,000,000 before the war. At the Moscow Conference (Oct. 1943) Great Britain, America, and Russia pledged themselves to restore the independence of A. The armed forces of A. were enrolled with those of Germany, and used throughout the campaign against Russia; but in 1945 the Russian armies invaded A. and captured Vienna (13 April). For the campaign in A. see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

On 27 April 1945 a provisional Austrian Gov. was set up in Vienna. This was recognised by the Allies as the rightful Austrian Gov. in Oct. Its constitutional structure was based on the constitution of 1920. Elections held in Nov. 1945 returned the People's party (Catholics) as the largest single party. Subsequently Figl became chancellor, while Renner, the veteran Socialist, became president. After the cessation of hostilities various zones of A. were occupied by allied forces

and administrations: the NE. or Russian zone included Lower A. (excluding Vienna), that part of Upper A. lying on the l. b. of the Danube, and Burgenland; the NW. (Amer.) zone included Salzburg prov. and the rest of Upper A.; the W. (Fr.) zone included Tirol and Vorarlberg; and the S. (Brit.) zone included Carinthia (including Ost-Tirol) and Styria (excluding Burgenland). Vienna, within the 1937 boundaries of the city, was jointly occupied by armed forces of the 4 allied powers, and its administration directed by an inter-allied governing authority of commandants appointed by the respective commanders-in-chief. At a meeting in Sept. 1945 the allied council of foreign ministers decided that the frontier of A. would not be changed save for minor rectifications, and this decision therefore barred the restoration to A. of the S. Tirol, of which she was deprived in 1919, unjustly in the opinion of many, unavoidably in the view of most. Since 1945 various It. acts in the Ger.-speaking areas of the It. Tirol have caused some renewed popular agitation in A. for a revision of the Tirol frontiers in A.'s favour.

The post-war Austrian Gov. concentrated on the problems of reconstruction. Vienna had suffered severe damage during the final fighting, and considerable programmes of rehousing were inaugurated. But the div. of A. itself and of Vienna into separate zones hindered economic recovery. The 4 occupying powers discussed the question of an Austrian peace treaty at frequent intervals: but for sev. years no agreement could be reached, and the military occupation of A. continued.

The elections of 1949 ensured a continuance of power for the People's party: in the 1953 elections they lost ground to the Socialists, but were able to retain office in a coalition gov. which included Social Democrats and Independents, though led by a People's party chancellor. In 1950 Renner d.: he was succeeded by Theodor Koerner, also a Socialist, who d. early in 1957. Raab succeeded Figl as chancellor after the 1953 elections.

In May 1955 the ambas. of the United States, Britain, France, and Russia began talks in Vienna on the subject of an Austrian peace treaty. On 15 May the treaty was signed. It became operative on 27 July 1955. A.'s sovereignty was recognised. The occupation forces were withdrawn, and A.'s future neutrality was laid down. Considerable reparations were to be paid by A. to the Soviet Union over a period of 10 years.

In 1957 suggestions that A. should join the European Coal and Steel Community were resisted by Russia on the grounds that such action would infringe the perpetual neutrality of A. as laid down in the 1955 treaty. That such action was being considered is evidence of A.'s pressing need to achieve genuine economic security, for though, since 1955, her economy has appeared healthy enough, this condition is to a great extent the result of substantial economic aid from

the W. in the period immediately after the Second World War. *See also* EUROPE, *History*; GERMANY, *History*; HOLY ROMAN EMPIRE; HUNGARY, *History*, etc.

Austria, Lower (Ger. *Niederösterreich*), prov. of NE. A., bordered on the N. by Czechoslovakia. It is bisected E.-W. by the Danube, to the N. of which is a wooded tableland, adjoining in the NW. the Forest of Bohemia (q.v.). S. of the riv. are offshoots of the E. Alps, the highest being Mt Schneeberg (6808 ft). Before the First World War L. A. was a crown land, the E. half of the archduchy of A. There are extensive vineyards, agriculture, and stockraising in the NE. and centre. Textiles, chemicals,

tobacco, glass, and sugar are among the manufs. The prin. tns are St Pölten, Wiener Neustadt, and Krems (qq.v.). Area 6950 sq. m.; pop. 1,400,500.

Austria, Upper (Ger. *Oberösterreich*), prov. of NW. A., bordered on the N. by Czechoslovakia and on the W. by Bavaria. It is traversed NE.-W. by the Danube, to the N. of which lie tablelands of the Forest of Bohemia (q.v.). S. of the riv. are mts and large lakes of the E. Alps. Before the First World War U. A. was a crown land, the W. half of the archduchy of A. The chief occupations are agriculture and forestry. Salt, lignite, gypsum, and granite are found, and there are brewing, distilling, metallurgical, textile, paper, and glass industries. The prin. tns are Linz (the cap.), Steyr, Wels, and Gmunden (qq.v.). Area 4630 sq. m.; pop. 1,108,720.

Austronesian, see *LINGUISTIC FAMILIES, Malay-Polynesian*.

Autarky (Gk *autarkia*, economic self-sufficiency). The idea that a country should produce everything it requires and cut down foreign imported goods gained considerable impetus after the First World War. Eire and Italy are 2 outstanding instances, but in neither case was the experiment a success. Hitler's 'new order' (1941) stultified the efforts of other European countries in this direction. The movement for A. in Nazi Germany itself, however, provided the best instance, being based primarily on military considerations in the hope of making the country immune from the rigours of blockade. *Autarky* (Gk *autarkhia*) means the gov. of a single person, or absolutism (q.v.).

Auteuil, dist. of Paris, on the r. b. of the Seine, close to the Bois de Boulogne, known for its steeple-chasing course. Molière and Boileau-Despréaux lived here, and it was the favourite resort of La Fontaine, Condorcet, and other literary figures.

Autheon, or Autun, Jehan d' (c. 1466-1527), Fr. poet and historian, was a native of Beaupaire, and a Benedictine monk. He was historiographer to Louis XII, the subject of his chief work, *Chronique du roi Louis XII*.

Authorised Version (of the Bible), first pub. in 1611. It is the only version 'appointed to be read in churches,' and until fairly recently its title-page contained the words 'printed by authority.' It has held its place so long more by its own merits than by the artificial support of law, though there are numerous minor defects, corrected in the R.V., and for nearly 3 cents. it has been the most potent factor in the spiritual educ. of the Eng.-speaking race. See *BIBLE*.

Authors' League of America, founded in 1912, opens its membership to authors and playwrights, provided that they make a regular profession of their work and are not merely unpaid amateurs. The league gives valuable advice to its

members on the placing of their works, advises them as to the proper rates of remuneration, and assists them in contractual analyses. The H.Q. are in New York.

Authors, Playwrights, and Composers, The Incorporated Society of. In 1883 Sir Walter Besant and a small group of leading writers of the time decided to form a society, provisionally called the *Company of Authors*, to protect and further the interests of authors. In 1884 a memorandum and articles of Association were settled and the society was estab. as the *Society of Authors*. Tennyson was its first president, and was followed in turn by Meredith, Hardy, and Barrie. The present president is Dr John Masefield. During the years since its foundation the society's scope has been continuously extended until to-day, within its framework, separate associations have been created for playwrights, screenwriters, and writers for radio and television. Members are entitled to legal as well as general advice in connection with the marketing of their work, their contracts, their choice of a publisher, etc. The society also undertakes litigation on their behalf in any part of the world in which their rights or interests are involved, provided that the Committee of Management is satisfied that the member's case is sound both in law and in ethics. The offices of the society are at 84 Drayton Gardens, London, S.W.10; the society's quarterly jour., *The Author*, has been pub. without break since 1885.

Auto, name of various types of religious and morality plays popular in Spain and Portugal from the 12th cent. onwards, and still performed in the latter country. They reached their highest perfection in the *As. sacramentales* of Lope de Vega (1562-1635) and Calderón (1600-81). The former was the author of 400 A.s. These plays were generally represented on religious festivals, especially the feast of Corpus Christi. They were mostly of an allegorical nature, the leading characters being personifications of vices, virtues, etc. They were frequently produced with great elaboration.

Auto-da-fé (act of faith), ceremony of the Inquisition in Spain and Portugal at which heretics were burnt after a public procession and service in the church. All Saints' Day was a favourite day for the A. An A. was celebrated in Mexico as late as 1815.

Auto-intoxication, condition subsequent upon the production within the body of poisons due to perverted functions of organs or tissues. As all the tissues of the body are mutually interdependent, defect in one part is followed by widespread effects, and the symptoms of A. are accordingly very varied. Among the most common types are uraemia (q.v.), or excess of urea in the blood; Graves's disease, or thyrotoxicosis (q.v.), due to excess of thyroid secretion; the delirium and coma of diabetes, caused by the saturation of the sodium salts of the blood by acetoacetic and oxybutyric acids, the products of imperfect proteid

metabolism; some forms of acute insanity, caused by defective metabolism or physiological instability, or both; and general symptoms produced by fatigue or indigestion.

Autobiography, see BIOGRAPHY.

Autocars, see MOTOR CARS AND MOTOR CYCLES.

Autochthones, Gk for aborigines, the first inhab. of a dist. as distinct from later-comers. In Gk mythology the A. were supposed to have sprung from the rocks and trees.

Autoclave, air-tight heating vessel, on the principle of Papin's digester, made of iron or steel, usually supplied with a safety-valve, in which substances can be heated above their boiling-points under pressure. Various types of A. are used for sterilisation and chemical and cooking purposes. In chem. A.s are used to produce reactions under great pressure.

Autocracy, see GOVERNMENT.

Autogiro, see ROTATING WING AIRCRAFT.

Autograph, something written in a person's own hand. The term is applied both to mere signatures and to documents of any description. A. hunters have become one of the accepted nuisances of modern civilisation, but they may claim to be carrying on a custom which seems to have its origin as early as the 14th cent., in the *Liber Amicorum*, a kind of visitors' book. In the 16th cent. were formed such famous collections of A.s as those of Loménie de Brienne and Lacroix du Maine. Evidence of a craze for the signatures of celebrities is afforded by a number of albums of the time of Elizabeth I and James I now in the Brit. Museum. Amongst high prices which have been paid for A.s of famous people are the 300 guineas paid by the Brit. Museum in 1858 for a Shakespeare signature, and the £65 for a letter of Defoe, 1887. Many collections of A. reproductions have been pub., notably Nichols's *Autographs of Royal, Noble, Learned, and Remarkable Personages*, 1829, Delpech's *French Autographs*, 1832 and *Facsimiles of Royal, Historical, Literary, and other Autographs in the British Museum*, 1896-1900. See also Scott and Davy's *Guide to the Collector of Historical Documents*, etc., 1891, and Broadley's *Autographs*, 1910. The relation between A.s and character has been ingeniously treated in Poe's *Chapter on Autography*. See also PUBLIC RECORD OFFICE.

Autolycus: 1. Son of Hermes, and grandfather of Ulysses, notorious for the cunning with which he stole his neighbours' flocks, until at last detected by Sisyphus, who marked his sheep under the feet. Shakespeare's A., in the *Winter's Tale*, has similar characteristics. 2. A. of Pitane, early Gk writer on mathematics and astronomy (fl. 4th cent. bc), who is reputed to have taught Arceilaus.

Automatic Action, physiological and psychological term used to denote all non-reflex actions which are not the result of conscious endeavour. Actions may be purely automatic when they are performed

while the attention is fixed altogether upon another object, or relative, when the details of an action are performed unconsciously while the attention is fixed upon the end or some other part of that action. Sleep-walking is one of the most common forms of A. A., and many of the phenomena of divination, spiritualism, etc., may be explained on this basis. A. A.s are distinguished from reflex actions by being produced by an internal instead of an external impulse, but in practice the two are frequently indistinguishable.

Automatic Machines, see AUTOMATION and ELECTRONIC COMPUTATION.

Automation, term applied to processes and machinery automatically controlled and to electronic computation (q.v.). The word comes from 'automaton' (derived from the Greek), a machine that imitates the action of men and animals, of which the first recorded seems to have been the wooden pigeon made by Archytas of Tarentum in 400 bc. A. has, in recent years, developed with unusual speed. In industries such as chemicals and oil-refining, for example, entire processes have become very nearly automatic. In offices and factories, electronic computers (or 'electronic brains') are becoming so good at routine clerical work that it is possible to envisage them taking over the central control of manufacturing processes and so bringing the fully automatic or 'push-button' factory within grasp. Present-day advances in A. are best reviewed under 3 heads—advanced mechanisation, control of processes, and electronic computation.

Mechanisation, the substitution of mechanical for manual operation in industry, has been going on steadily since long before the Industrial Revolution in England in the 18th-19th cents. During that time the actual working processes in certain simple crafts, e.g. spinning and weaving, were mechanised. But some of the early looms and lathes required skilled operators only to set and maintain them. In the process (or evolution) to a more complete mechanisation, America has led the way in the course of the last 100 years. The term 'robot' was also given earlier in this cent. to mechanisms devised to do the work ordinarily handled by man. Robot machines have been used to steer ships without human aid (1927), to operate telephone transmitters (1927), and to pilot an aeroplane (1931). Other forms of automatic mechanisation in use for many years include the coin-operated machine which, after testing the genuineness of the coin, delivers the packaged goods contained inside. Through the dual agencies of motion study and the production line more and improved machinery has gradually been developed, while the burden of loading and handling between operations has been lightened, and in some factories completely removed. Of the highly automatic machinery in use to-day the best example is perhaps the transfer-machine; this is really a series of machine-tools, each doing one operation automatically and

linked in a continuous production-line by mechanical devices that transfer components from one operation to the next. But complete mechanisation has so far been achieved only in a few industries, even in the U.S.A.

Control of processes by automatic action has a long hist. The control valve of the pressure-cooker, for instance, dates back to 1680. Early examples were mostly mechanical gadgets, little used in industry. Progress was slow until this cent., but the military needs of the Second World War provided a powerful stimulus and the pace has quickened. Automatic control is most advanced in industries where materials are easy to handle, such as in chemicals and oil-refining as already mentioned, and in food-processing. These industries have become highly automatic without any of the well-known inventions, such as transfer-machines or electronic computers. A system of control usually consists of 3 basic units—one that measures, one that controls, and one that corrects. Most controlling instruments are pneumatic, but some are mechanical or hydraulic. Electric or electronic units are now coming into favour, chiefly because they are fast and able to send signals over long distances, so giving 'remote' control. Only with the further development and improvement of instruments that will rapidly analyse the chemical composition of materials can automatic control be based on the quality of the final product; at present the product has to be tested at intervals and the process adjusted if necessary. Sev. analysing instruments, for which there is an immediate call, are already being developed. Electronic computers have brought full A. in offices much nearer. They have been developed only in recent years, but for most of this cent. machines based on punched-card systems have been taking over routine calculations from clerks (see ELECTRONIC COMPUTATION).

Current trends are leading towards the fully automatic factory. Some plants making simple products are already almost automatic. So are a few more complex factories except for the central control of what goes on. Although there may be automatic control of each process, it has yet to be extended to whole systems of production. But it is possible to envisage this being done with the help of an electronic computer. The master computer could plan production according to its analysis of orders received and expected, and it would set and change the programmes of the machines and their control-mechanism. The only manpower then needed would be managers, technical specialists, some clerical workers (including those who fed information to the computer), a few operatives to mind machines or watch processes, and skilled maintenance men. The electronic computer, though still confined to routine office calculations, is capable of making the more advanced calculations that are required for the central control of

production, but more has still to be known about the processes it is intended to control.

Even so, the computer has opened a new chapter in the hist. of A. Progress must depend at first on the willingness of pioneer firms to act with imagination and to take risks. Steady development in A. can be expected in many industries (in some it will affect few basic operations and few employees), but the shortage of trained managers, engineers, and technicians will probably be the most important brake on progress. A. calls for planning and control of a very high order by the management in both new and estab. plants. The study of the firm's operations, the use of electronic computers in providing better information, and the control of costs call for new techniques and changes in the structure of management. Automatic processes rest more on technical decisions than in the past. Thus it seems probable that scientists and technologists will rise more often to posts of higher management. So far as labour is concerned, there is a fear that A., which often reduces the need for operatives, will enable the demand for goods and services to be met with some workers unemployed. With full employment the danger need not become real, though there will be, as in the past, a steady movement of workers from one industry, occupation, or possibly one region to another. Much will depend on the rate at which firms introduce A.; experience has shown that the change need not be rapid. The demand for skilled labour is likely to be enlarged as A. develops. The present stage of mechanisation is sometimes regarded as still mainly opposed to the true interests of the worker, for his part in production can be so monotonous that he loses all interest in it. It has also been regarded as one of the fundamental causes of the split between thought and feeling so characteristic of the present age. But once workers cease to take an active part in the process as it becomes automatic, they are free to move at their own pace and so will probably find their work less irritating. They also benefit from the disappearance of heavy physical tasks and gain satisfaction from their new responsibilities and skills. On the other hand, they lose the close social contacts while at work which have often made the monotony of mass production bearable.

The prospect for A. is not altogether clear. But the present chain of technical developments is likely to stretch into the future and to have a considerable impact on many, though by no means all, industries in Britain. Like other advances in technique, A. will increase efficiency, reduce costs, and raise living standards. It will also help to keep the country's exports competitive. At the same time A. is likely to raise serious problems common to all forms of technical advance. These must be solved if industry is to absorb the new techniques without bad social effects. Attention will have to be given to the needs, feelings, and problems of the workers concerned.

Courses in higher technology which are concerned with one or more aspects of A. are being planned at technical colleges and other institutions throughout the country. These are mainly part-time and special courses offering facilities for students qualified and experienced in one of the fields to which A. can usefully be applied. There are also facilities for post-graduate training in research techniques at a number of univs. and univ. colleges. See MASS PRODUCTION IN THE U.S.A. See H.M.S.O., *Automation*, 1956; R. H. Macmillan, *Automation: Friend or Foe?*, 1956; Magnus Pyke, *Automation: Its Purpose and Future*, 1956; Paul Einzig, *Economic Consequences of Automation*, 1956.

Automatism, power of self-movement without external stimulus as exhibited in life of the cell or organism, and in the will of man. The term is also applied to the philosophical doctrine that all the actions of living beings, including man, are physiological in their origin, and are not the effect of volition, which is merely an accompaniment of the action.

Automaton, see AUTOMATION.

Automobile, see MOTOR CARS AND MOTOR CYCLES.

Autonomy, in its political sense denotes the polity of self-gov. or a self-governing community. Varying degrees of A. are exhibited by the Brit. colonies and dependencies. A more perfect instance is afforded by the powers of independent action of the anct Gk city communities. In Kant's philosophical use of the term it expresses the principle that no law without a moral foundation can be held as binding on the conscience.

Autoplasty (Gk *autos*, self; *plassein*, to form), repair of wounds or diseased parts by grafting tissues taken from other parts of the patient's body.

Autopsy, see POST-MORTEM.

Autosuggestion, see COUÉ; HYPNOTISM; PSYCHIATRY.

Autotransformer, single coil wound on an iron core and connected across the

alternating current supply through a switch. Supply at lower voltage is obtained by connection across one end and an intermediate point of the coil. If the total number of turns are N_1 ,

the turns in the tapped portion N_2 , the primary current I_1 , the secondary I_2 , the ampere turns in the top portion will be $(N_1 - N_2)I_1$, in the lower portion $N_2(I_2 - I_1)$, total $(N_1 - 2N_2)I_1 + N_2I_2$. In the ordinary transformer the total would be $N_1I_1 + N_2I_2$. The A. is thus more economical. By interchanging the primary and secondary connections a small step-up of voltage can be obtained.

Autran, Joseph (1813-77), Fr. poet and dramatist, b. Marseilles. He gained the Montyon prize of the Fr. Academy with his tragedy *La Fille d'Eschyle*, 1848, and was elected to the Academy in 1868. Amongst his vols. of verse are *La Mer*, 1835, *Milmanah*, 1842, *Epitres rustiques*, 1862, and *Sonnets capricieux*, 1873, all of which are distinguished by classical purity of form and beauty of rhythm.

Autrefois Acquit and Autrefois Convict, pleas by an accused person that he had been previously acquitted or convicted of the same crime of which he is now accused. The plea holds good only in cases of acquittal or conviction by a court of competent jurisdiction.

Autumn, third season of the year. It commences astronomically when the sun enters the sign of Libra, about 23 Sept., its declination being then zero, and ends when the sun has reached its greatest declination S., about 23 Dec., as it enters the sign of Capricornus. In the S. hemisphere it is reckoned from 21 Mar. to 22 June. See SEASONS.

Autun, Jehan d', see AUTHON.

Autun (anct *Augustodunum*). Fr. tn, cap. of an arron., in the dept of Saône-et-Loire, on the Arroux. As *Augustodunum* it was a prin. city of Rom. Gaul, famous for its school of rhetoric. Destroyed in 240 by Tetricus, and rebuilt by Constantine the Great, it was successively sacked by the Vandals (406), the Burgundians (414), the Huns (451), the Franks (534), the Arabs (739), the Normans (1095), the English (1379). It has Rom. remains, including a pyramid, a theatre, and 2 gates, and has a fine cathedral, mainly 12th cent., with a celebrated sculptured front of the Last Judgment. A. is still the seat of a bishopric. It has metallurgical, furniture, and shale-oil industries. Pop. 14,800.

Auvergne, anct prov. of France, corresponding to the present depts of Puy-de-Dôme and Cantal, and part of Haute-Loire. Upper A. is mountainous, with a climate subject to great extremes, while Lower A. is more level and contains some very fertile dists. There are rich mineral deposits in the mountainous region, which also contains many mineral springs. The name of the prov. is derived from that of the early inhab., the Arverni (see VERCINGETORIX). Part of the prov. was united to the Crown in 1527, and the rest in 1610.

Auvigny, Jean du Castro d' (1712-43), Fr. writer and soldier, killed at the battle of Dettingen. He wrote mostly in collaboration with the Abbé Desfontaines, his main works being *Mémoires de Madame de Barnevill*, 1732, *Histoire de la Ville de Paris*, 1735, and the first 8 vols. of *Vies des hommes illustres de la France*, 1739-57.

Aux Cayes, *see* CAYES, LES.

Auxerre (anc. Autissiodorum), Fr. tn, cap. of the dept of Yonne, on the Yonne. The fine Gothic cathedral is partly 13th cent., and the church of St-Germain has very anc. crypts, in which are paintings of the 9th and 10th cents. Paul Bert (q.v.) was b. here. A. is a mkt tn, and makes wines, ochre, and metal goods. Pop. 24,000.

Auxiliary Territorial Service, *see* WOMEN'S ROYAL ARMY CORPS.

Auxiliary Verbs are used with other verbs to help to form the voices, moods, or tenses of the latter. When so used they lose practically all their original signification. Such verbs are 'have,' 'may,' 'must,' etc., in English; 'haben,' 'werden,' in German; and 'être,' 'avoir,' in French.

Auximum, *see* OSIMO.

Auxonne, anc. Fr. fort. tn in the dept of Côte-d'Or, on the Saône. There is a noteworthy 14th-cent. Burgundian Gothic church. It has a market and steelworks. Pop. 5300.

Auzout, Adrien (1622-91), Fr. astronomer, b. Rouen. In collaboration with Picard he improved the micrometer for measuring the apparent diameters of the heavenly bodies by making use of silk fibres or silver wires. He was the author of *Traité du micromètre*, 1667, and *Lettres sur les grandes lunettes*.

Ava, ruined city of Burma, on the l. b. of the Irawadi, 6 m. SW. of Amarapura. From 1364 to 1740 it was the cap. of Burma, and again from 1822 to 1838. It was destroyed by an earthquake in 1839.

Ava, *see* DUFFERIN and AVA.

Avadavat, *see* AMADAVAT.

Avalanche (Fr. *avaluer*, to descend), mass of ice or snow, mixed sometimes with earth, which becomes loosened from a mt slope and dashes into the valleys, sometimes causing great destruction. There are various kinds—drift or powder A.s. composed of dry powdering snow, and blown into the valley like a cloud; A.s. caused by the melting of the snow in spring, in which case the ground itself becomes loose, and is swept down with trees and rocks; and ice A.s. consisting of frozen snow and ice, sweeping down from the glaciers, most frequently during the summer months.

Avalite, silicate found in green scales at the Mt Avala mines in Belgrade, where mercury is found.

Avalon (anc. Aballo), Fr. tn, cap. of an arron. in the dept of Yonne, on a promontory overlooking the R. Cousin. It is a mkt tn, has quarries, and makes wines. Pop. 5600.

Avalon, peninsula, Newfoundland, forming SE. portion of the is. In it stands the cap., St John's (q.v.).

Avalon (Apple-green Is.), paradise of Celtic mythology, Tennyson's 'island-valley of Avilion.' Some have thought to identify the A. of Arthurian legend with Glastonbury. A. contained a mystic fountain and the magic apples, and was the Vallhalla of the Celtic heroes.

Avalos, Fernando Francesco de, Marquis of Pescara, *see* PESCARA.

Avanturine, or **Aventurine**, glass-like variety of quartz, containing numerous spangles of brown mica. It is most common in the Ural Mts, but is also found in France, Spain, Austria, and India. There is also artificial A., known as 'goldstone,' consisting of glass into which red spangles of copper are introduced. A. is much used for the handles of umbrellas, brooches, etc.

Avanzi, Jacopo di Paolo d', It. painter of the 14th cent. He is supposed to have been a pupil of both Franco Bolognese and Vitale delle Madonne. Only a few of his works remain. He painted the frescoes of the chapel of San Felice, in the church of Sant' Antonio at Padua, 1376; frescoes in the old church of the Madonna di Mezzarata, with Simone da Bologna; 2 Triumphs in a public hall in Verona; and some work in the chapel of San Giorgio in the church of Sant' Antonio at Padua, with Aldighieri da Zevio. Two pictures in the gallery of Bologna are also attributed to him.

Avaticum, *see* BOURGEN.

Avaris, cap. of the Hyksos (q.v.) in the E. Delta of Egypt, later known as Tanis (q.v.). It was captured by Ahmes, the founder of the 18th dynasty.

Avars, warlike people of Turkic origin who settled on the steppes of the Don and in the neighbourhood of the Caucasus. They penetrated as far as Dacia and served in the army of the Emperor Justinian, AD 558. Later they took possession of Pannonia, and in 566 joined the Longobards against the Goths. From this time until the close of the first half of the 7th cent. they greatly extended their dominion over the Bulgarians and the Slav peoples of the Danube, until, in AD 640, they were driven out of Dalmatia. Their power was finally destroyed by Charlemagne in 796, and as a separate race they seem to have disappeared shortly afterwards.

Avatar (Sanskrit *avatāra*, descent), an incarnation and, more particularly, in Hindu mythology the descent of a deity to earth in a visible form. The 10 incarnations of Vishnu are notable A.s.

Avaugour, Pierre Dubois, Baron d' (d. 1664), Governor-General of Canada, 1661-3, previously Fr. ambassador in Sweden. He quarrelled with Bishop Laval over the question of the sale of brandy to the Indians. A. regarding the traffic as commercially beneficial to Canada, and especially to the fur traders; but Laval succeeded in getting him recalled. It was during A.'s tenure that Groseilliers and Radisson, Fr. fur traders, explored the country N. of Lake Superior, and in this matter, too, A. quarrelled, demanding part of the profits of the expedition. His report on Quebec shows that he was the first to point out the advisability of the French seizing Lake Champlain and the Hudson R. as far down as Manhattan, so as to possess an open-water harbour in the S. In his time, too, the Iroquois were subdued (*see* ARGENSON), the colony making good progress thereafter. A. was killed in Hungary in a campaign against the Turks.

Ave Maria, first 2 words of a Lat. prayer to the Virgin Mary used by Rom. Catholics. The first part is the salutation of the angel to Mary on her conception (Luke i. 28). The second part is an entreaty to the Virgin to pray for the salvation of sinners now and at the hour of death. The prayer usually follows the *Pater Noster* or Lord's Prayer.

Avebury, Sir John Lubbock, 1st Baron (1834-1913), politician and scientist, educ. at Eton. He was a Liberal M.P. (Liberal-Unionist from 1896), 1880-1900, when he was raised to the peerage. From 1890 to 1892 he was principal of the London Working Men's College, and vice-chancellor of London Univ., 1872-80. Among his many publs. on natural hist. were *Prehistoric Times*, 1865, *On Origin and Metamorphoses of Insects*, 1874, and *Notes on the Life History of British Flowering Plants*, 1905. A. is best known for his Bank Holidays Act, 1871.

Avebury, vil. and par. in Wilts, England, remarkable as the site of what appears to have been one of the largest pre-Celtic or Druidical temples in Europe. About 650 blocks of stone seem to have been placed in circles and rows. These stones, of which few remain, are of various sizes, from 5 to 20 ft high and 3 to 12 ft thick. There is a great variance of opinion as to the time when and the purpose for which this singular work was constructed, but it is thought that it was built over 3500 years ago, in the first phase of the Early Bronze Age. With its outer ring of massive stones enclosing over 28 ac., and its bank, $\frac{1}{2}$ m. in circumference, rising originally 50 ft above the bottom of the ditch, it is the most impressive of its kind in Europe, and the mightiest effort of prehistoric man. Yet for cents. this heritage was allowed to decay, and the megaliths were treated as quarries for building stone, while in the Middle Ages many were buried. Much is owed to the late Alexander Keiller, the owner of the site and director of the Morven Institute of Archaeological Research, for the work of preservation and restoration which was carried out in co-operation with the Ministry of Works. In 1925-1926 Keiller bought Windmill Hill (q.v.), 14 m. NW. of A., which hill, in his opinion, was of even greater significance than A. itself, and from 1929 he and his staff excavated the site. In 1938 the A. museum was opened in the 18th-cent. stables of the manor house. Previously, in 1935, the Office of Works first envisaged the preservation of A. and its surroundings in a planning scheme; but further anxieties for its preservation were set at rest in 1943, when the National Trust acquired 950 ac. of land at A. for the nation. The purchase from Keiller included the greater part of the group of prehistoric remains, the neolithic site of Windmill Hill, and the manor farm of 650 ac.

Aveiro: 1. Dist. of NW. Portugal, partly in Beira Litoral prov. and partly in Douro Litoral prov. (q.v.v.). It is on the Atlantic coast, is watered by the R. Vouga, and is mainly agric. Area 1070 sq. m.; pop. 477,200.

2. (Anct **Talabriga**), tn of Portugal, cap. of A. dist. It is on the Atlantic coast, on a salt lagoon (25 sq. m.), at the mouth of the Vouga. There is a cathedral, and there are fishing and salt industries, and a trade in agric. produce and wine. Pop. 13,000.

Avela, see AVILA.

Avellaneda, see FERNÁNDEZ DE AVELLANEDA.

Avellaneda, Nicolás (1830-85), Argentine statesman, b. Tucumán. His family were exiled from the country, but after the fall of Rosas in 1852 A. returned. He became a member of Congress in 1860, prof. of political economy in 1861, and was minister of public instruction in 1868. During his tenure of office the country made remarkable progress, and in 1874 he was elected president of the rep. He put down the insurrection of Mibie in 1875, and in the same year sent an expedition against the Indians. He was superseded in power by Gen. Roca on 12 Oct. 1880.

Avellaneda, manufacturing city, cap. of A. dist., on the R. Riachuelo, Argentina, named after Nicolás A. (q.v.). Important rail and industrial centre and chief industrial tn of Argentina. Pop. 100,000.

Avellino: 1. Prov. of Italy, in central Campania (q.v.). It is in the Apennines (q.v.), and has some high peaks in E. and S. There are sev. high riv. valleys; the chief rivs. are the Calore and Ofanto. The prin. tns include Avellino and Bisaccia (q.v.). Area 1104 sq. m.; pop. 500,000.

2. (Anct **Abellinum**), lt. tn, cap. of the prov. of Avellino, 28 m. ENE. of Naples (q.v.). It stands in the valley of the Sabato, has a cathedral (partly 10th cent.), and is an agric. centre. The trees of the dist. produce a nut, *nux Avellana*, which was esteemed by the Romans. Pop. 40,300.

Avempace, see IRN-BAJJA.

Avena, name of a genus of grasses which has deeply furrowed grains enclosed in glumes adherent to them. The genus contains 50 widely distributed species, of which the most important is the *A. sativa*, or oat.

Avenches, vil. of Switzerland situated in a detached part of the canton of Vaud. Known as Aventicum around 100 bc, it was then the cap. of the Helvetii (q.v.), with a pop. of 80,000. Later a Rom. colonial tn. It was sacked by the Huns in the year 451. Pop. 1600.

Avenio, see AVIGNON.

Avens, *Geum rivale*, water A., and *G. urbanum*, wood A., grow in woods and damp places of Britain. The mt A., or *Dryas octopetala*, is an Alpine shrub. All belong to the family Rosaceae.

Aventail: 1. Flap or movable visor of a helmet in old armour (q.v.).

2. Mail tippet hung from the lower edge of a helmet of the 14th cent., protecting the neck.

Aventine Hill, one of the 7 hills of Rome, included within the Servian Wall c. 280 bc. See ANCUS MARCIUS.

Aventinus (1477-1534), name used by Johann Thurmayer, author of the *Annales*

Boiorum (a hist. of Bavaria). He was a native of Abensberg, whose Lat. name he adopted. He has been called the Bavarian Herodotus, and was tutor to the sons of the Duke of Bavaria from 1509. His hist. was first pub. in 1554.

Aventurine, see AVANTURINE.

Avenzoar (Ibn Zohar, Abumeron) (1109?-1162), Arabian physician, b. Seville. His full name was Abu Merwan Mohamed ben Abdal-Malik Ibn Zohar. He was court physician to Ibrahim ben Yussuf ben Tashfin, the Almoravado sovereign of Morocco and Córdoba, and was the greatest physician of the W. Caliphate. He described the itch-mite, paralysis of the pharynx, mediastinal abscess, otitis media, and treatment of stone in the bladder. He was the first to attempt complete removal of the womb. He anticipated the modern stomach tube. His most important work was the *Teisir*, a treatise on clinical medicine, which was first printed in a Lat. trans. in 1490. See D. Campbell, *Arabian Medicine*, 1926.

Average: 1. In the science of numbers an A. is a sum or quantity intermediate to a number of sums or quantities, which is obtained by adding the sums or quantities together and dividing by the number; thus, if 5 sacks contain 6, 8, 11, 12, and 13 lb., the A. weight will be $\frac{6+8+11+12+13}{5} = \frac{50}{5} = 10$ lb. The A.

of such a kind is an arithmetical mean (see MEAN). But in ascertaining A.s which are to be of value for statistical or for other scientific purposes, such arithmetical A.s are not sufficient, and attention must be paid to the relative importance to each other of the quantities thus added together, and, as it is called by statisticians, the 'weighted' rather than the 'arithmetical' mean should be sought for. A simple example may be given. A offers to sell to B 3 plantations of trees, which he averages before counting the trees in each plantation at 2s. per tree for the first, 1s. 6d. for the second, and 1s. for the third. The arithmetical A. or mean price would be $\frac{4s. 6d.}{3} = 1s. 6d.$ On felling the trees in each plantation the numbers work out thus: 200 in the first, 100 in the second, 300 in the third; the weighted mean or A. will be then found by multiplying the number of trees in each plantation by the original price, adding the total, and dividing by the total number of trees; the weighted mean is then 1s. 5d.

2. Term used in shipping law in relation to loss of or damage to cargo or ships. It is of 2 kinds: (1) *General A.*, which connotes all loss which arises in consequence of extraordinary sacrifices made, or expenses incurred, for the preservation of the ship and cargo. In this case, if the sacrifice was incurred to avoid a danger common to all the interests, and was both real and voluntary, then the cargo-owner or shipowner who has sustained such loss or expense is entitled, provided the ship and cargo or some portion have actually been preserved, to be recouped his loss or part of it from the other interests in

the adventure. The question of general A., which is entirely in the hands of A. adjusters, is regulated for the most part by the York-Antwerp Rules of 1877 (as revised in 1890), and most Engr. contracts of carriage and marine insurance embody a reference to these rules. (2) *Particular A.* (so called) or 'partial loss.' This arises whenever damage is done to the goods or property of an individual by accident or otherwise, but the damage is not suffered for the general benefit, e.g. damage by water to cargo. See also CENSUS.

Averaging, operation on the stock exchange, by which a speculator increases his transactions at a higher or a lower figure when the market is going against him, so that the average price of the whole will be higher or lower than his original sale or purchase. Thus a 'bull' would purchase more stock and a 'bear' would sell more, as the price fell away or rose against him. A relatively smaller movement is thus necessary to ensure a profit.

Averdepois, see METROLOGY.

Averescu, Marshal Alexander (1858-1938), Rumanian soldier and Prime Minister, b. Ismail, Bessarabia. As war minister, 1907, he suppressed the peasant revolt; during the second Balkan War of 1913 he was chief of staff in the Rumanian invasion of Bulgaria. In the First World War he commanded the Rumanian army of the Danube in Transylvania and later held the supreme command in the Dobrudja. He strove to repel the Germano-Austrian advance under Gen. Mackensen, but had to fall back on Bucharest, which fell 7 Dec. 1916. He evacuated the Dobrudja Jan. 1917 and took up a new line on the Siret in defence of Moldavia, but on the defection of Russia (see BREST-LITOVSK, TREATY OF) was compelled to surrender unconditionally. After the war he founded the Popular party. He was Prime Minister in 1918, 1920-1, and 1926-7. Formed a political alliance in Rumania to oppose Prince Carol's return.

Averno, lake in Italy, about 2½ m. NW. of Pozzuoli (q.v.). Its classical name was Avornus (lik *aornus*, birdless). It is a circular sheet of water, about 1½ m. in circumference and of great depth. It is the crater of an extinct volcano, and its darkness and the noxious vapours, which were supposed at one time to have arisen from it, said to be fatal to birds, caused the anc. poets to refer to it as the entrance to the infernal regions. The lake, which is 213 ft deep and 3½ ft above sea-level, figured as the scene of many other legends cents. ago. It was supposed to be connected with the lower world, hence Virgil's 'Facilis descensus Averno.' In 214 bc Hannibal (q.v.) made a pilgrimage to it. Remains of baths are on the E. of the lake, including a lofty octagonal hall called the Temple of Apollo.

Avernus, see AVERNO.

Averrhoa, family Oxalidaceae, genus of 2 ornamental trees with alternate leaves, 5-parted flowers, and edible fruits; cultivated in India and China. *A. bilimbi*, the Blimbing, or Cucumber Tree, and *A.*

carambola, the Carambola Tree, have fruits with a pleasant acid juice, useful in preparing drinks and lemonades.

Averroës (Ibn-Rushd) (1126-98), Sp. philosopher of the Arabian school who wrote also on astronomy, medicine, and jurisprudence; b. Córdoba. The bulk of his work consists of commentaries upon Aristotle. These exercised no small influence upon medieval Aristotelian studies; and it is easy to detect in them the teaching of al-Farabi (q.v.) transmitted through Avempace and Abubacer (qq.v.). Chief among his independent philosophical treatises is *The Incoherence of the Incoherence*, written in reply to Qazali's *Incoherence of Philosophy*. A. upheld the primacy of reason, believing that the content of religious doctrine is merely a symbolic form of the truth discovered by philosophy. His theories tended to materialism and pantheism, and were condemned on their account by the univ. of Paris and later by the Holy See. The first complete ed. of his commentaries was pub. in Latin at Venice (1552), the *Incoherence* having been printed (also in a Lat. version) by Agostino Nifo in 1517. Of this latter work there is an Eng. trans. by S. van den Bergh, 1952. A. was the last of the great Arab physicians. His chief medical work was the *Kilab-al-Kulyat*, usually known as *Colliget* (Book of Universals). It was an attempt to found a system of medicine on the neo-Platonic modification of Aristotle's philosophy. It was first printed (in Latin) in 1482. See T. J. Boer, *The History of Philosophy in Islam*, 1903, and L. Gauthier, *Ibn Rushd-Averroës*, 1948.

Avers, valley in the canton of Grisons, Switzerland, adjoining the Hinter-Rhein valley. The lower portion, known as the Ferrera Glen, lying between Canicul and Cresta, is said to be the highest inhabited place in Europe (6394 ft.).

Aversa, It. tn, in Campania (q.v.), 8 m. N. of Naples (q.v.). It was the first place in Italy in which the Normans (q.v.) settled (1029). There is a cathedral (12th-18th cents.), and sev. notable churches. A. is an agric. centre, and has soap manufs. Pop. 35,900.

Avèsnès, Fr. tn in the dept of Nord, cap. of an arron. It has anct fortifications and a 13th-16th cent. church. There are wool and linen manufs., and cheese (Marolles) is made. Pop. 5200.

Avesta, The, 'Scripture' (mistakenly called sometimes the *Zend Avesta*, *Zend* meaning commentary), sacred writings of anct Iran and of Zoroastrianism and the Parsees (qq.v.). Originally far more voluminous, they were depleted by the ravages of Alexander the Great (350 bc) and by the Muslim invasions of the 7th cent. which drove the remaining faithful away to India, where they now survive. The few MSS. that they were able to carry with them form the A. as we have it. Its original language is akin to Sanscrit, and called Avestan, though written in the script of the old Persian vernacular, Pahlavi, into which the A. has also been trans., as well as into Sanscrit. The most anct part of the A. undoubtedly consists

of the *Gathas*, metrical prophecies probably composed by Zoroaster himself, and representing his teaching in its purest and most lofty form.

Aveyron, dept of S. France, formed of part of the anct prov. of Guyenne. It is mountainous, and is watered by the Lot, Tarn, and Aveyron. In the N. are spurs of the Cantal Mts, and in the S. are spurs of the Cévennes. Owing to the nature of the ground the prin. agric. industry is stock rearing, but some cereals, vines, tobacco, and fruit trees are cultivated. Coal, iron, and other minerals are mined. There are textile, iron, and cheese manufs., and hydro-electric installations. The prin. tns are Rodez (the cap.), Millau, and Villefranche-de-Rouergue (qq.v.). Area 3386 sq. m.; pop. 292,700.

Avezzano, It. tn, in Abruzzi e Molise, 22 m. S. of L'Aquila (q.v.). It is built on the drained lake of Fucino (q.v.), and was badly damaged in an earthquake in 1915, and again in the Second World War. Pop. 17,000.

Avogustov, see AUGUSTÓV.

Aviano, It. tn, in Friuli-Venezia Giulia (q.v.), 30 m. W. of Udine (q.v.). Pop. 6600.

Avianus, Flavius (fl. c. AD 400), Lat. writer of fables. He seems to have lived at Rome. His fables are 42 in number, and resemble those of Macrobius. They were dedicated to one Macrobius Theodosius. See the Prolegomena to the ed. of R. Ellis, 1887.

Aviation, heavier-than-air flight. See AERONAUTICS and the cross-references there.

Aviation, Civil or Commercial. Civil A. received a great impetus from the First World War through the accelerated development of aeroplanes and the ever-increasing number of aviators. During the actual period of the war, civil A. was of course restricted, but when in 1919 it was possible to remove the restrictions, commercial services and experimentation again went ahead. During the war the Air Council were invited by the gov. to consider the development and regulation of civil aerial transport from the international standpoint. The Council, through special committees, investigated questions of law and policy; technical and practical questions as to the powers of aircraft and the requirements of aerial service; commercial outlook of the aircraft manufacturing industry; labour questions; and scientific research. (See *Reports of The Civil Aerial Transport Committee*, 1918. Cd. 9218.) An International Air Convention was signed in 1919 by all allied and associated powers (and, later, a number of other nations subscribed to it), the chief value of which was in co-ordinating the regulations for air traffic. Subsidies, long-distance demonstration flights, and foreign missions were among the methods used by various states to encourage civil A. and to secure public confidence in its future. In 1919 (Aug.) the first regular commercial service between London and Paris was estab. by the Handley Page Company. A mail air service was instituted with Belgium

during the same month. By the end of that year not far short of 1000 passengers were carried on the London-Paris route and about £100,000 worth of goods over the routes to France and Belgium. Before the end of 1920 at least 100 aerodromes had been licensed by the gov., the first customs aerodrome being at Hounslow, others being organised at Cricklewood, Felixstowe, and Lymington. The Hounslow aerodrome was eventually removed to Croydon, which became the metropolitan terminus of commercial and civil flying from and to England, until London Airport came into use in 1946.

At first most air services were operated by private companies, but it soon became apparent that some form of official assistance or subsidy would be needed to keep the companies solvent. In many countries the prin. air carriers were eventually nationalised. In others, notably the U.S.A., assistance took the form of extensive subsidies for carrying air mail.

The first major advance in Britain came in 1924, when sev. private companies were amalgamated in the gov.-subsidised Imperial Airways. This company operated regular daily services in Europe from London to Paris, Brussels, and Cologne and, at certain seasons, Basel, Le Touquet, and Zürich. It had (1939) 8 weekly services to Egypt and back, 5 to India, 3 to Singapore and Central Africa, and 3 to Sydney via Egypt, Palestine, India, Burma, and Malaya. There was a weekly service between Khartoum and Lagos and a weekly service between New York and Bermuda; besides numerous other services and connections. In 1924-5 the company flew 11,395 passengers, 212,380 letters, and the aggregate m. flown were 853,042; by 1932-3 the totals were 58,060 passengers, 11,400,000 letters, 2,351,176 m.; by 1936-1937, 64,771 passengers, 35,668,430 letters, 5,231,655 m. The Atlantic air route was subsequently pioneered by Imperial Airways in collaboration with Pan-Am. Airways. The second major Brit. pre-war air transport company was Brit. Airways, which operated services from Heston to Hamburg, Copenhagen, and Stockholm; Heston to Paris; Croydon to Berlin; Croydon to Hanover. Like Imperial Airways the company was given financial assistance by the gov. for developing Brit. air routes overseas. It was the first Brit. air-line company to operate regular night services. The Cadman Committee, in 1938, recommended that Brit. Airways should be entrusted with the development of European services other than those on the London-Paris route, which were to be operated by a new company combining the interests of Brit. Airways and Imperial Airways. The gov. also chose this company to operate the England-S. America air route via the W. coast of Africa. A number of 250-m.p.h. Lockheed 14 airliners were ordered for the inauguration of a regular passenger and mail service to Lisbon along this section. The night mail services of Brit. Airways were operated from Croydon; all other services of the

company were operated from their terminal airport at Heston, to which the company's fleet and maintenance organisation were transferred from Croydon and Gatwick in 1938. Under a Bill introduced in 1939 the undertakings of Imperial Airways and Brit. Airways were transferred to a new State-guaranteed corporation, the Brit. Overseas Airways Corporation.

British civil airways during and after the Second World War. The war, perforce, gave a great impetus to air travel by civilians, not only by reason of the striking advances in aircraft development but because sea travel was too hazardous and shipping scarce. During the war little could be achieved, but in Oct. 1944 the Ministry of Civil A. was instituted to take over the functions of the secretary of state in relation to B.O.A.C. and deal with aerial transport generally, both home and overseas, and also with civil research and production. Early in 1945 the Brit. Gov. proposed to set up 3 separate corporations for the empire, Europe, and Lat. America, with directorates appointed by the Ministry of Civil A. and linked together not only by the participation of B.O.A.C. in all 3, but also by a common organisation in the overhaul of aircraft and a common school for the training of crews and technicians. Accordingly shortly after the war 2 new corporations were formed—Brit. European Airways and Brit. S. Amer. Airways. Railway companies and shipping firms were excluded from any participation in the ownership of the new corporations for those regions, though they put their experience and preliminary organisation at the disposal of the gov. At a conference in Bermuda (Feb. 1946) arrangements were made for the co-operation of the Brit. and Amer. Govs. in their common aim, defined as 'the widest possible distribution of the benefits of air travel for the general good of mankind at the cheapest rates consistent with sound economic principles,' and the conflicting principles of policy mentioned above were harmonised by the expedient of working on a schedule of international routes of interest to both govts. In 1946 B.O.A.C. announced its 6 main services—the Kangaroo to India, Australia, and New Zealand; the Tiger to the Middle E. and S. Africa; the Dragon to the Far E.; a W. African service; and a double N. Atlantic service to Montreal and New York. European routes were taken over by Brit. European Airways (B.E.A.), and S. Amer. services by Brit. S. Amer. Airways, which was subsequently merged with B.O.A.C. Eventually, independent companies were allowed to offer certain classes of service, and to-day they are responsible for cheap-fare 'colonial coach' and inclusive tour services, vehicle ferry services, and much troop-carrying under gov. contract.

All over the world, civil A. has grown at a tremendous rate, and in 1956 there were approximately 275 air-lines operating scheduled services throughout the world, plus a large number of charter companies. Excluding the air-lines of Russia and China, for which no statistics are available,

they carried a total of some 78 million passengers, of which approximately three-quarters were flown by the 74 major airlines belonging to the International Air Transport Association (the I.A.T.A., which controls fares, to prevent price-cutting, and which has been responsible for such developments as 'tourist' class fares, which have done much to popularise air travel). These I.A.T.A. members owned a total of 2580 aircraft in 1955 and gave employment to 274,000 persons. On a gov. level, the International Civil A. Organisation (I.C.A.O.) is responsible for co-ordinating civil A. development throughout most of the world.

Although it does not rank first in the number of aircraft movements, London Airport is the world's busiest in terms of international traffic, with air-lines of 29 overseas countries flying to it on scheduled services. They include Pakistan International Airlines, Trans-Canada Air Lines, Transportes Aereos Portugueses, Luft-hansa (Germany), Iberia Sp. Airlines, Aer Lingus (Ireland), Air France, Swissair, Alitalia (Italy), Scandinavian Airlines System, Aerolineas Argentinas, Pan-Amer. World Airways and Trans-World Airlines (U.S.A.), Sabena Belgian World Airlines, Middle E. Airlines (Lebanon), Finnair (Finland), K.L.M. Dutch Airlines, Panair do Brasil, Olympic Airlines (Greece), Icelandair and Loftleidir (Iceland), Qantas Empire Airways (Australia), Central African Airways, Jugoslovenski Aerotransport, Air Ceylon, Air-India International, Iraqi Airways, S. African Airways, and El Al Israel Airlines.

Aviation Spirit, see PETROL.

Avicenna, see IBN-GABIROL.

Avicenna (Ibn Sina) (980-1037), Arabian physician, philosopher, scientist, poet, and statesman, *b.* Afshena, Persia. His phenomenal memory and lively intelligence made him a prodigy of learning and at the age of 18 he was appointed vizier to the Prince of Hamadan. At 21 he had compiled an encyclopaedia of all the sciences except mathematics. He is said to have composed some of the quatrains in the *Rubaiyat* ascribed to Omar Khayyam. Over 100 books were written by A. His philosophical works placed him among the greatest of the Arabic philosophers. His prin. work in this sphere is the *Recovery* (of the mind from ignorance), a collection of treatises on logic, physics, mathematics, and metaphysics. His mathematical writings were striking and original. Overshadowing all these was his *Canon of Medicine*, the most famous medical text ever written, in which he attempted to codify all medical knowledge. It contained over a million words and was still a required text-book at Vienna Univ. 500 years after it was written. It showed him to be an experienced and skilful practitioner; he was called 'the prince of physicians.' The *Canon* was trans. into Latin by Gerard of Cremona in the 12th cent.; 15 Latin and 1 Heb. eds. were printed before 1500; an Eng. trans. of Book I, by O. C. Gruner, was pub. in 1930. In 1024 A. became

physician and literary adviser to the emir of Hamadan, where he *d.* after 13 years of concentrated work interrupted by periods of physical dissipation. See C. des Vaux, *Avicenna*, 1926; C. Elgood, *Medical History of Persia*, 1951; F. Rahman, *Avicenna's Psychology*, 1951; L. Gaudet, *La Pensée Religieuse d'Avicenna*, 1951; G. M. Wickens (ed.), *Avicenna: Scientist and Philosopher*, 1952.

Avicennia, genus of tropical plants of the order Verbenaceae. *A. tomentosa* is the white mangrove, used in Rio de Janeiro for tanning; *A. resinifera* is a native of New Zealand; *A. nitida* grows in Martinique.

Avicula, name given to a genus of marine bivalves of the class Pelecypoda, with pearly shells. It derives its name ('little bird') from the wing-like expansions of the hinge which occur in typical species. It is allied to the pearl oysters, and in some classifications includes them.

Avienus, Rufus Festus (4th cent. AD), Lat. poet, *b.* Vulsinii in Etruria. The only knowledge of his life that we have is derived from an inscription, printed in Meyer's *Anthologia Latina*, which is supposed to refer to him. He wrote on geographical and astronomical subjects, chiefly in hexameters, the latter including a trans. of Aratus's *Phaenomena*. He is supposed to be the Festus who was proconsul in Africa in 366, and in Achaia in 372. See the ed. of A. Holder (1887).

Avifauna, collective term applied to the various kinds of birds found in any country or dist.; the fauna as regards the birds of that region.

Avigliano, It. tn, in Basilicata (q.v.), 8 m. NNW. of Potenza (q.v.). It manufs. explosives, and is an agric. market. Pop. 18,000.

Avignon (anc. **Avenio**), historic Fr. city in Provence (q.v.), on the Rhône (q.v.), cap. of the dept. of Vaucluse. Although dating from Rom. times it did not rise to importance until the Middle Ages. In the 12th and 13th cents. it was a rep., but subject to the Counts of Provence. In 1226 it was besieged by Louis VIII during the crusade against the Albigenses (q.v.). From 1309 until 1377 A. was the residence of the popes (see PAPAcy) and the prosperity of the tn dates from this time. The Fr. antipopes (q.v.) also used A. as their seat (1378-1408). From 1411 to 1790 the tn was administered by ecclies. legates (see COMPTAT VENAISIN). The high, crenellated ramparts, dating from the 14th cent., still exist; on the N. side, however, is the *Rocher des Doms*, now a public garden, rising steeply from the riv. The famous 12th-cent. Saint-Bénézet bridge, immortalised in the folk-song 'Sur le Pont d'Avignon', has been in ruins since 1669. It is flanked by a Romanesque chapel (1234-7). The archiepiscopal cathedral (12th-17th cents.) stands beside the enormous fortress-palace of the popes, one of the most magnificent Gothic buildings of the 14th cent. There are many other fine medieval and Renaissance buildings, and there are Rom. remains and notable museums. The tn is much visited

by tourists, and it has silk, wine, ochre, machinery, and oil industries. Pop. 62,800.

Avila: 1. Sp. prov., in Castilla la Vieja (q.v.). It is mountainous, with fertile valleys. The prin. industry is stock-raising, and timber, cereals, olives, and chestnuts are produced. Area 3107 sq. m.; pop. 255,300.

2. (Anct Avela), Sp. tn, cap. of the prov. of Avila. It is 3609 ft above sea-level, and is enclosed on 3 sides by mts. The old part is surrounded by massive 12th-cent. walls, into which is built the fortress-like cathedral. There are numerous other fine old buildings, including a

having been ambas. at the court of Theodoric, King of the Visigoths, he became Emperor of the W. in AD 455 on the death of Maximus. He was, however, deposed the following year.

Aviz (Avis), tn of Portugal, in Portalegre dist., 29 m. SW. of Portalegre (q.v.). It gave its name to a royal dynasty, beginning with John I (q.v.), and to an order of knighthood. Pop. 1500.

Avizandum, Scottish legal term. When the judge, after hearing a case, temporarily withdraws it for private consideration, or for some other reason, he is said to withdraw it *ad A.* In England he would be said to reserve judgment.

AVIGNON

E.N.A.

The cathedral and palace of the popes with the Pont Saint-Bénézet—"le pont d'Avignon."

Moorish castle, and there was once a univ. (1504-1807). St Teresa (q.v.) of Jesus was b. here. Pop. 25,000.

Avilés (anct Flavionavia), Sp. tn in the prov. of Oviedo. There are coal and copper mines near by, and textiles and pottery are manuf. Pop. 18,000.

Avilia, Beato Juan de (1500-69), Sp. religious writer, b. Almodóvar del Campo. After studying at the univ. of Salamanca and Alcalá, he took holy orders, and settled in Andalusia. His prin. writings are *Audi filia* (1556-7), a vigorous work preaching Christian asceticism, and his famous correspondence *Epistolario espiritual*. He was beatified in 1894. See P. Gerardo de San Juan, *Vida del Maestro Juan de Avilia*, 1915.

Aviz, see AVIZ.

Avison, Charles (1709-70), musical composer, b. Newcastle on Tyne. He studied under Geminiani, and pub. numerous concertos, a few of which have been repub. in recent times, and many sonatas. He also wrote well on music, and his *Essay on Musical Expression*, 1752, is the first Eng. musical criticism.

Avitus, Marcus Maecilius (d. 456), Rom. emperor, a native of Auvergne. He was prefect of Gaul, and waged successful war against the Huns and the Vandals. After

Avksent'yev, Nikolay Dmitriyevich (1878-1943), Russian politician, leader of the right wing of the Socialist Revolutionaries (q.v.). In 1917, after the Feb. Revolution (q.v.), he became Chairman of the Soviet Peasants' Deputies, then Minister of the Interior in the Provisional Gov. (q.v.), and Chairman of the Pre-Parliament (q.v.). In 1918 he was a member of the Ufa Directory (q.v.). Later he lived in emigration.

Avlona or **Valona** (Albanian, *Vlonë*), tn and seaport of Albania on the bay of Janina, 58 m. S. of Durazzo (Durrës). It was under the gov. of Venice until 1691. There is a good harbour, and wool and tortoise-shell were formerly exported from A. in quantity. The dist. produces natural asphalt, salt, tobacco, oils, and alcohol. There is an oil pipe-line from the interior. It demands on Austria-Hungary, as formulated in April 1915, included recognition of her sovereignty over A. At the same time Italy was signing a secret agreement with the Allies whereby, *inter alia*, she was to annex A. and its neighbourhood. In Dec. 1915 the Italians occupied A., which was thus secured as a base to dominate all the S.-central part of Albania. After the downfall of Italy in the Second World

War, A. reverted to Albania and is now known as Vlone. Pop. 9100.

Avoca, or **Ovoca**, short riv. of co. Wicklow, Rep. of I., formed by the junction of the Avonmore and Avonbeg streams. It runs through exquisite scenery the 'sweet vale' of Thomas Moore's *Meeting of the Waters*. There are copper and lead mines.

Avocado Pear is the edible fruit of *Persea gratissima*, a species of Lauraceae, which grows in the tropics. It is also known as the alligator pear.

AVOCET

Avocet is the name of a widely distributed wading bird belonging to the genus *Recurvirostra*, characterised by its curious curved beak. The common A. bred in England till 1824, but then disappeared from England until 1947 when one bird returned and reared a family of 14 near Great Yarmouth. The genus is related to the snipe family and inhabits fen areas. It is found in Europe, Africa, and Central and S. Asia.

Avogadro, Count Amedeo (1776-1856), It. physicist, b. Turin, was made prof. of physics at Vercelli in 1809, and of mathematics at Turin in 1820. He enunciated in 1811 the hypothesis named after him: that equal vols. of gases at the same temp. and pressure contain equal numbers of molecules. This hypothesis is an important part of the atomic theory (q.v.).

Avoudupois (Averdepois), see METROLOGY.

Avola, seaport in Sicily (q.v.), on the E. coast, 14 m. SW. of Syracuse (q.v.). It has fine 18th-cent. buildings, tunny fisheries, and a trade in almonds, wine, and sugar. Pop. 22,000.

Avon, Celtic word meaning riv., the name of many Brit. streams, of which the following are the chief:

1. The Upper or Warwickshire A. rises near Naseby in Northants, and flows through Warwickshire and Worcs into the Severn.

2. The Lower or Bristol A., 70 m. long enters the Bristol Channel 6 m. below

Bristol. It is noted for its very high spring tides, which sometimes reach a height of 40 ft.

3. The eastern A. flows through Wilts and is navigable to Salisbury. It has a length of 50 m., and is noted for the delicate loach.

There are also 3 A.s in Scotland, tribs. of the Spey, the Clyde, and the Forth, and 2 in Wales, which flow into Swansea Bay.

Avondale, par. of W. Lanarkshire, Scotland, 7 m. SW. of Hamilton, famous as the scene of the battle of Drumclog (q.v.), 1679. Pop. 6000.

Avonmore, see AVOCA.

Avonmouth, suburb of the city and co. of Bristol (q.v.), Glos, England, at the mouth of the R. Avon, a fast developing port with extensive docks.

Avory, Sir Horace Edmund (1851-1935), Judge, b. London; educ. at King's College and Cambridge Univ. Called to the Bar, 1875; junior counsel to Treasury, 1889; senior, 1899. K.C. 1901. Appointed a Judge of King's Bench Div., 1910. He was generally accounted the ablest criminal lawyer of his day, and had the reputation of being an extremely stern judge but absolutely fair. It fell to his lot to try most of the worst criminals of his time—murder cases tried by him included those of Mahon, Vaquier, Brown and Kennedy, Field and Gray, Allaway, and Voisin. The Hatry case was also heard by A., and he presided over the trial of Lord Kylsant. As Crown counsel he prosecuted Adolf Beck, and it seems that the miscarriage of justice in that *cause célèbre* which led ultimately to the institution of the Court of Criminal Appeal (q.v.) was due chiefly to his scrupulous wish that the laws of evidence should be observed. See Gordon Lang, *Mr Justice Avory*, 1935.

Avranches, Fr. tn in the dept of La Manche, on a hill overlooking the estuary of the R. Sée. It was the seat of a bishopric from the 6th cent. until 1801. The cathedral, once considered the finest in Normandy, was demolished as insecure in 1790. In it Henry II of England received absolution for the murder of Becket. Horse-breeding, leatherwork, and fishing are the main industries. A. was the scene of decisive engagements during the Normandy campaign in the Second World War. Pop. 7500. See also WESTERN FRONT IN SECOND WORLD WAR, *Invasion of Normandy*.

Awaji, is. of Japan, in the strait at the E. entrance of the Inland Sea between Honshu and Shikoku. Much visited by tourists for its beautiful scenery. Length 30 m.; area 218 sq. m.; chief city, Sumoto; pop. 38,000.

Award, decision of an umpire in a submission to arbitration (q.v.). To be enforceable, the A. must determine all the differences at issue and no others.

Awash, riv. flowing SE. of Addis Ababa, cap. of Ethiopia, rising 20 m. W. of Addis Alam, and after a course of some 500 m. entering Lake Abbé. A hydro-electric scheme is in course of construction (1957) and is being financed by It. reparations.

When completed it will serve Addis Ababa with electricity.

Awe, loch and riv. in Argyll, Scotland. The loch is 23 m. long and 118 ft above sea level (greatest depth 307 ft), and is fed at the NE. end by the Orchy and Strae. On a peninsula (at high water an is.) stands Kilchurn Castle whose keep dates from 1440. The R. A. issues from the NW. end of the loch and flows through the Pass of Brander for about 5 m. into Loch Etive. It is an excellent salmon and trout stream; above it rise the 8 peaks of Ben Cruachan (3689 ft).

Awn, stiff, bristle-like projection from the glumes of many grasses, some fruits, and sometimes from leaf-tips or sepals.

Awomori, or **Aomori**, seaport of Japan and chief tn of the dept of A., on N. coast of Nippon, 444 m. N. of Tokyo. It has a fine natural harbour, and a large trade, mainly coal. Pop. 77,100.

Axbridge, par. and small tn of Somerset, England, 9½ m. W. of Wells, once a chartered bor. and now the centre of a rural dist. Pop. 1100.

Axe: 1. Riv. of Dorset and Devon, England, about 21 m. long, flowing through Axminster into the Eng. Channel at Lyme Bay. Not navigable.

2. Riv. of Somerset, England, about 25 m. long, rising in the Mendips and entering the Bristol Channel.

Axel, Dan. statesman, *see* ABSALON.

Axenberg, mt in the canton of Uri, Switzerland, to the SE. of Lake Luzern. Altitude 3670 ft. On a ledge of rock at its foot stands Tell's chapel (*see* TELL). The road called the Axenstrasse has been hewn out of the rock, and the mt is pierced by a tunnel on the St Gotthard railway.

Axestone, *see* JADE.

Axholme, Isle of, lowlying dist. of NW. Lincs, England, cut off by the Rs. Trent, Idle, and Don. Area 47,000 ac. It was probably originally covered with forest, and when this was destroyed, became a swamp, drained 1625-30 by Cornelius Vermuyden. There are still traces among the inhab. of the Flem. settlement at this time. Chief tns, Crowle and Epworth.

Axil, in botany, the upper angle between a leaf and the stem or branch from which it grows. Lateral buds usually grow out from the A., and are accordingly called axillary buds.

Axilla, anatomical term for the armpit, or pyramidal space between the inner side of the upper arm and the wall of the chest. The apex of the cavity points upward and inward towards the root of the neck, and its extent depends on the position of the arm, being greatest when it hangs at the side. When the arm is raised, the fore and hind boundaries form the axillary folds. The skin of the A. is dark and covered with large sweat-glands and hair. Large nerves and vessels of the arm pass through it, and there are numerous lymphatic glands into which drain the lymph channels from the arm, part of the breast, and part of the chest wall.

Axinite, name of a mineral which is a silicate of aluminium, lime, etc., with boracic acid, containing varying amounts

of iron and manganese. It derives its name from the fact that the edges of its glassy triclinic crystals bear some resemblance to the edges of an axe.

Axiom, self-evident proposition which may be taken for granted and requires no proof. The use of the word is now practically restricted to the general premises on which the truths of geometry rest. The term was so employed by Euclid, following Aristotle. Plato limited it to specifically geometrical truths.

Axis: 1. Rod or an imaginary line about which a body rotates, or is symmetrically disposed. The term has many special meanings in the various sciences. It is of frequent use in geometry, e.g. the A. of symmetry is the line joining corresponding points in symmetric figures; the A. of a solid is the line about which its angles are symmetrically disposed; the transverse A. of a conic passes through its foci; and there are similar uses in geometric crystallography and physics. In mechanics the term axle has the same meaning. As an anatomical term it denotes the second cervical vertebra, which supports the atlas.

2. In botany, term which is applied to the root and stem of the whole plant. When a seed has begun to germinate the plumule ascends into the air above the ground, while the radicle descends into the earth. The former is said to be the ascending A. of the plant, the latter the descending A., and around these axes of growth all other parts of the plant are arranged.

3. *Rome-Berlin A.*, the political and, later, military entente between Hitler and Mussolini, concluded, ostensibly, to present a common front against Bolshevism, but really as an essential factor in the formulation of a common policy against the W. democracies in order to secure the nullification of the treaty of Versailles. In Aug. 1937 Mussolini, speaking at Palermo, said: 'Another reality of which account must be taken is that which is now commonly known as the Rome-Berlin A. One does not reach Rome by ignoring Berlin, and one does not reach Berlin by ignoring Rome. There is an active solidarity between the 2 regimes. Let it be said in the most categorical manner that we will not tolerate in the Mediterranean Bolshevism or anything of a similar nature.' The term A. became a common description for the countries allied to Germany in the Second World War. Japan and the Ger. satellites subsequently joined the A. formally. *See further under* EUROPE; GERMANY, *History*; ITALY, *History*; JAPAN, *History*.

Axis Deer (*Axis axis*), species found in India and the E. Indies, somewhat resembling the common European fallow-deer, being profusely spotted with white on a fawn background, shading from almost black on the back to white on the under-parts. It is easily domesticated.

Axius, riv. of Macedonia, which rises in Yugoslavia, and runs SE. through Skopje into the Gulf of Salonika. It was called Bardarian in the Middle Ages, and the modern name, Vardar, is a

corruption of this. In the upper part of its course it runs through narrow valleys between high mts. At its mouth alluvial deposits have made great encroachments, and the land is low and swampy, intersected with small creeks. It is constantly changing course to the southward. The entrance is very intricate, but the riv. is navigable for boats of 30 tons for sev. m. The depth of the riv. depends on the season of the year. It is as low as 4 ft in summer, but in winter it is deep and rapid, and nearly 2 m. in breadth before reaching the sea.

Ax-les-Thermes, Fr. spa in the dept of Ariège, on the Ariège. It is a centre for winter sports. There is a road from A. over the Pyrenees into Andorra and Spain. Pop. 1500.

Axminster, urb. dist. of Devon, England, on R. Axe, 24 m. E. of Exeter, at the intersection of two anc. roads, Icknield Way and Fosse Way. It was long celebrated for its carpets, the manuf. of which was begun in 1755. The industry is now carried on at Wilton. The minster from which it takes its name was founded in the 13th cent. and varies from Norman to Perpendicular in style. Pop. 2330.

Axolotl, larval salamander of the genus *Amblystoma*, found in lakes in Mexico and the Rockies. It resembles a newt in shape, having a powerful tail, 2 pairs of weak limbs, and 3 pairs of simple external gills. In this form it breeds freely, laying eggs like a frog's, in strings attached to water-plants by a viscous substance, and the young, hatched in 2 to 3 weeks, resemble the parents. This was originally supposed to be the life hist. of the species, but from 1865 onwards experiments showed that this form is prematurely sexual, and that the *Amblystoma* is capable of attaining an adult form in which gills and the tail-membrane are lost. The offspring of these, the full A.s are gilled. Some kinds of the species never appear to make this change, which can be favoured or prevented by the conditions of life.

Axona, see AISNE.

Axum, see AHSUM.

Ay, Fr. tn in the dept of Marne, on the R. Marne, 14 m. S. of Rheims. It is a centre for wines, especially champagne. Pop. 6300.

Ayacucho: 1. Dept of S. Peru. It is watered by the Apurimac. There is much agriculture and raising of livestock, and precious metals are mined. Area 18,190 sq. m.; pop. 304,200.

2. Cap. of dept of same name. 220 m. SE. of Lima. Pop. 18,300. It was founded by Pizarro in 1539, and the name, originally Huamanga, was changed to A. in commemoration of the resounding victory gained at a small place of that name over the Spaniards in Dec. 1824, which confirmed Peruvian independence, and finally ended Sp. power in S. America.

Ayala, **Adelardo López de** (1828-79), Sp. dramatist and politician. He was president of the chamber under Alfonso XII, but his political life was marked by confusing changes of opinions. His chief

dramas are *El tanto por ciento*, 1860; *El nuevo Don Juan*, 1863; *Consuelo*, 1878.

Ayala, **Balthazar** (1548-84), jurist, son of Don Diego de A., of Burgos in Spain, and of his wife, daughter of an alderman of Antwerp, where Balthazar was b. He was made 'auditor' or judge-advocate of the troops of Philip II in the United Provs., in May 1580. In 1583 he became also member of the great council and master of requests in ordinary. The only work he pub. was *De Jure et Officiis et Disciplina Militari*, libri iii., 8vo, Douai, 1582. An Eng. trans. has fairly recently appeared in America.

Ayala, **Pero López de** (1332-1407), Sp. poet and historian, b. Vitoria. He became Chancellor of Castile in 1399. His chief work is a chronicle of his own period, giving a vivid and objective picture of those cruel and stormy times.

ATE-AYE

He composed besides a somewhat dull poem *El Rimado de Palacio*, satirising contemporary society. He also pub. trans. of Boccaccio, Boethius, and Livy.

Ayala, **Ramón Pérez de** (1880-), Sp. poet, critic, and novelist, b. Oviedo, Asturias. He studied law at Oviedo, and travelled widely. He wrote autobiographical novels, *Tinieblas en las Cumbres*, 1907, *A.M.D.G.*, 1910, *La Pata de la Raposa*, 1912, and *Troteras y Danzadoras*, 1913. In 1921 he pub. a very popular and humorous novel called *Belarmino y Apolonio*, about 2 cobblers, one with an artistic and the other with a philosophic ideal. He is essentially an intellectual; his writings are characterized by subtle observation, a sceptical humour and a sincere interest in human problems. Many of his works have been trans. into English. See C. Claveria, *Cinco estudios*, 1945.

Ayamonte, Sp. fishing port in the prov. of Huelva, on the Mediterranean at the mouth of the Guadiana (q.v.). It is on the Portuguese frontier. There are cod, sardine, and tunny fisheries. Pop. 12,500.

Aydın, an il of Turkey SE. of Izmir and the most important area for the production of olive oil. Pop. 415,352.

Aye-aye (*Chiromys madagascariensis*),

rare and remarkable animal found in the woods of Madagascar. The memoir of Sir Richard Owen, 1863, made it clear that it is really an aberrant lemur with many rodent affinities. It is the size of a cat, has rodent-like teeth, and a hairy hand with an exceedingly slender third finger, which is used to pick out the wood grubs on which it feeds. It is exclusively nocturnal and arboreal in its habits, and is regarded with superstitious reverence by the natives of Madagascar.

Ayenbite of Inwit (Remorse of Conscience), prose trans. of a popular Fr. treatise, *Somme des Vices et des Vertus*. Written about 1340 by an Augustinian monk, Dan Michel of Northgate, Canterbury, it is mainly of philological interest as an example of Kentish dialect.

Ayer, Alfred Jules (1910-), Brit. philosopher, educ. at Eton and Christ Church, Oxford. He was lecturer in philosophy at Christ Church (1932-5); served with the Welsh Guards during the Second World War; and was Dean of Wadham College, Oxford, 1944-6. In 1946 he was appointed Grote prof. of the philosophy of mind and logic; F.B.A., 1952. His prin. works include *Language, Truth, and Logic*, 1936 (revised ed. 1946), *The Foundations of Empirical Knowledge*, 1940, *Thinking and Meaning*, 1947, and *Philosophical Essays*, 1954.

Ayesha, favourite wife of Mohammed. She was *b.* in 613 or 614, was married when she was 7, taking her toys to her new home, though the marriage was not consummated till 2 years later. The other wives complained of the favour shown her. After Mohammed's death she was important as one of the Mothers of the Believers and, when Ali (q.v.) was chosen caliph, she joined his enemies in Medina, went with their army to Iraq, where it was defeated, and she was captured 656. After that little is heard of her; she *d.* probably in 678. Legend makes her a learned saint.

Ayin-i-Akbari, title of a geographical and statistical account of the Mogul empire in India during the reign of Jelal-ed-din Mohammed Akbar, written by his vizier, Abul Fazl. It constitutes properly the third or concluding part of the *Akbar Nameh* of the same author, which gives an account of Akbar's ancestors and his reign down to the forty-seventh year. The *Ayin-i-Akbari* is divided into 4 parts; the first 3 are chiefly political and legislative; the fourth part is chiefly statistical and geographical, with an account of the ancient institutions, religion, and literature of the Hindus. Francis Gladwin made a free and abridged trans. into Eng. of the *Akbarnamah* (Calcutta, 1783).

Aylesbury, market, assize, and co. tn of Bucks, England, 38 m. NW. of London, and an important railway centre. Built on high ground, it overlooks the fruitful valley of A. It was captured from the Britons by the Saxons in 571. During the Civil war a battle was fought near here (1642). Until 1885 it was a parl. bor. The par. church of St Mary stands impressively in the centre of the tn,

surrounded by a quiet square of 17th- and 18th-cent. houses. The main fabric is Early Eng. (13th cent.); the famous font is Norman. The curious stunted lead spire was added to the tower c. 1670, and the whole church was drastically restored in 1850. Industries include printing, milk and milk products, and many other manufs. A. was formerly noted for rearing ducks for the London market. Pop. 21,054.

Aylesford, vil. of Kent, England, 3½ m. NW. of Maidstone, on the r. b. of the Medway. St Peter's Church, partly Norman but restored in 1878, has 15th-cent. brasses and an early embattled tower. There are remains of cromlechs in the neighbourhood (see KITS CORY HOUSE). The friary, now housing Carmelite friars, incorporates part of the original building of 1247. Pop. 3700.

Aylesham, vil. of Kent, England, 8 m. from Dover, situated among orchards, with mining and textile industries. Pop. 5000.

Ayllon, Lucas Vazquez de (c. 1476-1526 or 1530), Sp. soldier and explorer; *b.* probably in Toledo; a captain and a rich and learned man. Made *auditor de guerra* or legal adviser to the Viceroy of Hispaniola. No Nicolás de Ovando, whom he accompanied in Feb. 1502 in the largest expedition yet dispatched to the new Amer. lands. Formed a company with some other inhab. of Hispaniola and sailed out with 2 vessels to capture Indian Caribs as slaves for the mines. Storm-driven on E. coast of Florida, A. entered the prov. of Chicora and by treachery captured 130 natives, most of whom died of homesickness. In 1524 he prepared another expedition to conquer Chicora and landed on another part of the coast. In 1526 he estab. a colony on the site of Jamestown, Virginia, where he *d.* in same year. See Gabriel de Cardenas y Cano, *Ensayo Cronologico de la Florida* (Madrid), 1723, and Arthur Helps, *The Spanish Conquest in America*, 1855.

Aylmer, John (1821-94), *b.* A. Hall, Tivetshall St Mary, in Norfolk. He was educ. at Cambridge and in 1841 became chaplain to the Duke of Suffolk. Afterwards, when archdeacon of Stow, he was obliged to leave the country on account of his opposition to the doctrine of transubstantiation, but returned to England and resumed his office on the accession of Elizabeth. In 1862 he was made archdeacon of Lincoln, and in 1876 Bishop of London. He was avaricious, and notorious for his severe treatment of any who differed from him.

Aylmer, Matthew Whitworth, Baron (1775-1850), twenty-ninth Governor-General of Canada (1831-5), general in the army and colonel of the 18th Foot. His tenure of office followed the conciliatory policy of Sir James Kempt on the question of the constitution of the Executive and Legislative Councils. A. had had a distinguished military career, but no administrative experience. Hence he approached this question with at least an open mind, as indeed all constitutional problems in Canada. His administration

was characterised by a series of measures which profoundly altered the aspect of the outlook of the Fr.-Canadian party, driving it to a clear-cut policy which led to open violence. In 1834 the Assembly voiced its grievances in the '92 Resolutions,' which document was sent to the Brit. Gov. in London. A royal commission then investigated the affairs of Quebec, and recommended that its revenue should be handed over to the Assembly in return for a 'civil list,' but that there should be no legislative council. This negative recommendation completely alienated the Assembly, and A. was recalled. It was during his tenure, too, that the *Royal William*, the first steamship to cross the Atlantic, was launched from its Canadian shipyard. Again, it was A. who caused a memorial to Montcalm to be placed in the Ursuline convent chapel of Quebec city. Sev. tns, lakes, etc., in Canada are named in memory of him.

Ayloffie, Sir Joseph (c. 1708-81), anti-quarian. He was one of the first members of the council of the Society of Anti-quaries, and was later made a commissioner for the preservation of state papers. He was author or editor of a considerable number of books.

Aylisham, par. and mrkt tn in Norfolk, England, 10 m. SW. of Cromer. Pop. 2600.

Aymará, tribe of S. Amer. Indians. They were in former times the inhab. of the dist. round Lake Titicaca and the adjacent valleys, and form the chief element in Bolivia, though the race is now of very mixed blood. In ant. days the Incas attributed the origin of all Quichua civilisation to the home of the A.s, which was therefore 'sacred land' to them. The A.s undoubtedly appear to have possessed a considerable culture before they were conquered by the Incas in the 13th and 14th cents. Evidence exists of their having important cities and palaces, and the ruins of Tiahuanaco show that these were of colossal size. At the time of the Sp. invasion the A.s had been under the dominion of the Incas for a considerable time and were to some extent degenerate. They retained, however, the privilege of using their own language, and on the whole their treatment by the Incas suggested that the conquerors believed themselves to be of A. blood. To-day they are poor farmers, in an arid region, and their culture is a simple one. They now number about half a million in Bolivia and S. Peru. See H. Tschopik, 'The Aymará,' in J. H. Steward's *Handbook of South American Indians*, vol. II, 1946.

Aymer de Valence (d. c. 1260), Bishop of Winchester, a half-brother of Henry III, who obtained for him the see of Winchester. The appointment was a bad one, for A. was ignorant of England, greedy and idle, and by no means priestly in his mode of life. He repudiated the barons' constitution at the Parliament of Oxford in 1258, and was forced to leave the country.

Aymer de Valence, Earl of Pembroke (d. 1324), son of William de Valence, nephew of Bishop A. (q.v.). He was

appointed guardian of Scotland in 1306; he defeated the Scots in that year at Methven, but was defeated by Bruce at Loudon Hill in 1307. He joined the Lancastrian party, and was a fierce opponent of Gaveston, whom he captured in 1312; but was later reconciled to the king. In 1314 he was made Lieutenant of Scotland, and fought at Bannockburn. In 1322 he joined in the judgment and condemnation of Lancaster.

Aymestry Limestone belongs to the Ludlow group of the Silurian system. It is a dark grey concretionary rock, consisting of thin beds. It is named after the vil. of Aymestry, in Herefordshire, where it has long been quarried.

Aymon, surname borne by 4 brothers, Alard, Richard, Guiscard, and Renaud. They occupied a prominent place as heroes of the cycle of romance in the time of Charlemagne. Their exploits were described in a romance written by Huon de Villeneuve in the 13th cent., entitled *Les Quatre Fils Aymon*. Renaud also appears as a leading figure in Ariosto's *Orlando Furioso*.

Ayot St Lawrence, vil. of Herts, England, 8 m. N. of St Albans. Here is Shaw's Corner (National Trust), home of George Bernard Shaw (1856-1950). The church is in the classic style (1778). Pop. 143.

Ayr 1. SW. co. of Scotland, bordered on the N. by Renfrewshire, on the E. by Lanarkshire and Dumfriesshire, on the SE. by Kirkcudbrightshire and Wigtonshire, and on the W. by the frith of Clyde. Off the coast are Ailsa Craig, Lady Is., and Horse Is. The surface of the co. is mountainous in the SE. and hilly in the SE. and N.; the chief rivs. are the Ayr, Irvine, Doon, and Girvan, and Loch Doon is the largest loch. The Afton, Cessnock, and Lugar R.s are known from the poems of Burns. The co. is noted for the breeding of Ayrshire cattle, and for dairy products, and agriculture flourishes here. It is also one of the prin. mining cos. of Scotland, and bauxitic clay and fireclay are found in addition to coal. The manufs. are important, and include cotton and woollen goods, lace curtains at Galston and Darvel, cabinet-making at Beith, ship-building at Troon, Ayr, Irvine, and Ardrossan (which is also a seaport), steel works at Glegarnock and extensive engineering works at Ayr and Kilmarnock. There is an international airport at Prestwick. A. and Bute cos. together return 5 members of Parliament. Area 1132 sq. m.; pop. 321,200.

2. Royal municipal, and police burgh, and co. tn of Ayrshire, Scotland, a seaport 4½ m. SSW. of Glasgow. It may have been the site of a Rom. station; here in 1197 William the Lion built a castle which no longer stands. Picturesquely situated on the S. bank of the riv., it has a fine bay and beautiful sands, while there are some handsome public buildings. Its manufs. are numerous, and include leather, woollens, carpets, lace, boots, shoes, etc.; there are foundries, engineering works, and saw-mills. The prin.

imports are timber and agric. fertilisers, whilst among the exports are coal, iron, and manuf. goods, and agric. produce. Ship-repairing is also carried on, and the harbour has both wet and dry docks. In 1935 the municipal boundary was extended to include the vills. of Alloway and Whitelatts. At Alloway, 2½ m. S. of the tn centre, Robert Burns was b., 25 Jan. 1759. Prestwick airport is situated some 4 m. N. of the tn. Pop. 43,011.

Ayr, riv. of Ayrshire, Scotland, rising 4 m. E. of Muirkirk and flowing W. for 38 m. to join the firth of Clyde at Ayr. Trout and salmon are found in the riv.

Ayrer, Jakob (c. 1543-1605), Ger. dramatist, citizen, and legal officer of Nuremberg. His extant works comprise 36 humorous pieces and 30 dramas. His works, both humorous and serious in character, are marked by a vigour of diction and purity of style, but the line of demarcation between the grave and the gay is often not sufficiently clearly defined. His works include comedies, tragedies, Shrovetide plays, and *Singspiele*, in the tradition of the Eng. jigs.

Ayres, John (fl. c. 1680-1705), the most eminent writing-master of his day; as such he is quoted by Samuel Pepys in his *Calligraphical Collection*. A. began life in a humble way, but in time became a celebrated calligrapher and 'Master of the Writing School at the "Hand and Pen"' near St Paul's School in St Paul's Churchyard. He also may have been writing-master to St Paul's School. According to Robert More, A. introduced into England the 'Italian style' of penmanship. This is not exact (it was introduced here in the 16th cent.), unless More had in mind the It. 'Bâtarde' hand, which became fashionable in England in the late 17th cent. A. pub. *The A la Mode Secrétaire*, 1680, *The Accomplish'd Clerk*, 1683, *Paul's School Round Hand*, 1700, and other works. But his most important work was *A Tutor to Penmanship; or, the Writing Master: a Copy Book showing all the Variety of Penmanship and Clerkship as now practised in England* (2 parts), 1698.

Ayrshire Breed, see CATTLE.

Ayrton, Michael (1921-), painter, sculptor, author, designer. His first one-man show of paintings was held at the Redfern Gallery in 1943 and in 1955 there was a retrospective exhibition of his work at the Whitechapel Gallery. He has illustrated many books and was art critic of the *Spectator*, 1944-6.

Ayrton, William Edward (1847-1908), man of science, entered the Indian gov. telegraphic service in 1867, and, after becoming superintendent, was made an associate of the Royal Society of London in 1881. He made many improvements in telegraphy and in the dynamometer. His wife, the only woman member of the Institution of Electrical Engineers, carried out a series of experiments on the electric arc, and was awarded the Hughes medal by the institution in 1908.

Ayscough, Samuel (1745-1804), librarian, b. Nottingham. Owing to family misfortunes he was forced to work as a

millar and then as an overseer of pavours. Coming to London he joined the staff of the Brit. Museum as a cataloguer and became an assistant librarian. He indexed the *Annual Register* of 1758-80 and the *Gentleman's Magazine* of 1731-86, and compiled the first Shakespeare concordance. He took orders about 1781 and held various livings, the last being at Cudham in Kent.

Ayscough, William (d. 1450), Eng. bishop. He became Bishop of Salisbury in 1438, and had great influence at the court of Henry VI, being the king's confessor. As a councillor of the king he was held to be responsible for the evil deeds of the court, and in his own diocese was disliked because of his continual absence. In 1450, after celebrating mass at Edington, he was seized by the congregation and beaten to death.

Ayscue, Sir George (d. 1671), admiral of the Commonwealth period. He had been knighted by Charles I, but became a parliamentarian and commanded the fleet in the Irish Sea in 1649, being then appointed admiral. At the beginning of the Commonwealth he defeated the Dutch off the Downs. In 1651 he was sent by Cromwell to Barbados to reduce the Royalists to subjection. In 1652 he fought an indecisive engagement off Plymouth. He was superseded in that year, but became commander of the Swedish fleet in 1658, and a navy commissioner on the Restoration. He fought in the second Dutch war, was imprisoned in Holland in 1666-7, and on his return to England did not again take an active part in naval matters.

Aysen, prov. of S. Chile. Area, 34,357 sq. m. Pop. (1952) 26,262.

Aytoun, or Ayton, Sir Robert (1570-1638), poet, b. Kinaldie, Fife. Educ. at St Andrews, he attached himself to the court of James VI and I, to whom he had addressed a Lat. panegyric, was knighted in 1612, and remained in the royal service till his death. Acquainted with the leading wits of his day, including Ben Jonson and Hobbes, he was one of the first Scottish poets to write graceful Eng. verse. His chief poem is *Diophantus and Charidora*, while among his shorter pieces 'Inconstancy Unpraised' is counted the best. He was buried in Westminster Abbey. See his *Poems*, ed. C. Rogers, 1871.

Aytoun, William Edmonstone (1813-1865), poet, b. Edinburgh, was related to Sir Robert A. (q.v.). Educ. at Edinburgh Academy and Univ., he was called to the Scottish Bar in 1840. In 1845 he became Prof. of Rhetoric and Belles Lettres at Edinburgh, and in 1849 married the daughter of Prof. John Wilson (q.v.). He was a contributor to *Blackwood's Magazine* from 1836 onwards, and in 1855, in collaboration with Theodore Martin, he pub. the *Bon Gaultier Ballads*, which had great popularity. His *Lays of the Cavaliers*, 1848, went into 28 eds. Others of his works are *Poland, Homer, and Other Poems*, 1832, *The Life and Times of Richard I*, 1840, *Firmitian, a Spasmodic Tragedy* (pub. under the name T. Percy

(Jones), 1854, *Bothwell*, 1856, *Norman Sinclair*, a novel, 1861, and *Ballads of Scotland*, 1870; an ed. of his *Poems* was pub. 1921. See life by T. Martin, 1867.

Ayub Khan (1855-1914), Afghan prince, son of Sher Ali, formerly Amir of Afghanistan. Took possession of Herat in 1879 after his father's expulsion from Kabul by the British. In 1881 he invaded Afghanistan in order to win Kandahar and the sovereignty. Defeated Gen. Burrows at the battle of Maiwand, but while hesitating to attack Kandahar, his force was assailed by Sir Frederick (afterwards Lord) Roberts and routed. He renewed his invasion soon afterwards, but after a short-lived success was utterly defeated by Abd-ur-Rahman. Ultimately gave himself up to the British, by whom he was sent to India as a state prisoner. He d. at Lahore.

Ayuntamiento, see **CARILLO**.

Ayuthia, anc. cap. of Thailand, sacked by the Burmese in 1782, and now called Krung Kuo ('Old Capital'). It was founded in 1351, and during the 16th cent. was a great port, being divided into special divs. for the Chinese, Japanese, Malays, and Portuguese who traded there. It still remains a fairly important tn, the greater part of it being now built on the water. Most of its great buildings are now in a state of ruin.

Azais, Pierre Hyacinthe (1766-1845), Fr. philosopher, son of the musician of the same name; b. Sorèze. He entered a monastery, but soon renounced the monastic life. At first a warm partisan of the revolution, he changed his views and was thereupon sentenced to deportation. He took refuge in the hospital of the Sisters of Charity at Tarbes, where he had leisure for his philosophical studies. After the fall of Napoleon, the gov. granted him a pension of 6000 francs. He d. at Paris.

AZALEA

Azalea is a plant now included in the genus *Rhododendron* of the family Ericaceae, which is a native of the mts of Asia

and N. America. The popular, greenhouse, so-called Indian A.s are derived from *Rhododendron simsii*, a Chinese species; the 'Mollis' A.s from *R. molle*; the Kurume A.s from the Jap. *R. obtusum*; and there are numerous varieties and hybrids. *Azalea pontica* of Asia minor is *R. luteum*, and *Loiseleuria procumbens* is sometimes called the trailing A. They do well in a mixture of loam peat and leaf-mould, to which has been added some sand. They may be increased by cuttings planted in a sandy soil in slight heat in spring. These shrubs grow to a height which varies between 10 and 15 ft.

Azara, see **MUEZZIN**.

Azaña, Manuel (1881-1941), Sp. politician, b. Alcalá de Henares. He made a reputation as one of the leading Sp. men of letters. Towards the close of Primo de Rivera's (q.v.) dictatorship A. came to the fore as a democratic leader, and, after de Rivera's fall, he was elected president of the Madrid Academy. He was a member of the revolutionary committee which in 1931 signed the pact of San Sebastian, and in 1932 he became war minister to the provisional Republican Gov. A. was largely responsible for the grant of autonomy to Catalonia and for those articles of the constitution which curtailed the freedom of the religious orders and legalised the suppression of the Jesuits. He succeeded Alcalá Zamora as head of the gov. from 1931 to 1933. When Zamora was deposed by the Cortes in 1936 A. was again elected in his place and left active politics. During the Civil war he was little more than a figure-head, and when the Nationalist forces were marching on Barcelona he went into exile in France.

Azande, Sudanic-speaking Negro people living in SW. Sudan, NE. Congo, and SE. Fr. Equatorial Africa in the Upper Uele region. The A. State is an amalgam of many small tribes which were subjected by an invading aristocracy, the Avongara, and the total pop. is about 750,000. The state was greatly weakened by Arab slave traders in the last cent. The A. were cannibals (from which comes their popular name of *Niam-niam*), and are fine wood-carvers and musicians. See G. Schweinfurth, *Heart of Africa*, 1873; E. E. Evans-Pritchard, *Witchcraft Oracles and Magic among the Azande*, 1937; P. Baxter and A. Butt, *The Azande*, 1953.

Azara, Don Felix de (1746-1811), Sp. naturalist and patron of science. Entered the Sp. Army and served for some considerable time in S. America, being appointed to 'the Council of Fortifications and Defence of the Two Indias.' His most famous book, pub. in 1809, was *Travels in South America from 1781 to 1801*.

Azara, genus of evergreen Chilean shrubs, family Flacourtiaceae, about 12 species. *A. microphylla* is often grown on garden walls.

Azariah, popularly called **Uzziah**, King of Judah, 735-734 bc, succeeding his father, Amaziah. The name also belonged to sev. minor O.T. characters.

Azay-le-Rideau, Fr. tn in the dept of Indre-et-Loire, on the Indre. It has a magnificent Renaissance château. Pop. 2200.

Aazel, name found in Lev. xvi. 8, 10, and 26, where it is trans. as 'scapegoat.' Reference is made to one goat for Jehovah and one for A., and the antithesis is best conveyed by regarding the trans. of A. as Satan, or an evil spirit. By many authorities, however, the word is regarded as being purely impersonal and simply conveying the idea of a 'going far away.' The Lat. is *capr emissarius*. The word was used by Milton as a name for Satan's standard-bearer.

Azeglio, Massimo Taparelli, Marchese d' (1798-1866). It. author and statesman, b. Turin. He was descended from a noble Piedmont family, and at the age of 15 he went to Rome with his father who had recently been appointed ambas. there, and became well known as a landscape artist. He later pub. 2 political novels and became known for his advocacy of It. unity, but on monarchist lines. He was wounded in the battle of Vicenza, 1848. After Novara he was appointed president of the Cabinet by Victor Emmanuel II, a position he held until 1852, when he was succeeded by Cavour.

Azerbaijan, **Azerbijan** (Russian **Azerbaydzhan**), country comprising E. Transcaucasia (see **TRANSCAUCASIA**) and NW. Persia. The former part (N. or Soviet A.) is a constituent rep. of the U.S.S.R., the latter (S. or Persian A.) a Persian prov.

Soviet Azerbaijan is mountainous in the N. and S., with the Kura R. lowland in the centre and the Talysh lowland in the SE., and has generally a dry, continental climate. There are rich oil deposits, as well as iron, copper, lead and zinc ores, and salt. Area 33,100 sq. m.; pop. (1956) 3,400,000, mostly Turkic-speaking Azerbaijanians (who form 60 per cent. of the pop.), Russians (since the 19th cent.), and Armenians. A. has a large oil industry, engineering, textile, and food industries, cotton-growing, sericulture, horticulture, and viticulture; it also has sheep, buffalo, and horse breeding (local breeds), and old crafts (silk, carpets). The prin. tns are Baku (cap.), Kirovabad, Sumgait, Shemakha, Nakhichevan', Stepanakert, Shusha. The area belonged in succession to Rome, Persia, the Arabs, Mongols, and Seljuk Turks, and again to Persia. In the 13th cent. there were sev. khanates semi-independent from Persia—Shirvan, Karabakh, Gandzha, Baku, Talysh, Nakhichevan', Kuba, and Shaki (qq.v.)—which were conquered in Russo-Persian wars or voluntarily submitted to Russia in 1804-28. Rapid development of the oil industry started in the 1870's, and by the end of the cent. A. was the largest oil producer in the world. After the seizure of power in Russia by the Bolsheviks A. entered the anti-Bolshevik Transcaucasian Federation (q.v.). Upon the latter's break-up an independent A. Rep. was formed in 1918, dominated by the Mussavat (q.v.) party. Owing to the

difficult international situation (military intervention by friendly Turks and hostile British, war with Armenia) and internal conditions (constant mutual massacres of Armenians and Muslims, Bolshevik underground in Baku) its existence was precarious, and in 1920 the Red Army easily conquered it. A. Soviet Rep. was proclaimed, which in 1922 was included in the Transcaucasian Federal Rep. and in the Soviet Union. Since the abolition of the Transcaucasian Federal Rep. in 1936 A. has been a constituent rep. of the U.S.S.R. See F. Kazenizadeh, *The Struggle for Transcaucasia*, New York, 1951; W. Kolarz, *Russia and Her Colonies*, 1952; R. Pipes, *The Formation of the Soviet Union*, Cambridge, Mass., 1954.

Azerbaydzhan, see **AZERBAIJAN**.

Azerbaijan, see **AZERBAIJAN**.

Azides, salts of azoimide or hydrazole acid. Azoimide (formula N_2H) has similar properties to those of hydrochloric acid.

Azimuth. The A. of a celestial object is the arc of the horizon measured from the N. point to the vertical of the body. In astronomy A. is measured from the N. point E. and W. up to 180°, and hence E. or W. must be inserted after the angle to show the correct A. In the figure the point H has the A. NH, 40° E.

In surveying, the exact bearing of at least 1 line and the lat. and long. of 1 station are needed to fit the survey into a main system and to place the system correctly on the surface of the earth. The direction of true N. is obtained from observation of a star whose A. is given in the Nautical Almanack, usually a circumpolar star at elongation or culmination, or the sun. When the direction to the star is observed, the A. being known, the direction N. is found.

Azinocourt, see **AGINCOURT**.

Azo, see **AZZO**.

Azo-Compounds, organic substances containing the group $R_1-N=N-R_2$, R_1 being an aryl radical and R_2 either an aryl radical or a substituted alkyl. Many A.-C. are important dyes, such as chrysoidine, Congo-red, and methyl-orange, and

other members of the group are azo-benzene, the amino-A.-C., the oxyazo-compounds, the diazoamines, diazoaminobenzene, the azoxy-compounds, etc.

Azo Dyes, see DYE.

Azo Pigments, see PIGMENTS.

Azoguo, quicksilver.

Azogues, cap. of Cañar prov., Ecuador. Area (of prov.) 1520 sq. m.; pop. 108,200.

Azoid (Gk *a*, without; *zōē*, life), geological term applied to such rocks as are found to contain no fossils. The constant tendency, however, is for geologists to discover traces of fossils in rocks hitherto considered A. Archaeozoic crystalline schists are held by some to form the A. system.

Azore, stuff like beaver cloth, manuf. in Styria, Austria.

Azores, or **Western Islands** (Portuguese *Açores*, from *acor*, hawk), archipelago in the Atlantic belonging to Portugal. It is situated between lat. 36° 55' and 39° 55' N. and long. 25° and 31° 16' W. There are 9 main is., divided into 3 natural groups: São Miguel and Santa Maria lie to the S.E.; 100 m. N.W. of them lie Terceira, Graciosa, São Jorge, Pico, and Faial; and 150 m. farther N.W. lie Flores and Corvo. Flores is 1176 m. W. of Cape Roca (q.v.). Politically the is. are part of Portugal, and for administrative purposes they are divided into 3 dists., named after the prin. seaports: Angra do Heroísmo, Horta, and Ponta Delgada (q.v.). The A. were evidently known to the Carthaginians, as Punic coins have been found on Corvo. They were known also to W. Europe in early medieval times, and were recorded on some maps of the period. They were, however, uninhabited when taken by the Portuguese, who colonised them 1431-53. They were presented by Alfonso V (q.v.) to his aunt, Isabella of Burgundy, under whose rule a large immigration of Flemings (see FLANDERS) took place. The is. are of volcanic origin, and their surface consists to a large extent of lavas and basalts; except for Flores, Corvo, and Graciosa, they are still liable to volcanic eruptions. There are many hot springs, the countryside is mountainous and rugged, and the coasts are in many places steep and inaccessible. The climate is moist but mild, and some of the is. are visited as winter resorts. Most of the flora is European, only about 40 plants out of a known 500 species being indigenous. Sugarcane, coffee, and tobacco are grown, as well as pineapples, oranges, bananas, and other fruit. Wine is produced, there is stock raising, and there is some whale fishing. The largest is. is São Miguel (41 m. by 9 m.), which contains more than half the pop. of the group, and the next largest are Terceira and Pico. Horta is an important cable station. Total area 890 sq. m.; pop. 317,400.

At the height of the battle of the Atlantic (q.v.) in 1943 the Portuguese Gov., at the request of Britain, agreed to grant temporary facilities in the shape of naval and air bases in the A. and other Portuguese is., which would enable better

protection to be given to merchant shipping in the Atlantic against Ger. submarines or other hostile craft. The agreement included provision for Brit. assistance in furnishing essential material and supplies to the Portuguese armed forces. These arrangements owed their validity to the treaty between Britain and Portugal made in 1373 and reinforced by 7 later treaties between 1386 and 1815, to a secret declaration of 1890, and, in more modern times, to treaties of arbitration made with Portugal in 1904 and 1914 which recognised the validity of all the antecedent treaties. Thus was vindicated an engagement which had lasted for nearly 6 cents., and which was without parallel in world hist.

See W. F. Walker, *The Azores, 1886*; J. Mees, *Histoire de la découverte des îles Azores*. Ghent, 1901; A. S. Brown, *Madeira, Canary Islands and Azores, 1922*.

Azorin, see MARTINEZ, RUIZ JOSE.

Azote (Gk *a*, without; *zōē*, life), name given at one time almost universally to nitrogen (q.v.), from the fact that it is unable to support animal life.

Azotised Bodies, substances which contain nitrogen and form part of the structure of plants and animals; such are albumen, casein, gelatine, etc.

Azotus, see AZHOD.

Azov (anc. Tanais), Russian port on the Don, near its mouth, in the Rostov Oblast. Pop. (1939) 17,500 (1926, 25,000). It was a Gk colony from the 3rd cent. BC, Genoese in the 13th cent., Turkish from 1471, and has been Russian since 1739.

Azov, Sea of, N. arm of the Black Sea, with which it is connected by the very narrow Kerch' strait (anc. Bosphorus (Immerius)). Area 14,000 sq. m.; greatest length 220 m.; average breadth 80 m.; maximum depth 45 ft. The water is very fresh and the Sea is frozen for 3 or 4 months almost every year. The main rivs. flowing into the S. of A. are the Don and the Kuban'. The chief ports are Zhdanov, Taganrog, and Kerch'. To the W. of the S. of A., and separated from it only by a long narrow sandy peninsula called Arabat, is the Sivash or Putrid Sea, a series of very salty lagoons and marshes.

Azpeltia, Sp. tn in the prov. of Guipúzcoa, on the Urola. One m. from it is the famous Sanctuary of Loyola, built round the house in which St Ignatius de Loyola (q.v.) was b. Pop. 8000.

Azrael, or **Raphael**, with Gabriel, Michael, and Uriel, the 4 archangels 'who go in and out before the glory of the Holy One.' Moslems regard him as the angel of Death, very similar to Fate. Jewish tradition has made him almost an evil genius. Christian tradition views him as the angel of healing from the part he plays in the book of Tobit. See also RAPHAEL.

Azrek, see BAIR-EL-AZREK.

Aztecs, *The*, are the best known of the numerous tribes which inhabited Mexico. The story of their early wanderings is told in their picture-writing. According to their hist., they came from a pleasant

land, Aztlan, somewhere to the NE., leaving it probably about the 7th cent. AD. They wandered towards the SE., led by their priests, leaving settlements which are distinguishable now. Finally, about 1200, they settled at Chapultepec, at the foot of the volcano Popocatepetl. However, their savage customs were resented by the tribe of the Chichimecs, and they were driven to the lagoons, but a hundred years afterwards they gained their liberty. Led by their priests, they chose a site for and built their cap., Tenochtitlan, also called Mexico, from the name of their god Mexitli. From this god also the A.

Mexican Embassy

SCULPTURE OF THE AZTEC TEMPLE OF
QUITZALCOATL

were called Mexicans, which name was afterwards applied generally to all the inhab. of the country. In this place they built up a magnificent civilisation, and by means of alliances and wars extended their empire over the greater part of what is now modern Mexico. Their later emperors, the Montezumas, were said to possess such wonderful treasures that they have become prototypes of magnificence, though it is probable that the greater part of this is due to tradition. Their religion included the sacrifice of human beings taken as prisoners of war. They were an agric. people, had an elaborate system of irrigation, and studied astronomy. According to their belief, time was divided into cycles of 52 years, the close of each cycle being supposed to portend some grave national disaster. During the last 5 days of each period they observed various religious ceremonies, intended to avert this catastrophe; immediately afterwards they gave themselves up to rejoicing. The last time that

this ceremony of 'tying up the years' was observed was in 1506. The last of the Montezumas succeeded in 1502. The A. were now at their greatest height, but they were feared and hated by all the surrounding nations, and this king, by carrying out a policy of wanton aggression and by the use of human sacrifices, increased this enmity. Rumours of the approach of the Spaniards had already reached Mexico. In 1517 emissaries of Velasquez, Governor of Cuba, penetrated far enough to see some of the glories. Hence, in 1519, Hernando Cortés began his famous expedition, which ended in the conquest of Mexico. He destroyed the greater part of the ships of Montezuma and advanced inland. Montezuma sent him gifts, and ordered him to return. Cortés replied insolently, and then proceeded to take advantage of the isolation of the A. He conquered and christianised Tlaxcala, a small rep. at enmity with Montezuma, and then advanced, Montezuma was forced to submit, and d. in 1520. Cortés was driven back for a time, but returned and besieged the cap., Mexico, for 80 days. With its fall comes the end of the native hist. of Mexico.

In the national museum of Mexico city is the famous Calendar stone of the A., or sun-stone, a beautiful and massive monolith of carved basalt, circular in form and 12 ft in diameter, which was used both as a sun-dial and calendar, such as the Egyptians and Chaldeans used. The inscribed procession of cyclical animals has given rise to the belief that the chronological system which produced the stone had some connection with the Tatar zodiac, and even with the Chinese and Indian astronomical system. Its age is about AD 1479, but it is said to have been a copy of some anterior stone evolved through the ages. Also in the museum is a sacrificial stone, 9 ft in diameter, sculptured from trachyte and upon which human victims in the terrible sacrifices of the A. were butchered, their breasts cut open with obsidian knives, and the still-beating heart torn out and flung before the statues of the war-gods in the temple on the *teocalli*.

Consult W. H. Prescott, *History of the Conquest of Mexico*, 1844; L. Spence, *The Civilisation of Ancient Mexico*, 1912; H. B. Parkes, *A History of Mexico*, 1950; G. C. Vaillant, *The Aztecs of Mexico*, 1950; C. A. Burland, *Magic Books from Mexico*, 1953.

Azuza, prov. in the Dominican rep., S. America, cap. Azua, with an international airport. Shallow pockets of petroleum are found in the region. Area 936 sq. m.; pop. 50,166.

Azuaga, Sp. tn in the prov. of Badajoz, in a silver- and lead-mining dist. It has Rom. remains. Pop. 17,500.

Azuay, S. prov. of Ecuador lying to the N. of Loja, and extending to the R. Amazon. It takes its name from the mt knot lying to the W. called Azuay. It is rich in ores, fertile, and well watered. The cap. tn is Cuenca. Area about 4000 sq. m.; pop. 276,152.

Azul, city and cattle dist. in the prov.

of Buenos Aires in the Argentine rep. The tn is the centre of a colony of Italians and Basques. The dist. has a pop. of about 44,373, the city 27,082.

Azulejos, Sp. and Portuguese name for tiles.

Azulene, synthesised by Pfau and Plattner in 1936 and shown to be a bicyclic hydrocarbon with a cycloheptane ring. Is a deep blue solid, melting point 99° C., and has the same odour as its

isomer naphthalene. A. occurs in nature, and is the parent substance of a group of colouring matters obtained from certain essential oils of the sesquiterpene type by oxidation or dehydrogenation.

Azun, dist. called the 'Eden of the Pyrenees,' in the SW. of dept of Hautes-Pyrénées.

Azuni, Domenico Alberto (1749-1827), It. writer on international law, and jurist, b. Sassari in Sardinia. He studied law at Sassari and Turin, and at the age of 32 was made a judge of the consulate at Nice. He pub. his general dictionary of mercantile jurisprudence in 1788, and in 1795 a book on the growth and progress of maritime law in Europe. He was appointed by Napoleon to be one of the commissioners engaged in drawing up a new commercial code, and in 1807 he

became president of the Court of Appeal at Geneva. After the fall of Napoleon he went into retirement until he was recalled and made a judge at Cagliari by Victor Emmanuel I.

Azure, heraldic term for blue. It is represented in drawings and engravings by horizontal lines.

Azurine, or **Blue Roach**, variety of the rudd, or red-eye, distinguished by its slate-blue back, silvery-white abdomen, white fins, and straw-coloured iris to the eye. It belongs to the Cyprinidae or Carp family. It is found all over the Continent, and has been introduced into England, not with very great success, although it is sometimes found in Lancs. The fish is small and hardy, affords good sport, and has firm, well-flavoured flesh.

Azurite, basic copper carbonate, name given to the stone which is also known as lazulite. This stone, together with lapis lazuli and mineral turquoise, is given the generic name of azure spar. It is a brittle, transparent mineral, with monoclinic crystals. It occurs in England in Derbyshire, Devonshire, and Cornwall, and in many parts of the Continent, such as France and Austria.

Azymes (Gk *a*, not; *zumē*, leaven), unleavened bread eaten by the Jews at the passover. (Heb. *Mazoth*.)

Azymites, name given by the E. Orthodox Church to the W. Christians who use unleavened bread for the Eucharist.

Azzo, sometimes called **Azo** and **Azzolenus**, prof. of civil law in the univ. of Bologna during the 13th cent. He has left us his *Readings on the Code*, which is considered by Savigny to be the most important contribution of his school.

B

B, second letter of nearly all the anct and modern alphabets. It is the exact counterpart of the Semitic *beth* (including N. Semitic and Hebrew), the Arabic *bē*, and the Gk *bēta*. The sound the letter represents is the sonant labial mute or lip-voice stop consonant, i.e. the sound produced by closing the lips and vibrating the vocal chords. In some languages, however, *b* tends to exchange value with *p*, *v*, *f*, or *m*. So, for instance, in the 4th cent AD, *b* in Greek came to assume the phonetic value of *v*, and hence in the Cyrillic alphabet and its descendants (Russian, Bulgarian, and so forth) the letter *b* has the phonetic value of *v*, but out of it a new letter was created to express the phonetic value of *b*. The symbol *b* passed through various forms. The capital B roughly corresponds with the anct Rom. and Gk classical B; the minuscule *b* is derived from the same form by eliminating a part of the letter (the upper loop), while the cursive form *ℓ* evolved from B by imperfect junctions of the loops. In the Aramaic alphabet the opening of the top of the letter *beth* was a prominent feature, and in its descendant, the square Heb. alphabet (the prototype of modern Hebrew), the upper loop completely disappeared. The evolution of the form of the Arabic *bē* (as of all the Arabic letters) was the most rapid amongst all the branches of alphabetic scripts. The numerical value of *b* is 2 in most alphabetic scripts. See ALPHABET.

B, in music. In English B represents the seventh degree of the diatonic scale of C, but in German H represents the Eng. B, while B represents the Eng. B♭. The musical signs denoting flat and natural are modifications of the letter *b*, i.e. the sign *b*, denoting flat, is a *b* with a slightly pointed loop, and the sign *n*, denoting a natural, is a *b* with a square loop. These signs are used because B was the first note of the scale to be modified by a semitone.

Baader, Benedict Franz Xaver (1765-1841), Ger. theologian and philosopher, *b.* Munich. He studied medicine at Ingolstadt and Vienna, graduating in 1784; but afterwards became an engineer, and was superintendent of the Bavarian mines from 1817 to 1820. Meanwhile, however, he had spent some years in England (1791-6), where his attention first turned to philosophy, and in 1826 he was appointed prof. of philosophy and theology at Munich. His writings, though mystical and too often obscure, have led some to consider him the greatest Catholic thinker of modern times; but his opposition to the claims of eccles. authority in the field of speculation led to a papal decree (1838) preventing laymen from lecturing on the philosophy of religion. B.'s works, with life by F. Hoffmann, were pub. in 16 vols. at Leipzig (1851-60).

Baal, 'Owner,' primitive Semitic title for the gods. In Palestine these local deities were agric., and were worshipped with fertility rites. The B. was represented by a stone pillar, perhaps phallic, perhaps animistic. It was natural for the invading Israelites to give the title B. to their own God, Yahweh, now that he had taken possession of the land. The word B. is found in many Semitic names, e.g. Jezebel (who introduced the worship of Melkart, the Tyrian B., into Israel), Hannibal, Baalbek, etc. We find many devout Yahwists including B. in their names, meaning of course by it Yahweh, e.g. Jerubbaal (Gideon), Meribbaal, son of Jonathan (deliberately perverted into Mephibosheth by later scribes). The practice held a real danger of syncretism, or pagan infiltration from heathen baalism, and the prophets stamped it out.

Baalbek, anct city of Coelo-Syria. The ruins stand 35 m. NNW. of Damascus and 38 m. SSE. of Tripoli. A centre of the worship of Baal (q.v.), whose symbol was the sun, it was known in Greek as Heliopolis. Of all Syrian cities B. was foremost for the beauty of its buildings and the splendour of its streets. It is remarkable now for the magnificent ruins of Rom. temples it possesses, among which one specially noteworthy is the Great Temple, the finest building in the city. The columns of the entrance measure 83 ft in height and 22 ft in circumference. Originally there were 54 columns, of which six are now standing, while the ground is strewn with the ruins of the remainder of the structure. A smaller temple stands to the S. of this, and is larger than the Parthenon at Athens. Both temples are of limestone. The actual hist. of B. is in its beginning difficult to trace. Without doubt it was used, as its name indicates, as a temple of Baal. Under Julius Caesar it was made a Rom. colony. In the 2nd cent. it was renowned for an oracle, and Trajan is said to have been sufficiently impressed with its powers to consult it before embarking upon his second Parthian war. The Great Temple was built by Antoninus Pius (AD 138-161), though the inhab. to-day attribute its erection to Solomon. Theodosius II. the Great converted it into a Christian church. During subsequent wars it was used as a fortress by the Arabs, traces of which are yet visible. In 1400 the city was completely sacked by Timūr Beg (q.v.). Near by is the largest cut stone in the world—60 ft by 17 ft by 14 ft—weighing 1500 tons. To-day the inhab. live in a state as wretched as the anct city was once opulent, and its pop. is only about 5000.

Baan, Jan van (1633-1702), Dutch portrait painter, *b.* Haarlem. By invitation of Charles II he came to England and painted portraits of the king and queen and many of the nobility. B.'s best piece of work is probably the portrait

of Prince Maurice of Nassau. He *d.* at Amsterdam.

Baasha, an Issacharite, slew Nadab, son of Jeroboam I, at the Philistine tn Gibeon. He afterwards killed all the rest of Jeroboam's family and became King of Israel (c. 909-886 bc). He prosecuted an energetic policy against Asa, King of Judah. By building Rama, he hoped to cut off Jerusalem from the outer world, but Asa procured the help of Syria. B. was buried at Tirzah, the royal residence. See 1 Kings xv. 27 to xvi. 7.

Bab, Babi, see BAHÁ'Í.

Baba: 1. Title formerly given in Persia and Turkey to members of certain dervish orders.

2. (The old woman), name of a favourite character in Slavonic mythology, represented as an old witch or hag with a hooked nose, prominent teeth, and grey dishevelled hair.

Baba, Cape, W. Asiatic Turkey. The Greeks called the cape Lectum, and it was important in classical times as separating Troas from Aeolia.

Babadag, tn situated in Rumania, cap. of the Dobrudja; has a considerable Black Sea trade; pop. (1930) 4600.

Babahoyo, or **Bodegas**, cap. of prov. Los Rios, Ecuador, S. America, on the R. Guayas. It is 40 m. NE. of Guayaquil, and is a busy trading centre. Pop. 9045.

Babar, see BABER.

Babbacombe, dist. of Torquay (q.v.), Devon, England, 2 m. from its centre, and a favourite resort of summer visitors. Gained much notoriety from the fact that the criminal Lee, who committed a murder at B., was thrice placed on the scaffold, the trap-door of which refused to work. Lee's execution was postponed, and subsequently commuted to penal servitude. Near by is Kent's Cavern, in which were found remains of prehistoric man.

Babbage, Charles (1792-1871), mathematician, b. Teignmouth, Devon, and promoter of an important Eng. mathematical revival. He observed that mathematical calculations were greatly impeded by the use of imperfect logarithm tables, and he devoted his attention to the construction of a correct table (1827). His ruling passion was the construction of a great calculating machine. The gov. contributed £17,000 and B. himself expended £6000, but the machine was never completed, owing to disagreements between the constructor and the gov. The imperfect machine is now in the S. Kensington Museum.

Babbitt's Metal, alloy of copper, antimony, and tin named after its inventor, Isaac Babbitt (1799-1862). It is an antifriction metal used for shaft bearings.

Babel, Tower of, according to Gen. xi the inhab. of B. built a tower with the intention of scaling heaven, and were foiled by having their speech confounded, which has been taken as an attempt to explain the diversity of speech among the different nations of the world. B. (Assyrian *Bab-ili*) is the native name for the Gk Babylon and signifies 'Gate of God.' It has no connection with the Heb. word *bālal*, signifying to confound.

There is an obvious similarity between this legend and the Gk myth of the Titans who attempted to scale heaven, but the Heb. legend is incomparably older. Behind it certainly lies the memory of the great ziggurat (q.v.) towers of Babylonia. These artificial mts or high places were temples, on the summit of which was the sanctuary, or dwelling place, of the God, i.e. heaven. Various sites have been suggested, e.g. Birs Nimrud 7 m. from Babylon, and Amran within the city. Nebuchadnezzar says that the Ziggurat Babili, or Tower of Babylon, 'the temple of the foundation of heaven and earth,' had been built to a height of 60 ft by a previous king who had not managed to complete it, and it was ruinous until he restored and finished it (*Kedinschriftliche Bibliothek*, III, ii. 52).

Bab-el-Mandeb, or The Gate of Tears, from its dangerous currents, is a strait separating Arabia and Africa. The Red Sea is joined to the Gulf of Aden by it. On the E. side it is called the little, and on the W. the great, strait.

Babelthuap, chief is. in the Palau group, W. Carolines, in the Pacific Ocean, being about 30 m. in length. It has a fertile soil, and is subject to volcanic eruptions. It was administered by the Japanese under mandate before the Second World War. Pop. (of the group) 6300.

Babenberg, name of a princely Ger. family which came from Franconia, near Bamberg, and fl. from c. 980 to 1246. The most famous member of the family was Leopold I, surnamed the Illustrious, who became margrave of Austria in the 10th cent. See VIENNA.

Baber, Edward Colborne (1843-90), author and traveller, b. Dulwich. Educ. at Christ's Hospital, he graduated from Magdalene College, Cambridge, in 1867. He went out to Peking as a student interpreter, and became a first-class assistant in 1872. In 1879 he became Chinese secretary of the legation at Peking. He made 3 journeys into the interior of China, in 1876, 1877, and 1878, which he described in *Travels and Researches in Western China*, 1886. *Chinese Tea Trade with Tibet*, 1886, which appeared in the Royal Geographical Society's *Supplementary Papers*, was awarded the medal of the society. He was consul-general in Korea (1885-6) and political resident at Bhamo on the Upper Irawadi from 1886 till his death. See the *Proceedings of Royal Geographical Society*, 1883, 1886, and 1890.

Baber (Fehir-ed-din Mohammed) (1483-1530), first great mogul of India. He was a descendant of Timur. At 12 he succeeded Omar Sheikh Mirza to the rule of the dominions lying between Samarkand and the Indus. Strife ensued owing to the usurpation of an uncle and the revolt of some of the nobles. With surprising courage and determination, however, the young ruler seized and held the provs. of Kashgar, Kunduz, Kandahar, and Kabul. Delhi and Agra speedily fell before the impetuosity of his attack. But his reign as mogul was short, for he *d.* after having reigned 5 years. Not

only were his talents remarkable in civil and military gov., but he possessed also a passion and genius for science and art, and to his many achievements of administration in the improvement of roads, the measuring of land, the levying of taxation, and postal organisation is to be added a hist. of his life and conquests written in the Tatar language. The eldest of his 4 sons succeeded him to the throne at Delhi.

Baber, or Babber, Islands, Indonesia, see Sunda Islands, LESSER.

Babeuf, François Noël (1760-97), Fr. revolutionary, b. St Quentin. He became a clerk, and on the outbreak of the Fr. Revolution he supported the extremists led by Marat (q.v.). In 1793 he adopted the title of Gracchus B. as editor of a paper called *Le Tribun du peuple*, uncompromisingly communistic in principle. He was guillotined for an attempt to overthrow the Directory and establish Communism.

Babilu, see BABYLONIA.

Babington, Anthony (1561-86), rebel, son of Henry B. and Mary, daughter of Lord Darcy. He was a fanatical Catholic, and acted as a page to Mary Queen of Scots when she was a prisoner at Sheffield. He soon became strongly attached to her and her cause. In 1586 B. was one of the chief promoters of a plot which had for its object the assassination of Elizabeth I, the liberation of Mary, and the reorganisation of the constitution in Catholic interests. Walsingham's spies unravelled the plot, and B. was arrested, tried, and condemned to death, vainly trying to save himself with offers of further information. The discovery of this plot was the immediate cause of Mary's own subsequent execution.

Babington, Churchill (1821-89), classical scholar, scientist, and archaeologist, b. Roedcliffe, Leics. He held the Disney professorship of archaeology at Cambridge, 1865-80, and lectured chiefly on Gk and Rom. pottery and numismatics. He was, moreover, an authority on botany, ornithology, and conchology. He catalogued the classical MSS. in the univ. library and the Gk and Eng. coins in the Fitzwilliam Museum. His fame as a classical scholar is based on his ed. of Hyperides' speeches (*Against Demosthenes*, 1850; *On Behalf of Lycophron and Euxenippus*, 1853; and *Funeral Oration*, 1858) from the papyri discovered at Thebes in 1847.

Babington, Francis (d. 1569), Eng. divine. When Elizabeth I came to the throne in 1558 the Catholic master of Balliol College, Oxford, was removed and B. appointed in his place. In 1560 he became rector of Lincoln College. Leicester chose him to preach Amy Robsart's funeral sermon at St Mary's in 1560, but later he appears to have lost his patron's favour. He was suspected of being a secret papist, was obliged to resign from the rectorship of Lincoln College, 1563, and in 1565 fled to the Continent, where he d.

Babington, Gervase (1550-1610), successively Bishop of Llandaff, Exeter, and Worcester; fellow of Trinity College, Cambridge; incorporated M.A. of Oxford

Univ., 1578. He became tutor to the Pembroke family, through whom he obtained many Church preferments. B. wrote many short treatises which are valued by collectors of Elizabethan quartos. They include his *Very Fruitful Exposition of the Commandments by way of Questions and Answers*, 1590 and 1600, and *Comfortable Notes upon the Bookes of Exodus and Leviticus*, 1604. A folio ed. of his works was ed. by Miles Smith, 1615.

Babinski's Sign, medical sign indicating organic disease of the motor nerve fibres of the spinal cord. Normally when the sole of the foot is tickled the toes turn downward (*flexor response*). If there is organic disease of the lateral columns of the spinal cord (the pyramidal tracts) the big toe turns upwards when the sole of the foot is tickled by stroking (*extensor response*). This sign is useful in distinguishing between hysteria and true organic disease. Babinski was a Fr. physician (1857-1932).

Babirusa, Babiroussa, or Babyroussa, interesting animal of the pig genus, and found only in the E. Indies, in Celebes and Buru. The B. is much more agile than the ordinary pig, having a less cumbersome body and longer and thinner legs. The peculiarity of this species lies in the fact that the upper canine teeth of the male are persistent, like those of rodents, and pierce through the skin of the snout and curve back over the forehead. The teeth have been known to penetrate the skull. The teeth thus correspond to the tusks and horns characteristic of the male sex of so many animals.

Babirush, see BABYLONIA.

Babol, dist. and tn in the prov. of Mazandaran, in Persia, formerly called Barforush. It had considerable trade with Tsarist Russia. Pop. of tn, 39,000.

BABOON

Baboon, or Dog-faced Monkey (*Papio*), genus of the primate family Cercopithecidae, which includes the mangabeys, macaques, mandrills, and guernons. Africa was their original home, though they have spread into the nearer portions of Asia.

The most characteristic features of the animal are prominent snout, large canine teeth, cheek pouches, strange ugly cushions on which it sits, and shortness of tail. It was sacred in Egypt, and figures frequently upon Egyptian tablet inscriptions and statues. They usually live in herds and form dangerous opponents, and will attack antelopes as large as sheep. More than the other monkeys, their food consists of animals such as scorpions, centipedes, and beetles. But they also eat roots, fruits, and other vegetables. They are intelligent animals and possess well-developed brains, besides extraordinary ferocity of temper.

Babrius (2nd cent. AD), Gk writer of verse fables on the model of Aesop. He was probably a hellenised Roman. Of the original 10 books, only portions have survived. These were ed. with commentary by W. G. Rutherford, 1883.

Babu, or **Baboo**, originally an Indian term of address applied to a proper name and corresponding to the Eng. 'Mr.' Under Brit. rule the word was often used as a rough trans. of the English 'clerk,' and lost in respect.

Babul Tree, *Acacia arabica*, also known as the gum-arabic tree, is a native of the E. Indies, Arabia, and Abyssinia. It is a tall tree and yields large quantities of gum-arabic, which is produced by wounding the bark and allowing the fluid to run out.

Babushkin (until 1938 Losinoostrovskaya), tn in Moscow Oblast of central Russia, 7 m. N. of Moscow, and a residential and industrial suburb of the cap. Pop (1956) 103,000 (1939, 70,000), the majority working in Moscow.

Babuyanes, Malay word meaning pig is. They are a group of is. to the N. of Luzon, one of the Philippine Is. The most prominent isles are Babuyan, Calayan and Camiguin. They are of a mountainous character.

Baby, see CHILD.

Baby Carriage. From illustrations there is evidence that wheeled carriages for a child are of great antiquity, known sev. cents. BC. The first reference to B. C.s in Britain is in the 18th cent., but it was not until the first half of the 19th cent. that their use began to be widespread. These first models were made of wood with solid iron spoke cart-type wheels and the first had 3 wheels only. In the second half of the 19th cent. more than a dozen Brit. manufacturers came into existence and about half have direct descendants to-day. The biggest fundamental change in the manuf. of B. C.s during the last hundred years has been the use of sheet steel or aluminium for the body instead of plywood, though this is not universal. Substantially a B. C. remains as it has been—an upholstered body with hood and apron, chassis, handle, and wheels. A major pre-war development was the introduction of shallow, detachable, and reversible bodies with hinged drop end and small wheels, and to-day these form 80 per cent of the non-folding types manuf.

Britain has always led the world in

B. C. fashion, and has always been the largest exporter. The perambulator industry, employing fewer than 5000 workers, is one of the smallest in Britain, and exports approximately one-tenth of its production. Despite the millions of babies born annually, only a very small proportion of mothers in civilised countries use B. C.s, and these are restricted in the main to the white pop. Early in the 20th cent. the metal folding baby car was invented in America and is to-day more universally used the world over than any other type. Outside Britain, the metal folding type of perambulator overwhelmingly predominates; this fashion is allied to the increase in motor car production, as this type of B. C. can often be accommodated in the boot of the car.

Marmet Ltd

A MODERN BABY CARRIAGE

Babylon: 1. Anc. city and cap. of Babylonia, on the Euphrates, c. 50 m. S. of Bagdad. First mentioned in a cuneiform tablet c. 2700 BC, it became the cap., after the decline of neighbouring Agade (see AKKAD), c. 2200 BC. B. is the Gk form of Semitic *Babili*, Heb. *Babel*, written KA.DINGIR.RA in Sumerian, all meaning 'The gate of god.' The ruins cover a wide area which was first explored by Rich and later partially excavated by Layard, Rawlinson, and Rassam. The careful work by the Germans under Koldewey in 1899-1917 laid the foundation for much later archaeological/scientific exploration in the Near E. He uncovered the citadel (modern Mujellibe) with its massive Ishtar gateway decorated with coloured enamelled reliefs of lions (the symbol of Marduk (Bel), the prin. god worshipped at B.), horses, and composite creatures (*nushmushu*). The sacred Procession Way leading to the temple of Marduk, called Esagila, and many adjacent palaces and other buildings were found. The city was divided by the Euphrates, which was spanned by bridges, and protected by massive walls, each, according

to an eye-witness (the Gk historian Herodotus), 120 stadia long and capable of bearing a double track for chariots on their summit. Many inscriptions and objects remain of the Chaldaean period when Nebuchadnezzar II extensively rebuilt the city and its walls (c. 600 bc). The Hanging Gardens of B. (q.v.), described by Diodorus and other Gk writers as built by Nebuchadnezzar for his wife Nitocris, may be the ziggurat (q.v.) in the mound of Amran which was denuded during the last cent. by natives seeking bricks to build the adjacent modern city of Hillah. Little has been found of the

to the S., the desert beyond the Euphrates to the W., and the R. Diyala and the Hamrin Hills to the N. Throughout its early hist. B. was subdivided into Akkad (q.v.) in the N. and Sumer (q.v.) in the S. These, and *mat kaldu* (Chaldaea) (q.v.), the S. marshes, gave their names to B. as a whole at differing phases of its hist.

The earliest civilisation is to be found in B., which was occupied in the 5th millennium by both Semites and non-Semites (Sumerians?). Prehistoric sites, including Al Ubaid, near Ur, and Jemdet Nasr, near Kish, are closely followed by the flourishing cities of Ur 'of the Chaldees,' Erech

THE RUINS OF BABYLON

Old Babylonian B. of the time of Hammurabi (q.v.), when it flourished as an important metropolis. B. was cap. of the prov. of Babylonia under the Persians and Seleucids. The city walls were demolished following a revolt under Darius I. Alexander the Great spared the city after its capture, but although it continued as a religious centre dedicated to Bel until AD c. 50, its place as cap. was taken by the new city of Seleucia on the Tigris. See R. Koldewey, *The Excavations at Babylon*, 1914, and Seton Lloyd, *Foundations in the Dust*, 1955.

2. On the Nile S. of Cairo; perhaps originally a Babylonian suburb of Memphis after the Persian occupation, 525 bc. B. was a Rom. fortress and military station.

Babylonia (Babylonian *Babīlu*, Persian *Bābirush*), ancst state in the fertile flat plain watered by the lower Tigris and Euphrates, i.e. S. Mesopotamia, now S. Iraq. B. was bounded by the hills of Elam (Persia) to the E., the Persian Gulf

Eridu, Lagash, Umma, and Nippur, which were continuously inhabited from early to late Babylonian times. In the earliest historic periods these city-states fought for supremacy, which was, however, generally local until the rise of Sargon I and Naram-Sin, c. 2300 bc (see AKKAD), and Gudea of Lagash, c. 2300 bc, who conquered places in Syria and S. Anatolia. The period of the 3rd dynasty of Ur founded by Ur-Nammu (c. 2100-1900 bc) was a 'golden age' for Sumerian art and literature written in the cuneiform script (q.v.). After a few years when Lagash was supreme a strong Amorite dynasty under Samsu-iluna brought political power into Semitic hands again. This 1st dynasty of Babylon is best known from the reforms of Hammurabi (q.v.), King of Babylon, 1792-1750 or 1728-1686 bc, according to the main current views (Smith and Albright). He united the Semitic and Sumerian elements in the pop. by promulgating a revision of the existing Code of Laws, by turning much of

the power of the landowning temples over to civil administrators, and by grants of land on the borders of B. to army veterans. Under Hammurabi the cap. was transferred to the city of Babylon (q.v.), which was rebuilt and from which he controlled as far E. as Eshnunna. Hammurabi raided as far N. as Mari (q.v.) and was in diplomatic touch with Shamshi-Adad I

was suppressed by Tiglath-pileser (q.v.) III (745-727 BC), who took over direct rule of B. under his native name of Pul(u). A local sheikh, Marduk-apal-iddina II (Merodach-Baladan, q.v.), seized the throne in 721 but was ousted by Sargon (q.v.) II of Assyria except for a brief period (705-703) during the confusion following Sargon's death while Assyria was

After D. J. Wiseman, 'Chronicles of Chaldean Kings' (British Museum)

of Assyria and the powerful kingdom of Yamhad (Aleppo). The proposed identification of Hammurabi with Amraphel of Gen. xiv and of Shinar with B. is most uncertain. Like all the rulers of ancient B. Hammurabi ensured the maintenance of the complex canal and irrigation systems on which the prosperity of B. depended. From 1600 to 1100 BC B. was under Indo-Aryan Kassite domination. At this time Dur-Kurigalzu (Aqar Quf), W. of Bagdad, was an important city, but comparatively little is known of B. until it was once more under the Assyrians. With Nabunassar (747-734 BC) began a new era of resistance to Assyria. A revolt led by Ukin-zer

engaged in the W. Sennacherib, however, by a skillfully mounted amphibious operation chased Merodach-Baladan across the Persian Gulf and then in 689 sacked Babylon. His son Esarhaddon, as crown prince, acted as Governor of B., but after his succession to the throne of Assyria (669) he nominated his elder son Shamash-shum-ukin to succeed him as King of B., while Ashurbanipal ruled Assyria. This arrangement lasted until 648 when B. rebelled against Assyria, and in the subsequent revenge Shamash-shum-ukin perished in the flames of the stricken city of Babylon. An Assyrian nominee, Kandalanu, was appointed king, but after his

death in 627 there was an interregnum of a year until Nabopolassar (q.v.), founder of the Chaldaean Dynasty and leader of renewed opposition to Assyria, was chosen king. Although the Assyrian garrison at Nippur was not eliminated until 620 the hold of Assyria on B. gradually weakened. Nineveh fell in 612 to the combined forces of the Medes, Babylonians, and Scythians, and with the capture of the last Assyrian stronghold of Harran in 609 B. inherited the former ters. of Assyria. However, the Egyptians strongly contested the Middle Euphrates area until Nebuchadnezzar defeated Necho II at Carchemish in 605 B.C. B. thereafter controlled Syria and Palestine by a series of campaigns including a major battle with Egypt in 601. Nebuchadnezzar II (605-581) captured Jerusalem on 16 Mar. 597 B.C. and took Jehoiachin of Judah prisoner to Babylon. In subsequent campaigns Nebuchadnezzar attacked Elam, the Arabs, and Egypt, and suppressed an internal rebellion. With his wife, Nitocris, he extensively rebuilt Babylon, its defences, and neighbouring cities, and the city enjoyed one of its most flourishing periods. Evil-Merodach (q.v.) (Amel-Marduk) reigned 561-559 B.C. and eased the lot of the many foreign prisoners held in B., including Jewish exiles. He was murdered by his brother-in-law Neriglissar (Nergal-shar-usur), a former army commander, who campaigned as far afield as Cilicia, where he sought to restrain the Lydian pressure against the Pers. of B. under the influence of the Medes. Nabonidus (Nabu-na'id) continued the same policy in trying to maintain the independence of B., but fell out with religious leaders over his projected religious reforms and the rebuilding of the temple of the moon-god Sin at Harran. He made his son Belshazzar (q.v.) co-regent and withdrew to Teima (S. Arabia), where he ruled a small kingdom until warned by a dream to return to B. after an exile lasting 10 years.

About 550 B.C. Cyrus captured Ecbatana and consolidated his hold over the Medes, whose king Astyages he had defeated. In 538, aided by a popular revolt and by Gobryas of Gutium, Cyrus captured Babylon and estab. Persian (Achaemenid) rule there. His son Cambyses (529-521 B.C.) continued his liberal policies but a serious revolt followed on the accession of Darius I. A number of such revolts marked the Persian rule, some usurpers, e.g. Bardiya and Nebuchadnezzar III, even ruling for a short period until Alexander the Great took over B. in 332 B.C. Following his death the Seleucids, Parthians, and Sassanids ruled B. B. itself was never under Rom. occupation despite wars with the Parthians. In 650 B. became a seat of the Caliphs, successors of Mohammed, with Bagdad (built in A.D. 762-6) as cap. After the Abbasids in 1258 and cents. of Persian rule B. came under the Turks, and finally was occupied by the British 1914-21 (after which Mesopotamia became the independent Arab state of Iraq (q.v.) under Faisal I).

Many details of the life and thought of ant B. are known from tens of thousands

of clay tablets inscribed in the cuneiform script. These are written in Sumerian and Babylonian, with a few in Aramaic and Greek. Later, leather and papyrus displaced the more cumbersome clay tablet although a few astronomical texts continued to be written in cuneiform until A.D. c. 50. The texts cover all types of literature, epics (Creation and the Flood), myths, proverbs, scientific literature of all kinds, especially mathematics, medicine, astronomy, and geology, but with many religious writings: hymns, prayers, incantations, astrology, and omens (see ASSYRIA). The culture of B. was largely inherited from the Sumerians (see SUMER) and was in turn passed on to the Assyrians and the Greeks (see BEROSSUS). A unique historical source is provided by the Babylonian Chronicle which lists the principal events of each year. Their religion was polytheistic and each city had its principal deity and attendant gods, e.g. Sin at Ur, Anu at Erech, Ea at Eridu, and Bel (later Marduk) at Babylon itself.

Excavations have been carried on almost continuously in B. since interest was aroused by early travellers like Rich (1840), who was followed up by excavators among whom the names of Layard, Rawlinson, Rassam, Loftus, and Woolley (British), De Cesonaccio and Parrot (French), Koldewey and Andrae (German), are perhaps outstanding. For details of excavation, art, and architecture see the articles on cities of B.: BABYLON; ERECH; ERIDU; KISH; UR. For the contingent civilisations in B. see also ASSYRIA and SUMER.

Babylonish Captivity, name given to the exile of Jews deported from Judaea to Babylon, after the capture of Jerusalem by Nebuchadnezzar. The exile lasted 70 years, till the Jews were allowed to return to their own land by Cyrus, who had conquered Babylon; though the N. tribes also had been deported to Mesopotamia over a cent. earlier, those who returned were exclusively of the tribes of Judah, Benjamin, and Levi.

Babyroussa, see BABIRUSA.

Baca, Valley of (Heb., valley of balsam trees), mentioned in Ps. lxxiv. 6, is probably El-Bakef'a, between Jerusalem and Bethlehem.

Bacacay, tn of Luzon, Philippine Is., on Tabaco Bay. It produces abaca, coco-nuts, and rice. Pop. 26,504.

Bacarra, tn of Luzon in the Philippine Is., 4 m. N.E. of Loag. It is situated in a fertile dist. in the prov. of Ilocos Norte. Pop. 15,851.

Bacău, or **Bakau**, cap. of the dist. of the same name in Moldavia, Rumania, on

the Bistrita, 50 m. WSW. of Jassy, and 188 m. N. of Bucharest by rail. It has a gymnasium, paper works, and some trade in agric. products. There is much petrol in the vicinity. Pop. (1930) 31,000, of whom half were Jews before the Second World War.

Bacca, technical name for the fruit commonly called by the name of berry. It is used to designate those fruits which have a thin skin, are pulpy internally, and have sev. seeds lying loose in the pulpy mass, e.g., the gooseberry, currant, and vine.

Baccarat, vulgarly called 'bac,' a card game of chance, said to have been introduced into France during the reign of Charles VIII, since when it has had widespread popularity. There are 2 types of the game—*baccarat à banque* (or *baccarat à deux tableaux*) and *baccarat chemin de fer* (q.v.). The rules of the game are intricate. In this country B. played for stakes is illegal, being a card game not involving skill, but on the Continent it is one of the most vicious and persistent gambling games.

Baccarat, Fr. tn in the dept of Meurthe-et-Moselle, on the Meurthe. It has famous crystal glass-works. Pop. 5000.

Baccha, genus of dipterous insects of the family of Syrphidae. It is remarkable in that the species have the 2 basal joints of the abdomen very long and slender, but the remaining joints depressed and suddenly increased in breadth. It is generally of a black or bronze colour, with yellow spots or markings, and is found in Britain.

Bacchae, Bacchantes and Maenades, women who took part in the wild orgies of the Bacchanalia, a festival of Bacchus. See DIONYSUS.

Bacchanalia, orgies in honour of Bacchus (q.v.). Men and women, intoxicated with wine, clothed in deerskins and Asiatic robes, with *thyrsi* (staves wrapped with ivy and vine leaves) in their hands, ran about beating drums and cymbals, and crying to Bacchus. B. were first introduced at Rome in 187 bc (Livy, xxxix, 8-10). Being celebrated every third year, they were called Trieterica. See also BACCHAE.

Bacchante, see BACCHAE.

Bacchelli, Ricardo, lt. novelist and literary critic, b. at Bologna in 1896. His best works are his 2 historical novels, remarkable for their wealth of detail, their humour, and their finished style. They are *Il diavolo al Pontelungo*, 1927, dealing with a 19th-cent. socialist movement; and his massive *Il mulino del Po* (3 vols.), 1938-40, a novel of epic dimensions, true to the Manzonian tradition. Eng. trans. are *The Devil at the Long Bridge* (trans. O. Williams), 1929, and *The Mill on the Po* (trans. F. Frenay, 2 vols.), 1952.

Bacchiglione, riv. of Italy, mainly in Veneto (q.v.). It rises in the Alps (q.v.), and flows SW. past Vicenza and Padua (q.v.) to the Gulf of Venice (q.v.) near Chioggia. It is navigable to Vicenza. Length 90 m.

Bacchius, Gk writer, sometimes in-

correctly called **Vaccens**. He was the author of *An Introduction to the Art of Music*, in Questions and answers, a work contained in the collection of Meibomius. It is not certain when he lived.

Bacchus, see DIONYSUS.

Bacchylides (fl. 467 bc), Gk lyric poet and nephew of Simonides (q.v.), b. Iulis in Ceos. From 478 until 467 he lived at the court of Hiero I of Syracuse, who is said to have proffered his work to that of Pindar (q.v.). The extant poems of B. are characterised by lucidity and picturesque detail. They consist of 14 *epinikia* and 6 dithyrambs discovered on an Egyptian papyrus in 1896 and first ed. by J. G. Konyon, 1897. There is also an ed. with commentary and trans. by It. C. Jebb, 1906. See B. Snell, *Bacchylides*, 1919.

Baccio d'Agnolo, see AGNOLO, BACCIO D'.

Baccio della Porta, see BARTOLOMMEO, DI PACHIALO DEL FATTORINO, FRA.

Bacciocchi, Felice Pasquale (1762-1841), see BONAPARTE, Marianne Elise Bonaparte.

Bacciocchi, Marianne Elise, see BONAPARTE, Marianne Elise Bonaparte.

Bach, Carl Philipp Emanuel (1714-88), the third son of Johann Sebastian, born Weimar. In his youth, though he studied under his father, he intended to adopt the legal profession. In 1738 he graduated, but soon abandoned the idea of a legal calling and decided to devote his life to music. The same year he went to Berlin, where he became private harpsichordist to the king. For his favourite instrument he composed very many sonatas and other works, while his *Versuch über die wahre Art das Clavier zu spielen* was recognised as an epoch-making book in the hist. of music. In 1767 he went as musical director to Hamburg. At Hamburg he composed church and instrumental music, and his *Sonaten für Kenner und Liebhaber*, which is his greatest work. He d. at Hamburg. His works suffered an undeserved eclipse for many years, but are now studied assiduously for their great historical interest, if rarely performed.

Bach, Johann Christian (1735-82), youngest son of Johann Sebastian, b. Leipzig. After his father's death he studied under his brother Carl Philipp Emanuel at Berlin. He became a pupil of Padre Martini in Italy in 1754, and in 1760 he was appointed organist at Milau Cathedral, for which he composed some masses. In 1762 he accepted an invitation to England. His success was rapid, and his operas and concertos were enthusiastically received. He soon became music master to the queen. Of his 13 operas *Orione*, 1763, and *La clemenza di Scipione*, 1778, were the best, but he also wrote a large amount of church and instrumental music, Eng. and It. cantatas, Eng. songs, etc. Mozart as a child was his pupil during the 1764-5 visit to London.

Bach, Johann Sebastian (1685-1750), one of the greatest musicians of the world. He was b. at Eisenach of a family of noted musical talent—the influence of sev.

members of which upon their relative was in some degree responsible for the great result. Before B. was 10 his father, Ambrosius, d. The boy was brought up by his brother Christoph, an organist at Ohrdruf, who withheld from him a MS. of organ compositions by great masters, perhaps from jealousy, but possibly only for some misguided disciplinarian reason. However, B. obtained access to the book, and copied it by moonlight. But the copy was taken from him when it was discovered although the work had taken the boy 6 months to accomplish. His beautiful soprano voice gained him a place in the choir at St Michael's School at Lüneburg, where he practised as an accompanist on the harpsichord and, after his voice broke, as a violinist. This was in 1700, and 3 years later he obtained a royal appointment at the court of Weimar, where he became acquainted with much It. music. The same year he became organist at the new church of Arnstadt, and here he began to compose. His brother's enlistment with the Swedish Guard led to the composition in 1704 of the *Capriccio on the Departure of a Brother*, which was followed and also preceded by sev. of his church cantatas. At this time B. obtained permission to go to Lübeck in order to hear the great Dan. organist, Buxtehude, then 68 years old. In his enthusiasm he over-stayed his leave, and this, with other reasons, led to a fresh appointment at Mühlhausen in 1707. He stayed here only a year, during which he married a cousin, Maria Barbara B. In 1708, aged 23, he returned to Weimar as court organist. Here he spent 9 years, and composed the best of his cantatas, while a close study of It. masters gave him a thorough mastery of their style, the foundations being thus formed for his later instrumental work. On one journey from Weimar in 1717 a quarrel arose between the supporters of B. and those of the Fr. organist Marchand, and a contest was arranged at Dresden. On the day fixed for the trial the Fr. musician was nowhere to be found, genuine acknowledgment of B.'s superiority rather than jealousy or fear being the causes of his flight. In 1718 B. left Weimar for the service of the Duke of Anhalt-Cöthen, and in 1720 his wife d.; in the following year he married Anna Magdalena Wilkens, who assisted him by copying his musical scores. It was then that B. began the composition of his suites, and the first half of the *Forty-eight Preludes and Fugues* was also written at Cöthen, though many years separated the first from the complementary portion. In 1722, after some difficulty, B. was appointed to the vacant position of cantor of the St Thomas School at Leipzig. Here he wrote all his finest choral work which includes the 2 settings of the story of the Passion and the Mass in B minor. In 1733 he presented 2 movements from the latter composition to Frederick Augustus, and received the title of *Hofcomponist*. In 1747 he visited Frederick the Great at Potsdam. The king, himself a musical amateur, received him with great regard. A few years later

B.'s eyes became painfully troublesome, and total blindness resulted from an operation. Apoplexy caused his death, aggravated by the remedies used during the operation. In his many clavier and

Embassy of the German Federal Republic

JOHANN SEBASTIAN BACH

harpsichord pieces B. introduced improvements in fingering, though modern fingering came only with Clementi (1732-1832). B. tuned his keyboard instruments in accordance with 'equal temperament,' exemplifying its possibilities in the 'Forty-eight.' As an organist he was supreme in his day and his organ compositions include many Preludes and Toccatas with Fugues, Fantasies and particularly the 143 Choral Preludes (q.v.) designed to introduce the hymn of the day in church. There are early biographies and critical works by H. Forkel, C. H. Bitter, P. Spitta (trans. 1899), and E. Heinrich. Later works on B. are: A. Pirro, *L'Esthétique de J. S. Bach*, 1907; C. H. H. Parry, *Johann Sebastian Bach*, 1909 (rev. ed. 1934); H. Grace, *The Organ Works of Bach*, 1922; C. S. Terry, *Bach: a Biography*, 1927, *Bach's Orchestra*, 1932, and *Music of Bach*, 1933; Albert Schweitzer, *J. S. Bach* (trans. by E. Newman), 1935; E. M. and S. Grew, *Bach*, 1947.

Bach, Wilhelm Friedemann (1710-84), eldest son of Johann Sebastian, b. Weimar, was by nature the most talented in the family, but his career was ruined by idleness and loose living. In 1746 he was appointed musical director of the Liebfrauenkirche at Halle, but lost this position owing to his dissolute habits. He lived a precarious life thenceforward, and d. in extreme want at Berlin. Some of his symphonies, concertos, trios, organ, and clavier works are extremely fine.

Bachan, see BATCHMAN.

Bacharach, Ger. tn in the Land of Rhineland-Palatinate (q.v.), on the Rhine (q.v.), 23 m. W. by N. of Mainz (q.v.). It has a fortress and two medieval churches, and has a trade in wine. Pop. 2600.

Bachaumont, Louis Petit de (1690-1771), Fr. man of letters, and a prominent member of Mme Doublet's salon for 40 years. His minor pubs. are *Essai sur la Peinture, la Sculpture et l'Architecture*, 1751, and *Mémoires sur le Louvre*, 1750; but he is chiefly remembered in connection with the *Mémoires secrets pour servir à l'histoire de la république des lettres*, pub. in Paris, 1771, in 6 vols., and afterwards extended to 36 vols. by Pidansat de Mairet and Mouflé d'Angerville.

Bachelier, Jean Jacques (1724-1806), Fr. painter, b. Paris. He was a director of the porcelain factory at Sèvres and also of the Academy of Painting, Sculpture, and Naval Architecture at Marseilles. In 1765 he founded an industrial school of art at Paris. He was received into the Fr. Academy as a flower painter in 1751 and as a historical painter in 1763, and exhibited at the Salon regularly between 1751 and 1767. His best-known works are 'The Death of Abel' and 'Cimon in Prison.' He is the author of *L'Histoire et le secret de la peinture à la cire*, 1755.

Bachelin, Auguste (1830-90), historical, genre, and landscape painter, b. Neuchâtel, and d. Berne. He studied in Paris under Gleyre and Couture. In 1859 he accompanied Garibaldi's volunteers, after which he painted many military and historical scenes.

Bachelor, word of uncertain etymology, probably derived, through the French, from Low Latin *baccalarius*, a word used in the 8th cent. of a servant, male or female, who assisted on a farm; cf. *baca*, Low Latin for *vacca*, a cow. (1) The word B. was early applied to a young knight or novice in arms who had no following of his own but fought under the banner of another. (2) It has also been adopted in univ. life. See **BACHELOR OF ARTS**. (3) In the popular sense of the word, it is used of an unmarried man, or candidate for matrimony. In Rome legislation placed unmarried men (*caelibes*) under certain disabilities, the chief of which were contained in the Lex Julia et Papia Poppaea in AD 9. The object of such legislation was to encourage citizens to bring up children for the State. Penalties on B.s were also inflicted in Sparta and at Athens. In England, too, higher taxes have, from time to time, been imposed upon B.s, but chiefly with a view to raising money for some additional State expenditure. In 1695 an Act was passed by which B.s and childless widowers had to pay a yearly tax of 1s. up to £12 10s. according to rank. In 1785 a higher tax was imposed for the servants of B.s, and in recent years deductions in income tax have been allowed to married persons with children. See **CELIBACY**.

Bachelor of Arts, for derivation, see **BACHELOR**. The word was first adopted into univ. life in the 13th cent. Pope

Gregory IX introduced the word *baccalarius* to indicate one who had undergone the first academical examination, but was not yet a 'master' or 'doctor.' The word was altered by a pun to *baccalaureus*, as if it were connected with *bacca lauri*, laurel berry. See **DEGREES**.

Baciccio, Giovanni Battista Gaulli (1639-1709), It. painter, b. Genoa, where he received instruction in design and colouring. Later he was a pupil of Bernini at Rome, where he painted portraits of the 7 popes and the cardinals of his time. His best known works are those in the angles of the dome at St Agnes in the Piazza Navona; the 'Assumption of St Francis Xavier' in the vault of the church del Gesù; the picture of St Anne kneeling before the Virgin and Child; and the altar-piece of the 'Death of St Saverio' in the church of Sant' Andrea.

Bacillus (dimin. of Lat. *baculus*, a rod), one of the forms into which bacteria are classified (see **BACTERIA**, classification).

Bacillus Pesticus, see **PLAGUE**.

Bacitracin, see **ANTIBIOTICS**.

Back, see **SPINE**.

Back, Sir George (1796-1878), Brit. Arctic explorer, b. Stockport. In 1808 he entered the Navy, but was made captive by the French in Spain. He was associated with Franklin in 3 polar expeditions in N. America. In 1833 he commanded in the expedition organised in search of Sir John Ross. During the expedition he suffered great hardships, but discovered Artillery Lake and the Great Fish (now Back) R. On his return he was made captain. In 1836 and 1837 he continued his Arctic expeditions. In recognition of his valuable discoveries the Geographical Society awarded both its medals to him. In 1839 he was knighted, and in 1857 he was made admiral. During the years of his retirement he suffered from ill-health. His works are a *Narrative of an Expedition in H.M.S. 'Terror'* 1838, and a *Narrative of the Arctic Land Expedition*, 1836.

Back Pressure, see **POWER STATIONS**; **TURBINES**, **STEAM**.

Backbond, term used in Scots law for a document, which shows that the possessor of property holds it only in security and is accountable to its real owner.

Backboned Animals, see **VERTEBRATES**.
Backer, Adriaen (1636-86), Dutch painter, nephew of Jakob B. (q.v.). He was b. in Amsterdam, and in early youth studied in Italy. He executed chiefly portraits and historical pieces. There is a fine picture of the 'Judgment of Solomon' in the tu hall of his native city.

Backer (or Bakker), Jakob de (1609-1651), Dutch painter, b. Harlingen; studied under Lambert Jakobz at Leuwarden and afterwards under Rembrandt at Amsterdam. He is chiefly known for his portraits, which he executed with remarkable facility and speed. He also painted historical subjects. There is an excellent head of Brouwer by this artist in the collection of the former elector palatine, and a picture of the 'Last Judgment' is in the cathedral church at Antwerp.

Backgammon, very old game in England which until the 17th cent. was called 'the tables.' The obvious derivation of the word is 'back game,' as it is necessary in order to win to bring one's 'men' back from the opponent's tables into their own, and there is also a penalty attached to the pieces of going back to the starting point. A similar game, the 'twelve-line game,' which consisted of a board, pieces, and the throwing of dice to control their moves, was in vogue among the Romans. The game is played in France, where it is called tric-trac, from its noise occasioned by the throwing of the dice. The game is one more of chance than of skill on account of the large part played by the dice-throwing. The board or table consists of 2 parts or 'tables.' At each end of the table are 6 points, alternately coloured white and black. Two persons take part in the game, owning each 15 pieces. The 2 sets of 15 are one black and the other white. At the commencement of the game the pieces are placed at particular places on the table. Two dice are used, and each person has his own dice box, though the dice themselves are used by both parties. The throws are alternate. In the event of a 'doublet,' i.e. the throwing that results in 2 similar numbers, the number signified by the dots may be doubled. Those numbers indicated accidentally by the dice when thrown bear a certain relation to the points of the table, and it is necessary to observe the position of the men on the points in order to understand the connection and the regulations that control movements. The persons sit at the tables so that the points of their opponents face them. Suppose one player be called Black and the other White. The question of 'starter' is decided by a throw of the dice, the higher score being the determining factor. The men are moved from point to point. The direction of White's moving is from Black's right-hand table to Black's left-hand table, then to White's outer table, and thence to White's inner table, completing the journey. Black's path is, of course, vice versa. The number signified by the dice, when thrown, indicates the number of points the thrower is allowed to travel unless the point at the end of the number is blocked by having 2 or more of his adversary's men upon it. The number indicated by the dice may be taken wholly with 1 man or shared between 2, so that each takes the number separately indicated. It is compulsory for a player to move the whole number signified if able. A 'point' is made by a player on placing 2 of his men on the same point. A 'blot' is that point occupied by 1 man; and it is cancelled by the arrival of an opponent who thus compels the previous occupant to go back to the bar. The numbers of the points count from the ace-point as 1, 2, 3, 4, 5, 6, and the man sent back to the bar is only allowed out again when the throw of the dice corresponds to the number of an unblocked point. While he has a man to enter, a player may not

move any other man. When all his men are in his inner table, or 'home,' the game is continued by that player for the purpose of removing his men from the board by throwing a number that corresponds with the point he wishes to empty. He may make a move with any number instead of bearing a man away. When 6 is empty, the same number being thrown is able to empty the other points, though, of course, singly. It is possible for a player to be hit on a blot while bearing his men off the board. In this case he must enter on his opponent's inner table and must move the man into his own inner table before he may continue taking his men off. The winner is he that succeeds first in removing all his men from the table. The degrees of winning are as follows: 1. A 'single' win if his opponent has begun bearing. (This is called a 'hit.') 2. A 'double' game if the adversary has not borne a man. (This is a 'gammon.') 3. A 'triple' win if the opponent has a man in the opponent's inner table. In the event of a series of games being played the beginner of the next is determined by the degree of victory. If a 'hit' is won the victor begins; if a 'gammon' a single die must be thrown. The winner of 2 games of 3 wins the 'rub.'

There is a Russian game called Russian B., which is in bulk similar to the Eng. game, as it varies in only a very few rules from the latter.

Backhaus, Wilhelm (1884-), eminent Ger. pianist, b. Leipzig. He studied music at the conservatoire, Leipzig, under Alois Reckendorf until 1899, and Eugen d'Albert at Frankfort-on-Main. From 1900 he made many concert tours throughout Europe and America, and won a reputation as one of the foremost pianists of the day. In 1905 he won the Rubinstein prize in Paris, and in the same year was appointed prof. of the piano at the Royal College of Music in Manchester.

Backhuysen, Ludolph (1631-1708), Dutch painter, b. Emden, Hanover. His masters were Everdingen and Dubbels. He is famous as a painter of seascapes, which are marked by their vivid realism. He worked for Peter the Great, d. at Amsterdam.

Backnang, Ger. tn in the Land of Baden-Württemberg (q.v.), 16 m. N.E. of Stuttgart (q.v.), with a Renaissance castle, a 15th-cent. church, and fine old houses. It has an important tanning industry, and manufs. of textiles, machinery, and electrical goods. Pop. 21,000.

Backs, The, lawns and gardens behind the prin. college buildings of Cambridge, England, through which runs the R. Cam.

Backwardation, term used on the stock exchange for a sum of money paid by a seller of stock to the buyer in order that he may delay its delivery until the following account.

Backwell, Edward (†1683), London goldsmith and banker at Unicorn, Lombard Street, one of the founders of the system of bank-notes. He had financial dealings with Oliver Cromwell, Charles II, and the queen mother, most of the

nobility of the day, and with the E. India Co. and sev. leading city firms. In 1662 he was sent to Paris on the matter of the sale of Dunkirk, and was employed on many secret services between Charles II and Louis of France. He was alderman for Bishopsgate, 1657, and M.P. for Wendover, 1679 and 1680.

Bac-ninh, cap. of the prov. of the same name in Tonking (q.v.), 16 m. N.E. of Hanoi (q.v.). B. has a Roman Catholic cathedral and an old citadel which was captured by the Fr. Gen. Negrier in 1884. The main industry of the tn is silk embroidery.

Bacolod, or **Bacolot**, former cap. of Negros, Philippine Is., now of the prov. of W. Negros. It is noted for its fishing and sugar exports. Pop. 22,920.

Bacolor, tn of the prov. of Pampanga in the is. of Luzon, Philippine Is., situated 40 m. N.W. of Manila. Sugar and rice are grown. Pop. 22,920.

Bacon, smoked meat product prepared from the sides, back, and stomach of pigs. In the Brit. trade B. generally consists of the whole side or half the side of the pig, or the half with only the shoulder end taken away; in America, of the smaller end from the back or stomach. Salt for preservation was used long before the preservation of food had reached its present stage of development. Pigs were cut up, put in brine tubs, and then smoked in an open chimney. The principle of B. curing is much the same to-day, but with the exception that it is now done in factories. Hams are often cured separately and sugar or molasses superadded to the salt. The hist. of B. production in Great Britain has been typified by cycles of over- and under-production. In an attempt to overcome this the Fatstock Marketing Scheme was introduced. This fixes a guaranteed minimum price below which the returns to producers are not allowed to fall but at the same time allows a competitive market so that the maximum price paid is not fixed.

Bacon, tn in SE. Luzon, Philippine Is., in a fertile dist. Pop. 22,859.

Bacon, **Anthony** (1558-1601), Eng. diplomat, brother of Francis B., educ. at Trinity College, Cambridge. In 1576 he was admitted with his brother a member of Gray's Inn. In 1579 he undertook a long continental tour, when he made the acquaintance of Montaigne, the essayist, Danaeus, an eminent Protestant theologian, and many leaders of the Fr. court. In 1593 he entered the service of the Earl of Essex, and undertook to keep him posted in foreign information, and as his private 'under-secretary of state for foreign affairs,' was in constant communication with numerous foreign ambas. Many of Bacon's letters remain in MS., much of which is preserved in Lambeth Palace library.

Bacon, **Delia Salter** (1811-59), Amer. authoress, b. Tallmadge, Ohio, sister of Leonard B. (q.v.). A schoolmistress and lecturer, she pub. sev. books, including *Tales of the Puritans*, 1831, and *The Bride of Fort Edward*, 1839. But she is remem-

bered chiefly as being one of the first to call in question Shakespeare's authorship of the plays called by his name. In 1857 she pub. *Philosophy of the Plays of Shakespeare Unfolded*, in which she expounded her theory that the so-called Shakespeare plays were written by Francis B., Edmund Spenser, Walter Raleigh, and others, in order to set forth a philosophy which they did not care to own publicly. For a time she received encouragement from Emerson and Carlyle, and Hawthorne writes of her in *Our Old Home* as a 'gifted woman.' She was insane during the last 2 years of her life.

Bacon, **Francis**, **Baron Verulam** and **Viscount St Albans**, often inaccurately called Lord Bacon (1561-1628), statesman, essayist, philosopher, b. York House in the Strand, London. His father, Sir Nicholas B., was Lord Keeper of the Great Seal; his mother, Ann Cooke, was a well-educated woman and a zealous Calvinist. Little is known of B.'s early life. In his thirteenth year he went to Trinity College, Cambridge, where he showed such intellectual precocity that the queen referred to him as 'the young Lord Keeper.' In 1576 he was entered at Gray's Inn and in the same year joined the embassy of Sir Amyas Paulet to France, where he remained till 1579, when the death of his father left him with straitened means. In 1582 he qualified as a barrister and in 1584 took his seat in the House of Commons as member for Melcombe in Dorset; subsequently he sat for Taunton, 1586, Liverpool, 1589, Middlesex, 1593, and Southampton, 1597. Failing to obtain help from his uncle, Lord Burghley, the great minister of the queen, he attached himself to Burghley's rival, the Earl of Essex, and in 1591 was installed as his confidential adviser. In 1593 he fell into disfavour with the queen through opposing her wishes in the matter of a subsidy, and was disappointed in his hope of becoming attorney-general, a post that was given to Edward Coke. He was still in straits for money, though Essex had presented him with an estate at Twickenham which he sold for £1800. At this point the downfall of Essex took place. Having formed a conspiracy he was arrested for treason. B. by his speeches helped to bring about his conviction and execution, after which he pub. *A Declaration of the Practices and Treasons Attempted and Committed by Robert Earl of Essex*, which was printed by authority. B. was taxed with ingratitude to his patron, but argued with some justice that his first loyalty was to his sovereign, and pub. this defence in a letter.

On the succession of James VI and I in 1603 B. was knighted and his fortunes took a turn for the better. He helped the king with his schemes for the union of England and Scotland and sought to pacify the Church of England and reconcile the claims of Crown and Parliament. In 1605 he pub. *The Advancement of Learning*, and in the following year married Alice Barnham, an alderman's daughter. His period of greatest success now began. Following his principle that

the sovereign's authority was supreme and that a statesman's first duty was to carry out the royal will, he supported the king against the claims of parliament, though always advocating toleration. In 1618 he was appointed Lord Chancellor, the highest office in the state, and created Baron Verulam, a title he changed in 1621 for Viscount St Albans. Now, however, at the height of his greatness, he was to meet with disaster. In 1621 want of money forced the king to convoke parliament, and the Commons at once proceeded to discuss the granting of monopolies, under cover of which Buckingham and others of the king's favourites had oppressed the people. Buckingham took fright, and proposed a plan by which certain people were to be sacrificed to the House to save others. The Commons, led by B.'s enemy, Coke, appointed a committee to inquire into the administration of the courts of justice, and B. was charged with having taken bribes in connection with Chancery suits. A list of 23 charges in all was drawn up, and B., seeing that his position was hopeless, gave up all idea of defence. He was accordingly found guilty of bribery and corruption, and the decision of the House of Lords was that he should pay a fine of £40,000, be imprisoned in the Tower during the king's pleasure, and never be permitted to hold office or sit in Parliament again.

The greater part of this penalty was never carried out. The fine was remitted, and the imprisonment lasted only 4 days; but B.'s career as a statesman was finished. There has been much difference of opinion about the degree of blame that attaches to him. He himself admitted frankly that he accepted presents from litigants, but insisted that they never influenced his judgment, and that on the contrary his decisions in the courts had always been scrupulously fair. Some years later he declared: 'I was the justest judge that was in England these fifty years; but it was the justest judgment that hath been pronounced these two hundred years.' It seems doubtful if he was guilty to any great extent of perverting justice, and after his fall he was treated with great consideration. He received a pension of £1200 from the gov., and his magnificence and extravagance were as great as ever, though he had retired from public life. He lived at Gorhambury, and spent his time in study and writing. To this period belong his *History of Henry VII*, his later philosophical and scientific works, and his *Apophthegms New and Old*, a somewhat jejune collection of jokes and witticisms. He was engaged on his *Sylva Sylvarum*, a work of natural hist., when he met his death, fittingly enough as the result of a scientific experiment. Wishing to test the preservative properties of cold, he dismounted from his coach in Highgate on a wintry day, bought a fowl at a cottage, and stuffed it with snow. The exposure brought on a sudden chill, and he d. of bronchitis. He was still deeply in debt.

B.'s work as writer and philosopher is

E.E. I

even more important than his political career. By far the best-known of his pubs. are the *Essays*, of which 12 first appeared in 1597; they were revised and augmented in 1612, and again shortly before his death; in its final form the collection totalled 58. These essays, though a novel literary form, were not what are commonly termed essays in modern times, when the word is used to denote a pleasant rambling discourse by an author who is as it were thinking aloud. B.'s essays were made up of detached reflections and observations, many of them so shrewd and pithy that they have become almost equivalent to proverbs. Such are 'Men fear death as children fear to go in the dark'; 'Revenge is a kind of wild justice'; 'Reading maketh a full man, conference a ready man, and writing an exact man.' B. himself, who regarded Latin as the language for work of permanent worth, was careful to see that there was a version of them in that language, for, as he put it, 'they come home to men's business and bosoms.' Another notable contribution to the country's literary development was B.'s *History of Henry VII*, 1622, a biography which he wrote to win favour from King James. It marks an important advance on earlier works of the kind written in English. Lives of great men before his time were either mere chronicles of their deeds and the events in which they played a part or homiletic discourses on the moral lessons to be drawn from their success or failure. As one of the first to study the psychology of his subject and to attempt a serious analysis of motives and purposes, B. may claim to be a pioneer in the development of the art of biography.

In the philosophic and scientific spheres also B.'s work was in advance of his time. He lived before the development of specialisation, in an age when it was still possible for one man to grasp and understand all that had been attained in the field of scientific investigation. At the age of 30 he wrote to Burghley: 'I have as vast contemplative ends as I have moderate civil ends, for I have taken all knowledge to be my province.' At Cambridge he had found the Aristotelian system which was the basis of philosophic thought there to be productive only of argument leading to no definite results, and had come to the conclusion that a new approach must be made to the whole problem of systematising knowledge. A new instrument of thought, a *novum organum*, must, he felt, be provided if men were to escape from the blind alley in which they had put themselves. Hence arose his great plan for the renewal of knowledge, his vast *Instauratio Scientiarum*, which he sketched out in 1620 in the introduction to his *Novum Organum*. It was a grandiose scheme, and he did not live to complete more than parts of it. First, there was to be a survey of existing human learning; the initial sketch of this was the *Advancement of Learning*, 1605, later revised and expanded in the Lat. version, *De Augmentis Scientiarum*, 1623. Second, there was to be a description of

Y

a new method of acquiring knowledge. The outline of this was the *Novum Organum*, 1620, which sets out its principles in an early passage, 'Man, being the servant and interpreter of nature, can do and understand so much, and so much only, as he has observed in fact or in thought of the course of nature.' The scheme was to have been completed with a section assembling empirical data, another containing solutions to the problems that these brought with them, and the final section was to embody a new philosophy. Most of these later sections were never written, but part was covered by the *New Atlantis*. Containing a description of B.'s ideal form of commonwealth, this has been compared with More's *Utopia*; it is at times remarkably up to date in describing the possible application of science to human problems, and even forecasts the telephone.

The influence of B.'s work was very great, and he is rightly regarded as the father of modern scientific research. Though properly speaking neither scientist nor philosopher, he was able through the profundity of his intellect to point the way of progress to both of these. By abandoning the deductive reasoning that was based on traditional arbitrary premises, and substituting the principle of inductive reasoning, he formulated a new system for the interpretation of nature. He showed that conclusions of real worth could only be reached by trial and experiment and by piecing together fragments of tested knowledge. Hence he was the prophet of a new era, opening the way to future progress. As Macaulay put it: 'The art which Bacon taught was the art of inventing arts. The knowledge in which Bacon excelled all men was a knowledge of the mutual relations of all departments of knowledge.' With all his faults, he stands out as one of the greatest of this country's thinkers, and it was not for nothing that Pope styled him 'the wisest, brightest, meanest of mankind.' His nature was a bundle of contradictions, but of his mental pre-eminence there can be no question.

His works were ed. by J. Spedding, R. L. Ellis, and D. D. Heath, in 14 vols., 1857-74. See also lives by R. W. Church, 1884, and E. A. Abbott, 1885, and studies of his philosophy by C. D. Broad, 1926, and F. H. Anderson, 1948.

Bacon, Henry (1866-1924), Amer. architect, b. Watseka, Illinois, and studied architecture at Illinois Univ. From 1891 until his death in 1924 he practised independently. Among the notable buildings he designed were the Union Square Savings Bank, New York; Public Library, Patterson, New Jersey; and the Whittemore Memorial Bridge, Naugatuck, Connecticut. He also designed the Civil War and World War monuments at Yale Univ., and the Parnell monument in Dublin. The Lincoln Memorial, erected at Washington, completed in 1920, was his most important work and was the result of a competition.

Bacon, John (1740-99), sculptor. He trained as a modeller and painter on

porcelain. In 1769 a bas-relief representing the flight of Aeneas from Troy won for him the first gold medal ever awarded by the Royal Academy for sculpture. In 1770 he exhibited a figure of Mars, and in consequence received the gold medal of the Society of Arts and was elected an associate of the Royal Academy. His rivals accused him of ignorance of classic style, and to repudiate the charge he executed a head of Jupiter Tonans. The best known of his works are the monuments of Pitt in Westminster Abbey and the Guildhall, of Dr Johnson and Howard in St Paul's Cathedral, and of Blackstone in All Souls', Oxford.

Bacon, Leonard (1802-81), Amer. Congregational minister, editor, and author, called 'the Congregational Pope of New England'; b. Detroit, Michigan. Graduated at Yale Univ., 1820, and Andover Theological Seminary, 1823. In 1825 became pastor of the First Church, New Haven, with which he was connected till his death. Ed. the *Christian Spectator*, 1826-38. He was prof. of didactic theology at Yale Univ.

Bacon, Nathaniel (1642-76), b. in England, but emigrated to Virginia, where he became a member of the governor's council. Headed an expedition against the Indians, in defiance of Governor Berkeley's policy. Was proclaimed a rebel, captured, tried, and acquitted. B. and his supporters demanded a reduction of taxes and an extension of the suffrage. Being for a second time proclaimed rebels, they marched on Jamestown, which they captured and destroyed, but B. d. before he could carry out any of his reforms.

Bacon, Sir Nicholas (1509-79), statesman, father of Francis B. (q.v.). He graduated at Corpus Christi College, Cambridge, in 1527, after which he entered Gray's Inn and was called to the Bar, 1533. In 1537 he became solicitor of the court of augmentations; in 1546 attorney of the court of wards and liveries; in 1550 he became a bench, and in 1552 treasurer of Gray's Inn. After the dissolution of the monasteries in 1539, he received a large share of the forfeited estates from Henry VIII. During Mary's reign he retained his office in the court of wards in spite of his unconcealed Protestantism. On the accession of Elizabeth in 1558 he became a Privy Counsellor and keeper of the great seal. In 1559 he was knighted and was allowed to exercise full jurisdiction of lord chancellor. B. is buried in St Paul's Cathedral.

Bacon, Sir Reginald Hugh Spencer (1863-1947), admiral; educ. H.M.S. *Britannia*. In 1897 he was appointed commander of H.M.S. *Thesius*. He started the submarine service in the R.N., and was naval assistant to the First Sea Lord in 1905. Captain of H.M.S. *Dreadnought* during her first commission; director of naval ordnances and torpedoes, 1907-9. Retired 1909 and became managing director of the Coventry Ordnance Works. When the First World War broke out he commanded the Heavy

Howitzer Brigade, Royal Marine Artillery, with the B.E.F. (q.v.) in France. Rendered great service in command of the Dover Patrol (q.v.) from 1915 to 1918. In 1918-19 he was controller of the munitions inventions dept at the Admiralty. Pub. *Benin, the City of Blood* (he was chief of intelligence service in the Benin expedition of 1897), *The Dover Patrol*, 1919, *The Jutland Scandal*, 1925, *A Naval Scrap Book*, 1925, *The Life of Lord Fisher of Kilverstone*, 1929, *The Concise Story of the Dover Patrol*, 1932, *The Life of John Rushworth, Earl Jellicoe*, 1936, and *Modern Naval Strategy* (with F. E. McMurtrie), 1940.

Bacon, Robert (d. 1248), first Dominican writer in England, the brother or, according to some authorities, uncle of Roger B. He was educ. at Oxford and Paris, joined the order of the Dominicans, and (possibly) succeeded Edmund Rich as treasurer of Salisbury Cathedral in 1233. He rebuked Henry III for his fondness for foreign advisers, notably Peter des Roches. He wrote a life of Edmund Rich, *Liber in sententias Petri Lombardi, Sectiones Ordinariae*, and other works.

Bacon, Roger (c. 1214-92), philosopher and scientist, b. near Ilchester, Somerset. He was educ. at Oxford, and also at Paris where he lectured for many years. It was during this period that he wrote the *Questions on Aristotle's Physics* and on the pseudo-Aristotelian *De Vegetalibus*. B. resigned his lectureship in 1247 and devoted himself to experimental science. Returning to Oxford c. 1251, he met Robert Grosseteste (q.v.) who exerted a powerful influence on his intellectual development. B. joined the Franciscans c. 1257, returning to Paris not long afterwards, and wrote his *Computus Naturalium* and probably *De Spectaculis* and *De Mirabili Poteestate Artis et Naturae*. At the invitation of Pope Clement II he next undertook what may be described as an encyclopaedia of learning. Having produced the *Communium Naturalium* and *Communium Mathematica*, B. saw that he had attempted too much. He therefore set to work on the *Opus Majus*, *Opus Minus*, and *Opus Tertium*. These were followed (c. 1268) by a treatise on alchemy; after which B. returned to Oxford. There he wrote his glosses on the *Secreta Secretorum*, the *Compendium Philosophiae*, and a Gk and a Heb. grammar. His last work, *Compendium Studii Theologiae*, was completed in 1292. B. did much to foster experimental physics and chem., and he made valuable contributions to the science of optics. He also encouraged the study of anc. languages, and pressed for a revised ed. of the Bible. Although he mistrusted undue reliance on authority, he held that all knowledge was contained in Scripture. In many respects he was in advance of his age, but shared a number of popular beliefs such as the philosopher's stone and the doctrine of signatures. B.'s works have been ed. as follows: *Opus Majus*, *Opus Minus*, *Opus Tertium* and *Compendium Studii Philosophiae*, by J. S.

Brewer in *Rogeri Bacon Opera Quaedam hactenus inedita*, 1859; *Opus Majus*, by J. H. Bridges, 1900; *Opera hactenus inedita Rogeri Bacon*, by R. Steele and others (16 vols.), 1905-47; *Textes inédits et autres textes de Roger Bacon*, 1948. See A. G. Little, *Roger Bacon: Essays* (with full bibliography), 1914; *Roger Bacon*, 1928; T. Crowley, *Roger Bacon*, 1950.

Bacon Beetle (*Dermestes lardarius*), destructive species of beetle, which attacks bacon, dried foods, and stuffed collections. The insect is small and black, with the exception of the root end of the wing, which is golden-brown and dotted with 3 dark spots.

Bacon-Shakespeare Controversy, see SHAKESPEARE, WILLIAM.

Baconthorpe, Bacon, or Bacho, John (d. 1346), schoolman and philosopher, called 'Doctor Resolutus', the grand-nephew of Roger B. (q.v.). He entered a Carmelite monastery near Walsingham, graduated at the univ. of Paris, and became the head of his Order in England (1329-33). In 1333 he went to Rome, and returned to England in 1346. He defended the teaching of Averroes (q.v.) against St Thomas Aquinas, and wrote commentaries on the Bible and numerous treatises, including *Commentaria super Libros I-IV Sententiarum*, Paris, 1485. See *De Scripturibus scholasticis Saeculi XIV ex Ordine Carmelitarum*, 1931, pp. 167 ff.

Bács-Kiskun County, see KECSKEMÉT.

Bacteria are microscopic organisms which have no chlorophyll and consequently most of them are unable to synthesise their body substance (protoplasm) from simple inorganic materials. A few, however, such as the iron and sulphur and nitrifying B. mentioned below, are able to build up protoplasm from carbon dioxide and salts by the process of chemosynthesis, allied to photosynthesis of green plants but taking place in the absence of light. In many respects B. closely resemble the fungi, and so are sometimes grouped as Schizomycetes, on account of their reproduction by fission (Gk *schizein*, to cleave; *mukes*, fungus). It is, however, preferable to regard B. as a distinctive group of very simple living organisms which have not yet evolved into either plants or animals, and which may resemble the primitive forms of life first produced on the earth. The names bacilli, microbes, micrococci, micro-organisms, and germs are also popularly applied to the group as a whole. Their multiplication is so rapid that they may produce more than 16,000,000 in a day, and they are so minute that about 2500 of some of the larger forms, placed end to end, would measure about one-tenth of an in. Others cannot be seen even under the highest magnification of the microscope, and their presence is detected, or rather deduced, only from their effect on other organisms in which they cause some of the most virulent diseases. Such ultra-microscopic forms are known as the filterable viruses, because they pass through the pores of a

porcelain filter. If the pores be fine enough, the virus may be separated from the microscopic B. (see VIRUSES).

Classification. The classification of B. is unsatisfactory, because the main diagnostic feature on which it was originally based was that of the shape of the cell. This method has been in use so long, and has consequently collected so much nomenclature founded on this feature, that there are obvious disadvantages to the medical profession in replacing it by a newer system of terminology. Moreover, the ready recognition of external form is of great importance in clinical work. Such a system of classification is, however, not really scientific, and the Society of Amer. Bacteriologists has

of the groups, are described as a diplococcus, e.g. the *Gonococcus* and *Pneumococcus*.

(d) *Sarcinae* divide in 3 planes, 2 longitudinal and 1 meridional, at right angles to one another, and so form groups of 8.

(2) *Bacilli* are rod-like B. which are really cylindrical. The main axis of the cylinder may be relatively long or short, and the ends may be flat or convex, so that under the microscope the bacillus looks like a rod with square or rounded ends. It may have flagella at one or both ends, or all round the body, or flagella may be absent.

(3) *Spirilla* are curved, rod-like forms. The curves may be undulatory or spiral;

BACTERIA

A, cocci; B, diplococci; C, streptococci; D, staphylococci; E, monotrichous flagella; F, amphitrichous flagella; G, peritrichous flagella; H, bacilli; J, vibrios; K, spirilla; L, spirochaetes; M, anthrax spores; N, tetanus spores; O, division of a bacterium.

suggested a system comparable to that of the higher plants.

The classification at present still in use in Great Britain divides B. into higher and lower forms. The latter, or Eubacteriales, are far more numerous, and include motile and non-motile unicellular organisms, consisting of a mass of protoplasm within an investment. Spores may be formed within the cells, and such spores are called endospores. Eubacteria are of 4 main types, and are classified according to their shape as:

(1) *Cocci*. These are spherical organisms reproducing by fission, but various members of the group divide in different ways, and so sub-divs., dependent on the mode of fission, have been formed.

(a) In *Streptococci* (Gk *streptos*, twisted) divs. occur in only 1 plane, and the cells are held together in a row by their gelatinous investments.

(b) In *Staphylococci* (Gk *staphulē*, bunch of grapes) divs. may occur in any plane and so will result in the formation of an irregular mass of cells.

(c) *Micrococci* in fission form groups of 4 or multiples of 4 by div. in 2 planes at right angles. Two of these cells, remaining in contact after the separation

at each end of the motile forms are from 1 to 20 flagella.

(4) *Spirochaetae* are non-flagellate, motile, spiral, or undulatory cells, usually comparatively long and thin. Various types of movement are effected by the contraction of the cell, and in some forms one end tapers so considerably that it is comparable to a flagellum.

The higher B. consist of branched or unbranched septate or aseptate filaments often invested with a gelatinous sheath. The units of these filaments resemble separate B., but the filament must be regarded as a simple colonial aggregate, for the units are interdependent and have sometimes a very special function. The unit at one end often fixes the organism while that at the free end divides, releasing spores called conidia, which can reproduce the bacterium immediately if conditions be favourable. The 3 chief orders of this group are:

(1) *Chlamydo- or Tricho-bacteria*. These are unbranched, filamentous forms, often with a narrow fixing base. They are mainly aquatic, and their envelope frequently contains iron oxide. Such forms are popularly described as 'Iron B.'

(2) *Streptothrices* are branched aseptate

filaments which may produce special reproductive branches from which chains of rounded conidia are formed, or the filament may reproduce by dividing transversely into a number of rods.

(3) *Thiobacteria* or 'sulphur B.' contain sulphur and sometimes bacterio-purpurin. A sheath is not always present, and the organisms may be free or attached. The free forms move by protoplasmic contraction.

The Amer. classification divides the B. into the six orders: (1) Eubacteriales; (2) Spirochaetales; (3) Chlamydo-bacteriales; (4) Thiobacteriales; (5) Actinomycetales; and (6) Myxobacteriales (see Buchanan, *General Systematic Bacteriology*). In this classification B. producing diseases in human beings belong to orders 1, 2, and 5.

Structure. Examined under the microscope, B. are seen as minute and transparent cells, usually colourless, and consisting of a mass of protoplasm surrounded by a definite wall which is different in character from the cellulose wall of higher plants. Around this wall many B. have a gelatinous covering, which enables them to cohere and form a slimy mass such as may be found on the surface of stagnant water and round flower-stalks which have begun to rot. This cohesive mass is the zooglee (i.e. 'animal glue'). Some B. are coloured, but since the majority are not their structure can be determined only with the aid of appropriate stains, usually aniline dyes. The presence of a differentiated nucleus has not been satisfactorily demonstrated, even in the larger forms, and from results so far obtained it seems unlikely that the cell contains an organised nucleus. The cells may contain food reserves of fat, carbohydrate such as glycogen, and of other materials.

Growth and reproduction. Under favourable conditions a bacterium grows very rapidly, and divides either transversely or longitudinally or in both directions. The new cells grow and divide almost immediately. When conditions become adverse, thick-walled resting spores, endospores, are formed inside the cell, and may rest and remain viable for months, or even years, awaiting the return of favourable conditions. Most B. are not killed unless they are subjected to extreme conditions.

Food and feeding. On account of the inability of all except the chemosynthetic species to synthesise food from carbon dioxide, water, and mineral salts, B. have to live on food manuf. by green plants. In a few cases they do this directly by living within or on parts of the plant. For example, some species live on seeds, and in feeding help to rot the testa and so help the seedling to grow out more easily. Most, however, do it indirectly by living in or on animals and on decaying plant or animal matter. In fact, the B. themselves effect the decay by the chemical decomposition due to enzyme (q.v.) action. These B. are either saprophytes (Gk *sapros*, decay) or parasites, but many of the parasites cause

the death of their 'host' or are expelled, and then go on living as saprophytes. To effect decomposition the B. secrete enzymes or ferments capable of decomposing such substances as cellulose, lignin, protein, and other compounds, and on this account are very useful to man (see below). On the other hand, some parasitic B., by decomposing blood and tissues, may cause great harm and even death. Some parasites are useful; those found in the intestine probably aid digestion.

The elements of food substances required by B. are practically the same as those needed by all plants—carbon, hydrogen, oxygen, phosphorus, sulphur, nitrogen associated with the metals calcium, potassium, and magnesium. Some species need iron, and sodium compounds are present in many. It is difficult to discover in exactly what form B. require these compounds, because any one species of bacterium is rarely found alone. Usually there are associations of sev. species, and each may modify the substratum, while the others may be feeding on materials produced by the modification. Most B. prefer an alkaline medium; even a small amount of free acid will inhibit the growth of the cholera bacillus, and many B. are killed by the hydrochloric acid in the gastric juice of the stomach. By the method of culture it is possible to discover the foods which some B. can use.

Methods and uses of culturing bacteria. In any medium where B. flourish freely there is a confusion of different forms, spherical, cylindrical, and spiral. Some species use up all the available nourishment and die or dwindle into spores. Other species enter and multiply, and are in their turn destroyed through the exhaustion of the food supply or by the poisons created in the medium by other species. The microbe pop. is thus always changing, and it is difficult to study their structure and actions unless each species can be separately collected. This may be done by sterilising a solution of agar-agar (obtained from a Jap. seaweed) to which has been added a food solution of materials similar to those on which the B. grow naturally. The sterilisation is carried out at a temp. which will not decompose the medium, and if it has to be as low as 57° C., sterilisation will take some days. If, however, it can be performed under pressure due to superheated steam, from 20 to 30 min. will be long enough to kill any spores which have found their way into the medium. This is poured into sterilised flat dishes, Petri dishes, or into test-tubes sloped to expose a long slant surface of the agar. In the latter case the medium is usually sterilised in the tubes, which are plugged with cotton wool. If sufficient agar be used the medium sets like a jelly, and is most convenient, because pieces on which B. are growing can easily be removed. Many other media are used for specific B.; the diphtheria bacillus grows on coagulated blood serum and the meningococcus on egg albumen. B. are

scattered on the surface by adding a drop of water or liquid gelatine or by dipping a platinum needle into a mass of B. and quickly stroking it across the medium. If conditions be favourable they divide, and the different types form separate colonies, which may be removed and subcultured separately on fresh media. In this way pure cultures may be obtained and subjected to experiments to determine the effect of changes in temp., light, food, materials, poisons, and other factors. Such researches may be invaluable in determining the most favourable conditions of life for disease-producing B., the means of ending their activities, and also the best conditions for the activities of B. of economic value.

Identification of bacteria. It is not usually possible to identify B. by the use of the microscope alone, though examination of stained preparations is, of course, employed; living B. can be viewed by dark ground illumination, and this method is particularly useful for recognising *Spirochaetes*.

A most important aid to identification is the manner of growth of B. in the pure cultures prepared as described above, and observed with the naked eye. The size, colour, shape, type of surface, and other similar features are all used. Further important methods of identification are: (1) whether gelatine, used instead of agar-agar in the culture medium, is liquefied by the bacterium; (2) whether indole, a substance which can easily be tested for by chemical means, is formed; (3) whether various sugars are fermented by the bacterium, with production of acids, as shown by the colour change of an indicator incorporated in the medium; (4) whether in (3) a gas is formed as a result of the fermentation.

Effect of temperature. Every organism has a temp. which is most favourable to its growth. Above or below this optimum temp. growth decreases until the limits beyond which it cannot take place are reached. These vary considerably, so that while for most B. the lower limit is about 12° C. and the upper about 40° C., a few will grow at 5° C., while those which decompose hay and dung grow well at about 60° C. Beyond the temp. limits endospores are frequently formed, so that though meat may be preserved in a refrigerator and milk by boiling, in neither case is it safe to assume that the B. are killed. Their activities, ended for a time, may be resumed if the endospores have survived and are given suitable conditions. Some B. have been found to survive temps. required to liquefy hydrogen, while the sulphur B. flourish in hot springs at a temp. of 77° C.

Effect of light. As a rule B. are destroyed in a short time by bright sunlight, and in any case develop more rapidly in the total absence of light. Ultra-violet rays have some bactericidal action, and the electric arc, which is particularly rich in blue-violet and ultra-violet rays, has been used with some success in the treatment of lupus (tuberculosis of the skin) by the Finzen lamp.

The action of the rays is limited, however, to the superficial tissues of the body; B. which are more than a centimetre from the surface remain unaffected.

Phosphorescence. On a dark night luminous gleams may be seen on the surface of the sea. These are usually caused by protozoa, such as *Noctiluca* (q.v.), but may also be due to B. living on organisms on the surface of the water or on fish. Other forms of phosphorescent B. are found on dead fish, putrefying meat, decaying wood and vegetables. The exact cause of phosphorescence is unknown, but oxygen is essential for its appearance. If phosphorescent material be put in an atmosphere devoid of oxygen, the light vanishes. Phosphorescence seems therefore to be the direct or indirect result of an oxidation process.

Bacteria and oxygen. Whereas most living organisms can exist for a very limited time without free oxygen, some B. can live only in the absence of this gas. The bacilli causing tetanus (lockjaw), botulism (q.v.) ('meat-poisoning'), and gas gangrene (see GANGRENE) all flourish in the absence of oxygen, and are consequently termed anaerobes. They are found in the active state only in situations where free oxygen is absent, e.g. deep wounds (gas gangrene) or tinned food (botulism), and are destroyed by hydrogen peroxide, which readily liberates oxygen. Other B., aerobes, are unable to live unless oxygen be present, and to this type belongs the bacillus (*B. subtilis*) which is found in an infusion of hay. Many of the disease-producing B. are able to live equally well with or without oxygen.

Bacteria and nitrogen. Among the most important phenomena associated with bacterial action is the way in which the nitrogen of the atmosphere is rendered available for the use of animals and plants. The higher plants are unable to use atmospheric nitrogen until it has first been converted into nitrates by the agency of bacteria. Leguminous plants, such as clover, peas, beans, etc., are so well served in this respect by particular B. that they actually leave the soil richer in nitrogen than when they were sown. The bacterium lives in the root of the plant, and its presence is indicated by the appearance of nodules or tubercles upon the roots. Plants which are affected by this bacterium grow more vigorously than plants grown in sterilised soil and free from nodules. Leguminous plants are therefore an important item in the rotation of crops, and artificial cultures of the B. concerned are prepared so that the plants may be as fully infected as possible and so be able to gain the greatest amount of nitrogen compounds. The bacterium is able to effect the conversion of the nitrogen into ammonium compounds, and then into nitrites and nitrates, which the plant may build into proteins. When the leguminous crops are cut, the roots decay and the nitrates and proteins pass into the soil. Here another group of B. decompose the proteins, breaking them down into ammonium

compounds and sometimes liberating free nitrogen. Some nitrifying B. live in the soil and can carry on the rebuilding process of ammonium compounds into nitrates available for the higher plants. Other nitrifying B. in the soil can build up the free nitrogen into the ammonium compounds. By the activities of these nitrifying and denitrifying B. the amount of nitrogen in the atmosphere is kept approximately constant, and depletion of nitrogen in any one form is prevented. The circulation is known as the nitrogen cycle.

Bacteria in industry. Owing to their power of secreting ferments, B. are of great economic importance. The separation of the fibres of flax is effected by the decomposing action of the B. on the tissues connecting the fibres. Those of jute and hemp are separated in a similar way. B. also play a part in the curing of tobacco, the manu. of vinegar from wine, the decomposition of dung for use as manure, leather tanning, and in the preparation of cream for butter. A bacterium known as *Clostridium* is now employed in the commercial production of acetone and butyl alcohol. Citric acid (for fruit drinks) is formed by a mould, alcohol and glycerine by yeast; both these organisms are closely related to B. Ginger-beer is obtained by fermenting sugar with yeast and a bacterium living in symbiosis. Sour milk may be produced by the action of many different bacilli; one of the best known of these is the lactic acid bacillus which during the fermentation produces the acid from which it is named.

Bacteria and disease. It had long been suspected that suppuration was due to the presence of organisms in wounds and that B. were responsible for many diseases (see PATHOLOGY). For instance, Semmelweis of Vienna had shown the value of washing the hands in chloride of lime as a means of preventing the spread of puerperal fever (see OBSTETRICS). Joseph (afterwards Lord) Lister (q.v.) realised the importance of Pasteur's work on microbes as agents of fermentation, and showed (1867) that suppuration was likewise due to micro-organisms (in this case B.) and could be avoided by killing the germs with antiseptics such as carbolic acid. Finally, Robert Koch (q.v.) isolated and cultured the bacterium which causes anthrax; similar work on other diseases quickly followed. The more superficial diseases due to B. entering wounds are commonly caused by small spherical B., *Streptococcus pyogenes* and *Staphylococcus aureus*. They are constantly present where people are gathered together, especially in sick wards of hospitals and other places where there are persons affected with suppurative inflammation. Childbed fever is caused by the same organisms, and undoubtedly many cases were occasioned by doctors and nurses carrying infection before the origin of the disease was known. The danger has been considerably lessened by the precautions taken to sterilise the hands and instruments used in childbirth

and by the improvement in the standard of midwifery.

Streptococcus pyogenes may produce degrees of inflammation varying from local redness to erysipelas, while *Staphylococcus aureus* is associated chiefly with suppuration. B. infection of the deeper tissues of the wound is more dangerous.

The formation of pus when wounds are infected by B. is due to the action of the leucocytes, or white corpuscles of the blood (q.v.). They are single cells which in ordinary circumstances circulate with the blood-stream, but are capable of penetrating the walls of the blood-vessels into spaces in the tissues. The work they do is the engulfing and digesting of small particles of waste or foreign substances, and they thus serve as scavengers to the blood. When B. enter a wound the corpuscles make their way to the part affected. Here they proceed to ingest the B. but if these multiply more rapidly than the leucocytes can ingest them, they may penetrate to other parts of the body and cause abscesses. If, however, the leucocytes can cope with the bacterial invasions, they help in forming new tissue to heal the wound, from which the dead corpuscles and B. are discharged as a yellowish-white mass known as pus.

Many of the pathogenic or disease-producing B. produce substances called toxins in the tissues or in the blood, and when toxins circulate in the blood-stream a general effect known as toxæmia is caused. In other cases the B. themselves, as well as their toxins, circulate and multiply in the blood, so spreading infection throughout the body and producing the conditions of septicaemia (blood poisoning). The following is a list of some well-known diseases caused by bacterial infection; they are described under their individual headings, to which reference should be made: *Cholera*, *Diphtheria*, *Enteric fever*, *Gonorrhoea*, *Leprosy*, *Meningitis*, *Plague*, *Pneumonia*, *Rheumatic fever*, *Syphilis*, *Tetanus*, and *Tuberculosis*. Many other diseases of an infective nature are caused by viruses, ultramicroscopic bodies which are on the border-line between a living organism and a non-living complex chemical structure. They are usually regarded as being of the nature of living bacteria (see VIRUSES).

Immunity means resistance to infection. Immunity may be inherent or acquired. When it is acquired it may occur as a result of natural means (as from an attack of the disease), or artificially (as from a vaccine or antitoxin). Acquired immunity may be active or passive. The infecting bacterial agent is known as an antigen or toxin, and the agent of immunity is known as an antibody or antitoxin. Individuals and races vary in their susceptibility to bacterial disease, owing probably to some inherited constituents in the blood which render it favourable or otherwise to the development of B. Where individuals are found to be unaffected by injurious germs, they are said to enjoy natural or hereditary immunity. It is also possible to acquire

immunity from a second attack of a disease by the changes induced in the body as a consequence of the first attack. When bacterial poisons (antigens) are produced in the blood, the body cells elaborate certain substances (antibodies) which unite with these toxins and render them harmless. Thus people who recover from infections such as smallpox, measles, scarlet fever, and, to a certain extent, typhoid fever are protected from further attacks for a considerable time. The antibody is usually specific—that is, it is only effective against one particular disease—and considerable progress has been made in the artificial preparation of antibodies to aid the natural resisting power of the body in fighting certain diseases. For example, when a horse is inoculated with the poison produced by diphtheria bacilli, his cells are stimulated to bring forth the appropriate antitoxin. The treatment is continued with larger doses of the toxin as the horse increases his resisting power by production of antitoxin. He is then bled and the serum or clear fluid removed from the blood and used to inoculate diphtheria patients, thus enabling them to combat the disease with greater prospects of success. Similar treatment is applied in cases of tetanus and botulism. Since the serum already contains the antitoxins, the immunity given by it is described as passive and its effects are shortlived. Active immunity is given by vaccines which stimulate the body to produce its own antibodies. Vaccines are emulsions of living or dead germs, or toxoids; that is, toxins which have been rendered innocuous by treatment with chemicals such as formaldehyde. The dead ones are usually obtained by heating the culture sufficiently; living ones are grown under such conditions that their vitality is impaired, so that when injected into the body they may readily be overcome by the leucocytes. The antibodies formed usually remain in the body for some considerable time.

Both serums and vaccines may be used in prophylactic as well as in curative treatment. When the antibodies disappear from the blood re-injection is necessary to preserve immunity. In vaccinations against smallpox (Jenner, 1798) the antibodies probably persist throughout life, though not in sufficient quantity to prevent an attack, but they probably never lose their power to modify it. For prevention, revaccination is necessary from time to time. The original anthrax vaccine (Pasteur, 1880) was efficacious for only 1 year. Immunity for a longer period is given by the anti-anthrax sera now used. Jenner and Pasteur were the pioneers in vaccine treatment; epidemics and war conditions have stimulated research, with the result that various vaccines have been discovered and are prophylactic against typhoid and paratyphoid fevers, plague, dysentery, cholera, and many other infections. The most notable advances in recent years in the use of prophylactic vaccines have been in those against tuberculosis (q.v.) and poliomyelitis (q.v.).

Also present in the blood serum are substances called *opsonins* (q.v.) which assist the leucocytes (see BLOOD) in their phagocytic action on B. Inoculation of a vaccine of dead B. at first decreases the power of opsonins. This 'negative phase' is followed by the permanent 'positive phase' in which the opsonic power is increased. Opsonins therefore play a part in immunity but different from that of the antibodies.

Bactria, prov. of the anct Persian Empire, bounded on the N. by Sogdiana, on the E. by Parthia, and on the S. by Aria, Drangiana, (see BLOOD) in their phagocytic action on B. Inoculation of a vaccine of dead B. at first decreases the power of opsonins. This 'negative phase' is followed by the permanent 'positive phase' in which the opsonic power is increased. Opsonins therefore play a part in immunity but different from that of the antibodies.

Bactrian Coins (from the anct dist. called in Greek *Bactria*) have been found in the 'topes' or burial-places to the NE. of Kabul. These coins are also known as Indo-Greek or Indo-Scythian. They belong to the period between 175 BC and the 1st cent. AD. They are inscribed in the Kharoshthi script, which probably originated from the Aramaic script in the 5th cent. BC, and was formed in NW. India, at that time under Persian rule, this rule being the best medium for the spread of the Aramaic speech and script. The great importance of the Kharoshthi script was realised after the discovery, in 1836, of a Kharoshthi inscription incised on a rock in the vicinity of Shahbazgarhi (on the Indo-Afghan border) giving a trans. of Asoka's edicts, attributed to 251 BC. Dr Isaac Taylor suggested that the present 'Arabic' numerals are the actual symbols of Kharoshthi letters found on the B. C. e.g. 4 is the letter *ch* (Indian *chatur* = Latin *quatuor*), 5 is *p* (Indian *panchan* = Greek *pentē*).

Bactris (Gk *baktron*, staff), genus of Amer. palms of small size, with slender stems which are much used in making light but solid walking-sticks. *B. maraja* produces a small fruit of pleasant taste; *B. acanthocarpa* a fibre used in making nets.

Bacup, industrial municipal bor. and mkt tn of the Rossendale div. of E. Lancs, England. The industries embrace cotton-spinning and weaving, shoe and slipper manuf., textile finishing (bleaching, printing, etc.), felt manuf., the making of overalls, shirts, underwear, and knitted goods, coal-mining, stone-quarrying, heating and ventilating, and other light engineering, printing, etc. Pop. 18,370.

Bad Aussee, see AUSSEE, BAD.

Bad Ems, see EMS.

Bad Ischl, see ISCHL, BAD.

Bad Nauheim, see NAEHEIM.

Badagry, dist. and tn on R. Badagry in

Nigeria, W. Africa. It does a considerable trade in palm-oil and palm kernels.

Badajoz: 1. Sp. prov., in Estremadura (q.v.), the largest prov. in Spain. It is watered by the Guadiana (q.v.) and its tribs., and is, in general, low-lying. The chief industry is stock-raising. Area 8358 sq. m.; pop. 835,200.

2. (Rom. *Pax Augusta*, later *Batalyoz*) Sp. tn, cap. of the prov. of B., on the Guadiana. It was originally a Celtic settlement, then a Rom. tn, and, under the Visigoths, was the seat of a bishop. In 1031 it became the cap. of a Moorish kingdom. Portuguese in the 12th cent., it was taken by Alfonso IX (q.v.) in 1229. It was besieged by the Portuguese in 1385, 1396, 1542, and 1705, and by the French in 1808 and 1809. It surrendered to Soult (q.v.) in 1811, but was captured and pillaged by Wellington's army in the following year (see *PENINSULAR WAR*). During the Civil war it was taken by the insurgents in Aug. 1936. B. is built on a hill, crowned by a ruined Moorish castle. It has a 13th-cent. cathedral, fortress-like in appearance, and a 16th-cent. bridge. Textiles, pottery, leather, and soap are manuf. Luis Morales and Manuel Godoy (qq.v.) were b. here. Pop. 86,550.

Badakhshan: 1. Gorno-Badakhshan Autonomous Oblast (prov.) of the Tajik S.S.R. of the Soviet Union. The cap. is Khorog. The pop. of 45,000 is composed of Tajiks and Kirgiz. The E. section forms a plateau with an elevation of 11,500-13,000 ft. The chief crops are grains and beans. Vegetables and fruit have recently been introduced.

2. Minor prov. of N. Afghanistan adjoining 1. The cap. is Faizabad. Its frontier with Russia was delimited in 1873.

Badalocchio, Sisto (c. 1581-c. 1650), surnamed *Rosa*, b. Parma, an It. painter and engraver, pupil of Annibale Carracci (q.v.), whom he and a co-disciple, Lanfranco, accompanied to Rome in 1606. His prin. engravings are the series known as *Raphael's Bible*, which were executed by him in conjunction with Lanfranco. On the death of Carracci, 1609, he went to Bologna, where he d.

Badalona, Sp. port in the prov. of Barcelona, a N. suburb of the city of Barcelona (q.v.). It has a shipbuilding industry, and manufs. textiles and glass. Pop. 55,800.

Baden, spa in the canton of Aargau, Switzerland, on the bank of the R. Limmat. Famous for its sulphur baths (the *Aquae Helveticae* of the Romans), which reach a temp. of 117° F. From the 15th to the 18th cent. it was the seat of the Swiss diet. Pop. 12,000, but visited yearly by 20,000 persons.

Baden, ter. in Germany, lying between Alsace-Lorraine and Württemberg (qq.v.). It was a state of the Reich from 1918 until 1945, and it now forms part of the *Land* of Baden-Württemberg (q.v.). Its early inhab. were the Alemanni (q.v.), who were conquered by Clovis I (q.v.) in 496 and converted to Christianity. In 748 Pépin the Short (q.v.) abolished the dukedom of Alemanni. In the 12th cent. a margravate

of B. was founded, but was frequently split between various branches of the ruling house of Lähringen; it was finally united under the margrave Charles Frederick in 1771. Charles Frederick joined the Confederation of the Rhine (q.v.), and in consequence doubled his estates, and gained the title of elector and grand duke. In 1811 he was succeeded by his grandson Louis Frederick, who seceded from the Confederation. The rule of the Grand Duke Leopold began in 1830 with political feelings in B. inflamed by the events of the Fr. Revolution of that year; and, although by 1846 it seemed that a peaceful solution might be found under a Liberal regime, in 1848, the 'Year of Revolutions,' Hecker and Struve drove out the grand duke and estab. a rep. The grand duke was reinstated by the Prussians in the following year, but in the war of 1866 (see *AUSTRIA, History*) B. favoured Austria. In the Franco-Ger. War (q.v.), however, B. fought on the side of Prussia, and became part of the new Ger. Empire. At the end of the First World War the grand duke, though personally popular, was forced to abdicate, and in 1919 a republican constitution was framed. At the end of the Second World War B. was partitioned: the S. part became a *Land* (called B.) in the Fr.-occupied zone; and the N. part, together with parts of Württemberg (q.v.), became a *Land* called Württemberg-Baden in the U.S. zone. In 1952 the *Länder* of (Fr.-occupied) B., Württemberg-Baden, and Württemberg-Hohenzollern were merged to form the present *Land* called Baden-Württemberg.

B. lies on the E. bank of the Rhine (q.v.), in the angle of the riv. forming the Ger.-Swiss border. It contains the Black Forest (q.v.), and is mountainous except for the part lying in the valley of the Rhine. Part of Lake Constance (q.v.) lies within its borders, and it has many mineral springs. Coal, gypsum, zinc, salt, and soda are found, live-stock is raised, and cereals, fruit, vegetables, wine, and tobacco are produced. There are light industries, including the manuf. of chemicals, china, glass, and textiles. The area of the state of B. was 5823 sq. m.; cap. Karlsruhe (q.v.).

Baden-Baden, Ger. spa in the *Land* of Baden-Württemberg (q.v.), in the Oos valley, 43 m. W. of Stuttgart (q.v.). The mineral springs (115°-150° F., containing iron, magnesia, lime, and sulphur) were known to the Romans, and the ruins of Rom. baths still exist. The great days of the spa were in the 19th cent., when it was one of the most fashionable in Europe: the hydropathic installations are still to-day, however, much frequented, and they are the finest in Germany. The tn has beautiful walks and gardens. The ruined 'Old Castle' on the Schlossberg was destroyed by the French in 1689, as was the 16th-cent. 'New Castle'; the latter has been restored and is now a museum. There are sev. notable churches, a theatre, and an art gallery, and there are sporting facilities of all kinds. The *Kurhaus* (casino) was once famous. Pop. 40,000.

Baden-bei-Wien (Baden near Vienna), Austrian spa, in the prov. of Lower Austria, 16 m. S. of Vienna. It was known to the Romans as *Aquae Panonicae*, and has sulphur springs. Pop. 24,000.

Baden-Powell, Robert Stephenson Smyth, Baron Baden-Powell of Gilwell (1857-1941), Eng. soldier, b. London, son of the Rev. Prof. B.-P. of Oxford. He had for godfather Robert Stephenson, son of the 'father of railways'; and his mother was descended from Capt. John Smith (1579-1631) of Virginian fame. Until he was nearly 12 he lived an outdoor life; then he went to a preparatory school, and in 1871 (with his younger brother) to the Charterhouse. He joined the 13th Hussars in 1876, with which he served in India, Afghanistan, and S. Africa. Assistant military secretary in S. Africa, 1887-9, in Malta, 1890-3; commander of the native levies in Ashanti, 1895; served with distinction in the Matabele campaign, 1896-7; raised to the command of the 5th Dragoon Guards, 1895. In the Boer War he won great popularity by his brilliant defence of Mafeking; in spite of famine and sickness, with a force of 1200 men he held the town for 215 days, till its relief on 18 May 1900. In recognition of his ability he was raised to the rank of major-general; inspector-general of the S. African constabulary, 1900; inspector-general of the cavalry, 1903-7. Always interested in boys and their welfare, he had written, some years prior to his retirement from the Army in 1910, his *Aids to Scouting*, which was eagerly read by large numbers of boys. The first experimental camp of Boy Scouts on Brownsea Is., Poole Harbour, in 1907 was so successful that B.-P. decided on more extensive operations, which spread rapidly in Britain and other countries and eventually formed the worldwide Boy Scout organisation which has played a great part in the physical and moral development of youth in all countries. A parallel organisation among girls—the Girl Guides—was founded in 1910. In the Boy Scout movement he was Chief Scout. He was knighted in 1909 and raised to the peerage in 1929. Exhibited sculpture in the Royal Academy, 1907. Lieutenant-general commanding Northumbrian Territorial Div., 1908; retired, 1910; O.M., 1937. He d. on 8 Jan., at his home in Kenya. Among his pubs. are *Pig-sticking or Hog-hunting*, 1889 (revised ed., 1924), *Vedette*, 1890, *Cavalry Instruction*, 1895, *The Matabele Campaign*, 1896, *Sport in War*, 1900, *Scouting for Boys*, 1908, *Quick Training for War*, 1914, *My Adventures as a Spy*, 1915, *Indian Memories*, 1915, *The Wolf-Cubs Handbook*, 1916, *Girl Guiding*, 1917, *Aids to Scoutmastership*, 1920, *Old Wolf's Favourites*, 1921, *What Scouts can do*, 1921, *Rowing to Success*, 1922, *Life's Snags*, 1927, *Scouting and Youth Movements*, 1929, *Lessons from the Varsity of Life*, 1933, and *Adventuring to Manhood*, 1937. See E. E. Reynolds, *Baden-Powell*, 1942.

Baden-Württemberg, Land of SW. Ger-

many, in the Federal Rep., formed in 1952 by the merger of the *Land* of Baden (q.v.), Württemberg-Baden, and Württemberg-Hohenzollern (see WÜRTTEMBERG). The chief towns are Stuttgart (the cap.), Karlsruhe, Mannheim, and Heidelberg (qq.v.). Area 13,925 sq. m.; pop. 7,077,300.

Badenoch, dist. in the SE. of Inverness-shire, Scotland, 45 m. in length and 19 m. in breadth, traversed by the R. Spey. Gneiss rock and granite are found.

Badenweiler, Ger. spa in the Land of Baden-Württemberg (q.v.), near the Fr. border, 97 m. SW. of Stuttgart (q.v.). It is near the Black Forest (q.v.) and its springs have been known since Rom. times. Pop. 2000.

Badgastein, Austrian tn in the Gastein valley (q.v.). It is a fashionable resort, and the most important spa in Austria, with radioactive thermal springs. Pop. 5600.

Badge, device used as a distinctive emblem of families, countries, etc. It is a simpler and more primitive cognisance than the crest or coat of arms, and is not subject to the laws of heraldry. B.s, like crests and coats of arms, are usually symbolic in character, but on the one hand are distinct from the coat of arms as not being supported on a shield, and on the other hand are distinct from the crest as not surmounting a helmet. Famous Eng. B.s are the *rose en soleil* of Edward IV, the falcon and fetlock of Richard, Duke of York, the ragged staff of the Beauchamp and Neville earls of Warwick. B.s are also worn as signs of office, or as a token of membership of some society, e.g. Solomon's seal and the mason's tools used as an emblem by Freemasons, and the primrose used as a B. by members of the Primrose League. B.s are used by savage peoples to identify their arms and mark their belongings.

Badger (*Meles*), genus of burrowing carnivores, constituting with the skunks the sub-family *Melinae* in the *Mustelidae* or weasel and otter family. Its chief characteristics are short, strong legs, long and more or less plantigrade feet, and a pointed muzzle. It has perineal glands containing a substance emitting a fetid odour, which is thought to be of use in sex attraction. The common B. (*M. meles*) is found in the hilly and woody dists. of Europe and Asia, but is now comparatively rare in Great Britain. Its colour is greyish-brown, with a white head marked with black lines running from the nose to the back of the ears. It is about 2 ft 6 in. long, and stands 1 ft high. It is an inoffensive, solitary animal, sleeping by day in subterranean burrows which it digs for itself, and wandering by night in search of its food, which consists of roots, insects, frogs, and the larvae of wasps and bees. The Amer. B. (*Taxidea americana*) is more carnivorous, and eats small animals such as marmots. B.s are conspicuous for their shrewdness, perseverance, and courage. The cruel practice of B.-baiting, or drawing the B., was prohibited in England in 1850. A B. was kept in a barrel and attacked

by dogs until it at last gave way and was dragged out. Then its owner released it from the dogs and put it back into the barrel to recover itself. This performance was continued during the day, and formed an attraction at public-houses of a low order. The verb 'to badger,' meaning to assail repeatedly, to worry, is derived from this practice.

Badger, George Percy (1815-88), Arabist, b. Chelmsford, Essex. Travelled in Arabic lands and acquired an unrivalled practical knowledge of Arabic dialects, and an intimate knowledge of the Near E. Gov. chaplain at Bombay, 1845. Joined Sir James Outram's expedition to Aden, 1854; when Outram became Commander-in-Chief of the Persian expedition (1856), B. became his staff chaplain and Arabic interpreter. In 1872 he was secretary to Sir Henry Bartle Edward Frere on mission to Zanzibar. Author of *Malta and Gers*, 1838 (2nd ed.), 1851, *The Nestorians and their Rituals* (2 vols.), 1852, *The State of the Dead* (2nd ed.), 1871, *The Syriac Liturgies*, 1875, and *An English-Arabic Lexicon*, 1881.

Badger-baiting, see BADGER.

Badger State, see WISCONSIN.

Badghiz (home of the winds), dist. in the NW. of Afghanistan, bounded by the Murghab and Harirod R.s.

Badia-y-Lablick, Domingo (1766-1818), Sp. traveller, b. Barcelona. He studied Arabic language and life, and he disguised himself as a Mussulman, calling himself Ali-Bei. His disguise was perfect, and he was invited to the court of the Sultan of Morocco, where he was held in high esteem. Two years later he went on a pilgrimage to Mecca, and there performed all the rites. At Paris he pub. an account of his adventures under the title of *Voyage d'Ali-Bei en Afrique et en Asie*.

Badius, Jodocus, or Jose (1462-1535), Fr. printer, b. Assche, near Brussels, and therefore sometimes called Ascensius. He studied at Ghent, Brussels, and Ferrara, and taught Greek at Lyons and Paris. Trechsel, a printer, engaged him as corrector of his press, and afterwards as a son-in-law secured his services as a partner. In 1500 he settled in Paris and estab. a printing office that went by the name of Prolum Ascensianum. He also wrote books, which include a life of Thomas à Kempis; *Sylva moralis contra vitia: Navicula stultarum mulierum*, a satire on the follies of women.

Badland Topography, term used to describe ground crossed by numerous gullies which have the effect of making the land uncultivable and very difficult to cross. B. T., called after the type locality in N. America (q.v.), is the result of the rapid erosion of soft beds and usually occurs where high seasonal rainfall or a lack of vegetation makes the run-off of rain-water very intense. In these circumstances a network of gullies may spread rapidly over once fertile land. Soil conservation and the cultivation of suitable crops are now practised to restrict the development of such gullies. See also BADLANDS.

Badlands, great stretches of waste and rugged country in the W. of the U.S.A.

Such regions are found in S. Dakota, SW. N. Dakota, and Nebraska, on the White R., the Bad, the Yellowstone, and the Little Missouri. Their chief interest is zoological, as they contain valuable fossil specimens.

Badminton, or Great Badminton, vil. of Glos., England. (Pop. 338.) Here is the seat of the Duke of Beaufort, B. House. It is an imposing mansion in the Palladian style of architecture, surrounded by fine grounds. B. House has given a name to the game described in the following article, to a kind of claret cup, and to the B. Library.

Badminton, rackets game invented about 1870 at Badminton House, the seat of the Duke of Beaufort in Glos. Since the end of the First World War it has spread to all parts of the world, and its overall organisation is governed by the International B. Federation, formed in 1934, and now having 32 national organisations in full membership. Except in such countries as Malaya, where there is a negligible amount of breeze, it is essentially an indoor game played mostly during the winter.

The missile used is a shuttlecock which weighs only between 73 and 85 grains, the actual weight selected being dependent upon climate and hall atmosphere. The shuttlecock is made from a half-sphere of cork about 1 in. in diameter with the rounded end being covered with leather. Into the flat end are inserted 14 to 16 goose feathers, each cut to measure from $2\frac{1}{2}$ to $2\frac{3}{4}$ in. in length from the tip to the cork base. They are fixed so that there is an outward spread of $2\frac{1}{2}$ in. at the top. They are firmly fixed into the cork with thread and glue.

Rackets are not dissimilar to lawn tennis rackets, though less wide and much lighter in weight. They weigh about $5\frac{1}{2}$ oz., though they are exceptionally strong and whippy. They are strung with gut, and the frame is usually made of hickory, though metal shafts have become very popular.

The doubles court, upon a restricted area of which singles is also played, is 44 ft long and 20 ft wide with a net across the middle. The net, $2\frac{1}{2}$ ft deep, hangs exactly 5 ft above the floor at the centre and 5 ft 1 in. at the posts, which are themselves that height. The lines of the court, as shown in the diagram (p. 672), are $1\frac{1}{2}$ in. thick and painted in either white or black. Except for marking the extremities of the whole court, they denote only the restrictions imposed upon the server and receiver at the commencement of each rally.

The singles game, for 1 player a side, is played within the narrower side-lines, so that the total width of the court becomes reduced to 17 ft, the length remaining the same. Where space does not permit the marking of a doubles court, singles can be played on a court marked out in accordance with diagram 2. There is no specification for the height of the court, but this should be at least 25 ft. Anything less will prevent exposition of the full range of strokes which varies from

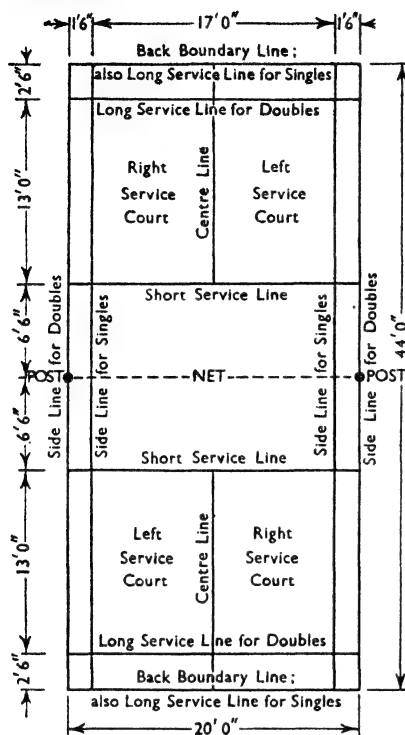

FIG. 1. DOUBLES COURT

Diagonal measurement of full court: 48 ft 4 in. Diagonal measurement of half court: 29 ft 8½ in. (from post to back boundary line).

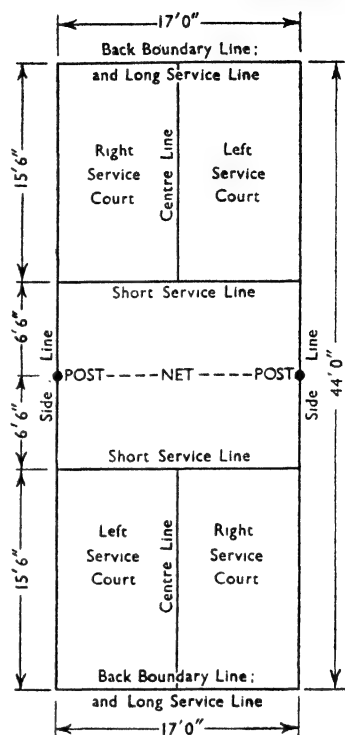

FIG. 2. SINGLES COURT

Diagonal measurement of full court: 47 ft 2 in. Diagonal measurement of half court: 27 ft 9½ in. (from post to back boundary line).

high and deep clears, designed to fall almost vertically on the back line, to very close and delicate net shots. Prominent strokes include the smash, which can well exceed an initial velocity of 60 m.p.h., and drop shots, hit from any part of the court, which fall just over the net. All strokes have to be made on the volley, and this fact makes the game an exhausting one, for shots have to be hit from overhead, as for instance with the smash and most clears, as well as from just off the floor. Great accuracy is necessary for success, and wrist power rather than arm power is the main impelling force.

The doubles and men's singles game consists of 15 or 21 points, though 21 is now rarely resorted to. Only the server, or in doubles the serving side, may add to his score, so that a game may frequently consist of 50 or 60 rallies before one side

has reached the score of 15. It having been decided by toss which side shall commence serving, the first service is hit from the right service court to the diagonally opposite service court; server and receiver must stand in their service courts without moving until the shuttle is served. Thereafter there are no restrictions on any player in so far as court position is concerned.

If the server, or serving side, wins the first rally, the same server will continue to serve, but from the left service court to the diagonally opposite service court, and so on until he loses a rally. Whenever the server, or his side, wins a rally he will advance his score by 1 point; if he loses a rally the score remains static, but the service changes as previously stated.

In doubles each partner has a 'hand,' by which is meant the right to serve

consecutively. Upon winning a rally, the server and his partner change sides so that the service is alternately delivered from each service court. When the server loses his 'hand,' the players do not change sides. At the beginning of each game the serving side has only 1 'hand,' and the winner of the previous game will always serve first in the succeeding game. A match is the best of 3 games, and the players change ends at the commencement of a new game, and also when the leading side's score reaches 8 in the third, or final, game.

When the score reaches 13-all, the side which first reached 13 has the option of 'setting' the game to 5 additional points, or of adhering to the original 15. If 'setting' is chosen, then the score is called 'love-all' and the side which first reaches 5 wins the game. At 14-all the game may be similarly 'set' to 3 points.

In ladies' singles the game consists only of 11 points; ends are changed at 6 in the final game, and the score may be 'set' to 3 at 9-all, or to 2 at 10-all.

Throughout a rally it is a fault if (a), in serving, the shuttle be hit when it is higher than the server's waist or if any part of the head of the racket be higher than any part of the hand holding the racket; (b) if, in serving, the shuttle falls outside the confines of the diagonally opposite service court; (c) if the server's feet or the receiver's feet are not both stationary and within the confines of the appropriate service court; (d) if before or during the delivery of the service either player makes preliminary feints; (e) if, when in play, the shuttle falls outside the boundaries of the court, fails to pass the net or hits the person of any player; (f) if the shuttle be not cleanly hit, be hit twice in succession by the same player or his partner, or if it be struck with the frame, shaft, or handle of the racket. There are also other infringements, such as invasion of opponent's court and obstruction of an opponent. See Sir George Thomas, *The Art of Badminton*, 1931; N. Radford, *Badminton*; K. R. Davidson and L. R. Gustavson, *Winning Badminton*, 1936; J. F. Devlin, *Badminton for All*, 1936; Betty Ueber, *That Badminton Racket*, 1950.

Badoc, tn of Luzon, Philippine Is., in the prov. of Ilocos Norte and about 20 m. SW. of Laoag. Pop. 13,573.

Badoglio, Pietro (1871-1956), It. marshal, Marquess of Sabotino and Duke of Addis Ababa, b. Sicily. He served in Tripoli in the Italo-Turkish war. In the First World War he commanded a corps at Caporetto (q.v.) and took a leading part in reducing the stronghold of Gorizia (q.v.). B. was Governor-General of Libya, 1928-33, and succeeded de Bono as Commander-in-Chief of the It. Army invading Abyssinia late in 1935, bringing the war to a successful conclusion in the spring of 1936. Later he was Viceroy of Abyssinia, but resigned and was given a dukedom. In Dec. 1940, during the Italo-Gk war, he was dismissed from his post as chief of the general staff. On the fall of Mussolini he became Prime

Minister (July 1943) and subsequently signed an armistice with the Allies. He resigned in June 1944 and was expelled from the Senate in 1946 because of his help to Fascism in the past.

Badrinath, group of mts in the Garhwal Himalaya; highest peak, 23,420 ft. Its glaciers are regarded by Hindus as the source of the holy R. Ganges, and as such it is visited annually by some 80,000 pilgrims. The vil. of Badrinath, with a famous temple and hot spring, stands at 10,000 ft on its E. flank.

Baacia, see BAEZA.

Baada, see BEDE.

Baedeker, Friedrich (1844-1925), Ger. publisher, son of Karl B. Became head of his father's business in 1878. Largely responsible for the accuracy in style of the famous B. guides, the scope of which he extended by embracing in them descriptions and information about countries outside Europe.

Baedeker, Karl (1801-59), Ger. publisher and writer, b. Essen, where his father carried on business as a bookseller. He started a bookshop at Coblenz (where he d.) in 1827. His fame rests chiefly upon his excellent series of guides. The first guide he pub. was a handbook on the Rhine. B. guides came to be considered the most reliable series in the market. They have been trans. into many languages, the first Eng. ed. appearing in 1861. The business was removed to Leipzig in 1872.

Baekeland, Leo Hendrik (1863-1944), Amer. chemist, b. Ghent, Belgium. Associate prof. of chem., univ. of Ghent, 1882-9, and later prof. of chem. and physics, Bruges. Went to U.S.A., 1889, and was afterwards engaged in chem. research. Collaborated in developing Townsend electrolytic cell for big power company, Niagara Falls. Member of Naval Consulting Board, 1915. Awarded Nichols medal of Amer. Chemical Society, 1909; John Scott medal, by Franklin Institute, 1910; Perkin medal for industrial chemical research, 1916; grand prize, Panama Pacific Exposition, 1915, and many others, in recognition of his work in organic chem., electrical insulation, and electrolysis. He was the inventor of the substance bakelite (q.v.) and held many patents in the U.S.A. and in other countries on the subjects of organic chem., electric insulation, synthetic resins, plastics, etc. He contributed to numerous pubs. on photo-chem., electro-chem., patent reform, and also on social and philosophic subjects.

Bael, or **Bhel** (*Aegle marmelos*), Indian tree prized for its fruit, which is of the orange order. The ripe fruit is agreeable, and the unripe fruit may be dried and used as an astringent. Yellow dye is derived from the rind.

Baena, Sp. tn in the prov. of Córdoba. It has a castle and ruined walls, and near by is a castle which belonged to Gonsalvo di Cordova (q.v.). There is an agric. trade. Pop. 18,000.

Baer, Karl Ernst von (1792-1876), Ger. zoologist, b. Plep in Estonia. His studies and researches in embryology

resulted in his discovery of the human ovum on which he wrote a treatise *Epistola de Ovi Mammalium et Hominis Genesi*. His next great work was his *History of the Evolution of Animals*. This book explodes the animalculist theory and proves that the Graafian follicles in the ovary are not eggs, but the real ovum is the spherical vesicle contained by them. He then traced the development of the fertilised egg and the order of the appearance of the organs of the body. B. was appointed librarian of the Academy of Sciences at St Petersburg in 1834. He made studies of the fish of the Baltic and Caspian seas. Towards the end of his life he pub. his autobiography. The work of B. influenced Huxley and Spencer, and he is regarded as the founder of comparative embryology.

Baerle, Caspar van, see BARLAEUS.

Baetis, one of the 3 provs. into which Augustus divided Hispania, the Sp. peninsula. The other 2 were Tarracensis and Lusitania. B., called after the R. Baetis (= Guadalquivir), was separated from Lusitania by the R. Anas (= Guadiana), and from Tarracensis by an imaginary line drawn from the Anas to the promontory Charidemus in the Mediterranean.

Baeyer, Johann Friedrich Wilhelm Adolph von (1835-1917), Ger. chemist, b. Berlin, d. Munich. Studied chem. and physics under Bunsen and Kekulé; prof. of chem. at Strasburg (1872). From 1875 he lectured at the univ. of Munich. He was awarded the Nobel prize in 1905. He was a leading authority on the chem. of indigo and made valuable contributions to the knowledge of theoretical chem. He was the inventor of aspirin (q.v.).

Baeza (Rom. *Baetica*; later *Bayesa*), Sp. tn in the prov. of Jaén. It was a flourishing city under the Moors, but was sacked in 1228 by the Castilians. There is a Gothic cathedral, and there are sev. other fine churches. B. had a univ. 1533-1807. Pop. 18,000.

Ba-Fan, see FANS.

Baffa, see BAFFO.

Baffin, William (1584-1622), Eng. explorer and navigator. Accompanied James Hall on a voyage in search of the NW. passage, when for the first recorded time long. at sea was determined by astronomical observation. In 1613 he commanded a whaling fleet to Greenland, and in 1615 he was the pilot of the *Discovery* under the leadership of Robert Bylot, when the bay now called by his name was discovered. He was killed at Kismis, near Ormuz, in 1622, whilst engaged in an Eng. expedition acting in conjunction with the Persians to drive the Portuguese out of the Persian Gulf.

Baffin Bay, sea passage extending between N. America and Greenland. It communicates with the Atlantic Ocean by Davis Strait and with the Arctic Ocean by Smith Sound and Lancaster Sound. It is about 800 m. long, with a mean breadth of 280 m. It was called after Wm Baffin (q.v.).

Baffin Island, lying W. of Greenland, called after Wm Baffin (q.v.). The coast is

mountainous and inhabited by Eskimoes. The interior is also mountainous, containing ice-caps and glaciers. Area 231,000 sq. m.

Baffo, or **Baffa** (a Venetian corruption of Paphos), seaport in the W. of Cyprus, an important tn in Rom. times (Acts xiii). See PAPHOS.

Bafulade, Fr. military station in the Sudan, on the R. Senegal, W. Africa. It has a large fort, and is of commercia importance. Pop. 1700.

Bagamoyo, seaport and trading settlement in Tanganyika Ter., lying in lat. 6° 26' S. and long. 38° 55' E., 36 m. to the NW. of Dar-es-Salaam. Prior to the construction of the railways B. was the chief starting point for the interior. It was once the centre of the Arab slave trade, since the suppression of which and the construction of railways it has been eclipsed by Dar-es-Salaam. Burton, Speke, Stanley, and other explorers took it as their starting point for the interior. It is the seat of a Rom. Catholic bishopric and there is a Fr. mission. In 1873 the remains of Livingstone were brought here by natives disguised as a bale of merchandise on account of the superstition of tribesmen whose ter. they traversed.

Baganda, see BUGANDA.

Bagaria, see BAGHERIA.

Bagasse (Fr.), sugar trash; crushed stalks of the cane after the juice has been expressed. Used as fuel.

Bagatelle (Fr., from It. *bagatella*, a trifle): 1. Thing of no importance.

2. Game, possibly derived from billiards. It is played with balls on a board or table varying in size from 6 ft by 1½ ft to 10 ft by 3 ft. The bed, either slate or wood, is covered with green cloth, and has at its upper end 9 numbered cups to receive the balls. Round the sides there is an indiarubber cushion. The balls used are 9 in number, generally 1 black, 4 red, and 4 white; the black ball is placed on a spot about 9 in. in front of the first hole, and at the player's end, about 18 in. up, there is a balk line, with another spot behind it from which to start play. These measurements vary with the size of the table. The balls are struck with a cue, as in billiards, and the object is to drive them into the holes, the black ball counting double. There are sev. forms of B., the most usual being: (a) Ordinary B. In this game each player sends all the balls up; no score is allowed until the black ball has been touched. (b) Fr. game. Two players, or 4 in partnerships, take part, playing alternately. The rules as to scoring vary slightly in different forms of this game. (c) Cannon game. This more resembles billiards, and may be played with either cups or pockets, or both. (d) Mississippi. Played with a bridge having 9 or more numbered arches (according to the size of the table), through which the balls must be played off the cushion.

Bagdad, or **Baghdad**: 1. One of the 14 provs. (*lieva*) of Iraq. The country is watered by the Euphrates and the Tigris, but the soil is, in general, poor and unproductive. There is a mixed pop. of

Turks, Arabs, Jews, Armenians, and Kurds numbering 800,000. Cap. Bagdad.

2. (Persian 'given by God') Cap. of Iraq. There was a tn near the site in Assyrian times and a settlement with this name when the Abbasid caliph Mansur built his new cap. on the W. bank of the Tigris, 762-6, and called it Mansuriya. As it was the cap. of the biggest empire of that time it grew quickly and before long the palaces of the caliphs and grandees were on the E. bank, the 2 parts of the city being joined by bridges of boats, 1, 2, and 3 at different times. At the height of its glory the total area was about 20 sq. m. including 22 ac. of cemeteries; in 1900 the total area was 737 ac. Hulagu captured the city in 1258, putting an end to the caliphate, and in 1393 Timut captured it. In the 16th cent. the Persians held it for a time and they and the Turks fought for it till the Ottoman Murad took it in 1638 and held it. In 1755 a Brit. trade agency was estab. there and the telegraph was introduced during the rule of the reforming governor, Midhat Pasha. B. was brought into world politics by the B. Railway (q.v.), which was begun at Haidar Pasha in 1871 and reached Konia in 1896, though through traffic to B. was not possible till 1940. The city built by Mansur has vanished entirely and few old buildings, which were built of brick, remain: part of the Mirjaniya mosque and college (14th cent.), the Mustansiriya college (13th cent.); it was used as a customs house but has now been repaired), the Aquliya mosque (13th cent.), and the minaret of al-Ghazi. In or near B. are some venerated shrines: Kadhmain, the burial place of 2 imams, the tomb of Aby Hanifa the jurist, and the shrine of Abd al-Qadir al-Jilani. Jews made pilgrimages to the tomb of Joshua. Midhat Pasha threw down the city wall but left two gates standing, and the remains of a late Abbasid palace still exist. B. has spread N. and S. and the new quarters are W. in their lay-out. Two steel bridges span the Tigris and a combined road and rail bridge is now in use. The bazaars in the old tn are crowded and picturesque and the new parts, built about 1920 to replace what was destroyed by a fire, are a testimony to the skill and taste of modern workmen. Pop. 550,000, Arabs, Persians, Armenians, Kurds, and Christians; most of the Jews have left. See G. Le Strange, *Baghdad during the Abbasid Caliphate*, 1924.

Bagdad Pact, defensive and economic pact, so-called because it was first signed at Bagdad between Turkey and Iraq in Feb. 1955. Subsequently Britain (April), Pakistan (Sept.), and Persia (Nov.) signed the B. P. Its existence provided a centre of relative stability in the Middle E. and Britain's adherence is notable. But it aroused the hostility of the more militant members of the Arab League, and attempts to secure Jordan's adherence resulted in riots in Amman which heralded the downfall of Brit. influence there. After Anglo-Fr. intervention in Suez, the Moslem members of the pact met without Britain: but by

1957 there were signs that Brit. active participation in the pact was again being considered by them. The United States had throughout refused to join the B. P., though expressing interest.

Bagdad Railway. The B. R. or Euphrates Valley Railway was a scheme for a line from Konia, in Anatolia, to Bagdad and thence to Basra on the Persian Gulf. Although by an agreement of 1903 the line, then only just begun, had been placed under international control, Germany aimed to use it as an instrument to destroy the value of the Suez Canal and assist German domination of the Middle E. This ambition was frustrated by the events of the First World War. The lines then built by the Brit. Army in Mesopotamia formed the basis of the present Iraqi State Railways which in 1940 were connected with those of Syria, following the intended route of the B. R. and realising at last the object of the promoters of that project to establish through communication by rail between Europe and the Persian Gulf.

Bagé, city in S. state of Rio Grande do Sul, Brazil, on the R. Negro, a trib. of the Paraguay. A centre for live-stock raising. Pop. 35,340.

Bagshot, Walter (1826-77), journalist, economist, and political writer. He was the son of a banker at Langport, Somerset, took his degree at London Univ., and was called to the Bar in 1852, but gave up law for literature, while retaining for many years a close connection with banking, which gave practical value to his economic studies. In 1858 he married Miss Wilson, daughter of the first editor of the *Economist*. Being in touch with many leaders in political and commercial life, including Gladstone, Sir George Cornewall Lewis, Robert Lowe, and prominent city bankers and merchants, he was able to write on politics and finance as one acquainted with their innermost working. His books, *The English Constitution* and *Lombard Street*, show not only observation, but deep research into the principles of gov. and finance. The theory of a practical banking reserve is developed by him with great clearness. His *Physics and Politics*, pub. in 1869, was successful abroad as well as at home. He was for many years editor of the *Economist*, and also helped to edit the *National Review*. He pub. his *Postulates of Political Economy* in 1876. His *Literary Studies and Economic Studies* were pub. after his death. See lives by Mrs Russell Barrington, 1914, and Wm Irvine, 1939.

Bagenaltown, see MUINE BHEAG.

Bagford, John (1650-1716), collector of rare books, both on his own account and on commission for booksellers and amateurs. He was b. in St Anne's par., Blackfriars, and began life as a shoemaker. He formed 2 collections, known as the Bagford Ballads, in which many old Eng. ditties have been rescued from oblivion, and the Bagford Fragments, an 'enormous collection of title-pages and other fragments in 64 vols. folio,' which earned him the description of 'shoemaker and biblioclast.' Apparently they were intended as materials for a hist. of printing. They

came to the Brit. Museum among the Harleian MSS. The Bagford Ballads were pub. in 1878 (ed. by Ebbsworth). B. was one of the revivers of the Society of Antiquaries. See Arundell Esdaile, *The British Museum Library*, 1946.

Baggaras, Muslim race of Bedouins, closely related to the Shuwa, who live in the valley of the Nile. Their chief occupation is cattle-rearing.

Paul Popper

BAGGARA

Baggesen, Jens Immanuel (1764-1826), Dan. poet, b. Korsør, d. Hamburg. While a student at Copenhagen he pub. his first work in verse, *Koniske Fortællinger*, 1785. In 1811 he was appointed prof. of Dan. language and literature at Kiel, but after 3 years returned to Copenhagen. He quarrelled with the romantic poet Øhlenschläger, and in 1820 left Denmark for good. He wrote much in German as well as in Danish. His works include the travel book *Labyrinthen*, 1792, and *Parthenis oder die Alpenreise*, an epic idyll, 1804. B. excelled in serio-comic satire. His *Samlede Vaerker* were pub. in 12 vols., 1827-32. See A. Baggesen, *Baggesen Biografi* (4 vols.), 1843-56, and C. E. Hesse, *Baggesen und die deutsche Philosphie*, 1914.

Baghdad, see BAGDAD.

Bagheria, tn in Sicily (q.v.), 8 m. ESE. of Palermo (q.v.). It has many fine 17th and 18th-cent. villas. Pop. 30,400.

Bagimond's Roll, originally named from Bolamund or Bagimond of Vici, or Vitia, who was sent by Pope Gregory X to assess the church revenues of Scotland for the purpose of raising a crusading fund, AD 1274. Part of this return has been preserved, and is known as B. R.

Bagirmi, or **Baghermi**, Moslem kingdom of W. Africa, lying SE. of Lake Chad. It is a Fr. possession. The people are of negroid race and number about 150,000. The cap. is Massenia.

Bagnacavallo (ancient Tiberiacum), It. tn, in Emilia-Romagna (q.v.), 11 m. W. of Ravenna (q.v.). Pop. 15,000.

Bagnacavallo, Bartolommeo (1484-1542), or **Ramenghi**, It. painter, b. Bagnacavallo. He studied under Francia, then worked for Raphael in Rome. He subsequently became eminent at Bologna, and was admired by Guido Reni and the Carracci, though Vasari (see *Lives of the Painters*) is severely critical of him. His prin. work at Bologna, 'The Disputation of St Augustine', was avowedly founded on Raphael's 'School of Athens.'

Bagnalstown, see MUINE BHEAG.

Bagnères-de-Bigorre (Rom. **Vicus Aquensis** or **Aquae Bigerrorum**), Fr. spa, cap. of an arron., in the dept of Hautes-Pyrénées, on the Adour. It has marble and slate quarries, textile manufs., and is a winter sports centre. Pop. 9900.

Bagnères-de-Luchon (Rom. **Balneariae Lixovienses**), Fr. spa in the dept of Haute-Garonne. It is a fashionable resort, and a centre for winter sports. Pop. 4100.

Bagnes (It. *bagno*), name given to the Fr. convict prisons which were substituted for the galleys in 1748. As the latter had naturally been stationed at the naval ports and arsenals, the B. were estab. in the same localities, and remained until the middle of the 19th cent. About 1852 the last 3, at Brost, Rochefort, and Toulon, were closed, and convicts were deported to Cayenne. The miseries of prisoners in the B., like those of galley-slaves, were extreme, and have often been described by writers of fiction. Jean Valjean, in Hugo's *Les Misérables*, was a sufferer there.

Bagnes, Val de, valley in the W. of Switzerland, canton of Valais. Its lower end opens into the valley of the Rhône, near Martigny. A catastrophe occurred here in 1818: the R. Dranse was for 2 months blocked by falls from the Grotto glacier; when the ice-dam burst the valley was devastated by a flood 90 ft deep.

Bagni di Lucca, It. spa, in Tuscany (q.v.), about 12 m. NE. of Lucca (q.v.). It is made up of sev. vills. in the Lima valley, and its hot mineral springs (temp. 98°-130° F.) have been known since early times; they were made popular by Falloppio (q.v.) in the 16th cent. Pop. 14,000.

Bagni di San Giuliano, see SAN GIULIANO TERME.

Bagno a Ripoli, It. tn, in Tuscany (q.v.). It is a SE. suburb of Florence (q.v.), and has warm baths. Pop. 19,000.

Bagno di Romagna, It. tn, in Emilia-Romagna (q.v.), 19 m. S. of Forlì (q.v.). It is in the Savio valley, near the source of the riv., and has hot springs. Pop. 10,600.

Bagnold, Enid, Brit. novelist, educ. at Godalming and in Paris. In the First World War she served as a V.A.D. and later with the F.A.N.Y. attached to the Fr. Army. Her war experiences are told of in *A Diary Without Dates*, 1917, and *The Happy Foreigner*, 1920. In 1925 she pub. *Serena Blandish*, and in 1935 her best-known novel, *National Velvet*, the story of a racehorse. *Sailing Ships*, 1918, is a vol. of poems. In 1920 she married Sir Roderick Jones, the prin. proprietor

of Reuters. Her play, *The Chalk Garden*, proved a great success when produced in London in 1956, and also on Broadway.

Bagnoles-de-l'Orne, Fr. spa in the dept of Orne. It is in the valley of the Vée on a lake. Pop. 730.

Bagnolet, E. suburb of Paris, known for its 'Plaster of Paris' (q.v.) made from local gypsum. It has textile and other manufs. Pop. 25,000.

Bagnols(-les-Bains), Fr. vil. in the dept of Lozère, on the Lot. It has sulphur springs. Pop. 320.

Bagnols-sur-Cèze, Fr. tn in the dept of Gard. It is thought that there were baths here in Rom. times. Wines and silk are produced, and there are nurseries. Pop. 5200.

Bagnone, It. tn, in Tuscany (q.v.), lying in the Magra valley, 17 m. NNW. of Carrara (q.v.). Pop. 1500.

Bagos, name often given to eunuchs. The best known of these (called by Josephus, Bagoses) attained great power under Artaxerxes III, whom he poisoned. He also poisoned the son of Artaxerxes, who had succeeded him, and then tried to poison Darius III, but the king was warned, and made Bagoses drink the poison himself. See Josephus, *Ant.* xi. 7; Diodorus, xvi. 50, 51; xvii. 5.

Bagot, Sir Charles (1781-1843), Eng. diplomatist and thirty-fourth Governor-General of Canada. He negotiated the Rush-Bagot treaty (1817), which is still in force, between Great Britain and the U.S.A., limiting the armaments of each country on the Great Lakes. Was ambas. at St Petersburg in 1825 when the agreement with Russia was signed defining the NW. boundary of Brit. N. America. Though his tenure as Governor-General of Canada (1842-3) was brief, his administration prepared Canada for the self-gov. which she received not long afterwards from Lord Elgin (1847-54). This B. achieved by forming a dual administration of the two sections of the country, Upper and Lower Canada, a div. which was retained until the Confederation (1867). It was on B.'s initiative that the geographical survey of Canada was begun in 1843. He d. at Kingston, Ontario.

Bagpipe, musical instrument, being a development from the primitive reed-pipe. Its characteristics are the bag for the wind-supply and the peculiar 'drone' which furnishes the ground bass. The former may be inflated either by a blow-pipe, as in the Highland B., or by a bellows worked by the arm, as in the musette (French) and the Northumbrian pipes. Every instrument has these prin. parts: (1) the wind-bag; (2) the chanter, or melody-pipe, which always has a double reed, and lateral holes for fingering; (3) the drones, each of which has one invariable sound, but can be tuned by means of sliding joints. The compass of the chanter ranges from 9 notes in the Highland pipes to 12 in the Irish and 15 in the Northumbrian. The musette, as improved by Hotteterre in the 17th cent., had a wider range, and was popular in France, being played at court and in the opera; Lully wrote music for it. In a

Highland pipe the notes of the chanter do not correspond with those of the diatonic scale, and are not strictly in tune. The same note cannot easily be repeated without the interpolation of grace notes, known as warblers; these, introduced to overcome a difficulty, form one of the chief beauties in pipe-music, 'brilliance in his warblers' being one of the distinguishing marks of a skilful player.

'The key of the Highland pipe is that of A major with a natural G and with the C and the F something between the sharp and the natural—a unique scale, but one with some similarities to certain scales of the Near East' (Scholes). (The normal key of the Northumbrian pipe is G and it has usually 4 drones tuned to G and D.) The B. is suitable both for solemn funeral marches and laments and for the liveliest dances. As for its antiquity, a drone-pipe with reed complete has been found in an Egyptian mummy-case. The Romans had pipes and introduced them into S. Britain, whence they spread into Caledonia and Ireland, and survived there after they died out in England S. of Northumberland. They are mentioned in Ireland as early as (possibly) the 5th cent. The modern Irish 'union-pipe,' like the musette, is blown by bellows worked by the arm. The old Ger. *Dudelsack* was made in sev. forms varying in their range: one is said to have had separate chanters, on which a two-part melody could be played. See also Pibroch.

BAGPIPES

Above, Scottish. Below, Northumbrian.

Bagradas, anct name of the Medjerdah or Mejrda, African riv., which rises in the Great Atlas and flows in a NE. direction into the Gulf of Tunis. Its length is nearly 300 m.

Bagratidae, royal dynasty in Armenia and Georgia. They ruled in Armenia, 885-1045, then in Georgia until its annexation by Russia in 1800.

Bagration, Peter Ivanovitch, Prince (1765-1812), Russian general, descended from the Georgian branch of the Bagratidae. In 1805, covering the retreat of Kutusov's army before superior numbers under Murat, he showed skill and courage, losing half his men, but saving the main army. He served in sev. lost battles, Austerlitz, 1805, Eylau, and Friedland, 1807, but always won personal distinction. When Napoleon invaded Russia in 1812 B. commanded the 2nd Russian Army. As before he was unsuccessful, being beaten by Davout at Moghilev, 23 July, but succeeded in rejoining the main force under Barclay. On 7 Sept. he was mortally wounded at Borodino.

Bagshot Sand, or Beds, part of the Upper Eocene strata found round London, especially in Surrey, and stretching as far S. as the Isle of Wight. The heaths of Surrey and Hants belong to this formation.

Bagster, Samuel (1772-1851), publisher. He began as a bookseller in the Strand in 1794, and in 1816 removed to Paternoster Row. The firm which he founded is famous for its eds. of polyglot Bibles, including the *Biblia Sacra Polyglotta Bagsteriana*, 1817-28, for an octoglot ed. of the Church of England liturgy, 1821, and for *The English Hexapla*, 1827.

Bagulo, summer cap. of the Philippine Is., and cap. of Benguet prov. It is picturesquely situated in the mt dist., Luzon, a dist. which includes what were formerly known as the B. and Suyoc mineral dists. The tn is built at a high elevation and in the vicinity of splendid pine-woods. It suffered great damage in the Second World War. Pop. 29,262.

Bahá'í, believer in a religion founded in the Middle E. during the 19th cent. The Bahá'í Faith claims that it incorporates what is best in all religions. Twenty thousand martyrs have given their lives rather than deny it. It has 3 central figures. The forerunner was Ali Mohammed, born at Shiráz in 1819, who adopted the title *El Báb*, meaning the Gate, when he declared in 1844 that he was the 'Mihdí' or 'Qá'im' promised in the Qur'án to save the nations. Orthodox Muslims and the Persian State conspired to overthrow him, so that he spent most of his teaching life in prison, his followers zealously carrying on his work of proselytizing in the face of fierce persecution. He was finally shot publicly at Tabriz in 1850. The body was recovered by his followers and hidden for 50 years in various places, eventually being enshrined on Mt Carmel, the chief centre of Bahá'í pilgrimage. In 1863 Husayn 'Ali, a Persian nobleman who took the name Bahá'u'lláh, meaning 'The Glory of God,' announced himself to be the One foretold not only by the Báb, but in the holy books of all religions, who will inaugurate an era of peace and spiritual well-being for mankind. As a

Báb, he had already been deprived of his considerable possessions and banished to Bagdad; banishment to Constantinople, Adrianople, and the prison city of Acre followed. His writings include Kitáb-i-Aqdas, Kitáb-i-Iqan, and many letters, including proclamation of his claim to the chief sovereignty of the world, among them Queen Victoria. On his death in 1892, leadership passed to his eldest son, 'Abdu'l-Bahá, the exemplar of the Bahá'í Faith, who had shared his father's imprisonment since childhood. He was freed by the Turkish revolution of 1908 and made an extended tour of Europe and America in 1911-13. He was knighted in 1920 for the part he played in averting famine in Haifa during the war, and d. in 1921. His will appointed as guardian of the cause his grandson Shoghi Effendi (q.v.), then studying at Balliol College, Oxford, under whose guidance the administrative order of the Bahá'í Faith developed. The Bahá'í Faith is based on a belief in successive progressive revelations of God, none of which is final. Thus Mohammed was a great prophet and his doctrines were revealed, but neither his revelation nor that of Bahá'u'lláh precludes God from revealing himself further in future ages. The morality of the Bahá'í Faith is high. The individual soul continues to exist after separation from the body and may draw ever nearer to God throughout eternity. The Bahá'í Faith claims to restore to mankind the power to achieve unity through love. The troubles of the present age are but a prelude to the necessary and inevitable unification of the human race. All prejudice, particularly of race, colour, class, or creed, is condemned; compulsory education, abolition of extremes of poverty and wealth, equal status for men and women are among its social teachings. It prohibits slavery, asceticism, mendicancy, and monasticism, prescribes monogamy, discourages, but does not prohibit, divorce. A universal auxiliary language is advocated and collective security urged as a step towards a world commonwealth. The Bahá'í Faith now has several hundred thousand adherents drawn from every important religion in every country outside the Soviet orbit.

Bahamas, formerly *Lucayos*, archipelago of is., cays, and rocks, lying between 20° 50' and 27° 37' N. lat. and 72° 37' and 80° 32' W. long., and extending from Inagua on the S. to Matanilla Reef on the N., from Mayaguana and its rocks and cays on the E. to (and including) the Cay Sal Bank on the W. The B. are separated from Florida to the W. by the Straits of Florida, and from Cuba to the S. by the Old Bahama and Nicholas Channels. The B. comprise nearly 700 is. and more than 2000 cays and rocks. The aggregate land surface of the group is 4375 sq. m., which is slightly less than that of Jamaica, the largest of the Brit. W. Indian Is. The most important is., though not one of the larger is., is New Providence, which contains the cap., Nassau (q.v.), the chief port, inhabited by more than one-quarter of the total pop. of the Colony. The is.

is about 21 m. long from E. to W. and 7 m. in breadth from N. to S.

Climate. The winter climate of the B. is most delightful. Frost is unknown, the average temp. is about 70° F., the rainfall is slight and cool breezes prevail. The rainy months are May, June, Sept., and Oct. Rainfall is about 40 in. per annum. The greatest heat is experienced during July, Aug., and Sept., the temp. ranging from 80° to 90° F.

History. The B. were visited by Columbus in 1492, and he stated that the group of is. was called Lucayos, implying that the name was Indian or Arawak. While it has never been finally settled whether Watling Is. was his first landfall in Amer. waters, most authorities are agreed that it was on this is.—which Columbus named San Salvador and the Indians Guanahani—that he landed. Others think the honour belongs to Cat Is., and yet others say Great Turk Is. But Watling Is. won the official sanction of the Bahamian Legislature in 1926. A few years after Columbus landed, all the Carib inhab. were transported to work in the mines of Cuba. It does not appear that the Spaniards had any settlements on any of the is. at any time. Early in the 17th cent. the is. were well known to the settlers in Bermuda. They were included in the royal grant to Sir Robert Heath, the attorney-general of England, of 30 Oct. 1629. The Co. of Eleutherian Adventurers was formed in London under the aegis of Wm Sayle, a former Governor of Bermuda, for the purpose of making a systematic colonisation of the is., but Charles II, ignoring previous titles, granted the land, in 1670, to 6 of the lords proprietors of Carolina. Before this grant, however, the inhab. had organised a settlement and instituted a form of gov. which included an elective House of Assembly, and had selected Capt. John Wentworth as their governor (1671). He was confirmed in office by the lords proprietors. Thirteen proprietary governors were appointed between 1671 and 1715. The settlement on New Providence was sacked by the Spaniards on sev. occasions between 1680 and 1684. In 1684 most of the inhab. were driven away, and it was not until 1688 that the settlement was re-formed under Thomas Bridges with settlers from Jamaica. Bridges became governor, and the settlement developed promisingly until, in 1703, it was practically annihilated by the French and Spaniards. A year or two later, however, the dispersed inhab. returned to New Providence, and another proprietary governor was appointed in 1707. But the is. then became a regular resort of pirates, and this determined the Crown to place it under a civil and military gov. Since 1717 there has been a regular succession of royal governors. The is. were surrendered to a fleet of the Amer. rebels in 1776, and again to the Spaniards in 1781, but they had been retaken by the British before the end of the war, and the Peace of Versailles (1783) confirmed the British in possession. In 1787 the lords proprietors surrendered

all their proprietary rights to the king for £12,000, which was provided by Parliament. During the Amer. Civil War Nassau became the H.Q. of the blockade runners and enjoyed a rapid prosperity, the total value of trade, which was under £500,000 in value in 1860, rising to £10,000,000 in the 4 years 1860-4. A rather similar state of affairs prevailed 60 years later when the B. carried on a roaring trade during the period of prohibition in U.S.A. That the revenue of the B. was converted in 1920 from a threatened deficit to a surplus was entirely due to wine and spirit duties.

Occupations. The total of arable land at present cultivated in the B. is estimated at 30,300 ac. The total area of forest land is approximately 800,000 ac. Agric. production is mainly in the hands of individuals, but there are a few holdings on plantation scale. The prin. crops for local consumption and export are seasonal vegetables such as cabbages, beets, carrots, spinach, peas, beans. Onions, tomatoes, pineapples, citrus fruits, and bananas are grown but not as yet in sufficient quantities for export. Crawfish valued at £160,847 (13,536 cwt.) were exported in 1955, mainly to the U.S. Sponge fishing is not now of importance. In 1955 there were 3640 horses; 3480 horned cattle; 22,280 sheep; 14,250 goats; 10,360 pigs; and 506,500 head of poultry.

Two petroleum companies hold oil exploration licences granted by the Petroleum Board. No field work was done by the companies during the year 1955, but interest has revived. Timber is an important industry. The yellow pine (*Pinus caribea*) is commercially exploited. Of 650,000 ac. of pine forest owned by the Crown, 390,000 ac. are exploitable; the balance is inaccessible. A further 50,000 ac. which are freehold are 75 per cent exploitable. Of 100,000 ac. of broadleaf forest an estimated 70 per cent is exploitable. In 1955, 9,831,704 board ft of yellow pine were exported from Grand B.; 5,343,708 board ft from Andros. A further 10,735 cub. fathoms of pit-props were also exported. Exports in 1955 were 11,617 cub. fathoms of pit-props valued at £186,962 and 7,045,000 ft of pine valued at £264,795.

The tourist industry is the most important source of revenue to the B. and is increasing in volume. Arrivals in 1953 were 99,867, as against 118,481 in 1954, and 142,689 in 1955. Most of this trade originates in the U.S. and Canada. A great deal is being done to improve and extend the existing facilities for tourists. In 1955 new hotels were being built and a yacht harbour had been approved by the Legislature in the S. part of New Providence where a large area is to be systematically developed (capital is being provided from U.S. sources). In the industrial field the development of a free port in the is. of Grand B. may offer great opportunities for employment. Financed by U.S. capital, the scheme envisages the construction of a deep-water harbour at Hawksbill Creek, Grand B. The Free Port Authority has acquired 50,000 ac.

for development and zoned areas have been demarcated and a town-planning scheme approved.

Education. Primary education is free for persons unable to pay. The statutory leaving age is 14 and in 1955 the Board of Education spent £295,394 on primary education. There are 105 board schools, with a roll of 16,258 children in 1955. Another 3962 children attended 80 private and denominational schools. The gov. high school (1955) had a roll of 209 and 5 private and denominational schools 607. In 1950 a teachers' training college was estab.

Health. Malaria is unknown and the health services are of a high standard. Birth-rate per 1000 (1955) was 34.8; death-rate per 1000, 11.3; infant mortality rate (death under 1 year) per 1000 live births, 82.0.

Imports and Exports

Imports (total):		
1953	1954	1955
£8,797,396	£9,404,103	£10,859,926
Exports (total):		
1953	1954	1955
£1,045,260	£956,902	£757,253

Food-stuffs, beverages, apparel, boots and shoes, motor-cars and trucks, petrol and oil, and cement were the main items of imports by volume and value. The chief exports by value were lumber and pit-props, crawfish, salt, and tomatoes. Imports from the U.K. (1955) totalled £2,390,876, the next most important supplier being Canada, £869,084, followed by Aruba, £555,639. Exports were mainly to neighbouring is. and to the U.S., £245,399, and U.K. £174,926 (1955).

Administration. The gov. is modelled on that of England, the governor representing the Sovereign and the nominated Legislative Council and the elected House of Assembly representing respectively the House of Lords and the House of Commons. The 'Eleutherian Adventurers,' who came to the B. from Bermuda after the Parl. grant of 1647, brought with them a conception of representative gov. already estab. in Bermuda. A charter of 1670 to the Lords Proprietors provided for an elected House of Assembly, and the constitution, such as it exists to-day, was finally settled in 1729 when the Crown assumed direct control of the Colony. The present gov. is representative, though not responsible. The executive gov. is vested in the governor who is appointed by the Crown, and he has the right of veto, but by convention acts on the advice of the Executive Council. The Legislative Council consists of 9 members nominated by the Crown, and was created a separate council by Royal Letters Patent in 1841. The House of Assembly is composed of 29 members elected for 15 dists. Women are not enfranchised. No forms of local gov. exist.

Justice. The law of the Colony is the common law of England as it existed at the time of the settlement of the Colony subject to the exceptions mentioned in the Declaratory Act (Chap. 7 Statutes,

revised ed., 1929); Statutes of the Imperial Parliament; Statutes of the Colonial Legislature. The Supreme Court sits in Nassau, having the jurisdiction of a High Court of England, and is presided over by the Chief Justice. Appeal in civil matters lies from the Supreme Court to the Privy Council.

Currency and Banking. Brit. sterling is the official currency but silver coins used in the U.K. are legal tender only up to 40s. There are local notes of 4s., 10s., £1, and £5 denominations. U.S. and Canadian currency is freely in circulation but residents must surrender this currency to authorised dealers. There are 2 overseas banks in Nassau, one British and one Canadian. The totals of revenue and expenditure during the years 1955-5 were:

	Revenue	Expenditure
1953	£2,610,678	£2,712,272
1954	£3,095,541	£3,006,515
1955	£3,507,953	£3,188,617

The main source of revenue from taxation was customs receipts, which were £2,024,502 in 1955.

Communications. The B. are in direct steamship communication with the U.K., Canada, the U.S.A., the W. Indies, S. America, and New Zealand. There are no railways in the Colony. All main roads and most of the secondary roads in New Providence are asphalted. Of the 205 m. in the Colony, 112 m. are asphalted. Oakes Airport in Nassau is an international airfield from which sev. international airlines operate.

Population. The estimated pop. in Dec. 1955 was 98,500, made up approximately of European, 10,800; African, 72,000; mixed, 12,500; others, 3200. See *Colonial Office Annual Reports*, and T. A. Thompson, *A Short Geography of the Bahamas*, Nassau, 1944.

Bahawalpur, tn, and former State, of W. Pakistan, lying on the railway between Karachi and Lahore. B. is a centre of new and expanding industry; cotton factories are being built and Lever Bros have installed a soap factory.

Bahia, see BAHIA.

Bahia Blanca, rail centre, 3 m. up the R. Napostá, prov. of Buenos Aires, Argentina, 350 m. from cap. Its port on Bahia Bay has been handicapped by a shallow channel, but dredging operations are expected to maintain a minimum draught of 30 ft. B. B. was founded in 1828; its prosperity dates from 1885, when the first railway was opened. It exports wheat, wool, meat, and hides. The naval station of Puerto Militar lies below the city. Pop. 93,122. See A. H. Coleman, *Mi vida de ferroviario inglés en la Argentina 1887-1948*, 1949.

Bahia de Todos los Santos, see ALL SAINTS' BAY.

Bahinda Steppe, see BAYIDA.

Bahr, Arabic term meaning sea, or large riv., as B.-el-Abiad and B.-el-Azrek, the White and Blue Nile. A dry riv.-bed is sometimes called B.

Bahr, Hermann (1863-1934), Austrian novelist, critic, and dramatist, b. Linz,

He is remarkable for his versatility. He wrote on naturalism in 1891 and on expressionism in 1914, passing through impressionism and symbolism. His best plays include *Der Meister*, 1903, and *Das Konzert*, 1909; his novels *Die Rahl*, 1908, and *Himmelfahrt*, 1916. He was also for a time manager of Reinhardt's Deutsches Theater and of the Vienna Burg Theater. See W. Handl, *Hermann Bahr*, 1913.

Bahram, or Vahram, name of 5 Persian monarchs of the Sasanid dynasty. They were B. I (AD 273-6), during whose reign the execution of Mani, founder of the Manichaeans (q.v.), took place; B. II (276-93), son of the foregoing; and B. III (293), son of B. II, who reigned for only a few months. War with Rome broke out under B. II and was concluded by the peace of 283, by which Armenia and Mesopotamia went to Rome; B. IV (388-399), son of Shapur III; and B. V (420-438 or 439), son of Yazdgerd I. B. V was a notorious persecutor of the Christians, a policy which involved him in war with Rome; by the treaty of peace concluded in 422, mutual toleration was extended to both Christians and Zoroastrians.

Bahramabad, see KAFSENJAN.

Bahr-bela-Ma (the waterless sea), valley in the Libyan desert, 50 m. W. of Cairo. It is 9 m. long, very deep, and dry and barren, but has been a watercourse. Some assert, on the strength of a passage in Herodotus, that a branch of the Nile once flowed here.

Bahrain, independent Arab state under Brit. protection. The ruling family came from near Koweit in 1782 and took B. from the Persians; hence the frequent claims of Persia to the is. It was in treaty relations with the Gov. of India for over a cent. It is a group of is. half-way up the Persian Gulf near the Arab coast (Al Hasa) and having a combined area of 213 sq. m. and a Muslim pop. of about 150,000. Manama, or B., the largest is. of the group, lies at the mouth of B. Bay; it is 27 m. long by 10 m. wide, flat on the whole, but having in its centre a rocky hill, Jebel Dukhan. The chief tn of B. is Manama (pop. 25,000). The next largest are Muharraq or Moharek, situated on a neighbouring smaller is., and Sitrah. The whole group is fertile, producing rice, herbs, and fruit; fish are abundant, and the pearl fisheries of B. have been famous for cents. The Bahrain (Brit.) Petroleum Co. have held a concession from the gov. since 1930 and have an oil refinery at Manama. The yield is over 1,000,000 tons (metric) a year. The ruler is a sheikh, to whom is attached a Brit. adviser and a Brit. political agent. On B. itself there is an immense collection of huge sepulchral tumuli, enclosing tombs of limestone; the plan of them is very like that of Phoenician tombs. Religion, Muslim. The pop. of the is., numbering altogether 120,000, are a mixed race, mainly Persian and Arab.

Bahrain Bay, on the E. coast of Arabia, noted for its pearl fisheries.

Bahr-el-Abiad, or White Nile, riv. in

Africa, rising in Lake Victoria, one of the chief branches of the main Nile R. It flows through about 2300 m. of flat marshy country, and is fed by the trib. rivs. Sobat on the E. and Bahr-el-Ghazal on the W. At Jinja the Owen Falls hydro-electric scheme was opened by Queen Elizabeth II in April 1954. Egypt's ability to maintain the mass of her people at subsistence level largely depends on the uninterrupted flow of the White Nile.

Bahr-el-Azrek, or Blue Nile, African riv. rising near Tana (or Tsana) in Ethiopia, at an elevation of 7000 ft. It unites with the White Nile, Bahr-el-Abiad, at Khartoum. Its length is about 900 m., 500 m. of which are navigable at high water. In Ethiopia it is called Abai. In ancient times the Blue Nile was temporarily diverted by the Ethiopians, thus causing great distress and alarm in Egypt, which derives the greater part of its vital Nile waters from the Blue Nile during part of the year. The Blue Nile is a weapon of immense strategic importance in the hands of Ethiopia and is the historical cause of Egyptian aspirations in respect of Ethiopia.

Bahr-el-Ghazal: 1. Trib. of the White Nile (or Bahr-el-Abiad), which it joins at Sobat. This riv. is responsible for the floating vegetation, called the *sudd* of the Nile. It gives its name to the dist. of Sudan through which it flows, formerly leased to the Congo Free State, but, since 1906, in the Brit. sphere of influence.

2. Riv. of the Sudan, which rises in the E. end of Lake Chad and flows in a N.E. direction, until it spreads into the lagoon of the Bodele.

Bai, Tommaso (1650-1714), It. tenor singer and composer, b. Crevalcore, near Bologna. He became master of the pontifical chapel. He is celebrated on account of his beautiful *Miserere*.

Baia (formerly *Bahia*), E. prov. of Brazil, state (since 1889) bounded on the N. by the states of Pernambuco and Piau, on the S. by Minas Geraes, on the W. by Goiás, and on the E. by the Atlantic Ocean. The land by the coast is fertile and woody, the climate being hot and moist. The interior is rocky, with plateaux rising in terraces, and the climate is dry. The country is watered by the R. São Francisco and its tribs. The prin. products of the soil are sugar, tobacco, coffee, cotton, Indian corn, rice, and cocoa. The SE. produces 95 per cent of Brazil's cacao crop. B. is a leading cattle-, sheep-, and hog-raising state, and yields most of Brazil's black industrial diamonds. Area 217,688 sq. m.; pop. (1950) 4,900,419.

Baia (Bahia), cap. of the state of B.; see of an archbishop, and a univ. tn, fourth largest city of Brazil. It is a hot, unhealthy port lying 750 m. to the N. of Rio, and is the oldest tn in Brazil. The upper and lower portions are connected by a celebrated lift system. As well as the univ. there are colonial and modern gov. buildings, a cathedral, and a monastery, Asã Bento; a normal school, a museum, and a public library. Seaport, with a flourishing shipping trade. There

is a fine harbour, protected by the natural breakwater formed between the is. Itarparica and the mainland. Industries are sugar refining, distilling, cotton-milling, cacao-processing, fruit-preserving, ship-building, boots and shoes, hats, and cotton materials, which are exported with agric. produce, hides, and jute-wares. The city was visited by Amerigo Vespucci, 1503, and again by Correa, a Portuguese, in 1510. It was colonised in 1536, but abandoned and refounded, 1549. Until 1763 it was the seat of the viceroys of Brazil, and it is one of the intellectual and economic centres of the country. Pop. (1950) 395,993.

Baiae, modern **Baia**, It. tn, in Campania (q.v.), on the Bay of Naples (q.v.), 10 m. W. of Naples. In Rom. times it was a watering-place, with warm sulphur springs; it had baths and palatial residences, and was a favourite resort of the Caesars. Nero built a villa here, and Hadrian d. in one that had belonged to Julius Caesar. B. had from early times a reputation for immorality; Cicero once apologised for defending a man who had lived there. The most notable relics of antiquity are the temples of Venus, Mercury, and Diana.

Baie des Chaleurs, see CHALEURS BAY. **Baiersbronn**, Ger. tn in the Land of Baden-Württemberg (q.v.), on the Murg, 42 m. SW. of Stuttgart (q.v.). It is a winter and health resort in the Black Forest (q.v.). Pop. 8100.

Baif (or **Bayl**), **Jean Antoine de** (1532-1592), Fr. poet, b. Venice. He studied with Ronsard under Daurat. He was a member of the Pléiade, and attempted to write Fr. verses with cadence and accent of Gk and Lat. poetry. These verses he set to music, and in 1561 pub. *Twelve Hymns or Spiritual Songs*, and in 1578 sev. books of songs. He founded an 'Académie de poésie et de musique,' 1567-84, in Paris, which was the first of its kind. His poems were pub. in 2 vols., *Oeuvres en rime* and *Les Jeux*, in 1573, and consist of serious, comic, and sacred pieces. His *Poésies choisies* have been ed. by Becq de Fouquières, 1874, and his *Mimes, enseignements et proverbes* by Blanchemain, 1880. See M. Augé-Chiquet, *La Vie, les idées et l'œuvre de Jean Antoine de Baif* (Paris), 1909.

Baikal, see BAYKAL.

Baikie, **William Balfour** (1824-64), explorer and naturalist, b. Kirkwall, Orkney. Obtaining his M.D. degree at Edinburgh in 1848, he became a surgeon in the R.N., and in 1854 was appointed surgeon and naturalist to the *Pleid* expedition, sent to explore the Niger. The chief officer dying, B. took command, and succeeded in going 250 m. further than any previous explorer, without losing another man. In 1857 he again went out in the *Pleid*; the ship was wrecked up the Niger, and his party returned home, but he remained in the country, and single-handed laid the foundation of the present colony of Nigeria. He d. at Sierra Leone.

Bail. In law, when a person is charged with an offence he may be released on

security given by one or more persons, usually householders, that he will appear at the trial. He is then on B., or in the B., i.e. custody, of the person giving B. or security. If he fails to appear, the B. is forfeited. If the sureties think the bailed person will not appear, they may surrender him, and be relieved of liability. A justice may now dispense with sureties and release the accused on his own recognisances if he be of opinion that justice will not be defeated. In felonies other than treason and in certain misdemeanours, the magistrate may in his discretion admit to B., but is not obliged to do so. In all other misdemeanours and in all summary cases the magistrate is bound to admit to B. In practice, however, B. is never allowed in a charge of murder, or in misdemeanours where the costs of prosecution may be allowed out of the co. rate. In treason it can only be granted by a judge of the Queen's bench div. or a secretary of state. The police may grant B. if, on arrest without warrant, the prisoner cannot be tried within 24 hours. In Scotland (Bail Act, 1888) murder and treason are the only non-bailable offences. The high court and the lord advocate can admit to B. In U.S. law B. is used to indicate either the bond which is furnished or the persons who bind themselves under penalty to see that the accused appears. Some state constitutions contain specific provisions as to the cases in which B. may be allowed; in other cases the courts have a general discretion, subject to statutory regulations. Release on B. is the rule, except in cases of murder or other capital charges. The amount of B. or penalty in the bond is fixed by the judge or court. The prohibition in the U.S. constitution of excessive B. is interpreted as a direction that B. shall not be refused in a proper case. See CRIMINAL LAW.

Baldon, tn in the W. Riding of Yorks, England, 4 m. N. of Bradford. There are sev. industries, including worsted mills and chemical works. Pop. 10,132.

Bailén, or **Baylén**, Sp. tn in the prov. of Jaén. Here, in 1808, the French suffered their first serious reverse in the Peninsular war, at the hands of the Spaniards. Pop. 10,300.

Bailey, prison or any modern structure situated where courts existed, as the Old B. in London. It formerly meant the exports of a castle formed by the spaces between the outward wall and the keep. In olden times it also meant the work, fenced with palisades or masonry, covering the outskirts of a tn by way of defence.

Bailey, **Henry Christopher** (1878-), novelist, b. London. He was educ. at the City of London School and Oxford, where he wrote an historical novel, *My Lady of Orange*. From 1901 to 1946 he was on the staff of the *Daily Telegraph*. He wrote a large number of novels, but is best remembered for his detective stories, *Call Mr Fortune*, 1920, *Mr Fortune's Practice*, 1922, and other books relating the adventures of that popular investigator.

Bailey, **Liberty Hyde** (1858-1953),

Amer. botanist and lecturer, b. S. Haven, Michigan; educ. at Michigan Agric. College and Wisconsin Univ.; prof. of agriculture at Michigan Agric. College 1885-8; later prof. of horticulture, Cornell Univ., fellow of the Amer. Academy of Arts and Sciences and the Botanic Society of America, and president of both in 1926. Among his works are *The Survival of the Unlike*, 1896, *The Cyclopaedia of American Horticulture*, 1900-2, *Botany*, 1901, *Lessons with Plants*, 1904, *The State and the Farmer*, 1908, and *The Apple Tree*, 1922.

Bailey, Nathan, or Nathaniel (d. 1742), lexicographer and philologist. His *An Universal Etymological English Dictionary*, pub. in 1721, an improvement on previous lexicons, went through many eds., and was taken by Dr Johnson as the basis of his dictionary 20 years later.

Bailey, Philip James (1816-1902), poet, b. and educ. at Nottingham. In 1835 he went to London, and entered Lincoln's Inn, but did not take up the legal profession in earnest. In 1839 he pub. his poem *Festus*, a version of the Faust legend. He continued to revise and enlarge it in successive eds. for the next 50 years. It is a work of great imaginative power and lofty moral tone, but has faults in execution. B.'s later poems, *The Angel World*, 1850, *The Mystic*, 1855, and *The Universal Hymn*, 1867, were, comparatively, failures.

Bailey, Samuel (1791-1870), philosophical writer, son of a Sheffield merchant. For some years he took an active share in business. His first book, *Essays on the Formation and Publication of Opinions*, appeared in 1821, and a sequel, *On the Pursuit of Truth*, in 1829. Other works were *A Theory of Reasoning*, 1851, and *Letters on the Philosophy of the Human Mind* (3 vols.), 1856-63.

Bailey, Old, see OLD BAILEY.

Bailey Bridge, see BRIDGING, MILITARY.

Baillie, or Baillie, superior officer or magistrate of a municipal corporation in Scotland. B.s are invested with certain judicial and administrative authority within the city or burgh for which B.s are appointed. They are assisted by a paid legal adviser called an assessor. The office is in some respects analogous to that of alderman in England, but unlike an Eng. alderman he retains his seat for the ward to which he has been appointed after selection as a B. The term of office is 3 years.

Bailiff, Eng. legal term signifying a superior steward or agent. The keeper of Dover Castle is called the Queen's B. The name now generally applies to the sheriff's officers. Such are either B.s of hundreds or special B.s. The former are appointed by the sheriff to collect fines, summon juries, execute writs and processes, and attend at assizes and quarter sessions. The latter were men selected for their skill in hunting and apprehending persons liable to arrest. Being compelled to enter into an obligation for the due performance of their duties, they are sometimes called bound-bailiffs, or vulgarly bum-bailiffs. Special B.s are appointed at the request

of a suitor, and the sheriff is not responsible for what is done by them. A B. cannot lawfully act until he has received a warrant under the hand and seal of the sheriff. B.s of a franchise or liberty are appointed by the lord of a liberty. They exercise jurisdiction in certain parts of the country, e.g. the liberty of Gower in Glos. The high B. of a co. court appoints sub-bailiffs who execute process of the court. His office is for life. See LOCAL GOVERNMENT.

Bailiwick, legal term used with regard to the co. or dist. over which the sheriff, as bailiff of the queen, has jurisdiction. See LOCAL GOVERNMENT.

Baillet, Adrien (1649-1706), Fr. critic, b. Neuville-au-Hez, in Picardy. He studied in a neighbouring convent, where he was introduced to the Bishop of Beauvais, who assisted him in obtaining a good education. In 1676 he received holy orders and was given the vicarage of Lardières; in 1680 he became librarian to M. de Lamoignon, the advocate-general. His *Les Enfants devenus célèbres par leurs études et par leurs écrits* (Paris, 2 vols., 1688) won popularity. His prin. work is *Jugements des savants sur les principaux ouvrages des auteurs*, 1685-6. He also wrote a life of Descartes (1691) and various historical works.

Bailleur, Fr. tn in the dept of Nord, on the R. Becque. The *hôtel de ville* dates from the 15th cent. The Bailioli family (q.v.) is said to have derived its name from B. The tn was largely destroyed in the First World War and afterwards rebuilt. The chief manufs. are linen and lace. Pop. 11,400.

Bailiage, Fr. term, equivalent to bailiwick. The word was used in Switzerland of portions of ter. over which a bailiff was appointed. This officer was in charge of the police and had jurisdiction in certain civil and criminal cases. In case of maladministration, appeal lay to the cantons to which the B. belonged.

Baillie, Lady Grizel (1665-1746), poetess, b. Kebrass Castle, Berwickshire, daughter of the patriot, Sir Patrick Hume, 1st Earl of Marchmont. In 1684 she supplied her father with food during his concealment in the vault of Polwarth church, and accompanied him when he fled abroad (1686-8). In 1692 she married the son of Robert B. of Jarviswood. The best known of her songs is 'And werena my heart licht I wad dee.' Memoirs of her and her husband were written by her daughter, Lady Grizel Murray of Stanhope (1693-1759).

Baillie, Joanna (1762-1851), poetess and dramatist, b. Bothwell, Lanarkshire. Educ. at Glasgow, she moved to London and spent her life there. Her *Plays on the Passions* (1798-1836) are artificial in conception and lacking in dramatic incident, but they are written with vigour, and were admired by Scott. *De Montfort* had a vogue through the acting of John Kemble and Mrs Siddons. She is at her best in her songs and ballads written in the Scottish dialect. See M. S. Carhart, *Life and Work of Joanna Baillie*, 1923.

Baillie, Matthew (1761-1823), anatomist

and physician, *b.* Shotts, Lanarkshire, nephew of John and William Hunter. Educ. at Glasgow and Oxford; M.B., 1786. Appointed physician to St George's Hospital, 1787; M.D., F.R.C.P., 1789. From 1810 he was physician to members of the Royal family. His *Morbid Anatomy of Some of the Most Important Parts of the Human Body* (1793; atlas, 1802) is one of the landmarks in the hist. of pathology and the first great work on the subject written in English. See life in T. J. Pettigrew's *Medical Portrait Gallery*, vol. ii, 1840.

Baillie, Robert (1599-1662), Scottish Presbyterian divine, educ. at Glasgow Univ. He was one of the commissioners appointed to prepare charges against Archbishop Laud, 1640 and became the first prof. of divinity at Glasgow Univ., 1642. He sat in the Westminster Assembly of Divines, and was made prin. of Glasgow Univ., 1660. B. had great influence on Scottish political affairs, playing a considerable part in rousing Scottish opposition to Charles I. and, later, in urging the repudiation of Cromwell and the restoration of Charles II.

Baillie, Robert, of Jerviswood (d. 1684), Scottish revolutionary, who has been called the Scottish Algernon Sidney. He opposed the tyranny of Charles II's favourite, the Duke of Lauderdale, in 1676, and was arrested on a charge of complicity in the Rye House plot, condemned to death, and hanged at Edinburgh.

Baillière, Jean-Baptiste Marie (1797-1882), founded the publishing firm of J. B. Baillière et Fils in Paris, and in 1826 started a branch in London to sell Fr. medical and technical books. He placed his brother Hippolyte in charge of the London house, which business was carried on successfully by H. B. until his death and afterwards by his widow. In 1869 A. A. Tindall and George Cox bought the business and continued it under the style of Baillière, Tindall & Cox, which to-day remains one of the best-known specialist medical publishing firms in London. The original Paris house is still active and also specialises in medical books. There is, however, now no connection between the Paris and London firms.

Baillon, Ernest Henri (1827-95), Fr. botanist, *b.* Calais. In 1864 he was appointed prof. of natural hist., and later prof. of hygiene, at the Industrial School of Art at Paris, where he *d.* Author of *Histoire des plantes*, 1860-85, and *Traité de botanique médicale phanérogamique*, 1884.

Ballot, Pierre (1771-1842), Fr. violinist. He studied music in Paris and Rome, made his début in Paris in 1791, and was prof. of the violin in the Paris Conservatoire from 1795 till his death. He studied the theory of music under Catel, Reicha, and Cherubini. He entered Napoleon's private orchestra in 1802, and afterwards travelled in Russia with Lamarre, 1805-8. In 1814 he organised concerts for chamber music in Paris with great success; toured in Holland, Belgium, and England, 1815-16, and became a

member of the London Philharmonic Society; director of the Paris Opera, 1821-31, and of the Royal Orchestra, 1825. B. belonged to the classical school of violin players, and won fame as a teacher. His compositions are difficult, and have been almost forgotten, but his *Art du Violin*, 1834, is still regarded as a standard work.

Baillou, Guillaume de (otherwise **Ballonius**) (1538-1616), Fr. physician, *b.* Paris. Began by teaching classics and philosophy in the univ. of Paris, and then studied medicine, taking his doctor's degree in 1570. B. was essentially the resuscitator of anct. medical studies, particularly the work of Hippocrates. He was the first modern epidemiologist and his outstanding work on this subject was his *Epidemiorum et ephemeridum libro duo* (Paris) (1640), which revived the doctrine of Hippocrates in 'epidemic constitutions.' He thus gave the impulse to Sydenham who went still further in the doctrine. Another notable work was *Definitionum medicinarum liber* (1639) (a glossary of the terms of Hippocrates). He is further remembered for being the first to differentiate between rheumatism and gout, and to describe arthritis, whooping cough, and sev. diseases of women (*De virginum et mulierum morbis liber*, 1643). His collected works were pub. in 4 vols., 1734-6.

Bailly (or Bailli), David (1584-1657), Dutch artist, *b.* Leyden. He studied first under his father, Peter B., and was afterwards a pupil of Jacob de Gheyn. He won a reputation as a portrait painter.

Bailly, Jacques (1629-82), Fr. painter, *b.* Gracay (Cher.). He settled in Paris and became a member of the Academy of Painting, in 1664. He etched 12 plates, representing bouquets of flowers, but is better known for his portraits in miniature.

Bailly, Jean Sylvain (1736-93), Fr. statesman and astronomer. In 1784 he was elected a member of the Fr. Academy and in 1785 of the Academy of Inscriptions. In 1789 he was president of the Third Estate and of the National Assembly and was mayor of Paris, 1789-91. He allowed the soldiers to fire on the mob in the Champs de Mars, July 1791, and immediately lost his popularity. He was executed in 1793 on a charge of conspiracy. His most famous pub. was his *Histoire de l'astronomie* (1775-87).

Bailment, term for the delivery of goods by the bailor to the recipient or bailee to be held according to the purpose of the delivery, and to be restored when the purpose is accomplished. B. is of 3 kinds: (1) For the benefit of the bailor or his representative. The bailee receives and keeps his deposit without reward, and is responsible only for gross neglect. (2) For the benefit of the bailee or his representative. The bailee receives a gratuitous loan, which he must return, without payment, at the end of a certain time. He is responsible in this case for the least neglect. (3) For the mutual benefit of the bailor and bailee or their respective representatives. This includes deposit as

a security (as when goods are left with a pawnbroker, or when furniture is stored with a warehouseman), and the hiring of the use of a bailed article. The bailee is responsible only for ordinary neglect.

Baily, Edward Hodges (1788-1867), Eng. sculptor, *b. Bristol*. He went to London in 1807 and entered Flaxman's studio. He was employed by George IV to execute the sculpture in front of Buckingham Palace and the figures on the Marble Arch. He executed a number of busts and statues of public men, the Nelson monument in Trafalgar Square, Charles James Fox and Lord Mansfield in St Stephen's Hall, Westminster, also the statue of Athens for the Athenaeum Club.

Baily, Francis (1774-1844), astronomer, *b. Newbury*. In 1827 he was awarded the gold medal of the Royal Astronomical Society (of which he was president at the time of his death) for revising their Star Catalogue. He set on foot the reform of the *Nautical Almanac*, 1829. See BAILY'S BEADS.

Baily's Beads, name given to a phenomenon which is observed in connection with the total eclipses of the sun, first fully described by Francis Baily (q.v.). Owing to the effect of irradiation and the irregularity of the moon's edge, the crescent-shaped portion of the sun that is unobscured by the moon's disk looks like a belt of bright spots in a dark background, compared to a string of beads.

Bain, Alexander (1818-1903), Scottish psychologist and philosopher. Educ. Marischal College, Aberdeen, 1836-40; became prof. of natural philosophy in the Andersonian Univ., Glasgow, 1845; secretary of the Board of Health, 1848-50. In 1860 he was appointed to the chair of logic in Aberdeen, and on his retirement was made lord rector of his own univ., 1881. He followed in the steps of Hartley, in that his psychology was based on physiology, and he belonged to the experimental as opposed to the transcendental school. His prin. works are *The Senses and the Intellect*, 1855, *The Emotions and the Will*, 1859, *Study of Character*, 1861, *Mental and Moral Science*, 1868, *Logic*, 1870, and *Relation of Mind and Body*, 1873. In addition he assisted in the editing of Grote's *Aristotle* and ed. Grote's *Minor Works*; he wrote, in 1882, a biography of James Mill, as well as a criticism of J. S. Mill. His autobiography appeared in 1904.

Bainbergs (sometimes called Schinbalds), armour (q.v.) of the 13th cent. to protect the legs.

Bainbridge, John (1582-1643), astronomer, *b. Ashby-de-la-Zouch*. He was the first Savilian prof. of astronomy at the univ. of Oxford. Pubs.: *An Astronomical Description of the late Comet*, 1619; *Procli Sphaera*, 1620; *Circularia*, 1648.

Bainbridge, William (1774-1833), Amer. naval officer, *b. Princeton, New Jersey*. He entered the merchant marine service at the age of 15; became a lieutenant-commandant in command of the schooner *Retaliation* in 1798; was captured off Guadeloupe by the French. In 1800 he was promoted to the rank of captain, and

was sent on an embassy to the Dey of Algiers, who pressed him into Algerian service, under which flag he was compelled to go to Constantinople. When in command of the *Philadelphia* he captured the Moorish frigate *Mesboha* (1803), but was himself taken prisoner off Tripoli. He was appointed commodore in 1812, in command of the *Constitution*, *Hornet*, and *Essex*, and captured the Brit. frigate *Java*. In 1820, on the *Columbus*, he went for the fifth time in his life to the Mediterranean, to impress the predatory nations with the growing power of the U.S.A. From 1832 to 1835 he acted on the board of naval commissioners.

Bainbridge, Sir Philip (1786-1862), Brit. general. He entered the Navy as a midshipman in 1799, but retired through ill health. In 1800 the Duke of York appointed him to an ensigncy in the 20th Regiment; inspector of fortifications at Curaçao, 1807; entered the senior dept of the Royal Military College at High Wycombe, 1809, where he invented a projecting pocket sextant; deputy assistant quartermaster-general in Portugal, 1811. He took part with distinction in the Peninsular war and also served in France. He commanded the forces in Ceylon, 1852-4, and was promoted to the rank of lieutenant-general.

Baines, Edward (1774-1848), journalist and economist, *b. Walton-le-Dale, Lancs*. He was apprenticed to a printer first at Preston and then at Leeds; bought the *Leeds Mercury* in 1801; and was M.P. for Leeds, 1834-41, as an independent Liberal. He advocated the reform of factory laws, Catholic emancipation, and opposed state interference in educational matters. He wrote a *History of the Reign of George III*, 1823, and a *History of the County Palatine and Duchy of Lancaster*, 1836. See life, 1851, by his son, Sir Edward B.

Baines, Peter Augustine (1786-1843), prelate, *b. Kirkby, Lancs*. He was educ. at the Eng. Benedictine abbey of Lampshire, Hanover, and entered the Benedictine order in 1804, and became a priest in 1810. He taught at Ampleforth till 1817, when he undertook the mission at Bath. He won a reputation as an eloquent preacher, and in 1823 he was appointed coadjutor-bishop to Collingridge, Vicar Apostolic of the W. District, and in the same year was consecrated Bishop of Siga. In 1829 he succeeded Collingridge, and in this year he bought Prior Park, where he founded St Peter's and St Paul's, a lay and eccles. college respectively. According to Wiseman, it was only the death of Leo XII which prevented B. from being created cardinal.

Baini, Giuseppe (1775-1844), It. priest, musical author, and composer, *b. and d. Rome*. He was appointed master of the pontifical chapel, composed numerous works, of which the chief is a *Miserere*, and wrote the *Memorie storico-critiche della vita e delle opere di Giovanni Pierluigi da Palestrina*, 1828.

Bains-d'Arles, see AMÉLIE-LES-BAINS.
Bains-les-Bains, Fr. spa in the dept of Vosges, 16 m. SSW. of Épinal. The

waters (86–123° F.) are used for rheumatic and arterial troubles. Embroidery is made. Pop. 1700.

Baiocco, or **Bajocco**, coin worth about a halfpenny, coined by the papal states, 1–100th part of the scudo = 4s. 3d., so called from its brown colour.

Bairaktar, or **Bairak-dar** (1755–1808), title of Mustapha, grand vizier of Mahmud II. He was b. of poor parents, and distinguished himself as a soldier, hence his title of B., meaning standard-bearer. On hearing that the janizaries had murdered Selim III and put Mustapha IV on the throne, he marched to Constantinople, deposed Mustapha, and elevated his brother Mahmud II to the throne, 1808. He was then appointed grand vizier. His policy was to strengthen the regular army and crush the power of the janizaries. But the janizaries revolted, seized the Seraglio, and demanded the restoration of Mustapha. B. then strangled Mustapha and killed himself.

Bairam, or **Beiram**, name in Turkey of 2 great Muslim festivals: (1) The Breaking of the Fast at the end of Ramadan; it lasts from 1 to 3 days and people put on new clothes and give presents. (2) The Festival of Sacrifices on the tenth day of the last month of the year. On that day the pilgrims kill their sacrifices (see HADJ) and those at home make their offering. Muslims explain this as a memorial of the sacrifice by Abraham.

Baird, Sir David (1757–1829), general, b. Newbyth, E. Lothian. Entered the service, 1772; served in Brit. India, 1780–9. He was wounded while fighting against Hyder Ali at Pernambucum in 1780, and was taken prisoner and kept in a dungeon at Seringapatam for nearly 4 years. He took Pondicherry 1793. In 1799 he led the assault at Seringapatam. Col. Wellesley (afterwards Duke of Wellington) being in command of the reserve. In 1801 he commanded an expedition to Egypt for the expulsion of the French. On his return to India he complained of the preference given to Wellesley, and asked for leave of absence. In 1804 he was knighted. Led an army to recapture the Cape of Good Hope from the Dutch settlers, 1806, and served at the siege of Copenhagen, 1807. In 1808 he was sent to the assistance of Sir John Moore with a reinforcement of 10,000 men, and distinguished himself at Corunna, 1809. In 1820 he was appointed Commander-in-Chief in Ireland, but was not successful as an administrator, and was removed from office in 1821, when the Marquess Wellesley became lieutenant.

Baird, Dorothea (Mrs H. B. Irving) (1873–1933), actress, b. Northumberland and educ. at a high school in Hampstead. She joined Bon Greet's company, filling Shakespearean roles. She made her name as the original Trilby in Sir Horbert Tree's production in 1895. Other parts: Sophia, in *Olivia*; Aote, in *Nero*; Mrs Darling, in *Peter Pan*; and Portia.

Baird, Henry Martyn (1832–1906), Amer. historian, b. Philadelphia, Pennsylvania; educ. Paris and Geneva, and

graduated at New York Univ., 1850. Was a tutor at Princeton Univ., and from 1859 to his death prof. of Greek at New York Univ. His best-known works are *History of the Rise of the Huguenots of France*, 1879, *The Huguenots and Henry of Navarre*, 1886, and *The Huguenots and the Revocation of the Edict of Nantes*, 1895.

Baird, Sir John, see STONEHAVEN.

Baird, John Logie (1883–1946), inventor of television, b. Helensburgh, Scotland, son of the minister of West Parish church; educ. at Larchfield and the Royal Technical College, Glasgow. He undertook independent research at the age of 18, when he set up a small laboratory at Hastings, and devoted himself to the problem of 'seeing by wireless.' By 1924 he had designed apparatus for image transmission in outline by wire or by wireless. Two years later television was demonstrated by B. at the Royal Institution. In 1928 B. demonstrated the possibilities of transatlantic television. In 1929 the Ger. post office, and later the Brit. Broadcasting Corporation began using his system. Improvements by the development of the cathode-ray tube were adopted by B. (see TELEVISION). Further developments were interrupted by the outbreak of war in 1939. In Dec. 1941, however, B. showed television in relief and full natural colour. In that year he became technical adviser to Cable and Wireless Ltd., in which position he remained until his death at Bexhill on 14 June 1946. In addition to television, he invented the 'noctovisor,' as a result of experimentation with infra-red rays. This instrument enabled visual impressions to be regarded in total darkness. At the time of his death B. was conducting experiments with a view to enabling cinema audiences to watch events taking place at considerable distances.

Baird, Robert (1798–1863), Amer. clergyman, reformer, and author. He was b. in Fayette co., Pennsylvania, and graduated from Princeton Theological Seminary, 1822. He was agent and secretary of the Amer. and Foreign Christian Union, and worked in Europe on behalf of temperance and a revival of evangelical Protestantism. He wrote *A History of Temperance Societies in the United States*, 1836.

Baird, Spencer Fullerton (1823–87), Amer. naturalist. Graduated from Dickinson College, Carlisle, Pennsylvania, to which he was elected prof. of the natural sciences, 1845. He became assistant secretary of the Smithsonian Institution at Washington in 1850, and secretary in 1878. During this period the National Museum was organised and developed by him. In 1871 he was elected commissioner of fish and fisheries. He wrote numerous books on zoology and Amer. archaeology, the most important being *Catalogue of North American Reptiles*, 1853, *Mammals of North America*, 1859, *Birds of America* (with John Cassin), 1860, and *History of North American Birds* (with Dr Brewer and Prof. Ridgway), 1874–84.

Baireuth, see BAYREUTH.

Bairn's Part of Gear, see LEGITIM.

Bairnsfather, Charles Bruce, artist and journalist, b. Murree, N. Punjab, 1887; eldest son of Maj. Thomas H. B. He was educ. at United Services College and served in Warwickshire Militia, 1911-14. Engaged in civil engineering when war broke out he rejoined the Warwickshire Regiment, going to France Nov. 1914. From 1916 he was attached to the War Office for work abroad. B.'s humorous drawings of army life, at first a subject of official censure, estab. him the war caricaturist *par excellence*. Pubs.: *Fragments from France* (6 vols.), 1916, etc.; *The Better 'Ole* (play); *Bullets and Billets*, 1917; *From Mud to Mufti*, 1919; *Old Bill*, M.P. (play).

Bairstow, Sir Edward (1874-1946), Eng. organist and conductor, b. Huddersfield, Yorks. Served his articles to Sir Frederick Bridge at Westminster Abbey. Organist, Leeds par. church, 1906, and York Minster from 1913 till almost the end of his life. In 1929 he became prof. of music at Durham Univ. His pubs. are chiefly songs, and organ and church choral music.

Baise, or **Bayse**, Fr. riv. It rises in the Haute-Pyrénées, and flows N. to join the Garonne W. of Agen. Length 145 m.

Baius, or **De Bay**, Michael (1513-89), Belgian theologian, b. Melun; studied theology at Louvain, became prof. of scriptural exegesis at the univ. in 1552, and chancellor, 1575. He was a deputy at the Council of Trent, 1563. At Louvain he was the leader of the Augustinian anti-scholastic school of theology. Pius V condemned him in the bull *Ex omnibus afflictionibus*, 1567, for his teaching on justification by faith, sufficiency of the scriptures and grace, free will, and original sin as applied to the immaculate conception. He was again condemned by Gregory XIII, 1579. His school came into conflict with the Jesuits, and later influenced Cornelius Jansen and Jansenism (q.v.). Collected works pub. 1696.

Baixo Alentejo, prov. of S. Portugal, largely co-extensive with Beja dist. (q.v.). There are cork-oak forests, live-stock is raised, and cereals are produced. The prin. tn is Beja. Area 5320 sq. m.; pop. 375,150.

Baize, coarse woollen cloth with a long nap. It was formerly made of a finer texture.

Baja, tn of Hungary, in Bács-Kiskun co., near the Danube (q.v.), 60 m. SW. of Kecskemét (q.v.). It is a mkt tn. and has chemical, textile, engineering, and other industries. Pop. 32,000.

Bajan, see BEJAN.

Bajazet, or **Bayazid**, I (1347-1403), Sultan of Turkey, son of Amurath I whom he succeeded in 1389. His rapid military tactics won him the title Ilderim (lightning). He conquered Bulgaria and parts of Asia Minor, Serbia, Macedonia, and Thessaly. B. gained a decisive victory over the united forces of French, Poles, and Hungarians at Nicopolis in 1396. He was, however, defeated in 1402 near

Angora by Timur, who kept him prisoner till his death. The literary tradition that he was kept in a cage and fed with bits like a dog (cf. Marlowe's *Tamburlaine* and Rowe's *Tamerlane*) is without historical foundation.

Bajazet, or **Bayazid**, II (1447-1512), Turkish sultan, son of Mohammed II. He became sultan in 1481. During his reign he engaged in continuous warfare with his neighbours, particularly with Hungary, Poland, Persia, Venice, and Egypt, but Turkey made few territorial gains, except at the expense of Venice. The last years of his reign were disturbed by the quarrels of his 3 sons about the succession to the throne. He finally abdicated in favour of his youngest, Selim.

Bajimond, see BAGIMOND'S ROLL.

Bakaos, Thomas (1442-1521), Hungarian cardinal and politician. He became Bishop of Erlau (1491), Archbishop of Gran (1497), and Cardinal and titular patriarch of Constantinople, 1510. He directed foreign policy under Michael Corvinus and Ladislaw II but failed in his candidature for the papacy in 1513. He also launched an unsuccessful crusade against the Turks.

Bakar (It. **Buccari**), tn in Croatia, Yugoslavia, on the Adriatic. It is built on the side of a hill, and is a picturesque tn with a ruined castle. Near by is a magnificent beach, bordered by a forest. There is tunny fishing. Pop. 4800.

Bakau, see BACAU.

Bakhichsarai, see BAKHCHISARAY.

Bake, Jan (1787-1864), Dutch classical scholar, b. Leyden. Prof. of Rom. and Gk literature for over 40 years in his native tn.

Baked Shale, see PORCELLANITE.

Bakel, fortified port and chief tn of the B. dist., Senegal, Fr. W. Africa. It is situated on the Senegal R., 85 m. below Kayes, and about 550 m. above St Louis on the coast. It is an important trading centre from the interior. Pop. 37,000.

Bakelite, substitute for celluloid, bone, ivory, etc. It is a carbon compound made from formaldehyde and phenol. B. was invented by the Belgian-Amer. chemist L. H. Baekeland.

Baker, co. seat of B. co., Oregon, U.S.A., on the Powder R. c. 80 m. SE. of Pendleton. It is the centre of a gold- and silver-mining dist. The chief industries are agriculture, lumbering, and mining. It is the H.Q. of Whitman National Forest. Pop. 9470.

Baker, Sir Benjamin (1840-1907), civil engineer. He invented the pneumatic shield; designed, in conjunction with Sir John Fowler, the Forth Bridge, and assisted in the construction of the Nile reservoir.

Baker, David (1575-1641), Benedictine monk, better known by his religious name of Augustine, b. Monmouthshire. He studied law, and, converted to Catholicism, entered a monastery at Padua, and joined the revived Eng. congregation of Benedictines, 1619. He was spiritual director of an Eng. Benedictine convent at Cambrai, and was on a mission

in England when he d. His valuable MS. collection on eccles. hist. is in Jesus College, Oxford.

Baker, Henry (1698-1774), scientist and author, b. London, was at one time a bookseller, but, in 1720, as tutor to a deaf girl, invented a system of teaching the deaf and dumb. He kept his methods secret, and estab. a profitable private school for deaf mutes. He helped Defoe in the *Universal Spectator*, 1728, and married his youngest daughter, Sophia, 1729. His scientific work was concerned with the microscope. He was made a fellow of the Royal Society in 1740, and gained the Copley gold medal for observations on the crystallisation of salts in 1744. He helped in the foundation of the Society of Arts, 1754, and by his will founded the Bakerian lecture of the Royal Society.

Baker, Sir Herbert (1862-1946), architect, b. Cobham, Kent, was articled to Arthur B., then became assistant to Sir E. George, among his colleagues being Edwin Lutyens and Guy Dawber. He won the Ashpitel prize of the R.I.B.A. in 1889. In 1892 he went to S. Africa, and after the Boer War designed many important buildings in that country. He built Groote Schuur for Cecil Rhodes; the administrative buildings for the S. African Gov. at Pretoria; the fine cathedrals of Cape Town, Pretoria, and Salisbury (Rhodesia), and the railway stations at Pretoria and Johannesburg. He designed the Rhodes Memorial on Table Mt. and Rhodes House at Oxford. He designed also the Kimberley siege memorial and the S. African Institute for Medical Research, and he may be said to have created the architectural character of S. Africa. This character combines effectively the ideals of the ruling race, as derived from ant. Rome, with different aspects of the local tradition of building, and in his later work, in India, he revealed the same ability to infuse local sentiment into the classical tradition. Rhodes made it possible for him to visit Rome, Athens, Thebes, and Paestum, and his work in S. Africa shows strongly the dominating influence of Mediterranean architecture. He was associated with Sir E. Lutyens in the designing of the new cap. at Delhi, the secretariat and the legislative buildings being his work. After the First World War he designed the memorials at Neuve-Chapelle and Delville Wood and, in England, the Winchester College war memorial and the Haileybury war memorial hall. His chief work in London was the reconstruction of the Bank of England, a difficult task, which involved adherence to the style of Sir John Soane's original. India House, Aldwych, is a conspicuous example of his ability to introduce a special atmosphere into classic design. Other works: S. Africa House, in Trafalgar Square; Glyn, Mills's bank in Lombard Street; the building of the Royal Empire Society in Northumberland Avenue; London House, Bloomsbury; and Church House, Westminster. He was knighted in 1926; K.C.I.E., 1930; R.A., 1932. His memoirs, under the title

Architecture and Personalities, were pub. in 1945.

Baker, John Gilbert (1834-1920), botanist, b. Guisborough, Yorks; became in 1886 first assistant at the herbarium of the Royal Gardens, Kew, and keeper 1890-9. He was Victoria medallist of the Royal Horticultural Society, 1897, and gold medallist of the Linnean Society, 1899. He was associate editor of the *Journal of Botany*, and pub. botanical works, of which the most important are *Synopsis Filicum*, 1883 (begun with Sir W. J. Hooker), *Flora of the Mauritius*, 1877, *Flora of the English Lake District*, 1885, *Handbooks of the Fern Allies*, 1887, *Amoryllidaceae*, 1888, and *Bromeliaceae*, 1889.

Baker, Josephine Turck (1861-1942), Amer. authoress, b. Milwaukee, Wisconsin. Founded the *Correct English Magazine*, 1899; president and founder of the International Society for Universal English. She pub. *Correct English*, and other similar works; also *Songs of Triumph*, 1933, and 4 plays, including a drama on Mme de Staël.

Baker, Newton Diehl (1871-1937), Amer. politician, b. Martinsburg, W. Virginia, and educ. at Johns Hopkins and Washington and Lee Univs. President Wilson in 1916 appointed him secretary for war. A little over a year later, when the U.S.A. entered the First World War, B. and Wilson decided to adopt conscription almost immediately. The measure was bitterly fought in Congress; nevertheless the law was enacted. B. left office in 1921. He was appointed by Coolidge in 1923 as an Amer. member of the Court of International Justice at The Hague, and in the same year was elected president of the Woodrow Wilson Foundation.

Baker, Ray Stannard (1870-1946), Amer. author. Studied law and literature, Michigan Univ. Became managing editor of McClure's Syndicate, 1897-8; appointed to the special commission of the Dept of State in Great Britain, France, and Italy during the last year of the First World War. Among his numerous pubs. are *The Spiritual Unrest*, 1910, *What Wilson did at Paris*, 1919, and *Woodrow Wilson and World Settlement—a History of the Peace Conference* (3 vols.), 1922. With Prof. E. W. Dodd ed. *The Public Papers of Woodrow Wilson* (6 vols.), 1925-1926. Under the pseudonym of David Grayson: *Adventures in Contentment*, 1907; *The Friendly Road*, 1913; *Hempfield*, 1915; *Adventures in Understanding*, 1925; *Adventures in Solitude*, 1931; *The Countryman's Year*, 1936.

Baker, Sir Samuel White (1821-93), Brit. explorer, was intended for business by his father, a W. India merchant, and went to Mauritius, and in 1846 to Ceylon, where he founded an agric. settlement. He travelled in Asia Minor and E. Europe, and in 1861 started on his explorations of the Nile basin which made him famous. He first explored the Atbara and Ea tribes of the Nile. In 1862 he met Speke and Grant at Gondokoro returning from the discovery of Victoria Nyanza and the main sources of the Nile. With their

information B. discovered Albert Nyanza, 1864, through which he proved the Nile flowed, and the Murchison Falls of the Victoria and Nile. He returned to Khar-toum, 1865. He was given the gold medal of the Royal Geographical Society, and was knighted, 1866. In 1870 the Khedive Ismail appointed him Governor-General of the Nile equatorial dists. for 4 years to suppress the slave traffic and open up the country for trade. Many difficulties prevented his success, but he laid the foundations for Gen. Gordon, his successor. His second wife (married 1861), a Hungarian, Florence von Sass, accompanied him on all his travels. His pubs. include *The Albert Nyanza and the Exploration of the Nile, 1866, Nile Tributaries of Abyssinia, 1867, Ismailia, 1874, and Wild Beasts and their Ways, 1890.*

Baker, Valentine (1827-87), also known as B. Pasha, Eng. soldier, brother of Sir Samuel White B. Entered the army in 1848, serving in the Kafir war, 1852-3; promoted to colonel of the 10th Hussars, 1860; explored the N.E. frontier of Persia, 1873. Having been convicted of a criminal offence, he was dismissed the Brit. Army, 1875, and entered the service of the sultan, 1877, becoming a major-general in the Turkish Army. He took part in the Russo-Turkish war; organised the Egyptian Army for the khedive, 1882-1887, and was defeated by Osman Digna at El Teb, near Tokar, in 1884. On his return to England he joined the staff of Gen. Wolseley, 1885, but his application to rejoin the Brit. Army was refused. Two years later he returned to Egypt and *d.* at Tel-el-Kebir. Author of *Clouds in the East, 1876, and The War in Bulgaria (2 vols.), 1879.*

Baker Mount, volcanic mt. 10,827 ft in height, belonging to the Cascade Range in Whatcom co., Washington, U.S.A.

Bakersfield, co. seat of Kern co., California, on the Kern R., and on the S. Pacific and the Atchison, Topeka, and Santa Fe railroads. It is a stock-raising and fruit-growing dist., and there are machinery works, foundries, oil and natural gas fields, oil refining, pipeline and rail shipping, and the manuf. of oil tools; there are also railroad shops. The manuf. of paint, chemicals, metal products, and farm equipment is also important. Pop. 34,784.

Bakewell, tn in Derbyshire, England, on the R. Wye, 25 m. from Derby. The scenery of the dist. is beautiful; near by are Haddon Hall and Chatsworth (qq.v.). There are Saxon remains on Castle Hill; the church of St Anne is mentioned in Domesday; on its S. side stands an 8th-cent. carved stone cross. Lead-mining was practised from early times, and chert limestone is still worked. The almshouse dates from 1602, the grammar school from 1637. Pop. 3,400.

Bakewell, Robert (1725-95), agriculturist, *b.* Dishley, Leics., England; he devoted himself to the breeding of live-stock; his new long-wool 'Leicester' sheep and the 'Dishley longhorn' cattle became famous. See CATTLE.

Bakhchisaray ('Garden Palace'), tn in

the Crimea, 20 m. S. of Simferopol, a former residence of Crimean khans. It has many historic mosques, and the famous palace of the khans built in 1519. Before 1945 it had a museum of Tatar culture; this was closed, but in 1950 reopened as the Suvorov museum. Pop. (1926) 10,000 (c. 1914, 17,000), before 1945 mostly Tatar.

Bakhmut, see ARTĖMOVSK.

Baking, method of cooking in which food is cooked in a heated oven; the term is also used in connection with the making of pottery (q.v.) and bricks (q.v.). The chem. of the process is explained in the article on cookery (q.v.).

Baking Powder is used to aerate a wide variety of cake, pudding, and biscuit mixtures. It is composed of tartaric acid (or potassium hydrogen tartrate), bicarbonate of soda, and a fine farinaceous substance, usually rice flour. When B. P. is in contact with water the acid reacts with the carbonate and carbon dioxide is evolved. When subjected to heat the gas expands and gives the mixture lightness and porosity. The rice flour in B. P. absorbs the moisture from the atmosphere so that it does not clump during storage.

Bakninh, see BAC-NINH.

Bakony Forest (Ger. *Bakonyer Wald*), wooded mt dist. in Hungary, N. of Lake Balaton and SW. of Budapest (qq.v.). It is an outlying E. portion of the Alps, and is separated from the Carpathians by the Danube (qq.v.). The highest point is Mt Kőrös (2339 ft). Bauxite, manganese, and coal are found, and large numbers of pigs are reared. The forest was the haunt of robbers in Hungarian folk-song. Length about 60 m. The chief tn is Veszprém (q.v.).

Bakonyer Wald, see BAKONY FOREST.

Bakshish (Persian, from *bakhshidan*, to give), word meaning a gift, and used in the Muslim E. of petty almsgiving, also for gifts to procure service, hence equivalent to 'tip.'

Bakst, Leon (1866-1924), Russian painter and designer (real name Rosenberg), *b.* probably at St Petersburg (Leningrad), where he passed his earliest years. He attended the Imperial Academy of Arts; but left after displeasing the authorities there by his painting of a 'Madonna Weeping over Christ,' in which all the figures were Jewish. He was employed to teach the children of the grand duke Vladimir—afterwards his patron in theatrical matters. Associated with Alexandre Benois in the 'World of Art' group, he helped the movement for reviving native Russian art. He was also active in restoring the antique beauty of presentment of the drama of ancient Greece. In the autumn of 1906, exhibited in Paris; in 1908 became famous as the scene-painter of Diaghilev's Russian ballets, 'Scheherazade' (1909) being one of his triumphs. He returned to Russia in 1922; but afterwards resumed residence at Paris, and *d.* there. His brilliant and exotic *décor*s for ballet made a great impression, influencing fashions in dress and interior decoration. See life by A. Levinson, 1923.

Baktashites, see DERVISHES.

Baktohisaral, see BAKKHISARAY.

Baku (Azerb. **Bakki**), cap. of Azerbaijani Rep. and one of the main economic and cultural centres of the Soviet Union. Situated on the W. shore of the Caspian Sea, on the desert-like Apsheron peninsula, it has a hot climate and strong NW. winds. It is the centre of the large B. oil-fields, with refineries and cracking plants and engineering (mainly oil industry equipment), light, and food industries. It is the starting point of the pipeline to Batumi (on the Black Sea). B. is the largest port on the Caspian Sea (shipment of oil to central Russia via Astrakhan). The Azerbaijani Academy of Sciences (founded 1945) and a univ. (founded 1919) are situated here. It has outstanding architectural monuments of 11th–15th cents. Pop. (1956) 598,000 (14th in Soviet Union; 1863, 14,000; 1897, 112,000; c. 1914, 225,000; 1923, 245,000); with industrial settlements of the peninsula subordinated to B. city council (1956) 901,000 (4th in Soviet Union; 1926, 453,000; 1939, 809,000)—mainly Russian, Azerbaijani, and Armenian. B. has been known since the 8th cent. It was under Arab rule, then under Shirvan (q.v.) and Persia; it was Russian 1723–35 and from 1806, became cap. of B. prov. in 1859, of independent Azerb. Rep. 1918–20, and was taken by the Red Army in 1920. It was cap. of B. Oblast within Azerbaijan 1952–3 (abolished).

Bakunin, Mikhail (1814–76), Russian anarchist and revolutionary, b. Tajok, of a noble family. He resigned his commission in the Imperial Guard, and in 1846 met Proudhon, the founder of anarchism, in Paris. Expelled from France in 1848, he shared in the Dresden revolution and was sentenced to death. The sentence was commuted, and he was later handed over to the Russian authorities and exiled to Siberia, 1855. He escaped in 1861, and spent the rest of his life chiefly in Switzerland. He joined the International in 1869, becoming the leader of the more violent Lat. section, styling themselves federalists or anarchists as opposed to the political socialists under Marx. His attacks on his opponents at The Hague Congress of the International, 1872, led to the expulsion of B. and the anarchists. He d. in Bern. His best-known work is *Dieu et l'Etat*; his complete works were pub. in 1905. See THIRD INTERNATIONAL. See also E. H. Carr, *Michael Bakunin*, 1937.

Bala, tn and urb. dist. of Merioneth, N. Wales, an angling centre. B. lies within the Snowdonia National Park and is set in superb scenery. B. College is a preparatory college of the Presbyterian Church of Wales. B. Lake (Llyn Tegid), 4½ m. long by 1 m. wide, is the largest in Wales. Pop. 1500.

Balaam, son of Beor, a Moabite prophet (Num. xxii, xxiii), recognised as inspired by God on this occasion, although a pagan. In other parts of the Bible (e.g. 2 Peter ii. 15, Rev. ii. 14) he is reproved for loving the 'wages of unrighteousness.' Jewish

tradition was always unfavourable in its judgment of him. Balak, King of Moab, alarmed at the victories of Moses and the Israelites, sends twice with promises of reward to summon B. from Pethor on the Euphrates. Forbidden at first, he temporises until commanded to go, but only to speak the words God puts into his mouth. On his way occurs the incident of the angel and the speaking ass. Three times B.'s curses are turned to blessings, at the high places of Baal, Pisgah, and Peor. These blessings form 7 poems: (1) Num. xxiii. 7–10, the power of Israel; (2) and (3) xxiii. 18–24, xxiv. 3–9, the coming monarchy; (4) xxiv. 15–19, the rise of the star and sceptre out of Jacob; (5), (6), and (7) xxiv. 21–23, the doom of Amalek, conquest of the Kenites by Assyria, the ships from the W., Chittim (Cyprus), to overthrow Assyria. The last 3 poems are considered a later addition by modern critics, who trace 2 distinct versions in the story of Numbers. B. was slain in the punishment of Moab (Joshua xiii. 22).

Balachong, Chinese condiment made of putrid shrimps or small fish pounded with spices and salt and then dried and eaten with rice.

Balaclava, see BALAKLAVA.

Balad, see BELED.

Balaena, see RIGHT WHALE.

Balaeniceps (Lat. *balaena*, whale; *caput*, head), shoebill or whale-headed stork. The single genus and species *B. rez* is put into a distinct family Balaenicipitidae. The shoebill, which is a large, long-legged bird standing about 5 ft high, lives in swampy areas of the upper White Nile and in parts of Uganda and the Belgian Congo. It feeds on fish, frogs, snakes, various molluscs, and carrion.

Balaenoptera (Lat. *balaena*, whale; *Gk pteron*, wing), name given by Lacépède to the fin-whales (q.v.) or rorquals.

Balakhissar, see BALKHESRI.

Balakirev, Mily Alexeevich (1837–1910), Russian musical composer, b. Nizhni-Novgorod. He was the acknowledged leader of the Russian 'Nationalist' school of the fifties, and carried on the tradition of Glinka. It was in 1861 that he began to attract around him promising musicians like Borodin, (q.v.), Mussorgsky (q.v.), and, later, Rimsky-Korsakov (q.v.), and on all of them he exercised great influence, and also upon composers who were not his pupils, such as Tchaikovsky. In 1867 he became conductor of the Imperial Russian Musical Society. In 1881, after some years of seclusion, he returned to St Petersburg with his masterpiece *Tamara*. As a composer B. is original, even though he reveals the influence not only of Glinka, but also of Chopin, Liszt, Schumann, and, to a lesser degree, of Berlioz. Although he wrote 4 overtures, 2 symphonies, and 2 piano concertos, the largest part of his output consists of piano solos and songs. He d. in St Petersburg.

Balaklava, tn in the Crimea, on the Black Sea about 10 m. S. of Sevastopol. Pop. (1923) 1600. In 1854–6 it was held by the British; near B. the famous charge on the Russian guns was made by the Light Brigade (Six Hundred).

Balalaika, form of the guitar common in Russia, where it is used by the peasants to accompany popular songs. It has a triangular body, and usually 3 strings, and is made in various sizes.

BALALAIKA

Balance (Lat. *bi-*, twice; *lanx*, a dish), instrument for comparing the masses of bodies. The application of the term is extended to any condition of equilibrium, as in B. of power (q.v.), and also to the excess of one quantity over another, or the quantity necessary to establish equilibrium, as in B. of trade (q.v.), and the credit or debit B. in a book-keeping account.

The common B. consists essentially of a beam resting at its middle point upon a fulcrum and furnished at its extremities with 2 scale pans; the goods to be weighed are placed in one of these, and known weights (strictly speaking, masses) placed in the other until the beam assumes a horizontal position. The B. thus constitutes a lever of the first class, the condition of equilibrium being estab. by the force rotating the beam in one direction being counteracted by an exactly equal force tending to rotate the beam in an opposite direction. In order that the B. should give a true result, the following conditions must exist: (1) The 2 arms of the beam must be precisely equal in length, otherwise a weight depending from the end of the shorter arm will be balanced by a smaller weight on the longer arm, as in the steelyard. A sufficient test is provided by placing weights in the 2 pans until the beam is horizontal and then interchanging the weights, when the beam should become horizontal again. (2) The B. should be in equilibrium when the scales are empty. This does not necessarily mean that the

arms are equal, for unequal arms may be compensated for by pans of unequal weight; this condition would give an incorrect result, a weight in the lighter pan on the longer arm having more additional turning power than an equal weight in the heavier pan on the shorter arm. (3) The centre of gravity of the beam and pans should be in the same vertical line as the fulcrum when the beam is horizontal, and should be a little below the fulcrum, otherwise the slightest displacement would result in the beam toppling right over.

A B. is said to be delicate, sensible, or sensitive when a small additional weight in one pan causes an appreciable rotatory movement of the beam, that is, when the angle moved through by the beam is large for a small difference in the weights at either end. Delicacy may be obtained by attention to the following points: (1) The arms of the B. should be made as long as is consistent with lightness and rigidity, for the longer the arm is, the greater will be the turning power of a small weight. (2) The weight of the beam should be as small as is consistent with rigidity, for the amount of rotation should depend as much as possible on the weight in the pan, or, in other words, the weight in the pan should be the greatest possible proportion of the total weight tending to turn the beam about its fulcrum. These two conditions are often met by making the beam of aluminium and constructing it so that it is capable of bearing the greatest strain without bending in a vertical direction. (3) The centre of gravity of the beam should be brought a very little below the point of support, so that the weight of the machine should tend as little as possible to keep the beam in a horizontal position. (4) Friction should be reduced to a minimum. To effect this, the edges from which the beam and pans are supported are made as sharp and as hard as possible, and the surfaces on which they rest as smooth and as hard as possible. The edges are therefore often made of agate and the surfaces of polished steel. Additional sensitivity is imparted to the machine by the use of a long vertical pointer attached to the middle of the beam, the slightest deflection of which causes a considerable arc to be described by the end of the pointer.

It is sometimes necessary that a B. should be stable, that is, that the beam should return as quickly as possible to the horizontal position after deflection. To effect this, it is necessary that the centre of gravity of the beam and pans should be some distance below the fulcrum, so that when the beam is deflected, and the centre of gravity therefore no longer vertically beneath the fulcrum, the weight of the machine will operate in bringing the B. to rest again. This condition is the reverse of that required for sensibility, so that the properties of stability and sensibility are in some degree incompatible. In commerce, where quickness of weighing is desirable, stability is aimed at; whilst in physical and chemical research, where accuracy is of prime importance, the centre of gravity of the B. is brought close

to the fulcrum. Excessive oscillation of the beam can be avoided by the application of a damping mechanism, e.g. hollow pistons moving in cylinders with one end closed, or electromagnetic devices. In the delicate B.s used for chemical analysis, the distance of the centre of gravity from the fulcrum can be regulated within small limits by the use of a screw on the beam vertically above the fulcrum, turning the screw so that it rises, bringing the centre of gravity nearer the fulcrum, and vice versa. Such B.s are protected from air currents, dust, etc., by being enclosed in glass cases, with sliding fronts. Strong sulphuric acid, caustic potash, or some other dehydrating substance is usually exposed in dishes to absorb moisture from the air. The wearing of the parts in a chemical B. is obviated by allowing the

weights, but if the B. is false through the pans being unjustly loaded, the true weight will be the arithmetical mean of the apparent weights.

Roberval's B. consists of 4 rods hinged smoothly in the form of a parallelogram. In its position at rest the rods form a rectangle, the weight pans being firmly fixed to the vertical rods, and the horizontal rods free to turn about their middle points, which are supported by fixed vertical uprights. Whatever movement takes place, the 4 movable rods form a parallelogram, those supporting the weight pans always being vertical. The vertical work done in displacing one of the pans downwards is therefore always equal and opposite to the virtual work done in displacing the other, no matter on what parts of the platforms the weights may be placed. This form of B. is commonly used for weighing letters and parcels.

Beranger's B. is at first appearance much more complicated than Roberval's B.; but in reality is not so. The principle of placing the pans above the beam is retained, but all loads on the pans are transferred to subsidiary beams arranged below the main beam, which, in their turn, transmit a pull, always vertical and equal to the load, to the sharp edges of the main beam, and, by this means, the intervention of lateral forces is avoided.

The common or Rom. steelyard is a lever of the first class, but equilibrium is obtained by varying the distance of the weight from the fulcrum instead of varying the weight. It consists of a beam movable about a fulcrum near the end, from which is suspended the body to be weighed. A weight is moved along the long arm until the beam balances horizontally. Graduations on the long arm indicate the weight.

The Dan. steelyard consists of a bar with a heavy knob at one end and a hook at the other from which the body to be weighed is suspended. In this case the fulcrum is movable, and usually consists of a loop of string, its position with respect to graduations on the bar indicating the weight of the body.

The bent lever B. consists of a lever of unequal arms, the lighter of which ends in a pan to receive letters or small parcels. The other arm is bent downwards and weighted, and moves in front of a graduated arc. The nearer the weighted arm is to the horizontal position the greater is its turning power, as the weight acts at a greater distance from the fulcrum. Therefore the weight of the body placed in the pan is determined by the extent to which it lifts the weighted arm. The instrument is generally graduated empirically.

The spring B. consists of a steel wire wound in the form of a spiral, and usually enclosed in a cylindrical case with a slot through which the spring is attached to a pointer moving along a vertical scale. The body to be weighed is suspended by a hook, or placed in a pan attached to the bottom of the spring, and the weight is indicated by the amount of stretching that the spring undergoes. The elasticity

THE COMMON BALANCE

beam and pans to rest on suitable supports when not in use, the knife-edges being brought into contact with their surfaces by moving a screw in front of the instrument. A graduated scale behind the pointer renders it unnecessary to wait for the B. to come to rest at each weighing, as equal deflections either side are quite sufficient to indicate equal weights. A small 'rider,' or movable piece of wire, can be used to bring the B. into equilibrium when the difference in weights is very small; the rider is moved along the beam towards its extremity over small graduations, the motion over one graduation being generally equivalent to an additional weight of one-hundredth of a grain.

Even if a B. be not accurate in itself, a good result may be obtained by double weighing. The body to be weighed is placed in one pan and shot or sand is poured into the other until the beam is horizontal. The body is then taken off and known weights are placed in the pan until the beam is again horizontal. The result will be accurate even if one of the pans is loaded. Another method consists in placing the body to be weighed in the 2 pans successively and obtaining 2 results. If the fault of the B. is that it has unequal arms, the true weight will be the geometrical mean of the apparent

of the spring varies with time and use, and as it is used directly against the force of gravity, the readings of such an instrument vary in different parts of the world. This B. measures weight and not mass.

The *torsion B.* consists of a fine wire clamped at one end and carrying an index swinging in a horizontal plane at the other. The angle through which the index is twisted is proportional to the force causing the torsion. The index is usually a magnetic needle, and the instrument is used to measure the force of magnetic attraction and repulsion. See WEIGHING MACHINE.

Balance of Power, in diplomacy, the principle of maintaining an equilibrium between states or groups of states so that no single state or group becomes overwhelmingly powerful. In diplomatic relations the principle of the B. of P. has operated from the earliest times, e.g. in the leagues of the Gk city states; the maze of wars and alliance of the Il. repubs.; or the attempt of Wolsey and Henry VIII to make England the balancing power in Europe. In the 17th and 18th cents. the B. of P. was recognised as a definite formula of diplomacy. It was the guiding principle of William III in his lifelong struggle against Louis XIV. It explains the tangled diplomacy and constant wars of the 18th cent., culminating in the coalition of all the powers against Napoleon. Canning's famous remark, 'I called the New World into existence to redress the balance of the Old,' in regard to his recognition of the revolted Sp. colonies in S. America, illustrates the vitality of the theory. The years before the First World War confirmed its place as a principle of modern European policy; the Triple Alliance was countered by the Dual Alliance, and by her *entente* with France and the later agreement with Russia, Great Britain left her 'splendid isolation' in order to maintain the equilibrium threatened by the increase of Ger. power and the weakness of Russia. The estab. in 1918 of the League of Nations was an attempt, in the words of Asquith, to form 'a community of power' to replace the B. of P. European public opinion has become more influenced by opinion in the U.S.A., which has always been, in theory at least, against the B. of P. While formerly the principle was confined to European diplomacy, the tendency was to extend it to world politics; China and the Middle E. came into its sphere; the rise of Japan made the B. of P. in the Pacific a vital question for the future of Australia, and, as the event proved, not for Australia alone. The end of the Second World War revived the ideal of substituting an international authority for diplomacy based solely on the B. of P. See UNITED NATIONS. See also the *Cambridge Modern History*.

Balance of Trade, *the*, is a term applied to the difference in value between the exports and imports of a country. The Mercantilists (see MERCANTILE SYSTEM) held that the wealth of a country depended on the difference in gold between its exports and imports; if there was an

excess in the value of exports over the value of the imports, the balance was in favour, it not the balance was against the country. In consequence legislation tended to protect the exports and place prohibitive taxes on the imports. This theory is now regarded as fallacious.

In addition to the exports and imports of commodities, settlements in respect of freights, insurances, loans, interest on loans, expenses of gov. abroad, receipt of tribute, etc., have to be made. These are known to economists as *invisible* exports and imports. For many years Britain was able to absorb an excess of imports in actual commodities over exports, an excess which was measured by many millions of pounds. This excess was paid for by the money received for *invisible* exports. In 1932, however, Great Britain abandoned its policy of free imports and instituted a tariff scheme, thereby gradually reducing the gap between imports and exports. But during the Second World War Great Britain was compelled to sell her foreign, and particularly her Amer., securities in order to find foreign currency, and especially dollars, to finance her war requirements. In consequence imports in the shape of interest or dividends on foreign investments were much reduced. Hence, after the war the country bent all its efforts on manufacturing for the export trade in the hope of reducing the great adverse balance of trade.

Putting aside *invisible* services, the money value of exports must equal the money value of imports in theory, and the relative prices of commodities must be adjusted in such a manner as to attain this equality. If this adjustment were not made, the country with an excess of imports must export money for as long as the excess continued. This outflow of money would reduce prices to a point when it paid to export some commodities or not to import others. In other words, exports would be increased and the imports reduced and the B. of T. would be restored. New Zealand attempted to do this in 1938-9 when the Labour Gov. there, having spent large sums on social services, endeavoured to restore the balance by a drastic prohibition of all kinds of imports. Other modes of redressing an adverse balance are by the payment of export bounties or subsidies, and by barter agreements. See also BREITON WOODS AGREEMENT; GOLD AND DOLLAR RESERVES; TRADE.

Balance Spring, see WATCH.

Balanchine, George (1904-), Russian choreographer. *b.* St Petersburg. His early years were spent at the Imperial (later Soviet State) School of Ballet. He was with the Diaghilev Ballet from 1924 until 1929, and since 1933 has worked mainly for Amer. companies, notably the New York City Ballet, although he was engaged at the Paris Opéra for some months in 1947. Among his best-known ballets are *Le Fils prodigue*, 1929, *Cotillon*, 1932, *Concerto Barocco*, 1941, *Ballet Imperial*, 1941, and, revived for the Solder's Wells Ballet in 1950, *Palais de*

cristal, 1947, *Orpheus*, 1948, and a new version of *Casse-Noisette*, 1954. The most musical of modern choreographers, B. uses his wide range of invention within the limits of classical technique, and excels in abstract ballets which aim at translating the spirit of the music into movement.

Balanga, cap. of Bataan, on the is. of Luzon, Philippines, on the W. side of Manila Bay, 31 m. from Manila. There is irrigation from the R. Talisay. Pop. 12,379.

Balaninus, genus of coleopterous insect of the family Curculionidae which includes many species of small size. The members of this genus have a long snout furnished with a pair of horizontal jaws which assist in placing the eggs in the kernels of fruit. The egg hatches into a larva, when the creature feeds on the host-kernel, bores a hole through it, and assumes the pupa state when it has burrowed into the ground. They are cosmopolitan. *B. nucum*, the nut-weevil, attacks common nuts and filberts; *B. glandium* the acorn.

Balanoglossus (Gk *balanos*, gland; *glossa*, tongue), the typical genus of the Balanoglossidae of the protochordate group Enteropneusta. It has a worm-like, elongated body, breathes by means of gill-slits, and bears in the anterior region a curved-shaped proboscis which serves as a burrowing organ. It inhabits the sand of various seas, and about 10 species are known.

Balanophoraceae, family of parasitic dicotyledons comprising many tropical species. The chief genus is *Balanophora*, which consists of 11 species growing in India.

Balanus (Gk *balanos*, acorn, gland), the scientific name by which is indicated the barnacle (q.v.) or acorn-shell (q.v.).

Balacan, or **Balang**, tn in the prov. of La Union, Luzon, Philippines, 15 m. N. of San Fernando; pop. 12,274.

Balard, Antoine Jérôme (1802-76), Fr. chemist, b. Montpellier; d. Paris. He became prof. of chem. in his native tn, and in 1826 he discovered bromine (q.v.). In 1844 he was elected member of the Academy of Sciences, and in 1851 was appointed prof. of chem. in the College of France.

Balaruc (-les-Bains), Fr. spa in the dept. of Hérault, on the étang de Thau (q.v.). It has a petrol refinery. Pop. 1600.

Balas Ruby, term used to designate the rose-red varieties of spinel (q.v.). It occurs as crystals, softer than those of the oriental ruby, a much more valuable stone. B. R.'s are found chiefly in India. As the name indicates, it has often been confused with the ruby.

Balashov: 1. Oblast in Central Russia, SE. of Moscow, situated on the Oka-Don lowland, in the black earth belt. Area 14,700 sq. m.; pop. (1956) 964,000, almost entirely Russian. It has wheat and sunflower growing and food industries. The prin. tns are Balashov, and Borisoglebsk. Unpopulated until the 16th cent., the area was then colonised by Cossacks.

2. Cap. of the above, on the Khopër, a

trib. of the Don, 125 m. W. of Saratov. It was founded in the 17th cent., and is a railway junction and local industrial centre, with an aircraft plant and extensive food industries. Pop. (1956) 56,000.

Balasore, tn, in Orissa State, India, near the sea coast. It was formerly of commercial importance and Dutch, Danes, English, French, and Portuguese all estab. centres here.

Balassagyarmat, tn of Hungary, in Nógrád co., on the R. Ipoly, 22 m. W. of Salgótarján (q.v.). It is near the Czechoslovak border, has an archaeological museum, and has a trade in agric. produce, wine, and alcohol. Pop. 12,500.

Balassi, Baron Bálint (1854-94), Hungarian poet, b. Zólyom, wrote lyric poetry of great freshness and beauty, for which he used new verse-forms. He d. at Esztergom, fighting against the Turks.

Balata, juice or latex obtained from *Mimusops balata*, the bullet or bully tree, belonging to the same family, Sapotaceae, as the Malay gutta-percha tree (or *Dichopsis*). B. is used as an inferior substitute for caoutchouc and gutta-percha, but the presence of resin in the latex renders it useless for electrical purposes. It is used for belting, on account of its strength. The B.-tree grows in the W. Indies, S. America, and in Guiana.

Balaton (Ger. *Plattensee*), lake in W. Hungary, lying S. of the Bakony Forest (q.v.). It is the largest lake in central Europe (length 48 m.; width 74-10 m.; area 245 sq. m.) and has an outlet to the Danube (q.v.). The N. shore is hilly, with reed-grown inlets, whereas the S. shore is generally flat; on both shores there are bathing, health, and fishing resorts. The surrounding dist. is very beautiful, and produces vines and fruit. It was the scene of desperate fighting during the Russian invasion of Hungary in 1944 (see EASTERN FRONT).

Balausta, fruit of the pomegranate (q.v.), in appearance a golden colour, about the size of an ordinary orange, and the rind is thick, enclosing numerous seeds, each embedded separately in pulp surrounded by a cell-wall. This pulp is in reality the outer layers of the seed-coats, and it is employed in the manuf. of cooling drinks.

Bayan, seaport of the is. of Luzon, Philippines, in the prov. of Batangas. It is situated 30 m. NW. of Batangas, and at the NW. end of the Bay of B., which is deep, but open to southerly winds. It produces coco-nuts, corn, rice, and sugar. There is fishing. Pop. 18,305.

Balbec, see BAALBEK.

Balbi, Adriano (1782-1848), It. geographer and statistician, b. Venice; became prof. of geography at Murano on the pub. in 1803 of his *Survey of Political Geography*. In 1813 he was appointed to the customs at Venice. His best-known works were *Atlas ethnographique du globe*, 1826, and the *Abrégé de géographie*, 1832. His son, Eugenio (1812-84), ed. his writings, 1841, and was also a geographer.

Balbinus, Decimus Caelius Calvinus,

Rom. emperor (AD 237-8). On the death of the 2 Gordians in Africa, B. and Maximus (Clodius Pupienus) were chosen joint emperors to continue the opposition to the usurping Emperor Maximinus, then with the army in Pannonia. Their powers were equal, and each bore the titles of pontifex maximus and princeps senatus. Maximinus invaded Italy, but was assassinated by his soldiers at Aquileia. On the approaching departure of Maximus against the Persians and of B. against the Goths, the Praetorian guard, adherents of the dead Maximinus, put the 2 emperors to death. B. had gained some reputation as a poet and orator, and both he and his colleague were of the highest rank and character in the senate.

Balbo, Italo (1896-1940), It. marshal and airman, b. Quartesana, Ferrara. In the First World War he served in an Alpine regiment. By 1920 he had become a Fascist and was organising 'flying squadrons,' which made attacks on Communists and Socialists. Mussolini put him in charge of the Blackshirt Militia, and in the 'March on Rome,' Oct. 1922, B. was one of the quadrumvirs who led the Fascists. In the Fascist regime he became under-secretary of national economy; but his chief work was the regeneration of the It. air force, which he lifted out of mediocrity to the point of challenging comparison with any other in Europe at the time. B. himself made a number of spectacular and much-publicised flights. In 1929 he was appointed air minister. He was promoted to marshal 1933. In Nov. 1933 Mussolini took over the Air Ministry and made B. Governor-General of Libya, the general assumption being that Mussolini was jealous of his popularity and wanted to exile him. He was killed at Tobruk (which he had converted into a strong air and naval base) in June 1940, together with 9 other occupants of a plane which crashed there. The Brit. Foreign Office denied the It. announcement that he had fallen in action against the R.A.F., and it was rumoured that his machine had been deliberately shot down by the Italians themselves.

Balboa, Vasco Núñez de (1475-1517), Portuguese discoverer and adventurer who settled a colony at Santa María in the Gulf of Darien in 1513. He subsequently marched across the isthmus of Darien and discovered the Pacific Ocean. He was superseded in his command, but was appointed lieutenant-governor of the countries on the Pacific coast, and married the daughter of Pedrarias Dávila, his successor at Darien. He was accused of disloyalty, and put to death by Pedrarias.

Balboa, monetary unit of the rep. of Panamá. It is of the same size and fineness as the U.S.A. silver dollar, but is maintained equivalent to the gold dollar.

Balboa Heights, H.Q. of the administrative organisation known as the Panama Canal; also H.Q. of trans-isthmian railroad. Pop. 364.

Balbriggan, seaport in co. Dublin, Rep. of Ireland, 22 m. N.E. of the cap., noted for

its hosiery manuf. and its hot salt-water baths. Pop. 3000.

Balbus, Lucius Cornelius, Rom. soldier, native of Gades (Cadiz), in Spain. He served under Pompey in the war against Sertorius, for which he received Rom. citizenship. Prosecuted on a charge of illegal assumption of the citizenship, he was defended by Cicero and acquitted. He was chief engineer to Caesar in Gaul, looked after his affairs in Rome during the civil war, and was the first foreigner to become consul (40 BC).

Balcarres, see CRAWFORD AND BALCARRES, EARLS OF.

Balchen, Sir John (1670-1744), Brit. naval officer. He first served in the W. Indies, then in the N. Sea, 1703-5, and on the coast of Guinea, 1705. He was twice captured by the French—when he was in command of the *Chester*, 1707, and when in command of the *Gloucester*, 1709. He again served in the W. Indies, 1715-16, and in the Baltic, 1719-27. In 1728 he was appointed rear-admiral, in 1734 vice-admiral, in 1743 admiral, and 1744 governor of Greenwich Hospital. He was lost with his ship off Alderney, Oct. 1744.

Balchin, Nigel Marlin (1908-), author, b. Wilts. Educ. at Peterhouse, Cambridge, he later combined business with authorship. During the Second World War he was Deputy Scientific Adviser to the Army Council, and attained the rank of brigadier. He wrote humorous sketches for *Punch*, which were collected as *How to Run a Bassoon Factory*, 1934, under the name 'Mark Spade'; *Business for Pleasure* followed in 1935. *The Small Back Room*, 1943, is a novel of the Civil Service. Others of his books are *No Sky*, 1934, *The Simple Life*, 1935, *Income and Outcome*, 1936, *Darkness Falls from the Air*, 1942, *Mine Own Eccutioner*, 1945, *A Sort of Trailors*, 1949, *The Anatomy of Villainy*, 1950, and *Private Interests*, 1953.

Balcony, railed gallery in front of a window. That it was not always placed before a casement is proved by its origin, as it was built out from the sides of fortified places to enable the defenders to throw stones and boiling liquid on the besiegers. Its introduction in dwelling houses dates from the early part of the 15th cent. It, in origin, it soon became popular in other countries.

Bald Buzzard, see OSPREY.

Baldachin, Baldaquin (It. *Baldacchino*), Sp. term originally applied to a rich brocade made in Bagdad; then to canopy hung with such brocade and fixed over a throne or altar; finally to an isolated structure over an altar. The finest example is the great bronze *baldacchino* over the high altar of St Peter's in Rome (1633).

Baldassaro da Belgioioso, see BALTAZARINI.

Balder, Norse god of light, son of Odin and Frigg, and husband of Nanna; the Scandinavian Apollo. The gods knew that if evil happened to him it would be the signal for their overthrow, and so Frigg laid every object, quick and dead, under an oath to refrain from hurting him. Loki, the god of evil, however,

found that this oath had not been administered to the mistletoe plant, which was thought too young and weak to hurt anyone. Profiting from the omission he threw a sprig of it at B., who fell down dead. Hel, goddess of the dead, offered to restore him to life provided all things wept for him. But Loki refused and B. was lost. The B. myth is regarded by some authorities as a remnant of tree-worship, by others as a ritual myth, but it is more probably a sun-myth, the slaughter of the luminary by the malevolent powers of winter. The mistletoe may have been originally a name of derivation, a magic sword, *Mistelleinn*, totally different from that of the plant, which is unknown in Iceland, whence the oldest known form of the myth comes. See F. Knauffmann, *Balder: Mythos und Sage*, Strassburg, 1902.

Baldi, Bernardino (1553-1617), It. poet and scholar, b. Urbino. He wrote a number of works in prose and verse, the greater part of which have remained unedited. Among those pub. are a poem on navigation *La Nautica*, 1590, eclogues, and several prose dialogues. He also compiled a short chronicle of all the mathematicians known from Euphorbius down to his own time, and he pub. 2 Lat. works on Vitruvius.

Baldi, Lazzaro (1623 or 1624-1703), It. painter and engraver, b. Pistola. He studied under Cortona at Rome, and became a clever imitator of that master. His works include: at Rome, 'Annunciation' in the church of San Marcello; 'The Virgin, St Catherine, and St Bridget,' in the church of Santa Maria della Pace; and 'St John, the Evangelist,' in the basilica of St John Lateran.

Baldinucci, Filippo (c. 1624-c. 1696), It. art historian. He pub. a work on the hist. of the painters from Cimabue (1260) to 1670 (1681-8, 1767-74); and a hist. of the most celebrated engravers and their work (1686).

Baldivia, see VALDIVIA.

Baldmoney, see MECUM.

Baldness, absence of hair upon the scalp, which may be a sign of old age or may be congenital. Senile B. (*calvities* or *calvitium*) is much more common in men than in women. Until the prime of life is passed, new hairs grow to replace the dead ones that fall out daily; it is not till failure in the nutrition of the scalp occurs that B. begins. Congenital B. (*hypotrichosis congenita*) usually gives place in time and with treatment to a natural growth of hair, but may last through life. B. that is not senile or congenital is generally due to ill health, though it may be hereditary. Pre-senile B. or premature alopecia in men may be due to wearing tight leather bands inside the hat or closely fitting waterproof and cloth caps. It may also be due to seborrhoeic dermatitis, the characteristic of which is extreme scurfiness of the scalp. Nervous complaints, anaemia, child-bearing, and favus are all said to be causes of B. B. in patches, see ALOPECIA.

Baldo, Monte, see GARDA, LAKE OF.

Baldock, urb. dist. in Herts, England,

on the Great N. Road. It has a 14th-cent. church. Hosiers are manuf., and there is an electrical industry. Pop. 6300.

Baldovinetti, Alesso (c. 1426-99), It. painter, b. Florence. From what is known of him it is evident that B. was one of the most eminent of the early masters of the Florentine renaissance, though his extant work shows some imperfections in colour and according to Vasari he ruined much work by experiment in his medium. In the representation of details he had real merits and he was famous for his extensive views of landscape background, while the profile 'Portrait of a Lady' (National Gallery) is excellent. Of his pictures the best known are an 'Enthroned Virgin and Child' with 6 saints, now in Florence; his own portrait in the Bergamo gallery; and 'The Nativity,' a large fresco in the cloisters of the Santa Annunziata (1460). He d. at Florence. See R. W. Kennedy, *Alesso Baldovinetti*, 1938.

Baldrey, Joshua Kirby (1754-1828), engraver and draughtsman. His works consisted of portraits after Reynolds, which were exhibited in the Academy in 1793 and 1794; religious subjects as 'The Finding of Moses' (1785), after Salvator Rosa; classical subjects as 'Diana,' after Carlo Maratti; his *chef-d'œuvre* is the E. window of King's College Chapel, Cambridge. In 1818 he pub. a work on the windows of that chapel.

Baldric (O.F. *baudret*, belt), broad belt, often of ornate design, worn in the Middle Ages across the body from shoulder to waist diagonally, used for supporting a quiver, or even a sword.

Balducci, Francesco (1600-42), It. poet b. Palermo. His *Rime* estab. his reputation as an anacreontic poet, and he also wrote *Canzoni siciliane*.

Baldung, Hans (c. 1484-1545), called also Hans Grün, Ger. painter and wood-engraver, the contemporary and friend of Albrecht Dürer. He was b. at Gmünd, in Swabia, but lived chiefly in Switzerland, at Strasburg, and its neighbourhood. His woodcuts are variously signed H. B., H. B. G., and H. G. As a painter he was little inferior to Albrecht Dürer in colouring and richness of detail. His works include 'The Adoration of the Kings' (Berlin) and 'Crucifixion' (Basel), and some allegories that show a fantastic imagination.

Baldwin, name of sev. cities, townships, and post-vils. of N. America. It is also the name of a co. of Alabama, which is bounded on the S. by the Gulf of Mexico and has Bay Minette for its cap. Pop. 40,977.

Baldwin (d. 1190), Archbishop of Canterbury during the reigns of Henry II and Richard I. He became a monk and later abbot in the Cistercian abbey of Ford, Devonshire. In 1180 he became Bishop of Worcester. In 1184 Henry II had him appointed to the see of Canterbury, in spite of the opposition of the monks. In 1189 he crowned Richard king at Westminster. B. successfully asserted the pre-eminence of the see of Canterbury, forbidding the bishops of

England to receive consecration from any other than the Archbishop of Canterbury. Having made a visitation in Wales, preaching the Crusade, B. took the cross and followed Richard to the Holy Land (1190). He d. at Acre in the same year. B. wrote *De Sacramento Altaris* and other religious treatises.

Baldwin, name of sev. counts of Flanders. The countship was founded by B. I, Bras de fer (Iron Arm). He married Judith, the daughter of Charles the Bald, without her father's knowledge, which brought about war between Flanders and Aquitaine. He d. in 879 at Arras.

Baldwin IV, 'the Handsome,' was guardian to Phillip, the young King of France, during his minority, 1060-7. B. married his daughter Matilda to William of Normandy, whom he accompanied to England on the Conquest. He d. in 1067 and was buried at Lille. Five other B.s succeeded to the countship, the most important being B. IX (c. 1171-1205), who became first Lat. Emperor of Constantinople.

Baldwin I (c. 1171-1205), Lat. Emperor of Constantinople, b. Valenciennes. He joined the fourth crusade in 1200 as Count of Hainault and Flanders, and took part in the capture of Constantinople on behalf of Alexis, son of Isaac II, Emperor of Constantinople, against his uncle, the usurper, Alexius Angelus. Alexius was unable to keep his promises with regard to payment, and in consequence was murdered and Constantinople was sacked. B. was chosen emperor and crowned in 1204, his kingdom comprising only the city of Constantinople and its surroundings, and a few is. in the Aegean. The Greeks with the help of the Bulgarians massacred the Latins in Thrace; B. laid siege to Adrianople, but was defeated and taken prisoner by John, King of Bulgaria, 1205, and d. in captivity shortly afterwards.

Baldwin II (1217-73), Lat. Emperor of Constantinople, son of Peter II (de Courtenay) and nephew of B. I, became emperor in 1228, but was not crowned till 1239, John of Brienne, his father-in-law, acting as regent during his minority. In 1261 he was driven out of his cap. by Michael Palaeologus, ruler of Nicaea, and took refuge in Italy.

Baldwin I (1058-1118), King of Jerusalem, son of Eustace, Count of Boulogne, and of Ida of Lorraine. He accompanied his 2 elder brothers, Godfrey and Eustace, to the first crusade in 1096, but left the main body of the crusade in 1097 and succeeded in obtaining the lordship of Edessa in Armenia. On the death of Godfrey, 1100, he was called to succeed him in Jerusalem. He became protector of the Holy Sepulchre, and assumed the regal title, which his brother had refused, and was crowned on Christmas Day, 1100. He carried on continual warfare against the Turks; he conquered Caesarea, Arsuf, and Jaffa, 1101, Acre, 1103, and Sidon, 1111. He was the true creator and consolidator of the kingdom of Jerusalem.

Baldwin II, du Bourg (d. 1131), Count of Edessa, succeeded his cousin B. I as

King of Jerusalem, where he reigned from 1118 to 1131. During his reign Tyre was taken (1124), and the military and religious orders of the Templars and Hospitalers were instituted for the defence of the Holy Land. He renounced the throne in favour of his son-in-law, Fulk of Anjou, in 1131, and retired to the monastery of the Holy Sepulchre, where he d. in the same year.

Baldwin III (1129-62) succeeded his father, Fulk of Anjou, King of Jerusalem, in 1143. Under his reign the Christians lost Edessa, which was taken by storm in 1144 by Zenghi, Turkish Prince of Aleppo and father of the famous Nur-eddin, or Nureddin. B. had to struggle during the greater part of his reign with the power and abilities of Nur-eddin. Louis VII of France and Conrad III, Emperor of Germany, joined B.'s forces in an attempt upon Damascus, in which they failed. After his death the Christian kings soon began to lose their power in the E. He was succeeded by his brother, Amalric or Amaury, who d. in 1174.

Baldwin IV (d. 1186), the Leper, son of Amalric, reigned as King of Jerusalem from 1174 to 1185, when he resigned in favour of B. V, son of his sister Sibylla, and a child of 6 years old. He d. a few months after his uncle.

Baldwin, Evelyn Briggs (1862-1933), Amer. Arctic explorer, b. Springfield, Missouri. He accompanied Peary on the N. Greenland expedition as meteorologist, 1893-4, and acted in a similar capacity as second in command of Walter Wellman's polar expedition to Zemlya Frantsa-Josifa, 1898-9. He discovered and explored Ostrov Greem-Bell (Graham Bell Island), 1899, and organised the B.-Ziegler polar expedition, 1901-2. He built and named Fort McKinley. He pub. sev. meteorological reports, and wrote *Search for the North Pole, Frans Josef Land, and North Greenland Expedition*.

Baldwin, James Mark (1861-1934), Amer. psychologist, b. Columbia, S. Carolina, and educ. at Princeton. He studied psychology at Leipzig under W. Wundt (q.v.). While holding a teaching post at Toronto he founded the first experimental psychology laboratory there, and later another at Princeton Univ. Eventually he turned to the study of evolution, genetics, and sociology. He lectured at Oxford (1915-16) and in France (1915), where, at the Ecole des Hautes Etudes, he was appointed lecturer (1918) and prof. (1919). His pub. include *Handbook of Psychology* (2 vols.), 1888, *Social and Ethical Interpretations* (4th ed.), 1907, *Mental Development of the Child and the Race* (3rd ed.), 1907, *Darwin and the Humanities*, 1909, *The Individual and Society*, 1910, *History of Psychology*, 1913, and *Genetic Theory of Reality*, 1915. See his *Psychology in Autobiography*, ed. C. Murchison, 1930.

Baldwin of Bewdley, Stanley, 1st Earl (1867-1947), statesman, b. Bewdley, Worcs, the son of a wealthy manufacturer. B. was educ. at Harrow, and at Trinity College, Cambridge. At one period he had thoughts of becoming

an Anglican clergyman; but he joined his father as partner when he came of age, and for 20 years devoted himself to the business. On his father's death B., who had in 1906 unsuccessfully contested Kidderminster for the Conservatives, succeeded his father to the seat in Parliament—later called the Bewdley div.—which he kept until he received a peerage. When the second Coalition Gov. was formed under Lloyd George, Bonar Law became chancellor of the exchequer, and B. was appointed his parl. private secretary in Jan. 1917. A few months later

Topical Press

EARL BALDWIN

he was financial secretary to the Treasury. From April 1921 he was president of the Board of Trade. As the time for a general election approached in 1922, B. became dissatisfied with the Coalition, and his speech at a party meeting in Oct., condemning the Coalition, played a great part in the fall of Lloyd George's gov. The election gave the Conservatives a clear majority; and the Bonar Law gov., already formed, met Parliament with B. as chancellor of the exchequer. His most prominent action while in this office was his visit to Washington in Jan. 1923 with Mr (later Lord) Norman—the Governor of the Bank of England—to settle the funding of the debt of \$978,000,000 to the U.S.A.

In May 1923 Bonar Law retired through ill health, and B.—who, 6 months before, had been hardly known to the greater part of the public—became Prime Minister at the age of 56. During the early months of his first premiership B. attained to an almost unprecedented position of authority as the leader and

spokesman of the nation. But at a general election held in Dec. the Conservatives lost their clear majority; B. was defeated in the Commons 21 Jan. 1924, and resigned next day. The Labour Gov. that followed fell on 8 Oct. over the Campbell prosecution question: B.'s management secured their defeat. Then followed the 'Zinoviev' election: the Conservatives came back with a large majority, and B. was premier once again. The main problem of his premiership on this occasion was the serious general strike (q.v.) of May 1926—the foremost figure in gov. action being not the Prime Minister but Churchill. The same year B. paid a visit to Canada. In 1929 B. went to the country on an extension-of-safeguarding programme; and at the general election of 30 May his party sustained a heavy defeat, and he resigned—the Labour party taking office again, though without a clear majority. He was elected rector of St Andrews Univ., May 1930. In 1931 he took office as lord president of the Council in the National Gov. formed by Ramsay MacDonald. In July 1932 he headed the Brit. Gov.'s delegation to the Imperial Economic Conference in Ottawa.

On MacDonald's resignation in 1935, B. took his place as Prime Minister. In his Indian policy he was taunted by Churchill with splitting the Tory party, but he pursued his course and secured sufficient support for a Bill framed on the general lines of the Joint Committee's Report (see INDIA, *History*). The Bill (Government of India Bill, 1935) received the Royal Assent on 22 Aug. 1935, and B. had again triumphed, for the Tory party had escaped a split and the National Gov. was prepared to make a united appeal for a new vote of confidence. But B.'s personal triumph was short-lived, for within a month thereafter the Hoare-Laval Pact for settling the Abyssinian war by the cession of Ethiopian ter. to Italy was concluded in Paris, and the swift reaction of Brit. public opinion inflicted upon B. the greatest humiliation of his career, the pact being regarded as a betrayal of the League of Nations. B. immediately declared the proposals in the pact 'absolutely and completely dead.' At the general election in 1935 B. had been returned with a majority of nearly 250. At about this time B. began to stress the increasing menace of air attack and so to prepare the nation for a policy of rearmament. But he did so with little sense of urgency, and with insufficient emphasis. A more daring leader would have attempted to lead public opinion more positively in this vital matter: but B. was not of this calibre. It fell to him, in the midst of preoccupations with grave international problems, to advise King Edward VIII on the constitutional position arising out of his proposed marriage. In the event King Edward abdicated (Dec. 1936). B.'s Cabinet took the precaution of drafting a Bill cited as 'His Majesty's Declaration of Abdication Bill,' and it was B. who laid the measure before Parliament. Towards

the Sp. Civil War B. pursued a policy of non-intervention. B. retired from an active part in politics in 1937, being granted an earldom in the same year. He retired, a highly popular and respected figure: when he d. 10 years later he became the target for exaggerated criticism for his conduct 1935-7, Britain's unpreparedness for war in 1939 being often blamed on him alone. Posterity will be more just: at the time B. undoubtedly had the majority of his countrymen behind him. He can, however, be condemned morally for shrinking from positive actions which facts at his disposal must have made him know were right, but which would have earned him at least temporary unpopularity. Perhaps his chief title to enduring fame is that he could impose his character upon the mind of Parliament and the nation for as long as 14 years. He had sweetness of temper and magnanimity, but was prone to inexcusable inertia and only too conscious of his indolence. See lives by Wickham Steed, 1930; A. Bryant, 1937; G. M. Young, 1952.

Baldwin, William (fl. 1547-60), Brit. poet. Educ. at Oxford, he was printer, clergyman, and schoolmaster. He ed. the first ed. of *A Mirror for Magistrates*, 1559, to which he contributed. His separate works include *Canticles or Ballads of Solomon*, 1549, and a popular prose *Treatise of Moral Philosophy*, 1547.

Bale, John (1495-1563), prelate and author, b. Cove in Suffolk. Educ. at Jesus College, Cambridge, in 1529 he became prior of the Carmelites of Ipswich. Soon after this date he adopted the principles of Protestantism, and wrote in its defence. In consequence Edward VI made him Bishop of Ossory, 1552, but on the accession of Mary he was forced to escape, first to Holland and then to Switzerland. On his return to England he was made a prebendary of Canterbury by Queen Elizabeth. He d. at Canterbury, and was buried in the cathedral. His fame rests on his contributions to early Eng. drama, notably *King John*, which is a link between the morality plays and Elizabethan historical drama. He also wrote a Lat. *Account of the Lives of Eminent Writers of Great Britain*, 1548, and one or two autobiographical pieces. His select works were pub. by the Parker Society, 1849.

Bâle (Switzerland), see BASEL.

Bale, package or certain quantity of goods or merchandise, packed up in cloth and tightly corded or hooped and marked and numbered so as to correspond with the marks and numbers in bills of lading for identification purposes. Specifically a bale of cotton, weighing 500 lb. (Amer. cotton) or 700 lb. (Egyptian cotton), and other fixed weights for various other commodities.

Balearic Isles (Sp. *Islas Baleares*), group of is. lying off the E. coast of Spain in the Mediterranean, the prin. of which are Majorca, Minorca, Ibiza, Formentera, and Cabrera (qq.v.). They form a Sp. prov., the cap. of which is Palma (q.v.). The is. were held successively by the Greeks,

Carthaginians, Romans, Vandals, and Moors. The inhab. had a reputation for their skill in war as slingers. The is. were taken from the Moors in the 13th cent., and were finally incorporated with Aragón (q.v.) in 1349. Minorca was in Brit. hands for most of the 18th cent. The climate of the is. is generally temperate; cereals, wine, fruit, and oil are produced, and there are anchovy and sardine fisheries. Area 1936 sq. m.; pop. 425,900. See F. Chamberlin, *The Balearics and their Peoples*, 1927.

Balechou, Jean Jacques (1715-64), Fr. engraver. His works are still valued and sought for by collectors.

Balen, Hendrik van (1560-1632), Flem. historical painter, and the first master of Van Dyck and Snyders, b. Antwerp. He studied under Adam van Noort, and later at Rome.

Balestra, Antonio (1666-1734 or 40), It. painter, b. Verona. He was brought up as a merchant, but before his twenty-first year he was studying painting under Bellucci at Venice. He afterwards studied under Maratta at Rome, and combined the chief beauties of Venetian colour with the characteristic correctness and solidity of design of the Rom. school. He is regarded as one of the most able painters of his time.

Balfé, Michael William (1808-70), Irish singer and composer, b. in Dublin, and early showed great talent, acting as leader of the Drury Lane orchestra in 1824, when only 16. After a career as operatic singer and composer in Italy (1825-33) he began to compose Eng. operas, of which he wrote 19, besides 3 more in Italian and 3 in French. *The Siege of Rochelle*, 1835, ran for 8 months, but it was his *Bohemian Girl*, produced in 1843, that brought him prominently before the public. In 1845 he was appointed conductor of the It. Opera, Covent Garden, and in 1857 produced *The Rose of Castile*. He was fashionable on the Continent as far as Russia and at his best could rival Donizetti or Auber. Unfortunately his Eng. librettos are exceedingly feeble.

Balfour, Alexander Hugh Bruce, Lord Balfour of Burleigh (1849-1921), Scottish nobleman, b. Kennet, Alloa, and was educ. at Loretto, Eton, and Oriel College, Oxford. He was created 6th Baron B. of Burleigh in 1869. The title had originally been bestowed upon his ancestor Sir James B., in 1607, but the 5th baron having been implicated in the Jacobite rising of 1715, the title was attained. He was a Conservative, and was secretary for Scotland, with a seat in the Cabinet, from 1895 to 1903, resigning because of his opposition to tariff reform. He took an active and useful part in political, educational, and social reform movements.

Balfour, Arthur James, 1st Earl (1848-1930), statesman, b. Whittinghame, E. Lothian, and educ. at Eton and Trinity College, Cambridge. In 1874 he commenced his long political career by being returned as the member for Hertford in the Conservative interest; this constituency he continued to represent until

1885, when he was returned for E. Manchester. In 1878 he became private secretary to his uncle, the Marquess of Salisbury, who, on the resignation of Lord Derby, had become foreign secretary. In his capacity as private secretary B. accompanied Lords Beaconsfield and Salisbury to the Berlin congress, where he received his first lesson in international politics in the settlement of the affairs of Russia and Turkey. In 1880, on the accession to power of the Liberal Gov., he became a member of the Fourth party (q.v.), but took no very active part in its affairs. With the beginning of Lord Salisbury's first administration B.'s active official career began. In 1885 he became president of the Local Gov. Board. The second Salisbury administration, formed in the July of 1886, saw B.'s appointment to the chief secretaryship of Scotland and a seat in the Cabinet. In 1887 he became chief secretary for Ireland. This was B.'s first great appointment, and by the work which he did there, by the firmness with which he suppressed crime, by the tenacity with which he clung to his policy, he made himself the most prominent of Conservative statesmen, the most loved and respected by his adherents, the most hated but at the same time the most respected by his opponents, the Nationalists.

His work covers one of the most vital periods of Irish hist., and in the face of open outrage, in the face of threats and insults, B. proceeded with his work, which consisted of the pacification and good gov. of Ireland. The real success of his policy is doubtful, however: he did reduce crime enormously in Ireland, but the criticism that he turned Ireland into an armed camp cannot be altogether denied. That he was helped by events is also true; the Parnell Commission, followed by the O'Shea divorce case, which led to the downfall of Parnell and the break up of the Irish party, must have helped him considerably. In 1891, on the death of W. H. Smith, he became first lord of the Treasury and leader of the House of Commons. During his first tenure of this post he introduced a local gov. Bill for Ireland, which was withdrawn just before the dissolution of 1892, a dissolution which led to the downfall of the Unionist party and the accession to power of the Liberals. On the defeat of the Liberal party in 1895 he again became first lord of the Treasury and leader of the House of Commons in the administration of Lord Salisbury. During the early days of this second period of leadership B.'s attitude on the education questions called forth criticism not only from the opposition but from his own party as well, and this feeling was accentuated by his suggested scheme for a Rom. Catholic univ. for Ireland. His conduct of foreign affairs during the absence and illness of the Premier, Lord Salisbury, however, added very considerably to his reputation.

In July 1902 Lord Salisbury resigned and B. succeeded him as Premier. The administration which followed is remembered chiefly by the fiscal questions which

came to the front during that period. The Conservative Cabinet, surprised by the sudden proposals of Joseph Chamberlain, divided itself into 2 camps. Many resignations took place, but B. retained his position as Premier, and declared himself in favour of a retaliatory tariff. By-election after by-election went against the ministry, and in Nov. 1905 the gov. resigned, a gov. being formed by Campbell-Bannermann. The general election which followed brought about the complete downfall of the Unionist party, B. himself being defeated in E. Manchester, a seat he had held for 20 years. A safe seat was found for him in the City of London. Up to 1911 B. led the opposition in the House of Commons: on the question of the Veto Bill B. sided with Lord Lansdowne, and found himself opposed by a considerable and influential section of his party. In 1911 he resigned his leadership of the party, saying that his health forbade his further continuance in so arduous a post. However, he did not give up his seat, but, until the outbreak of war in 1914, he lived in comparative retirement, although speaking strongly, both in and out of Parliament, against Home Rule for Ireland and disestablishment of the Church in Wales. He devoted some of his new-found leisure to giving addresses on literature and philosophic subjects.

On the formation, in 1915, of the first Coalition Cabinet, he became first lord of the Admiralty. When Lloyd George succeeded Asquith as Prime Minister, B. accepted the foreign secretaryship, an office in which he had had some experience and had thus shared in the recent foreign policy. No sooner had he assumed this office than Germany instituted the unrestricted submarine campaign which brought the U.S.A. into the war. The result of this was that B. left England for America, in April 1917, as head of the Brit. mission which went to arrange co-operation with that country. His visit was a triumph, and he received the compliment of being asked to address the House of Representatives. B. was also one of the 4 members of the War Cabinet.

In the business of making the peace after the First World War he was the second Brit. representative at the conference which assembled in Paris in Jan. 1919. Shortly after the Peace of Versailles was signed he left the Foreign Office and became Lord President of the Council, in 1919. About this time he was elected chancellor of the univ. of Cambridge. He did not again hold Cabinet office. In February 1920 he presided at the first meeting of the council of the League of Nations and remained the Brit. representative of the League until he retired from office in Oct. 1922. In July 1921 he had accepted the invitation of President Harding to an international conference to be held at Washington, to deal with the limitations of armaments and to discuss Far E. and Pacific problems. Here he endorsed the bold proposals of Secretary Charles Hughes for the reduction of armaments and was largely

responsible for the contribution made towards international peace. See WASHINGTON, TREATIES OF (4).

He visited Palestine in 1925 to open the univ. of Jerusalem. He had been associated with the gov. policy on Palestine enunciated in 1917 (see BALFOUR DECLARATION). On his return he became Lord President of the Council in Baldwin's second ministry, and took charge of the Civil Research Committee. B. attained no less a rank as a philosopher than as a statesman. In 1904 he had become president of the Brit. Association at Cambridge. He was raised to the peerage in 1922. Amongst his varied publs. are *A Defence of a Philosophic Doubt*, 1879, *Essays and Addresses*, 1893, *The Foundations of Belief*, 1895, *Economic Notes on Insular Free Trade*, 1903, *Questionings on Criticism and Beauty*, 1909, *Theism and Humanism*, 1915, and *Theism and Thought*, 1923. See E. T. Raymond, *Mr Balfour: a Biography*, 1920, and B. E. C. Dugdale, *Arthur James Balfour, First Earl of Balfour* (2 vols.), 1936-40.

Balfour, Francis Maitland (1851-82), biologist, younger brother of Earl B. b. Edinburgh, educ. at Harrow and Trinity College, Cambridge, where in 1870 he was elected natural science scholar. Animal morphology next claimed his attention, and he succeeded in obtaining one of the two seats allocated to Cambridge at the zoological station at Naples. He had been impressed by the work of Sir Michael Foster in comparative embryology, and in 1880 pub. the first vol. of a treatise on that subject, following it with a second in 1881. The first of these vols. dealt with the embryology of the invertebrata, the second with that of the vertebrata. B. was resolute in refusing all offers of professorships from other univs., and continued to reside at Cambridge, which at length recognised his singlemindedness and ability by the institution of a special chair of animal morphology, of which he was appointed first prof. His health, never robust, was undermined by typhoid fever. On his convalescence he visited Switzerland, and whilst there he essayed the ascent of the Aiguille Blanche, Mont Blanc, which at that time had not been attempted. In this effort he lost his life.

Balfour, George John Gordon Bruce, Baron Balfour of Burleigh (1883-), succeeded his father as 7th baron in 1921. During the First World War he served with distinction in France.

Balfour, Gerald William, 2nd Earl (1853-1945), politician, younger brother of 1st earl, to whose title he succeeded in 1930. He was educ. at Eton and Trinity College, Cambridge. In 1885 he was returned to the House of Commons as Conservative member for Central Leeds. He was chief secretary for Ireland, 1895-1900; president of Board of Trade, 1900-5; president of Local Gov. Board, 1905-6. He was instrumental in introducing an Irish Local Gov. Bill which did much to conciliate the Home Rule party and which estab. co. councils and dist.

councils, one half of the expenditure of those bodies being met from the imperial exchequer. On his defeat at Leeds in 1906 he retired from politics.

Balfour, Sir Isaac Bayley (1853-1922), botanist, b. Edinburgh. He was regius prof. of botany at Glasgow, 1879-84; Sherardian prof. of botany at Oxford and fellow of Magdalen College, 1884-8. In 1888 he accepted a similar chair at the univ. of Edinburgh, and was regius keeper of the Royal Botanic Garden in that city from 1888 until his death in 1922. For the same period he was king's botanist in Scotland. In 1880 he explored the is. of Socotra, in the Indian Ocean, and in 1888 pub. his findings in the *Transactions*, vol. xxxi, of the Royal Society, Edinburgh. He also ed. *The Annals of Botany* from 1887.

Balfour, Jabez Spencer (1849-1916), Brit. financier and politician, who became notorious as the chief promoter of the Liberator Building Society, 1868, and of similar speculative ventures, which failed in 1892 with liabilities amounting to over £8,000,000. B. fled to the Argentine, but was extradited to England and sentenced, in 1895, to 14 years' penal servitude. He was released in 1906. Between 1880 and 1893 he sat as Liberal M.P. for Tamworth and Burnley.

Balfour, James (1702-95), Scottish philosopher, b. Pilrig in the shire of Midlothian, was admitted an advocate of the Scottish Bar in 1730. He early became an opponent of Hume, whose speculations he attacked in two anonymous treatises, the one entitled *A Delineation of Morality*, the other *Philosophical Dissertations*. In 1754 he resigned his judicial office, having been elected to the chair of moral philosophy at Edinburgh. This he resigned in May 1764 for the chair of public law, and afterwards he pub. his lectures under the title of *Philosophical Essays*. In 1779 he resigned the chair of public law, and retired to Pilrig, where he d.

Balfour, Sir James, of Denmyne and Kinnaird (c. 1600-57), Scottish historian. He studied heraldry at the College of Heralds in London, and later wrote the *Monasticon Scoticum*, a collection of Scottish eccles. charters. In 1630 he was created Lyon king-of-arms, and in 1633 was made a baronet. He was deprived by Cromwell of his office, and thereafter devoted himself to the collection of heraldic antiquities, and wrote sev. abridgments of Scottish charters and chronicles, notably the *Annals of the History of Scotland from Malcolm III to Charles II* (pub. 1837).

Balfour, Sir James, of Pittendreich (d. 1584), Scottish lawyer. He was implicated in the murder of Cardinal Beaton, and in 1547 he was sent with other conspirators to the Fr. galleys, whence he escaped in 1550. When he returned to Scotland his lack of Protestant zeal angered Knox. He was created a lord of session or judge by Queen Mary in 1563. In 1567 he was appointed Governor of Edinburgh Castle, and, having assisted the enemies of the queen, was after her dethronement made president of the court

of session. He was forced to retire to France because of a charge brought against him of drawing up the bond for Darnley's murder, but later returned. He compiled *Practicks of Scots Law*, a handbook of the Scottish legal system.

Balfour, John Blair, see KINROSS OF GLASCLUNE, BARON.

Balfour, John Hutton (1808-84), botanist, b. Edinburgh and graduated at the Univ. of his native city. He took his M.D. degree in 1831; prof. of botany in Glasgow, 1841, Edinburgh 1845. He was also appointed keeper of the Royal Botanic Gardens, where he had been preceded by Hope, Roxburgh, and Buchanan. This dept. of his work brought him recognition from botanists all over the world. He was dean of the faculty of medicine in Edinburgh for 30 years, ultimately retiring from his various appointments in 1879.

Balfour Declaration, see PALESTINE and ZIONISM.

Balfrush, or Barfurush, see BABOL.

Balgonie, Lord, see LESLIE, ALEXANDER.

Balguy, John (1686-1748), theologian, b. Sheffield. He was educ. at Cambridge, and in 1718 pub. 2 pamphlets in defence of Bishop Hoadley. In other works he defended Dr Clarke and his views against such antagonists as Tindal and Shaftesbury. He wrote an *Essay on Redemption*, 1741, which exhibited considerable broad-mindedness for his time, and for his services, personal and otherwise, was appointed a prebendary of Salisbury in 1727 by Hoadley.

Balguy, Thomas (1716-85), Eng. divine of the Latitudinarian school, educ. at Ripon Free School and St John's College, Cambridge, where he held the Platt Fellowship, 1741-8, and was assistant tutor to Dr Powell, lecturing on moral philosophy for 16 years. Among the various positions he held at different times were those of public orator, tutor to the Duke of Northumberland, rector of North Stoke, prebendary of Winchester, archdeacon of Salisbury, archdeacon of Winchester, and vicar of Alton. He pub. many discourses, sermons, essays, and a life of his father, John B.

Bali, or Little Java, is. of Lesser Sundas, Indonesia, situated E. of Java, separated by B. Strait, and W. of Lombok across Lombok Strait. Of volcanic origin it has a mountainous interior (Mt Agung, 10,308 ft) with a large plain in the S. Agric. products include copra, rice, coffee, tobacco, and teak from the forests; and live-stock is reared. It is an important handicraft centre for wood, metal, and weaving. Moderate climate and light rainfall except during the monsoon. B. is very important culturally and economically to Indonesia. Dutch trade began in the early 17th cent., but Dutch rule was not firmly estab. until 1908. Occupied by Japanese in the Second World War, B. became part of Indonesia, 1950. Pop. over 1 million, of Hindu-Javanese extraction; religion Hindu.

Balikesir, or Balakhisar, or Balikliari, fl and tn of Asiatic Turkey. Situated in a fertile basin, the chief products are

opium, silk, and cereals. Pop. (11) 563,000; (tn) 36,000.

Balin and Balan, 2 brothers in the Arthurian legend. They met on their wanderings, and, failing to recognise each other, fought, and both were slain. Consult Malory, *Morte d'Arthur*. There is also an early poem called *Balan*, belonging to the Charlemagne cycle, the Eng. version of which is *The Soucdone of Babyllone*.

Balingen, Ger. tn in the Land of Baden-Württemberg (q.v.), in the Eyach valley, 38 m. SSW. of Stuttgart (q.v.). It is a holiday resort, and has an 11th- and a 15th-cent. church. Pop. 8700.

Balliol, Family of. The B. family was founded by *Bernard de B.*, who came from Barnard Castle, and was a courtier of David I of Scotland. It was of Norman origin, and shared in the prosperity and prestige which the Normans attained in Scotland in the 12th cent. In the dispute concerning the heirship of the crown of Scotland on the death of the Maid of Norway (1290) *John de B.* (1249-1315) claimed the crown as grandson of Margaret, the eldest daughter of David, Earl of Huntingdon, brother of William the Lion. After the commissioners of Edward I of England had heard the rival claimants, the chief of whom was Robert Bruce, grandfather of the famous monarch of the same name, their award was given to John de B., who assumed the crown of Scotland as vassal of Edward (1292). From the first he was unpopular with the Scots, who dubbed him the Toom Tabard, or empty garment. In 1296 he revolted from his vassalage, giving as his reason for so doing the wanton outrages which Edward committed upon his subjects. The Scots made an inroad into Tynedale, but were defeated with considerable loss at Dunbar (28 April 1296). B. was compelled to surrender his crown, after which he and his 3 sons were sent to London, where they were confined in the Tower for 3 years, and then released at the request of Pope Boniface. B. d. in France, at his patrimonial estate of Bailleul. *Edward* (d. 1363), his son, displayed some ambition, and he invaded Scotland in 1332, in the reign of David II of Scotland, defeating the Earl of Fife at Kinghorn. He again defeated the royal forces at Dupplin Moor, and took Perth. He was crowned at Scone in Sept., but the country rose against him, and he was routed at Moffat. After the defeat of the Scots at Halidon Hill, however, B. returned to Scotland, and attempted to dismember the kingdom by dividing it among the nobility. In 1335, deserted by the nobles, he fled to England and surrendered his claims to Edward III. He d. childless. *Henry*, his brother, had been slain at the battle of Moffat. *John B.*, father of the King of Scotland of the same name, founded Balliol College, about 1263.

Ballista, see BALLISTA.

Balistes, Trigger-fish, or File-fish, classified in the order Plectognath div. of the Teleostei, and generally known as

file-fishes from the serrated spines on their dorsal fins. A peculiarity of this spine is that it can be retracted by muscular action into a groove in the underlying osseous structure, and when erected can be fixed by interlocking with a spinal projection which can be depressed and raised at will. There are sev. species, of which one, *B. capricus*, is occasionally found off the coasts of Great Britain. File-fish is also the name given to a related genus *Monacanthus*.

Baliuag, tn of Luzon, Philippine Is. Rice is milled, and buri-palm hats are made. Pop. 30,870.

Belize, see BELIZE.

Balkan Mountains (anc't *Haemus*), branch or sub-range of the central European mt system, extending from the Iron Gates of the Danube to Cape Emin on the Black Sea. Most of the range, which is about 15 to 25 m. broad and 375 m. long, lies within Bulgaria (in Bulgarian it is called *Stara Planina*). The highest mt is Yumrukchal (7795 ft). The chief pass is the Shipka.

Balkan Peninsula, *The*, the most easterly of the 3 great peninsulas of S. Europe, running southward between the Aegean and Adriatic Seas. Its area is about 200,000 sq. m. The boundary of the peninsula is roughly a line drawn from the mouth of the Danube to the head waters of the Adriatic at Trieste. On the E. it is bounded by the Black Sea, the sea of Marmora, and the Aegean, on the S. by the Mediterranean, and on the W. by the Ionian and the Adriatic Seas. *See* ALBANIA; BOSNIA-HERCEGOVINA; BULGARIA; CROATIA; DALMATIA; GREECE; HUNGARY; MACEDONIA; MONTENEGRO; RUMANIA; SERBIA; SLOVENIA; TURKEY; YUGOSLAVIA.

History of the Balkan Peninsula during the Nineteenth and Twentieth Centuries. Up to the beginning of the 19th cent. the Turks were the dominant race in the B. P. The whole of the peninsula was under their sway except Dalmatia, Montenegro, and the Ionian Is. The cents. of Turkish rule had brought to the conquered races no desire to amalgamate with their conquerors, and no real assimilation of races had taken place, though large numbers of people had been converted to the Muslim faith, notably in Albania. In the third decade of the 19th cent. the war of Gk Independence resulted in an independence for Greece which was recognised by the Turks in 1829, and in 1830 the independence of Serbia as a tribute-paying principality was also recognised. The real break-up of the Ottoman empire began in 1875 with an insurrection in Hercegovina. Similar revolts in Bulgaria were crushed by the massacre of 12,000 Christians, an act which alienated Brit. sympathy and paved the way for the Russo-Turkish war (1877-8). By the treaty of San Stefano a large Bulgarian principality was created as a threat to Turkey, but England and Austria, both hostile to Russia, forced a revision of this treaty at Berlin in 1878. Bulgaria was cut down to a smaller state under the suzerainty of the sultan;

Serbia, Rumania, and Montenegro were now independent, while Bosnia and Hercegovina were put under Austrian administration. The new states had a respite of about 20 years in which to attend to internal development. Attempts to strengthen Bulgarian national unity led to trouble with Russia and Turkey; while suspicion between Serbia and Bulgaria was already almost traditional. To counteract the increasing strength of nationalism in the B. P., Turkish despotism was increasing under Abdul 'the Damned,' who was befriended by Germany. His reign was marred not only by the Armenian massacres, but also by the oppression of the Turks themselves. In 1909 the Young Turk party revolted, and a more constitutional gov. was set up under Abdul's brother, Mohammed V. But the Young Turks' foreign policy embroiled them in a war with Italy over Tripoli, and their oppression in Albania and Macedonia precipitated the formation of the Balkan League in 1912.

The first Balkan war began in Oct., and the allies (Bulgaria, Serbia, Montenegro, and Greece) were victorious over Turkey. Then the 'allies' quarrelled over the partition of almost the whole of former Turkey-in-Europe, and the second Balkan war followed in June 1913. *See further* BALKAN WARS.

Germany was now maturing her scheme of a *Mittel-Europa*, a central empire from Hamburg to Constantinople. Ger. influence was already predominant in Turkey and Bulgaria, while Austria coveted the port of Salonika. At the outbreak of the First World War, Turkey, Greece, Rumania, and Bulgaria declared their neutrality. The aim of diplomacy was to bring these nations into the conflict on one side or the other. By Nov. England and Turkey were at war. The prestige of the Entente suffered by the failure to force the Dardanelles in the Gallipoli campaign of 1915. Bulgaria declared for Germany. The Gallipoli forces were diverted to Salonika, and from there operations were started to save Serbia from the Austrians and Bulgarians. These also failed, and Serbia was disabled in the autumn of 1915. In 1916 Rumania declared war on Austria, but was decisively defeated. The dreams of the pan-Ger. imperialists were now almost fulfilled.

In June 1917 Greece under Venizelos (q.v.) declared war on Germany, Turkey, and Bulgaria. A year later a general allied attack began with Salonika as base and Bulgaria was put out of the war. The various treaties at the end of the war caused the growth of Rumania and the union of the Serbs, Croats, and Slovenes into the kingdom of Yugoslavia. Not long after the war, however, there were three conflicts, first, between Italy and Yugoslavia over the Dalmatian seaboard and the occupation of Fiume (1919); then between Greece and Turkey over the Gk occupation of Smyrna (1922); and finally between Greece and Italy over a political murder, leading to the bombardment of Corfu (1923).

During the 12 years following the First World War, the B. P. states had a hist. of political instability, resulting in dictatorships of one sort or another being set up in all of them, though cloaked by the retention, in name at least, of parl. institutions. All were keenly aware of their external vulnerability.

In 1933 Bulgaria tried to form a S. Balkan bloc, consisting of Bulgaria, Greece, and Turkey, by way of political and economic counterpoise to the Little Entente. A Balkan pact, between Yugoslavia, Rumania, Turkey, and Greece, was, however, signed at Athens, 9 Feb. 1934, by which the signatories mutually guaranteed the security of all their Balkan frontiers; and also, not to embark on political action against any other Balkan non-signatory without previous mutual discussion, or to assume any political obligation towards any other Balkan state without mutual consent.

The movement for a Bulgar-Yugoslavian *rapprochement* was advanced by the signing of a non-aggression pact between those two countries in 1936, and there were also, in the same year, tentative efforts towards a Bulgarian *rapprochement* with the Balkan Entente (Greece, Rumania, Turkey, and Yugoslavia). In Feb. 1938 the permanent council of the Balkan Entente, meeting at Ankara under the presidency of Metaxas, the Gk Prime Minister, to consider the orientation of the Entente after the It. conquest of Abyssinia and the general tension in the Mediterranean owing to It. and Ger. interference in the Sp. Civil war, described their Mediterranean policy as one of good relations and co-operation with the Mediterranean powers, Great Britain, France, and Italy. By this time the general political situation in Europe had deteriorated, and swift diplomatic moves were made by Balkan countries to safeguard their position in the event of a general European war. A non-aggression pact between Bulgaria and the Balkan Entente was signed at Salonika on 31 July 1938. Under this treaty (besides the provisions on mutual non-aggression) the military and naval clauses of the treaty of Neuilly, 1919, were renounced, as also were those clauses in the Lausanne convention of 1923 respecting the Thracian frontier. The effect of this pact was that Bulgaria was thenceforward free to introduce military service and to complete her armaments without restrictions; and, further, she was at liberty to occupy with troops the Thracian frontier zone between Bulgaria, Greece, and Turkey, which had been demilitarised under the Lausanne treaty. The integrity of the three countries of the Balkan Entente—Greece, Rumania, and Turkey—was guaranteed by Great Britain and France in 1939 as a counter-move to the fear of Ger. penetration into SE. Europe. The most definitive of these guarantees was the mutual aid pact between Great Britain and Turkey concluded in May 1939; this was, in effect, a long-term agreement of a reciprocal character in the interests of their national security. For

the impact of the Second World War on the B. P. see EASTERN FRONT, or RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR; also EUROPE, *History*; and GREECE, SECOND WORLD WAR CAMPAIGNS IN (1941).

After the Second World War it seemed for some time that the whole B. P. would come within the Soviet orbit; but Brit. military aid helped to prevent a communist revolution in Greece, and from mid 1948 Yugoslavia acted independently of the Soviet Union in foreign affairs. Rumania, Bulgaria, and Albania remain (1956) firmly linked to the Soviet bloc, being members of the Warsaw pact; in 1953, however, Yugoslavia, Greece, and Turkey signed a treaty of friendship which, though vague in terms, promised a new era of co-operation between these countries of the B. P. which had a common hist. of disagreement. Greece and Turkey were already members of N.A.T.O. (q.v.). From 1954 onwards, however, this Balkan link with N.A.T.O. was progressively weakened by Græco-Turkish bitterness arising out of the Cyprus dispute, and at the beginning of 1957 Western influence in the B. P. was in general at a low ebb.

BIBLIOGRAPHY: *The Present Condition of the Balkans and of European Responsibilities*, by various writers, ed. by Luigi Villari, 1905, has historical value. Other useful works on this earlier period or before are *Turkey in Europe*, by 'Odysseus,' 1900, and W. Miller, *The Balkans*, 1909. Works on the period immediately preceding and on that since the First World War include N. Forbes, A. Toynbee, and others, *The Balkans*, 1913, W. S. Murray, *The Making of the Balkan States*, 1912, J. A. R. Marriott, *The Eastern Question*, 1924, W. Miller, *The Ottoman Empire and its Successors* (3rd ed.), 1927, G. E. R. Gedyes, *Heirs to the Hapsburgs*, 1932, J. S. Roucek, *Politics of the Balkans*, 1939, B. Newman, *Balkan Background*, 1944, and C. Wilmot, *The Struggle for Europe*, 1952. See also bibliographies under individual Balkan nations.

Balkan Wars, The (1912-13). The epoch of European hist. brought to a close by these wars was that which opened in 1453 with the fall of Constantinople, cap. of the Byzantine empire, which, together with the whole Balkan Peninsula, was submerged beneath the wave of Turkish invasion from Asia Minor. In the cents. which followed it was only gradually that one by one the Balkan races achieved partial or complete autonomy. The decline of Ottoman power in the 19th cent. was slowed down by the jealousies of the great powers of Europe and by the rivalries of the petty Balkan states themselves. The Crimean war (1854-6), between Russia on the one hand and England and France on the other, was undertaken by the latter powers to maintain Turkish rule in Europe, and in 1885 Bulgaria and Serbia, for a brief period, were at war with one another because the latter country feared a territorial aggrandisement by Bulgaria in E. Rumelia. The sultan, Abdul-Hamid II, benefited from these jealousies,

and thus for many years secured an immunity, during which he continued to oppress his European provs. But his misgovernment and despotism were too much even for his Muslim subjects. He was deposed in 1909, and a more constitutional regime inaugurated, with his brother, Mohammed V, as sultan.

The hopes raised by the successful revolution of the Young Turks that the Christian pop. of Turkey-in-Europe would be better treated proved to be illusory. So far as the Turks themselves were concerned, some reforms were effected. Jews and Christians were indeed allowed to become officers in the army, but the non-Islamic pop. as a whole (which in Turkey-in-Europe numbered about three-fifths of the total pop.) was no better off. The small states who were Turkey's neighbours in the Balkan Peninsula unavailingly protested against the oppression of their kinsmen in Albania, Macedonia, and Thrace. They appealed to the great powers, who formed the so-called Concert of Europe, to fulfil the obligation to which they had pledged themselves by the treaty of Berlin in 1878, but with little result. At last, despairing of anything being done by the powers, the Balkan states decided to settle the problem themselves by military action. Greece had already, in 1897, fared badly in a war with Turkey. But what each state was individually too weak to accomplish might be effected by union. Sinking for a while their differences, Bulgaria, Serbia, Greece, and Montenegro combined (1912) to form the Balkan League, a league having for its object the safeguarding of the common interests of its nationals in the Turkish empire. By this means a striking force was formed of approximately the same strength as the Ottoman troops, with the added advantage of being able to attack on all sides at once. A suitable opportunity to strike presented itself towards the end of Sept. 1912. The Ottoman administration was suffering from the strain of a year-old war with Italy, and an Albanian rising. After the Balkan mobilisations the great powers, hastily seeking some formula which would preserve an artificial *status quo* in the Balkans, invoked the almost forgotten clause xxiii of the treaty of Berlin—an article by which the great powers pledged themselves to compel Turkey to introduce reforms into its European provs. But on 8 Oct. the smallest of the Balkan states, Montenegro, without even an ultimatum, declared war on Turkey. On 10 Oct. the great powers by their collective note made a last attempt to induce Turkey to grant such reforms as would avert war, and three days later an identical Graeco-Serbo-Bulgarian note was presented to the Ottoman Gov. Turkey's reply to the latter was to declare war on the Balkan allies on 17 Oct. In the meantime the Montenegrins had invaded Albania. Before Turkey declared war on the allies two other significant events had taken place: the admission of deputies from Crete into the Gk Chamber on 14 Oct., and the conclusion on 15 Oct. of

the Peace of Ouchy (or Lausanne) between Turkey and Italy, a peace in which Turkey recognised the *fait accompli* of its occupation of Tripoli.

The Serbs and Greeks invaded Macedonia, the Bulgarians entered N. Thrace. Each of the invading armies overcame Turkish resistance in various parts of the country. The Bulgarians on 22 to 24 Oct. at Kirk-Killise turned the right flank of the army under Nazim Pasha, the Turkish commander-in-chief. The Turks fled from Kirk-Killise, abandoning in their flight large quantities of stores and guns. By this turning movement the Turkish forces were divided: some were driven S. towards the Aegean Sea; the main body retreated towards Constantinople (now Istanbul), while the remainder speedily found themselves invested in Adrianople (Edirne). Pursued by the Bulgarians, Nazim nevertheless succeeded in rallying his forces, and a stand was made in an engagement extending over a front of 100 m. In this great battle, known as that of Bunar Hisse-Lule-Burgas, which was fought on 28-31 Oct., the Turks gained some early successes; but later they were compelled to fall back to Chatalja, with heavy loss. Subsequent Bulgarian attempts to storm Chatalja failed, however.

Meanwhile the Serbian forces were marching on Uskub, the cap. of Old Serbia. At Kumanovo the Serbs won a great victory on 23-4 Oct. The losses on both sides were heavy, the Turkish casualties being estimated at 5000. On 26 Oct. Uskub was occupied by the Serbian troops, and a few days later (2 Nov.) King Peter made his triumphal entry. In a short time the Serbian troops had swept over Macedonia, and a detachment was sent to occupy ports on the Adriatic. Monastir surrendered on 18 Nov. and Alessio, on the Adriatic, was occupied two days later.

The Gk army, under the crown prince, Constantine, was equally successful. Advancing through Thessaly, a few minor engagements were fought with a numerically weaker Turkish force, which retreated towards Salonika. The Turks were badly beaten at Yenidje near the Vardar on 1-2 Nov. The Greeks crossed this riv., and on 9 Nov. Salonika, then the second city of Turkey-in-Europe, surrendered without further fighting.

A notable feature of this war was the presence in the field of all the sovereigns of the allied states, Ferdinand of Bulgaria, Peter of Serbia, George of Greece, and Nicholas of Montenegro. From the military viewpoint the war demonstrated the usefulness of aeroplanes (of which Bulgaria had sev.), and showed that the bayonet was still a most effective weapon, especially in a final assault after artillery preparation.

Naval operations were of minor importance. Three only of the combatants possessed any fighting ships—Greece, Bulgaria, and Turkey. The Turkish fleet at that time was negligible, but it served to establish a blockade of the Bulgarian coast in the Black Sea, and it

bombarded a few coast tns, notably Varna. On the other hand, the Gk Navy occupied the is. of the Aegean Archipelago, beginning with Lemnos on 21 Oct., and finishing with Mitylene, 22 Nov. On 12 Nov. Turkey asked Bulgaria for an armistice. On 25 Nov. delegates met at Chataltja to arrange terms for this armistice, and the eventual peace. The armistice was signed on 3 Dec. by Turkey and all the allies except Greece, who maintained that the terms were too favourable to Turkey.

It is estimated that during the first weeks of the war the Turks lost from all causes 200,000 men. The allies captured 500 guns, 100,000 rifles, and vast quantities of stores and ammunition. The total casualties of the Balkan League are put at 80,000.

In the peace negotiations in London the issue was narrowed to the question whether Turkey was willing to surrender the Aegean is. and all her European possessions W. of Adrianople. Turkish agreement to this was finally secured, but before the settlement could be carried out Kiamil's gov. was overthrown on 23 Jan. 1913 by the Young Turk party, led by Talaat Bey and the popular Enver Bey (see ENVER PASHA). Kiamil resigned, and the Young Turks set up Mahmud Shevket Pasha as grand vizier. The new ministry made the retention of Adrianople a cardinal point of policy. The conference of London broke up and hostilities were resumed. During Mar. and April the 3 centres of Turkish power in the Balkans, the garrison tns of Adrianople, Janina, and Scutari, surrendered to the Bulgarians, the Greeks, and the Serbs respectively. On 30 May the Turks were compelled to sign the treaty of London. In this treaty the great powers of Europe had a guiding hand, and reserved to themselves the right to settle the boundaries of Albania and to determine the destiny of the Aegean Is. Turkey-in-Europe was confined to a piece of E. Thrace, within a boundary line drawn from Enos to Midia. The Balkan allies had the task of partitioning the rest of Turkey's former possessions in Europe. The div. of Macedonia was at once a source of contention. Bulgaria especially was dissatisfied with her gains, and on 29 June 1913 the Bulgarian army made a treacherous surprise attack along the Gk and Serbian lines in Macedonia, starting what is generally known as the Second Balkan War. A month's fierce fighting followed between the Balkan allies, during which Turkey seized the opportunity to reoccupy Adrianople. Rumania advanced upon Bulgaria from the N. and occupied the ter. of Silistria. Bulgaria was forced to make peace, and on 10 Aug. 1913 the treaty of Bucharest was signed, thus bringing to an end the Second Balkan War. By its terms Bulgaria was excluded from Macedonia, and Adrianople reverted to the Turks. Rumania, Montenegro, Serbia, and Greece made large territorial gains. The two wars had caused the death of nearly 350,000 men, and caused a legacy of hatred among the

Balkan states which was to have repercussions over the next four decades. They had, however, succeeded in their original aim of breaking Turkish power in Europe.

Consult J. B. Schurman, *The Balkan Wars, 1912-13*, 1914; D. J. Cassavetti, *Hellas and the Balkan Wars, 1914*; R. Rank, *Inner History of the Balkan War, 1914*; R. W. Seton-Watson, *The Rise of Nationality in the Balkans, 1917*.

Balkars, Turkic-speaking people closely related to the Karachay (q.v.), who lived until 1943 on the N. slopes of the main Caucasian range, E. of El'brus, and numbered (1939) 43,000. They were subject to Kabarda (q.v.) from the 1820's to Russia, and were included in the Mountain Peoples' Autonomous Rep. in 1921, and in the Kabarda-Balkar Autonomous Oblast in 1922. In 1943 the B. were deported to Asiatic Russia for alleged collaboration with the Germans. They were rehabilitated in 1957. See W. Kolarz, *Russia and Her Colonies, 1952*.

Balkh, formerly cap. of a principality of that name in N. Afghanistan, and once known by its Persian name Bakhtri as the cap. of anct Bactria (q.v.). It is situated 23 m. S. of the R. Amu Dar'ya and the ruins of its anct site are still discernible, having a circumference of at least 20 m. Four m. to the eastward lies the new tn, called Mazari-i-Sherif, the modern Afghan cap. of the prov., with a pop. of about 30,000. It was here that the Graeco-Asiatic civilisation first found expression, but even before this the magi of Persia founded the Zoroastrian religion. On the death of Alexander the Great it became incorporated with the Graeco-Syrian kingdom of the Selucidae, and later figured as a centre where Buddhist propaganda was disseminated. The natives designated it Am-ul-Beled, mother of cities, and trusted in its rehabilitation to the condition of its anct splendour. The neighbouring soil is fertile, and large quantities of wheat are grown.

Balkhash: 1. Lake in the Karaganda and Taldy-Kurgan Oblasts of the Kazakh S.S.R. of the Soviet Union. It is 150 m. in length, with a breadth of half that distance, and is the fourth largest inland sea in the U.S.S.R. For 6 months in the year, from Nov. onwards, it is frozen over. During the rest of the year it is open to water-borne traffic, and shipyards have been put in operation at the mouths of the Karatal, Lepsa, and Ili R.s, which are the chief rivs. feeding the lake.

2. A tn situated on Lake B. An important centre of the copper industry. Pop. 60,000.

Ball, Games of. Originally the game of B. had probably a religious significance, and some of the pastimes into which the use of the B. or sphere enter, such as the B. game of certain Amer. Indian tribes, or that of the anct Mexicans, are known to have possessed an astronomical basis. Again, the struggle of good against evil is thought to have been typified by certain anct Persian B. games, the sphere in this instance representing the world. In Greece and Rome in classical times

various B. games were played by young and old, and in medieval England and France tennis and pell-mell were favourite pastimes. In more modern times first golf, native to either Holland or Scotland, then cricket were evolved as B. games, and football, perhaps the most popular of all, has been a game of both the Scottish and Eng. people for cents. Polo and baseball, the latter a game of Amer. origin, lawn tennis, lacrosse, and basket-ball are other modern B. games. See separate articles.

Ball, Albert (1896-1918), air-ace of First World War, b. Nottingham. An outstanding fighter pilot, he was awarded the V.C. posthumously in 1918 (having already won the D.S.O. and M.C.).

Ball, Sir Alexander John (1757-1809), Eng. admiral, served in the Mediterranean under Lord Nelson. In 1799 he was elected by the Maltese as their chief and the president of their congress. He became rear-admiral, 1805. Nelson thought him a 'great coxcomb' before B. received a command; but afterwards, when B. was continuously employed, they became close friends. B. served under Nelson at the battle of the Nile, where his ship *Alexander* was the particular opponent of Brueys's flagship *L'Orient*, which blew up. He proved a very popular governor of Malta, being solicitous for the interests of the Maltese.

Ball, John (d. 1381), Eng. priest and agitator who helped to stir up the mob during the Peasants' Revolt (q.v.). He had travelled the country for 20 years previously preaching doctrines which seem to have combined religious reform with ideas of social revolution. He was in prison in Maidstone when the revolt began, but was freed by the rebels and is said to have spurred them on to many excesses. On the collapse of the revolt and the death of Tyler he was captured and hanged at St Albans, 15 July 1381. See Wm Morris, *A Dream of John Ball*, 1888, and Sir C. Oman, *The Great Revolt of 1381*, 1906.

Ball, John (1818-89), Irish scientist, politician, and traveller. He was called to the Irish Bar, 1845; became M.P. for co. Carlow, 1852; under-secretary of state for the colonies, 1855-7; and first president of the Alpine Club, 1857. He pub. the *Alpine Guide*, 1863-8, ed. *Peaks, Passes, and Glaciers*, and wrote works on physical and geographical science.

Ball, Sir Robert Stawell (1840-1913), astronomer, b. Dublin; educ. at Trinity College. Lord Rosse appointed him his astronomer in 1865, and in 1873 he was elected F.R.S. and created prof. of applied mathematics in the Royal Irish College of Science. In 1874 he became prof. of astronomy at Dublin, with which went the office of Royal Astronomer of Ireland, and in 1892 became Lowndean prof. of mathematics at Cambridge. His best-known works are *The Story of the Heavens*, 1885, *In Starry Realms*, 1892, and *In the High Heavens*, 1893. D. at Cambridge.

Ball, Thomas (1819-1911), Amer. sculptor, b. Charlestown, Massachusetts. In early life he was a distinguished bass,

but soon gave up singing for painting and sculpture. In 1852 he made busts of Jenny Lind and Daniel Webster; his other chief works are the statue of Washington in Boston Public Garden, of Webster in the Central Park of New York, and the group 'Emancipation' in Washington. See his autobiography, *My Threescore Years and Ten*, 1891.

Ball Bearings, hard steel balls surrounding a shaft or axle, intended to lessen friction by substituting rolling for sliding contact. Where a fixed bearing is used, the journal, or portion of the shaft within the bearing, slides over the surface of the encircling material; such movement not only causes the wearing out of the parts in contact, but necessitates work being done to overcome the friction. Both of these disadvantages may be minimised by efficient lubrication, that is, providing a thin film of oil between the journal and the bearing. Theoretically, the resulting friction is reduced to the reluctance of the fluid to move over either surface; but practically it is impossible to maintain an absolutely continuous film of oil. For light loads and moderate speeds it has long been the custom to place a row of balls between hardened surfaces, called ball-races, on the rotating piece and the stationary piece. The balls roll over these surfaces if properly adjusted, and the only sliding friction which occurs is between ball and ball, and if the balls are of good shape and well lubricated, this is not considerable. The qualities of an efficient B. B. are therefore hardness in the balls and races, perfect sphericity and equality of diameter in all the balls, and a good lubricating arrangement. The races may be plane or concave, the best results being obtained where the races are curved to a radius of two-thirds of the balls' diameter.

Ball-flower, ornament in Eng. Gothic architecture, resembling a ball placed within a circular flower, sometimes with 3, sometimes with 4, petals. It is characteristic of the Decorated style of the 14th cent. It is supposed by some to be an imitation of a pomegranate, and by others of a hawk's bill.

Ballachulish, vil. and par. in Argyll, Scotland, on the S. banks of Loch Leven. The name is derived from Gaelic *Baile-aig-a-chaolas*, the vil. at the narrows or straits. The staple industry is slate-quarrying. Pop. 1500.

Ballad, poetical composition narrative in matter and lyrical in form which generally recounts some legend or story. It must not be confounded with the ballade (q.v.). This type of composition appears to have arisen spontaneously in almost all literatures, and represents one of the early stages in the evolution of poetic art. Its origin is much in dispute, but it seems to have begun, as its name implies (Lat. *ballare*, to dance) as a song intended to accompany a dance. Hence the term was applied to a spirited poem, and then to a poem in which a popular story was vividly and simply told. It originally received its present name and shape in Italy of the 12th cent. It is,

Valentine, Dundee

LOCH LEVEN AND THE GLENCOE MOUNTAINS FROM NORTH BALLACHULISH

however, in N. Europe that the B. has risen to highest distinction, and although the B.s of the Ger. poets Uhland, Bürger, Goethe, and Schiller certainly touch a level of the highest excellence as regards both composition and romantic feeling, it is to our own country we must look for the B. in its most natural form. The most perfect specimens of the Brit. B. are those early compositions to which no authorship can be assigned, although the works of Scott, Wordsworth, Tennyson, and Coleridge contain modern examples of this type of story-song.

What is true of folklore may be also held true of folk-song. The plots utilised in the B. are few and of world-wide acceptance. As the epic, folk-tale, fairy-tale, and *Märchen* are all universally wrought on the basis of a few venerable plots, so the material for the folk-song is almost equally scanty. These bases of the B. are among the romantic heritage of the sev. European peoples as much as is the story of the 'fatal children' common to all mythologies, or the tale of the neglected daughter, the origin of so much matter of faery. We have, too, the tale of the girl who follows her 'fause luve.' Such is the subject-matter of *Burd Ellen*, one of the most touching ever sung to the harps of the 'North Countree,' and such is the plot of B.s in French, Danish, and other tongues. Again, we have the B. of the girl who, doubting her lover, is taken by him to a secret place, and is there told by him that she must die. By a trick she succeeds in taking his life instead. Such a plot is almost universal. In the B.s of Bürger and Goethe, modelled on older types, we notice that the shades of the departed act as if alive. They

return to lie beside their lovers until cock-crow, and ride on swift steeds on which they often carry off the object of their earthly affections. So acts Clerk Saunders in the old Scottish B., and so do scores of ghostly wights in the B.s of all lands. This conception is drawn from Norse mythology. For example, we find in one of the Norwegian sagas the wife returning to the dead husband who is buried in the great mound on the moor by his dwelling. We thus find the same machinery employed throughout the B.s of many lands, however different the local colouring may be. But there are other marks which betray the universality of B. material. For example, we are never far away from the talking bird or the chorus of birds, the 'wee birdie' of the Scottish B.s which with warning accents bids the 'bonnie may' beware of the 'fause Sir John.' Again, we find that the generality of B.-mongers have a decided partiality for gold and silver, and that the heroes and heroines of their songs are always mightily bedizened. They are liberally bedecked with the 'red gould,' and 'siller' is always plenteous. They have 'roses till their shoon,' and a great display of feathers. Their body-linen is invariably white as snow, and the cramoisy and satins they wear are minutely specified with all the snobbery of a sycophantic bardhood. But there is wretchedness too. Hynd Horne and his like who come to claim their own are dressed as beggars, but the lordliness shines through their rags, and after receiving hospitality they stand forth in their native dignity and are duly remembered. In the refrains of such—in *Hynd Horne* it is 'The birk and the broom blooms bonny'—we find many

allusions to plants. We know not the wherefore of this popularity of the heath plants, which permit their names to recur in B. refrain alternately with 'down-derry-down,' and the like, but some deeper significance probably lurks behind what would seem to be mere caprice. Ghastly crime is often, too, found in the B. motif. The Lammikin who slaughters his may (maid), the luckless 'childe' who is drowned or smothered—invariably the possessor of 'gouden looks'—recur among the old, unhappy, far-off things with the dastard groom who goes in his master's stead to his lady's bower, and is slain by his exasperated lord.

The ballad in Britain. Practically no B. forms of Brit. origin of a greater antiquity than the 14th cent. have come down to us. One example from the 13th cent. is a 36-line poem *Indas* which is now accepted as an early B. In the 14th cent. the native Eng. composition began to find favour with the people to the detriment of the Fr. importations, and the 15th cent. appears to have been that of its highest ascendancy and its most abundant and successful production. In succeeding cents. the B. form became gradually neglected and remained so until the period of its resuscitation by Bishop Percy, after a period of nearly 300 years. In his *Reliques of English Poetry* he gave an impetus to the immense vogue of the romantic which dominated Eng. poetry for the next cent. The material whence Sir Walter Scott's *Minstrelsy of the Scottish Border* and its like was drawn was in all probability for the most part 'made' in the 15th and 16th cents. The *Ballad of Sir Patrick Spens*, for example, is regarded by some as a modern forgery, yet in its machinery and circumstances it bears the stamp of old. It was probably written in the 16th cent. from a still older B. contemporary with the times of which it sings—the days succeeding the death of Alexander III of Scotland, when the Maid of Norway was called to the throne. It was not the Chaucers, the Dunbars, the Lindsays, or Spensers who fostered the B., but the Blind Harrys, the Huchecrons, and the 'borrel' or rustic minstrels. The literature of the Brit. B. has been examined by Furnivall, Ritson, Madden, Halliwell, and others, and especially by Prof. F. J. Child (q.v.).

The ballad in Germany. Although the *Volkslieder* of the Ger. peoples is a form of considerable antiquity, it probably attained its present type at the hands of the minnesingers who clustered around the courts of the landgraves and petty kings of the Germany of the Middle Ages. At the court of Hermann, landgrave of Thuringia (c. 1180-c. 1200), poetical effort reached a high standard, and such singers arose as Wolfram von Eschenbach and Gottfried von Strassburg. Such 'epics' as the *Parzival* and *Tristan* of these poets were the lineal ancestors of the B. form, and we find their echoes in many a later effort. In the *Heldenbuch*, or great book of national heroes, and the *Nibelungenlied* we find gathered together a number of B.s, the sequence of which assists to make

up a completed whole. During the 15th cent. a satiric type of B. arose, and was succeeded by the comic B. of which *Till Eulenspiegel* is the form *par excellence*. During the Lutheran period the B. declined, but upon the romantic renaissance which in Germany had as its protagonists Klopstock, Wieland, and perhaps Lessing, the B. returned to fostering influences, and in the hands of Bürger, Goethe, Schiller, and Uhland attained perfection. The B.s of modern Germany do not possess the almost childlike brightness of those of the old *Minnelieder*, but are marked by a gloomy grandeur and mysticism.

The ballad in France. The earliest Fr. B.—perhaps the only one of early origin that has survived—is that of *Aucassin et Nicolette* (really a *conte-fable* or *nouvelle*), and with the withering of the *Langue d'Oc* before the *Langue d'Oïl* practically all the B. poetry of the former dialect must have vanished. Such 'epics' as the *Chanson de Roland*, *Ogier le Danois*, and the like, were probably a conglomeration of B.s. During what may be called the Arthurian period the B. appears to have been lost among the romances which, if they partook of the B. form, and were sung in the same manner as a B., were yet too extended to justify their inclusion in the same nomenclature. In medieval France, in short, the B. ran to a more extended and epic form, and thus lost that simplicity and brevity which were its chief characteristics. It is not until the 15th cent. that we get back to anything like the B., the rather affected and frigid efforts of Charles d'Orléans possessing some slight affinity with its *genre*. Villon, too, had B. affinities which, however, were counter-balanced by his richness of fancy and display of effort. With the rise of the romantic school in 1830, the B. came back to its own, and in the works of Victor Hugo, Gautier, Sainte-Beuve, and Emile Deschamps received liberal treatment and recognition.

The ballad in Spain. Sp. literature is rich in B.s. Perhaps the earliest type is that of the *Poema del Cid*, probably, like most early epics, composed of numerous B.s joined into a compact whole. The strife with the Moors inspired many B.s which in their turn might have been welded into another epic like the *Cid* had the master-hand been present. These are mostly anonymous, and deal with the deeds of noble knights, the love of fair ladies, Spanish and Moorish, and other chivalric matter. A good idea can be had of the quality of these B.s by a perusal of Lockhart's *Spanish Ballads*. In Spain the B. has mostly to do with romance pure and simple. A peasant or bucolic music arose separately, but although it approximates at times to the B. type it cannot altogether be classed with it. The B.s of Spain are in general composed in a more varied metre than those of other European countries, and have furnished many Brit. poets with models for the composition of narrative verse.

In other countries of Europe the B. may be said to have followed a course

similar to that indicated in the case of those countries dealt with. The foreign type of B. which bears most resemblance to the British is the Scandinavian, and there can be no doubt that sev. of our B.s are direct Scandinavian importations, whilst the reverse can also be maintained. Norman-Fr. forms also display some connection with ours, and the B.s of Brittany exhibit what might be described as a territorial connection with those of this country. The B. is by no means confined to Europe, and the various Asiatic countries possess forms which closely approximate to the European. S. America, too, has a B. literature of its own, and the U.S.A. is by no means destitute of folk-songs cast in B. form.

The ballad in music takes various forms: (1) the It. *balletta* (originally *ballata*, a dancing-piece), which was a song in dance-measure and sometimes accompanied by dancing; (2) tunes that became traditionally attached to literary B.s, such as *Edvard* or *Chevy Chase*; (3) songs or choral works in narrative form, especially of the romantic school, relating heroic or fantastic stories, such as Schubert's *Erkling* or Stanford's *La Belle Dame sans Merci*; (4) instrumental works illustrating or suggesting similar subjects in the form of symphonic poems for orchestra or of piano pieces (Chopin, Liszt, Brahms, etc.); (5) Eng. drawing-room songs of about the turn of the 20th cent., usually inferior music set to sentimental verses of no better quality.

Entwistle, *European Balladry*, 1939; M. J. C. Hodgart, *The Ballads*, 1950.

Ballad Opera, type of Eng. stage piece the libretto of which consists of spoken dialogue interspersed with songs which, instead of being specially composed, have their words fitted to tunes already existing, either in the form of folk-songs or of popular contemporary melodies. The first and most famous example is *The Beggar's Opera* (1728) by John Gay. Many others appeared during the next 12 years, but the fashion declined after 1740.

Ballade, form of verse consisting of 3 stanzas of 8 or 10 lines, concluding with an envoi of 4 or 5 lines. Each stanza must include 3 rhymes only, and the same rhymes in the same order must occur in

each of the succeeding stanzas throughout the B. Each stanza, as well as the envoi, must have the same refrain. The envoi usually contains the dedication of the poem to some particular person, and often commenced with the title of the person to whom it was addressed, as 'prince' or 'sire.' It forms the climax of the poem. The B. is usually classed by prosodists among the forms utilised as *vers de société*. It must not be confounded with the ballad (q.v.). Modern B.s of excellence have been written by W. E. Henley, A. C. Swinburne, Austin Dobson, Andrew Lang, G. K. Chesterton, E. C. Bentley, Bayard Simmons, Paul Selver, Hilaire Belloc, and Théodore de Banville (qq.v.), who brought this and other medieval Fr. forms into fashion again. It is essentially an antique form modernised, and was probably first perfected by Villon.

Ballagi, Mór (originally Bloch, Moritz) (1815-91), Hungarian linguist and theologian. Jewish by birth, in 1843 he became Protestant. His main aim was to magyarise and convert the Hungarian Jews. Hence, he pub. Hungarian practical grammars and dictionaries; founded (in 1858) the *Protestáns egyházi és iskolai lap* ('Protestant Church- and School-paper'); and began the trans. of the Bible into Hungarian.

Ballance, John (1839-93), New Zealand Premier, b. Glenavy, Antrim, N. Ireland. He emigrated to Wanganui, where he was first a shopkeeper, then a journalist, and the founder of the *Wanganui Herald*. He took an active part in the Maori war of 1867. In 1875 he entered the House of Representatives; in 1878 became treasurer in Sir George Grey's ministry; resigned in 1879. He re-entered Parliament in 1884 as minister of lands and native affairs; became leader of the Liberal opposition in 1888, and Prime Minister in 1891. In politics he showed himself broadminded, and his treatment of the Maoris was pacific. He adopted the humanitarian ideals of Sir George Grey (q.v.) with quiet enthusiasm and promoted them with the practical common sense of the trained politician. See *Dictionary of New Zealand Biography*.

Ballanche, Pierre Simon (1776-1847), Fr. philosopher, b. Lyons. Early in life he succeeded in joining the literary circle represented by Madame Récamier and Chateaubriand. He was an exponent of the theocratic school of philosophy, being opposed to rationalism and upholding revelation and authority. His prin. work is *Palingénésie*, divided into 3 parts—I. 'L'Orphée'; II. 'La Formule'; and III. 'La Ville des expiations'—in which he may be said to outline the hist. and philosophy of the world, past, present, and future. His later *Vision d'Hébal* contains the supposed prophecies of a chief of a Scottish clan gifted with second sight, who sets down what he sees of the future hist. of the earth. See C. Huit, *La Vie et les œuvres de Ballanche*, Paris, 1904.

Ballantine, James (1808-77), author, b. Edinburgh. He is known for *Gaberlunzie's Walley* (1843), a miscellany in which the

items are supposed to be drawn from the wallet of a wayfaring pedlar. He was also the author of *The Miller of Deanhaugh*, and of some of the liveliest of Scottish humorous songs. One of the first to revive the art of glass-painting, he was appointed to provide stained-glass windows for the House of Lords in 1844.

Ballantine, William (1812-87), serjeant-at-law, b. London. Educ. at St Paul's School, he was called to the Bar in 1834, and being disposed to a literary and theatrical life, soon acquired a number of friends connected with these professions. His most famous case was the one in which he defended the Tichborne claimant. He successfully carried off sev. *causes célèbres*, especially that of Franz Müller, who was tried for murder in 1864. He also acted for the gaekwar of Baroda in 1875. He d. at Margate. Anecdotes of B. will be found in Montague Williams's *Leaves of a Life*, 1890.

Ballantrae, vil. in SW. Ayrshire, Scotland, once the centre of a thriving fishing industry, now noted for early potatoes. S. R. Crockett's *The Grey Man* is set in B., but R. L. Stevenson's *The Master of Ballantrae* centres round Borgeue, Kircudbright. Pop. 500 (of par. 1300).

Ballantyne, James (1772-1833), editor and publisher, b. Kelso. As a young man he founded the *Kelso Mail*, and was the first to introduce an improved style of printing into Scotland. This attracted the notice of Sir Walter Scott, whose productions he printed, not hesitating to advise certain alterations in the subject-matter of the MSS. In 1826 the company of which he was the head became involved in the bankruptcy of Messrs Constable. B. distinguished himself in the eyes of his contemporaries as a judge of dramatic literature.

His brother John was b. at Kelso in 1774. He took part in the business of his brother, and was known as a judge of *objets d'art* and works of antiquity. He pub. separately a number of celebrated works, notably Scott's ed. of the *British Novelists*, and the works of Beaumont and Fletcher. He also ed. 2 periodicals, *The Visionary* and *The Saleroom*. He d. at Melrose in 1821.

Ballantyne, James Robert (1813-64), Scottish orientalist; taught Oriental languages at the Naval and Military Academy, Edinburgh; was principal of, and prof. at Sanskrit College at Benares 1845-61; librarian to the India Office, London, 1861. He pub. numerous books aiming at rendering Indian philosophy familiar to European students, and W. thought to Indian intellectuals.

Ballantyne, Robert Michael (1825-94), author, b. Edinburgh, a nephew of the printer of Walter Scott's works. His descriptions of the life of the trapper and hunter dwelling in wild outposts gave him a reputation as a writer of books of adventure for boys, and his informative and interesting method of writing from personal experience has given his work a value not often associated with fiction of its class. Among his best-known books are *Ungava*, 1857, and *The Coral Island*,

1858. His *Personal Reminiscences in Book-making* appeared in 1893.

Ballarat, or **Ballaarat**, city of Victoria, Australia, 74 m. by railway WNW. of Melbourne. It is famous for its goldfields, which were discovered in 1851, and still yield a considerable revenue. But whereas the auriferous soil was found almost at the surface in the middle of last cent., it has now to be sought at a depth of about 2500 ft., and quartz mining has become the staple industry of the dist. The deepest mine, S. Star, yielded, from 1851 to 1930, over £85,000,000. The community is divided into B. E. and W., the pop. of the 2 portions aggregating 40,000. The city is modern in construction, and possesses many handsome buildings, besides factories, breweries, and mills. There are Anglican and Rom. Catholic cathedrals, art galleries, botanic gardens, an observatory, a museum, and a school of mines affiliated to the univ. of Victoria. B. is the third city of Victoria; it is an important railway junction, and, being nearly 1500 ft. above sea level, has an excellent and healthy climate. On 3 Dec. 1854, the method of licensing miners brought about a serious riot which culminated in a veritable battle known as the Eureka Stockade, where over 500 miners were attacked by 270 troops and police, who captured the stockade; about 30 miners were killed and some 60 wounded. Pop. 40,000.

Ballard, name of a famous family of Fr. printers of music who held the monopoly of their business for 2 cents., handing it down from one generation to another until the Revolution. They were enabled to resist all innovations in music-printing by their privilege, and were supported by the court. Robert B., the founder of the firm, received his privilege from Henry II in 1553; and each generation of the family was confirmed in its monopoly by successive royal commands until 1793, when monopolies were abolished by the Revolution.

Ballast, term used to denote any weight placed in a ship's hold, with the object of sinking her deeper in the water, to secure proper stability and safe sailing, when her cargo is too light. B. may consist of gravel, stone, sand, iron, or water. Modern steamers carry tanks forward, aft, and amidships, which can be filled with water to regulate the trim of the boat. The term is also applied to bags of sand and gravel used to steady a balloon. The word is used in engineering to denote the gravelly material laid as packing between railway sleepers.

Ballater, small burgh of Aberdeenshire, Scotland, 42 m. W. of Aberdeen, on the R. Dee. On account of its proximity to the royal residence of Balmoral and the numerous beauty spots in that part of the co. it is a favourite tourist centre, and the rail terminal on 'Royal Deeside.' Pop. 1320.

Ballenstedt, Ger. tn in the dist. of Halle, at the N. foot of the Harz Mts (q.v.), 35 m. NW. of Halle (q.v.). It was the first property of the house of Ascania (q.v.), and the tomb of Albert the Bear

(see ALBERT OF BRANDENBURG) is in the church. The tn is a health resort. Pop. 11,000.

Ballyny Isles, group of volcanic antarctic is. in the S. Ocean discovered by John Ballyny and H. Freeman, the commanders of 2 vessels sent out on a sealing expedition to the S. Seas, in 1838. The group was first seen 9 Feb. 1839. It consists of 5 is. which, proceeding from E. to W., are called Sturge Is., Buckle Is., Borradaile Is., Young Is., and Row Is. Young Is. rises to a peak, called Peak Freeman, which is 12,000 ft above sea level. Whales, penguins, seals, and Cape pigeons are numerous. Thick fogs are frequent, and navigation in the neighbourhood of the is. is dangerous from drifting ice. They belong to New Zealand.

Ballet (see also DANCING), one of the theatrical arts, in which the prin. mode of expression is the dance, this being allied, with rare exceptions, to music and spectacle. The origins of the art can be traced back to the It. courts of the Renaissance, when professional dancer-musicians produced lavish entertainments for special occasions, the dance technique employed being then already highly developed. As a result of Franco-It. contacts, It. dancing-masters made their appearance at the Fr. courts during the 16th cent. and, encouraged particularly by Catherine de' Medici, developed the *ballet de cour*, the most successful work of this type being Beaujoyeux's *Ballet Comique de la Reine* (1581). In succeeding reigns, and particularly under Louis XIV, many *ballets de cour* were produced in which the courtiers, often including the king, took part with a sprinkling of professional dancers. Encouragement of the arts was one of the cornerstones of Louis XIV's policy of *agrandissement* of the monarchy, and in 1669 the *Académie de Musique*, or the Paris Opéra, was founded with the exclusive royal privilege of producing opera in France. Until well into the 18th cent. the forms of B. and opera, as we know them, were often intermingled in the opera-ballet, the most historic of which was *Les Indes galantes* (1735) with music by Rameau. The first great ballerinas, Camargo and Sallé, fl. at this time, as did the great male dancer Dupré. The divorcing of B. from opera, and the introduction of the *ballet d'action* in the second half of the 18th cent., marked a revolutionary development. The credit for this innovation is generally given to Noverre (1727-1810), but others, notably Hilverding and G. Angiolini, were working simultaneously in the same direction. Noverre allied mime to the dance to produce an entertainment without recourse to song or speech, and his *Lettres sur la danse et sur les ballets* (first pub. in 1760) remains one of the basic and most important works on the aesthetics of B. During the 18th cent. B. spread to nearly every important cap. in Europe, including St Petersburg, Milan, and Copenhagen, where permanent B. schools were estab. as in Paris. Noverre's precepts were followed

in France by Dauberval, M. and P. Gardel, and Milon, while in Italy at the end of the cent. elaborate B.s in which mime held a more predominant place were being produced by S. Viganò. The 18th cent. saw a great development in technique, particularly among male dancers, the most famous being G. and A. Vestris, and improvements in costume gave the dancers more freedom of movement. Further progress was made in the 19th cent., particularly between 1820 and 1860, the period of the 'Romantic B.' The discarding of the heeled shoe led to the introduction of *pointe* work, which enlarged the ballerina's technique disproportionately to that of the male dancer. Brugnoli was one of the first ballerinas to dance on *pointes*. Marie Taglioni (q.v.) was the greatest dancer of that age, her chief rivals being Cerrito, Carlotta Grisi, Rosati, and Grahn. In sympathy with the Romantic movement, the most popular subjects for B.s shifted from tales of gods and heroes to legends of supernatural creatures with exotic settings, which were sometimes written by poets such as Gautier, and with the scenic progress then being made and the introduction of gas lighting an illusion much greater than ever before was achieved. Most famous of the B.s of this period were *La Sylphide*, 1831, and *Giselle*, 1841, from Paris, *La Esmeralda*, 1844, and the *Pas de Quatre*, 1845, from London, and *Napoli*, 1842, from Copenhagen, the important choreographers being Aumer, F. Taglioni, Henry, J. Coralli, Perrot, Mazilier, Saint-Léon, Bournonville, and Cortesi, and the teachers including Coulon and Blasis. Except in Russia, B. declined rapidly in popular favour from 1860 until the coming of the Diaghilev Ballet in 1909, but sev. works survive from the Paris Opéra repertory of this period, *Coppélia*, 1870, *Sylvia*, 1876, and *Les Deux pigeons*, 1886. In Russia, on the other hand, the importance of B. was maintained at St Petersburg, where M. Petipa dominated the scene from 1870 until 1903. Russia had long had a *corps de ballet* unmatched in any other country, and elaborate scenic resources of which fullest use was made, but Russian ballerinas were only just establishing themselves as the equal of It. visitors such as Zucchi and Legnani. Tchaikovsky composed scores of 3 B.s first produced in Russia in the last quarter of the 19th cent., and all 3 have now become classics: *Le Lac des cygnes*, 1877, *The Sleeping Beauty*, 1890, and *Casse-Noisette*, 1892. The great ballerinas of the period separating the Romantic B. and the Diaghilev B. were Zucchi, Mauri, Kshessinskaya, Preobrazenskaya, Zambelli, and Genée. In 1909 Serge Diaghilev (q.v.) brought a company of Russian dancers to Paris and for 20 years, by his genius in co-ordinating the talents of choreographers, dancers, musicians, and painters, he infused fresh vigour into B. in W. Europe, raising it from decadence to an artistic peak it had never known before. His first B.-master Fokine (q.v.) was almost as great an innovator as Noverre, and his B.s came as

a revelation, as did the dancing of Karsavina (q.v.), Lopokova (q.v.), Sokolova (an Englishwoman, Hilda Munnings), Nijinsky (q.v.), and Bolm, and later Spessivtseva (who went on to become *étoile* of the Paris Opéra), Danilova, Dolin, and Lifar. Of the other choreographers who worked for Diaghilev, the most important were Nijinsky, Massine, Nijinska, Balanchine, and Lifar. Foremost among the teachers of this period was Cecchetti, whose system is extensively used to-day, and who completed the training of Karsavina and Nijinsky, and taught Massine, Lifar, Markova (q.v.), and many other famous

been enhanced by such distinguished dancers as Darsonval, Chauviré and Vyroubova, Lifar himself, and Renault. Among the most vigorous manifestations of Fr. B. in recent years have been the performances of the Ballets des Champs-Élysées and the Ballets de Paris, both directed by R. Petit, among whose B.s may be mentioned *Les Forains*, 1945, *Carmen*, 1949, and *Le Loup*, 1953. The Diaghilev revolution has largely passed by Russia, where B. has followed a different path, preferring a greater realism in treatment and being much less adventurous in its association with the allied

A ballet school scene in the foyer of the Opera House, Paris, 1872.

contemporary dancers. The itinerant B. company did not die with Diaghilev in 1929, but its status and importance have gradually declined as the national companies have assimilated the lessons of the Diaghilev B. Among later impresarios who have attempted to follow in Diaghilev's footsteps have been René Blum, Col. de Basil, and the Marquis de Cuevas; it was the B. Russe de Monte Carlo, directed by de Basil and Blum, that presented to the world the 3 so-called 'baby ballerinas,' Tomanova, Baronova, and Riabouchinska, in 1932.

Contemporary foreign ballet companies. The most important companies to-day are the national companies of France, Britain, Russia, America, and Denmark. The Paris Opéra B. has taken on a new lease of life since the engagement in 1929 of Lifar, who has produced a great number of works, among them *Icare*, 1935, *Le Chevalier et la damoiselle*, 1941, *Suite en blanc*, 1943, and *Les Noces fantastiques*, 1955, and the company's tradition has

arts of music and painting, although the technical standards remain at a very high level. The contemporary Russian ballerina Ulanova may be classed with Fonteyn and Chauviré. The strength of the Dan. B. repertory lies in the classics from its past, Galeotti's *The Whims of Cupid and the Ballet-master*, 1786, and numerous B.s by the 19th-cent. choreographer Bournonville, all of which have been faithfully preserved. It owes its present prestige largely to Lander, its B.-master from 1932 to 1951. Amer. B. has only recently become culturally important, the leading contemporary companies in the U.S.A. being B. Theatre and the New York City B., of which latter company Balanchine (q.v.) is the prin. choreographer. Sev. Amer. ballerinas have achieved international fame, notably Hightower, Alonso, Kaye, and Marjorie and Maria Tallchief.

Ballet in England. Eng. B. is also of relatively recent development, although B. has been seen in England since the 18th

cent. The pantomime B.s of John Weaver early in the 18th cent. foreshadowed Noverre's reforms, but were not followed up. At the King's Theatre, London (the It. opera-house), many famous foreign choreographers and dancers were engaged by the season, but few Eng. names appeared: the male dancer Slingsby was one of the rare exceptions. In the early 19th cent. the preponderance of the foreign element continued, although J. d'Egville and J. Byrne produced B.s with casts of Eng. dancers. One of the most promising Eng. dancers of the 19th cent., Clara Webster, d. at the age of 23 in 1844, a few days after being severely burnt at Drury Lane during a performance. The King's (from 1838, Her Majesty's) Theatre went through a period of great glory during the years 1842-3, when the choreographer Perrot's creative powers were at their height, but afterwards B. rapidly declined in popularity and almost vanished from the opera-house, to appear, however, at music-halls such as the Alhambra and the Empire Theatres, where a succession of foreign ballerinas triumphed. Early in the 20th cent. Adeline Genée (q.v.) gained wide popularity in London. It was, however, the Diaghilev B., which first visited London in 1911, and the popularity of Anna Pavlova (q.v.) which prepared the ground for the estab. of a national B. in England. Sev. Eng. dancers appeared with distinction in Diaghilev's company, the most notable being Sokolova, Markova, and Anton Dolin. In 1930, after the death of Diaghilev, the Camargo Society was formed to stimulate interest in B. and contributed much to the development of the Vic-Wells B. (later Sadler's Wells B.) and the B. Club (later B. Rambert), being discontinued in 1933, when its task was considered done. In that year, which saw the return of the B. Russe, the Vic-Wells B. was already firmly estab. The Sadler's Wells B. (called the Royal B. (q.v.) from Jan. 1957) now holds its own with other great national companies and already has a tradition of its own. It is everywhere held in great esteem and respect, particularly in America where it is billed as 'the fabulous.'

The assimilation of other influences. All these great companies of to-day base their repertoires on the same classical B. technique, although styles vary in nuances from company to company. B. has also been subjected to other influences, such as the ideas and technique of so-called free and modern dancers, the most important of whom have been Isadora Duncan (q.v.), Kurt Jooss, and Martha Graham: But the classical technique which has developed continuously over a period of some 5 cents. has remained the foundation of B., and no doubt will continue to do so, for the hist. of the art shows the strength of the main stream of its tradition, which always emerges unimpaired from every phase of innovation, however drastic and revolutionary.

See A. Haskell, *Ballet*, 1938, and *The Making of a Dancer*, 1946; D. Lynham, *Ballet Then and Now*, 1947; I.

Guest, *The Romantic Ballet in England*, 1954.

Ballin, Albert (1857-1918), Ger. ship-owner, of an old Jewish family in Hamburg. Joined his father's emigration business in 1874. Was agent for some Eng. shipping companies. Joined Hamburg-America line in 1886 and became director-general. Had gifts as a negotiator and worked for a political agreement between Germany and England. On the Ger. collapse in 1918 he committed suicide 2 days before the armistice of 11 Nov.

Ballin, Claude (1615-78), Fr. goldsmith, who copied the works of Poussin, and who was employed by Louis XIV. His nephew, Claude B. (c. 1660-1754) was also a noted goldsmith, his chief work being the coronation crown of Louis XV.

Ballina, seaport and tn of co. Mayo, Rep. of I., built on both banks of R. Moy, some 6 m. S. of Killala Bay. The E. part of the tn is called Ardnaree. Ships from Brit. and Continental ports discharge cargoes at B. quay, and live-stock and farm produce are exported. The R. Moy and Lough Conn are favourite resorts for fishermen, and the salmon fishery is one of the most important in Ireland. B. has flour- and grain-mills, printing, works, saw-mills, and mineral-water factories. Pop. 6225.

Ballinasloe, mkt tn of co. Galway, Rep. of I., on the R. Suck, a trib. of the Shannon. The ruins of the celebrated Kilconnell Abbey (Franciscan, 1400) are near by. Garbally Castle, former seat of the Earl of Clancarty, is now St Joseph's College. B. is noted for its horse, sheep, and cattle fairs, especially the great Oct. fair during the week in which the second Tuesday of the month occurs. Industries include modern shoe and meat and bone-meal factories, and limestone quarries. Pop. 5600.

Ballingeary, vil. in co. Cork, Rep. of I., 14 m. W. of Macroom. The Irish college is widely attended during the summer. Pop. 100.

Ballinrobe, tn in co. Mayo, Rep. of I., on the Robe near its mouth in Lough Mask, famous for its brown trout fishing. Pop. 1200.

Balliol College, Oxford, founded by Sir John de Balliol of Barnard Castle, Durham, and his wife Dervorguilla as a house for poor scholars some years before 1266. It was part of a penance imposed on John de Balliol by the Bishop of Durham. In 1282 Dervorguilla gave the house a charter. The house consisted of 16 scholars who were to be students of arts. In 1340 Sir Philip de Somerville enlarged the foundation by the addition of 6 further scholars in arts providing that 6 of the scholars should proceed to the study of theology. Wycliffe was master c. 1356-61. In the 15th cent. Wm Gray, afterwards Bishop of Ely, lived in the college, and after his death in 1473 his books came to the library, the largest private collection to survive in England from the Middle Ages. New statutes were drawn up by Richard Fox, Bishop of Winchester, in 1507. The original hall

(now the Lower Library) and the Upper Library date from c. 1430, but the rest of the buildings are 18th–20th cent. The rise of the college to a pre-eminent place in the univ. dates from the early 19th cent., when under a series of able masters and tutors it attracted some of the best scholars from the public schools. Benjamin Jowett was fellow from 1838 and master from 1870–93. Among its distinguished graduates are Adam Smith, Robert Southey, Matthew Arnold, A. H. Clough, T. H. Green, Gerard Manley Hopkins, Swinburne, Viscount Grey of Falloden, Lord Oxford and Asquith, Lord Milner, and Wm Temple.

Ballista, engine used by the Romans for propelling heavy missiles in siege operations. It was constructed on the same principle as the catapult, the difference being that the catapult was used for propelling arrows, stones, etc., in siege and field warfare, whilst the B. discharged heavy beams and large stones for the battering down of buildings, or, in other words, the distinct high-trajectory B. discharged heavier stones from the end of rotating arms. The motive power in both types of engine is supplied by tightly twisted hemp, sinews of animals, or raw hide. Two such skeins were firmly fixed vertically in a heavy wooden framework; two stiff wooden arms were inserted in the skeins and were attached to a bow-string which was drawn back by a winch and locked by a trigger mechanism. The projectile was propelled through a window in the vertical framework. See Sir R. Payne-Gallwey, *Projectile-throwing Engines of the Ancients*, 1907.

Ballistic Pendulum, see PENDULUM.

Ballistics, study of the motion of projectiles. It consists of 2 main branches, interior B. and exterior B. (see PROJECTILE). Interior B. deals with the motion of the projectile inside the bore of the gun, and is concerned with providing a theoretical basis for the methods and rates of burning of various kinds and shapes of propellants, the ultimate object being the determination of the maximum pressure set up by the gases inside the gun, and the velocity with which the projectile is ejected from the muzzle. The theory having been developed, the practical application is the fixing of the weight of the propellant, and the size and shape of its component pieces or grains, necessary to produce any desired velocity in a particular gun without subjecting it to a pressure greater than the material can stand. The consideration of the stresses in the material itself belongs to the prov. of the gun construction and design. Exterior B. deals with the motion of the projectile outside the bore, and its prin. problem is the calculation of the path of a given projectile once its muzzle velocity and the elevation at which it was fired are known. The solution of this problem enables the ballistician to construct range-tables by means of which the gunner can lay his gun so as to hit a given target. In investigating the problem, measurements have to be made to ascertain the nature

and amount of the air's resistance to the shell; how its path is affected by the weight, shape, and steadiness in flight of the projectile and how by the atmospheric conditions of temp., air density, and humidity; and, finally, what amount of twist must be given to make the projectile come down nose first, and how this twist affects the flight of the projectile. These measurements are usually considered under the heading of experimental B., and the term exterior B. is properly applied to the calculation of trajectories once the necessary data regarding velocity, elevation, and air resistance are known.

Developments in anti-aircraft defence have led to increased interest and research in the production of accurately burning time fuses for projectiles. This section of B. belongs both to interior B. as regards the rate of burning of the powder of the fuse under various pressures, and exterior B. both as regards the variations in pressure occurring as the projectile travels along the trajectory and the time taken for it to reach various points on that trajectory.

Bomb-dropping from aeroplanes calls for a knowledge of exterior B., bomb sights being constructed from ballistic data obtained from experiments on the air's resistance to bombs of different shapes and sizes moving at various speeds. See FIREARMS and PROJECTILE. See also C. D. Cummings, *Everyday Ballistics*, 1950.

Ballistite, smokeless explosive formed from gun-cotton. It is very similar in composition to cordite and the various blasting gelatins.

Balloch, vil. of Dunbartonshire, Scotland, in Bonhill (q.v.) par., at the S. end of Loch Lomond. It is a rail terminus for the loch steamer. Pop. 3500.

Ballonius, see BAILLOU, GUILLAUME.

Balloon, lighter-than-air aircraft (aerostat), consisting of an envelope which contains a gas lighter than the surrounding atmosphere. The envelope, with any equipment attached to it, will then rise if the volume of light gas is sufficient. The lighter-than-air principle, originally suggested no doubt by the sight of clouds, became the subject of curious speculation during the Middle Ages; waited until 1670 for Francisco Lana to suggest the evacuation of 4 copper spheres to act as a lifting force (forgetting that the spheres would have collapsed from atmospheric pressure); was possibly incorporated in a toy hot-air B. by Gusmão at Lisbon in 1709 but not proceeded with; and finally suggested itself to 2 papermakers—the brothers Montgolfier—of Annonay in France. On 5 June 1783 they sent up a sizeable model hot-air B. in public at Annonay, and dispatched a description of the event to Paris, neglecting, however, to state what the lifting medium was. The great Parisian physicist, Prof. Charles, reading this account, concluded that the brothers had raised a sphere by inflating it with Cavendish's 'inflammable air' (hydrogen). He thereupon set to work and designed a model hydrogen B. which

he sent up from Paris on 27 Aug., preparatory to the construction of a full-sized man-carrying vehicle. Meanwhile the Montgolfier brothers had arrived in Paris and, to the astonishment of Charles, started building a large B. which he saw immediately was a hot-air machine and not a hydrogen one as he had believed.

The first Montgolfier triumph was the sending up of a cock, sheep, and duck in a basket from Versailles (19 Sept.); and then, after tethered ascents, a man-carrying version which, piloted by Pilatre de Rozier and the Marquis d'Arlandes, made the first aerial voyage of hist., a 5½-m. journey from the Bois de Boulogne across Paris, on 21 Nov. 1783. Charles soon finished his full-sized hydrogen B., with a rubberised envelope, and on 1 Dec. 1783 made the first 'hydrogen' voyage (of 27 m.) with one of the brothers Robert. The *Charlière* type of B. was much more remarkable than the *Montgolfière*, as it was virtually the modern B. complete with net over the envelope to support the basket, valve in the crown and ballast to control the height, and a barometer to act as altimeter. Only the ripping panel (invented in 1839) was missing from this *ab initio* invention. The *Montgolfière*, after a short but picturesque career, including—in 1784—the conveyance of the first lady to fly (Mme Thible), soon went out of fashion as it was far less efficient than the *Charlière*. However, it did appear from time to time in the 19th cent. to take up parachutists and even to carry out the first air-raid of hist., when the Austrians used pilotless hot-air B.s with timing devices to bomb Venice in 1849.

The *Charlière* estab. the B. as a new and safe means of locomotion. It crossed the Channel in 1785 (Blanchard and Jeffries), having taken up the same crew for vague scientific experiments the year before, and went on to become familiar and popular the world over. In 1794 hydrogen B.s were used by Napoleon for military observation; in 1797 a B. took up the first successful air-to-ground parachute jumper (Garnerin); and in 1804 there started the serious use of B.s for scientific investigation (Gay-Lussac and Biot). Coal-gas was introduced as a cheap alternative lifting agent in 1821, and from then onwards the B. became an accepted vehicle for scientists, showmen, and adventurers, with military observation, always tethered of course, as a sideline in most of the subsequent wars, a function in which the spherical gave way to the sausage-shape (1896) and finally to the modern streamlined and finned Caquot type (1916), which to-day is mostly relegated to barrage duties.

Within a few months of its invention, the B. began to irritate and challenge its pilots by its lack of dirigibility. A B., they soon discovered, would only go where the wind was going and at the wind's pace. So they began to navigate it, with elongated envelopes and without, with hand-driven rotating fans and even with aerial oars; but all to no avail, without prime-movers more powerful than

human muscles. The first feasible dirigible airship, steam-driven, was made by Giffard in 1852, and the first practical dirigible was the electric-powered *La France* built by Renard and Krebs in 1884. Thereafter, with rapid improvement of engines and propellers, the airship became an accepted form of locomotion, and indeed the first flying machine to be raised, sustained, and steered at will. See AIRSHIP.

B.s in the 19th cent. were popular sights in Europe and America, most of them being flown by professional aeronauts or showmen who made their living by ascending at fairs and other entertainments, and occasionally varying their routine by riding the air on horses, or even stage, and giving nocturnal firework displays. Women, too, had long since taken to the air, both as B. pilots and parachute jumpers, and they added a quota of charm to what could easily have become a somewhat tame entertainment. Throughout the cent. there was, of course, a full enough programme of aerostatic adventures and tragedies over and above the many thousands of routine ascents for entertainment. But amongst adventures and tragedies 2 stories stand out as sagas in the cent.'s ballooning hist. In the Prussian siege of Paris (1870-1) no less than 66 B.s left the city with cargoes of refugees and carrier-pigeons, the latter returning with micro-filmed letters for the beleaguered pop. Then in 1897 the Swedish explorer Andrée set off by B. from Danes Is. with 2 companions in an attempt to float across the N. Pole: they disappeared into the arctic mist, never to be heard from again. In 1930, by an outrageous stroke of chance, the remains of the expedition, complete with diaries and photographs, were discovered perfectly preserved beneath the ice of White Is., Spitzbergen. Long-distance flights saw a record created in 1836 by Green, Holland, and Mason when they flew 480 m. non-stop from London to Weilberg, a record for trips out of England which remained unbeaten until 1907. Scientists ascended from time to time and made their studies of the atmosphere; and in 1893 the science of meteorology enlisted the B. as unmanned instrument carrier, a role it has played with distinction ever since. The 20th cent. saw the final blossoming and decline of ballooning as a sport, and the growing service of the unpiloted, and occasionally the manned, B. as a carrier of instruments into the upper atmosphere. Thousands of such small B.s ascend annually, and, less often, translucent giants of polythene which rise as high as 22 m. The official height record for manned B.s stands at 100,000 ft. made in 1957 by Maj. D. Simons, Amer. Air Force doctor. The non-stop distance record was made in 1914 by Berliner and still stands—1890 m. The 20th cent. has also seen the revival, by the Japanese, of the unmanned 'bomber-B.s' (which were sent across the Pacific to America in the Second World War); the declining use of observation B.s; the continued use of barrage B.s; the use of B.s

for carrying propaganda leaflets, and for such curious tasks as taking up wireless aeriels for surviving airmen and sailors adrift on the sea. The first decade of the present cent. deserves a note on its own, for, from the founding of the Aero Club (now the Royal Aero Club) in 1901, it saw a renaissance of ballooning as a sport, a period which suffered eclipse only when the aeroplane showed signs of becoming a practical proposition about 1909-10. Ballooning as a sport still lingers on but is chiefly confined to a handful of continental enthusiasts. Curiously enough, one of the longest traditions of ballooning

For Photos

BARRAGE BALLOONS

stands to the credit of the U.S.A., owing to that country's long use of dirigible airships and the practice of training their pilots in free ballooning.

The following are details of the construction and equipment of a typical large sporting B. of about 1907. Maximum capacity for the type in those days was 80,000 cub. ft. The envelope, of treated silk or other material made up of sections called 'gores,' had a valve in the crown operated by a line hanging down inside and emerging through the dangling neck, which was kept open throughout the flight so that the expanding gas could blow off harmlessly: there was sometimes a separate filling tube attached to the envelope; otherwise the ground filling hose would be coupled directly on to the neck. Then there was the ripping panel—nearly half a gore—which was torn away inside the envelope to empty the B. rapidly on landing. The envelope was

covered by a net which ended in leading lines which supported the hoop; and toggled on to the hoop were the car-lines which supported the basket. Also fixed to the hoop were the ends of the grapnel rope and the trail rope, both of which were kept coiled on the outside of the basket, the trail-rope being let down when flying over 'unoccupied' land where its heavy swelled end would drag along the ground and act as automatic ballast. Ballast proper of sand was in 20-lb. or 30-lb. bags, both in and outside the basket, and the other equipment included maps, compass, aneroid barometer (as altimeter), and statoscope (for rate of rise or fall). Flight was controlled by judicious use of ballast and valve-line according to the height desired and in relation to the amount of sun—or lack of it—shining on the envelope and hence expanding the gas.

Ballot (It. *ballotta*, dimin. of *balla*, a ball), a little ball used for secret voting; hence 'voting by B.' is secret voting. Under the Athenian and other democracies in ancient Greece this method was known as *psēphisma* (from *psēphos*, a pebble, the original instrument of balloting). It was used on all questions affecting the status of individuals. These were of 2 kinds: lawsuits, and proposals of ostracism in the ecclesia. A vote for ostracism (q.v.) was recorded by inscribing the intended victim's name on a potsherd (ostrakon). The elaborate voting machinery of the Athenian courts in the 4th cent. BC is described at great length by Aristotle in his *Constitution of Athens*, which also gives particulars of a curiously shaped apparatus used instead of an ordinary ball and designed to prevent the insertion by each dicast of more than one vote into the B. box. At Rome the system of open suffrage allowed of so much corruption and intimidation that a series of laws (139-107 BC) prescribed the use of B. for all business transacted in the popular assemblies. Secret voting at elections of members of Parliament was advocated by Eng. reformers in the early 19th cent.; it was included in the draft of the Reform Bill of 1832, a Bill on the subject having been introduced by O'Connell in 1830. It was first used in 1870, in the London School Board elections. Two years later Forster's Ballot Act introduced it into parl. and municipal elections. The practice is now in force at elections in all countries where a constitutional gov. prevails.

Ballou, Hosea (1771-1852), Amer. Universalist clergyman, b. Richmond, New Hampshire; son of Maturin B., a Baptist minister. In 1794 B. became a pastor at Dana, Massachusetts. From 1817 until his death he preached as pastor of the second Universalist church at Boston. Founder and editor of the *Universalist Magazine* (later called the *Trumpet*), the *Universalist Expositor*, and the *Universalist Quarterly Review*. His *Notes on the Parables*, 1804, a treatise on the Atonement, estab. him as chief Amer. expositor of Universalism.

Ballou, Hosea (1796-1861), grand-nephew of the above, b. in Guilford,

Vermont, also a Universalist preacher, and associated with his uncle in editing the *Universalist Quarterly Review*. Advocated the Universalist estab. of Tufts College at Medford, Massachusetts. He wrote *Ancient History of Universalism down to AD 553*, 1829.

Ballou, Murray Maturin (1820-95), son of the first Hosea B., pioneer of Amer. illustrated Journalism. Ed. *Gleason's Pictorial*, later known as *Ballou's Pictorial* and founded and ed. the *Boston Daily Globe*. Wrote a life of his father and a hist. of Cuba.

Ballybay, mrkt tn of co. Monaghan, Rep. of I., 10 m. S. of Monaghan. It has a tannery and is the centre of a flax-growing area. Pop. 1000.

Ballybunion, seaside vil. in co. Kerry, Rep. of I., 9 m. NW. of Listowel. It has a wireless station. Pop. 956.

Ballycastle, mrkt tn in the N. of co. Antrim, N. Ireland, opposite Rathlin Is. The castle was built by the Earl of Antrim in the reign of James I. It is noted for its large Lammas Fair on the last Tuesday in Aug. Pop. 2600.

Ballyclare, mrkt tn of co. Antrim, N. Ireland, 10 m. ENE. of Antrim. It has important bleaching, dyeing, and finishing works. Textile machinery is also manuf. for both the home and the export markets. Pop. 4100.

Ballymahon, mrkt tn of co. Longford, Rep. of I., in the heart of the Goldsmith country. Pop. 650.

Ballymena, tn in co. Antrim, N. Ireland, on the R. Braid, a railway centre on the Belfast-Londonderry line. Linen manufs. were introduced about 1733, and are an important feature of the tn; agric. industries are also carried on. Pop. 14,200.

Ballymoney, tn in co. Antrim, N. Ireland, centre of a large agric. area. It has bacon-curing, milk products, jam, and spinning industries. Pop. 3300.

Ballymote, mrkt tn in the co. of Sligo, Rep. of I. In 1300 Richard de Burgh built a castle here the remains of which are still standing, and it was the scene of hostilities in 1641 and 1652. There are also the ruins of a Franciscan foundation of the 13th cent. The friars have left a literary monument in the *Book of Ballymote*, a MS. now in the possession of the Royal Irish Academy. It is a miscellaneous collection of prose and verse, written in Gaelic, and compiled about 1391. The book was once in the possession of the O'Connell family, who bought it for 140 cows. A facsimile reprint was issued in 1887, ed. by Prof. Atkinson. The district is renowned for archaeological remains and historic legends. Pop. 1000.

Ballynahinch, mrkt tn of co. Down, N. Ireland, 11 m. NW. of Downpatrick. B. is also an alternative name for Connemara (q.v.).

Ballyshannon, seaport of co. Donegal, Rep. of I., at the mouth of the Erne. Owing to a bar, the harbour is only available for small craft. Remains exist of a castle of the O'Donnells, where the English were defeated in 1597, and of the

Cistercian abbey of Assaroe (1 m.). Wm Allingham was b. here. The Erne has been harnessed above the tn for the national hydro-electric scheme. Pop. 2800.

Balm (*Melissa officinalis*), species of Labiatae found in Europe and W. Asia, and cultivated in Eng. and Amer. gardens for its sweet scent. It has an upright stem, toothed, ovate leaves, and flowers of faint yellow or white. The leaves are used in medicine for their tonic and stimulant properties. Bastard B. (*Melittis melissophyllum*) is the only species of its genus, and is found in S. Europe; it also belongs to the Labiatae.

BALM

Balm of Gilead, or **Balsam**, oleon-resin produced from the *Commiphora opobalsamum* and used in oriental countries for its sweet scent and medicinal properties. It is referred to in the O.T. and by many anc. writers, who affirm its power to heal. See COMMIPHORA.

Balmaceda, José Manuel (1838-91), Chilean politician, b. and d. at Santiago. As a politician he joined the Liberal party and later became president of the rep. of Chile. He did much work for the development of public instruction and for the army and navy. He also promoted the construction of railways.

Balmes, Col de, mt pass situated between Mts Blanc and Dent du Midi. It is traversed by the road from Martigny to Chamonix. Its highest point is 7200 ft above sea-level.

Balmerino, James Elphinstone, 1st Baron (1553-1612), Scottish politician. Under James VI he was appointed judge and royal secretary. He was made Lord B. in 1604. In 1599 he was responsible for sending a cordial letter from James to Pope Clement VIII without the king's knowledge. James repudiated the letter, and B. was imprisoned.

Balmes, or Balmes, Jaime Luciano (1810-48), Sp. polemist and philosophical writer, b. Vich in Catalonia. He founded a political paper of a clerical

and monarchical character in Madrid in 1844, calling it *El Pensamiento de la Nación*. His *Filosofía fundamental*, 1848, has been trans. into Eng. His *Obras Completas* were pub. in 2 vols., 1948.

Balmont, Konstantin Dmitriyevich (1867-1943), Russian poet of Scottish descent, the most talented among the older Symbolists, famous for the melodiousness of his verses. After 1918 he lived in exile in Paris.

Balmoral Castle, residence of the British sovereign in Aberdeenshire, Scotland, situated on the r. b. of the Dee, which at this point is crossed by a suspension bridge. The prince consort acquired it from Sir Robert Gordon in 1852 and gave it to Queen Victoria, together with the estate attached. It is built in granite and has an E. tower 100 ft. high, which commands a magnificent view.

Balnaves, Henry (d. 1579), of Halhill, reformer, b. of poor parents at Kirkcaldy, Fife, and studied at St Andrews Univ. and at a free school at Cologne. He acted for some time as a procurator in the courts of St Andrews and then removed to Edinburgh, where in 1538 James V made him a lord of session. On the accession of Mary (1543) B. was promoted to the office of secretary of state, and was instrumental in getting the Holy Scriptures trans. into the Scots vulgar tongue. He was confined for 6 months in the castle at Blackness for his aggressive Protestantism. In 1546 he joined the murderers of Cardinal Beaton in the castle of St Andrews. In the following year he was captured by the French and was shut up in the castle of Rouen as a prisoner of war. In 1554, when the dowager queen, Mary of Guise, became regent of Scotland, B. was released and his forfeiture rescinded. On his return to Scotland he took an active part on the side of the lords of the congregation, and in 1563 was appointed a lord of session and was chosen as one of the commissioners to revise the *Book of Discipline*. During his imprisonment he wrote a treatise on justification, which was pub., with a preface by Knox, under the title of *A Confession of Faith*.

Balneariae Lixivienses, see BAGNÈRES-DE-LUCHON.

Balneology and Balneotherapy, science of baths and their effects upon the system. Baths act more by modifying temp. than by skin absorption. The *cold bath* (45-66° F.) causes a contraction of the vessels of the skin and consequently drives the blood into the internal organs, where the resulting dilatation causes an exhilarating after-effect if the immersion be of short duration. The cold bath is thus valuable as a tonic. The *tepid bath* (85-90°) is of value in fevers through actual heat abstraction. Between 93° and 95° baths are at the point of thermal indifference; they do not change the movement of the bloodstream and have a sedative effect on the nervous system. Baths of higher temps. promote circulation in the surface blood-vessels, and the *hot bath* (103-108°) was at one time used to encourage the

excretion of toxic products through the skin. If the immersion be prolonged there may be weakness of the heart, with the possibility of fainting. The *Turkish bath* is a hot-air bath where the patient passes through compartments ranging in temp. from 100° to 200°. It is used for promoting perspiration. It is deleterious in fatty degeneration of the heart. The *Russian bath* is a vapour-bath in which steam is generated by throwing water on heated mineral or metallic surfaces; it is of value in rheumatism. The *douche* is a bath where water is forced by considerable pressure upon the surface of the body; it is used in insomnia and the coma of alcohol or sunstroke. The *shower-bath* is a douche where water is forced against the body from a nozzle with numerous perforations; it is used as a general tonic.

There are also special forms of bath where the body is immersed in peat, mud, slime, pine-leaves, herbs, brine, sand, bran, malt, tan, glue, milk, soap, acid, mustard, etc. Air-baths are dealt with under AEROTHERAPEUTICS, and electric baths under ELECTROTHERAPY.

Balneotherapy is a term generally restricted in application to treatment at spas, where patients systematically drink and bathe in water naturally mineralised, or artificially modified at the places where the springs emerge from the earth. The beneficial results of spa treatment in many types of diseases are undeniable, but there is some difficulty in apportioning the credit among the various curative factors in such treatment. The usually favourable climate, the submission of the patient to a regime that would probably be relaxed at home, the presence of physicians with special experience, the provision of specially appropriate appliances and organisation, and the combination of regular exercise in a good atmosphere with systematic medical treatment, all contribute in varying measures to the well-being of the patient. As to the waters themselves, it is undoubtedly true that many of them lose their properties when bottled and exported, and cannot be artificially prepared so as to produce the same conditions, or contain such subtle ingredients that their composition is not wholly known. It has been suggested that the warm mineral springs consist of water which is formed by the combination of hydrogen distilled from granite rocks at great depths with oxygen derived from metallic oxides also found there, thus producing what is called nascent or virgin water. Many waters also contain radium emanation, which has a therapeutic value in certain morbid conditions. The bubbles of carbonic acid gas, which have such an exhilarating effect on the skin, cannot be exactly reproduced in baths artificially charged with carbonic acid.

Spa treatment is suitable in the sub-acute or chronic stage of disease, where the patient has a good supply of reserve force. Acute cases, or those tending to a fatal issue at an early period, should not be recommended; serious visceral disease, advanced arterio-sclerosis, serious mental

or nervous depression are also unsuitable, whilst children and old people should have recourse to climatic influences only.

The chief object of spa treatment is to promote excretion by way of the kidneys, bowels, and skin. For elimination by the kidneys the alkaline waters at Vichy, Bad Neuenahr, Vittel, Contrexéville, Wildungen, Evian-les-Bains, and Aix-les-Bains are suitable. For elimination by the bowels the waters containing sodium sulphate are useful, as at Marienbad, Karlovy Vary (Karlsbad), Brides-les-Bains, and Cheltenham. Arthritic ailments are best suited by Aachen, Aix-les-Bains, Bath, Droitwich, Harrogate, and Buxton. Nervous diseases are specially provided for at Oeynhausen, Schlangenbad, and Church Stretton. Colitis is a leading speciality at Plombières and Châtel-Guyon. Primary anaemias are treated at Schwalbach, Spa, and St Moritz, whilst for secondary anaemias Royat, La Bourboule, Uriage, Harrogate, and Llan-drinod are suitable. Marienbad is specially recommended for the systematic treatment of obesity. Diabetic patients will secure experienced treatment at Karlsbad, Brides-les-Bains, Neuenahr, Vichy, Vittel, Royat, Buxton, Gastein, Evian-les-Bains, St Moritz, and other spas. Phlebitis and varicose veins are specialised in at Bagnols-de-l'Orne. Luchon and Schinznach have a good reputation for the cure of skin diseases, and Caunteris attracts sufferers from throat maladies. Famous Amer. watering-places are Hot Springs, Arkansas; French Lick Springs, and W. Baden, Indiana; White Sulphur Springs, W. Virginia; and Saratoga Springs, New York. See R. G. Gordon and F. G. Thomson, *The Physiological Principles of Hydrology*, 1930.

Balquhider, vil. of Perthshire, Scotland, at the head of Loch Vail and below the braes of B. It is celebrated in the hist. of Rob Roy. Pop. 200.

Bairampur, tn in Uttar Pradesh, India. It is the home of the leading talukdar of Oudh, and the most convenient centre for a visit to Saheth-Maheth, site of the anct city of Sravasti, and of the Buddhist convent of the Jetavana, where the Buddha is said to have lived and preached for 25 years.

Balsa, raft or fishing-boat, used by Indians on the Pacific coast of S. America. It is constructed usually of floats made of logs of the B. tree. B. wood is a light useful timber now used in the construction of aircraft.

Balsam (Gk *balsamon*), name given in medicine to many resins and oils taken from plants of different kinds, but given in particular to B. of Peru and of Tolu. These two varieties come from leguminous plants, the first species being known as *Myroxylon pericarpe*, the second as *M. toluiferum*. Liquidambar, a balsamic product of *Liquidambar styraciflua*, is sometimes called white B. of Peru. B. of Copaiba is also obtained from many varieties of the genus *Copaifera*. Bs have a pleasant fragrance which renders them of service in making confectionery

and perfumes; they also have tonic properties.

Balsam (*Impatiens balsamina*), tender annual, native of India, with many double-flowering forms, bearing large flowers of various colours; raised under glass for summer and autumn colour. See IMPATIENS.

BALSAM

Balsam Apple, see MOMORDICA.

Balsaminaceae, family of Dicotyledons, which contains only 2 genera, *Hydrocera* and *Impatiens*, the chief. It has numerous species of herbs which are cosmopolitan and are remarkable for the elastic force with which the valves of the capsular fruit contract and eject the seeds. The flowers are regular zygomorphic, have 5 petaloid sepals, 5 petals, 5 stamens, and 5 carpels which are united, superior, and contain numerous ovules.

Balsamo, Giuseppe, see CAGLIOSTRO.

Balsamodendron, see COMMIPHORA.

Balsham, Hugh de (d. 1286), Bishop of Ely. He succeeded Wm de Kilkeny at Ely in 1256. In 1280 he obtained a charter to introduce 'studious scholars' into his hospital of St John, Cambridge, in place of the secular brethren. In 1284 he founded Peterhouse, Cambridge, for his own pupils.

Baltard, Louis Pierre (1764-1846), Fr. architect, engraver, painter, and author, b. Paris. He at first became an engraver, then went to Italy, where he served as an architect, but owing to the revolution he returned to Paris and entered the army. He afterwards became prof. of architecture at the Polytechnic, and built the chapels of Sainte-Pélagie and Saint-Lazare, and the court of justice at Lyons. His numerous engravings, however, including 'Paris et ses monuments', 1803, are the main source of his fame.

Baltazarini (?-c. 1587). It. musician, first violinist of his time and founder of the modern ballet. His real name was Baldassaro da Belgioioso; he went to France and became first *valet-de-chambre* to Catherine de' Medici (1555) and led

his royal mistress's string band—gallicising his name to Balthazar de Beaujoyeux. He introduced It. dances to Paris. *D. c.* 1587.

Balthazar, or **Balthasar**, Gk form of the name Belshazzar (q.v.).

Baltic, **Battle of the**, sea-fight which took place off Copenhagen on 2 April 1801. In this battle Parker and Nelson destroyed the Dan. fleet.

Baltic Exchange, St Mary Axe, London, E.C., the members of which are produce merchants and brokers, shipowners, shipbrokers, etc. The B. E. originated in meetings of the 18th-cent. merchants interested in the Baltic trade in the Baltic Coffee House, and now concerned with trading in all parts of the world. It was purely mercantile until fusion with the London Shipping Exchange in 1899.

Baltic Provinces, name used before 1917 for the 3 provs. of the Russian Empire, Estland, Livland, and Kurland (qq.v.), which had belonged to the Teutonic Knights, later to Sweden and Poland, and were annexed to Russia in the 18th cent. The majority of the pop. were Estonians and Latvians, but the political and largely the economic power, as well as cultural influence, were concentrated in the hands of the Ger. minority. Russification measures (Russian language in administration and at Dorpat Univ.) dating from the 1880's were primarily aimed at undermining this preponderance of the Ger. upper classes. In 1918-19 the B. P. formed parts of the new independent states of Estonia and Latvia (qq.v.). See also **BALTIC STATES**.

Baltic Sea, sea between 54° and 66° N. lat. and 9° and 30° E. long. It is surrounded by the dominions of Sweden, Russia, Germany, and Denmark. It is 960 m. long and 400 m. broad. It has 5000 m. of coastline. A channel connects it to the N. Sea. The W. portion of this channel is called the Skagerrak, while the remainder is called the Cattegat. Is. all the S. extremity of the Cattegat, and communication is continued by narrow straits called the Sound, the Great Belt, and Little Belt. Its total area is 166,397 sq. m. The separating factor between the B. S. and the N. Sea is a plateau upon which the is. Zealand, Fünen, and Laaland are situated. Its depth has been computed to be 36 ft., which falls considerably lower than that of any other inlet of the sea of similar character. The bed of the B. S. in the deeper parts is generally of soft brown or grey mud, or else of hard clay. Near the low coasts and on the shallower banks fine sand with small pebbles are seen.

Its navigation is rendered dangerous by shallowness, narrowness, and sudden changes of wind followed quickly by storms. It runs eastward into three gulfs, Gulf of Bothnia, the northernmost, Gulf of Finland, and Gulf of Riga. There is not such a quantity of salt in the B. S. as in other oceans, and the water therefore is clearer on that account. From 3 to 5 months of the year access through the sea is hindered by ice, but the whole surface is seldom frozen entirely, though

records of that event have been estab. in the years 1658 and 1809. It possesses the characteristic of all inland seas that it is little affected by tides. The perceptible rise and fall of its waters are due more to the variations in the water-bulk of its rivs. than to any tidal circumstances. Of the rivs. that discharge their waters into this sea there are 250, resulting in a drainage of almost one-fifth of the area of Europe. The most important of these are the Oder, Vistula, Niemen, Dvina, Narva, Neva, while the chief of the is. are Zealand, Fünen, Bornholm, Stamsöe, and Laaland (Denmark); Gottland, Oland, and Hveen (Sweden); the Aaland Is. (Finland), and Rügen (Germany). The prin. exports from its bordering countries are timber, furs, tallow, and grain. Amber is cast upon its shores in stormy weather. The canals connecting the B. S. with the N. Sea are the Kiel, which cost £8,000,000, and which proved an immense advantage to Germany; the Elder Canal, and the Gotha Canal. The chief harbours in the Baltic are Copenhagen (Denmark); Kiel, Lübeck, Stralsund (Germany); Szczecin (Stettin) and Gdansk (Danzig) (Poland); Kaliningrad (Königsberg) and Klaipeda (Memel) (Lithuania); Riga (Latvia); Narva (Estonia); Kronstadt (R.S.F.S.R.); Sveaborg (Finland); and Stockholm and Karlskrona (Sweden).

Baltic States, name commonly given to the 3 independent states, Estonia, Latvia, and Lithuania, which were formed after the First World War out of ters. of the former Russian Empire inhabited by Estonians, Latvians, and Lithuanians. Soviet Russia recognised their independence in peace treaties signed in 1920, but in 1939 the Soviet Gov. forced them to concede occupation of important military bases by Soviet troops, and in 1940 they were completely occupied, annexed, and transformed into constituent reps. of the Soviet Union. For appearance' sake Soviet style elections were held and the new parliaments unanimously resolved to ask for admission into the Soviet Union, which was duly granted. The ensuing terror and deportations caused large sections of the pop., despite their traditional anti-Ger. attitude, to welcome Ger. troops as liberators in 1941. Under Ger. occupation they, together with Belorussia, were included in the Reich Commissariat 'Ostland.' With the advance of the Soviet Army in 1944 many inhab. fled to W. Europe (Sweden, Germany). Sev. countries, including Britain, have not recognised the incorporation of the B. S. into the U.S.S.R. and continue to recognise their accredited diplomatic representatives. See F. W. Pick, *The Baltic Nations*, 1945, and J. A. Swettenham, *The Tragedy of the Baltic States*, 1952.

Baltic-White Sea Canal, see **WHITE SEA-BALTIC CANAL**.

Baltimore: 1. Port and the largest city of Maryland, U.S.A. It is in pop. the sixth largest city of the U.S.A., and is situated at the head of the R. Patapsco, an inlet from Chesapeake Bay. It is 210 m. distant from the ocean by canal.

Its environment is pleasing, and its site is of varied altitudes. It owes a great deal of its importance to its safe harbour, whose minimum depth is 24 ft. and it has direct communication with the prin. ports on both sides of the Atlantic. Over 100 steamship lines enter the port, which is one of the best on the Atlantic coast. Many railways converge at B., and it is served by Friendship International Airport. A great trade in bread-stuffs is carried on, while among further articles of export are tobacco, provisions, coal, cotton, naval stores, canned fruit, and oysters. The chief articles imported are guano, coffee, other tropical products, fertilisers, iron, steel, tin-plate, and chemicals. Besides its great shipping trade, B. has extensive industries including smelting and refining copper, tractors, motor vehicles, tin cans and other tin-ware, refining sugar and petroleum, slaughtering and meat-packing, printing and publishing, and the making of clothing, textiles, pharmaceuticals, fertilisers, glass products, soap, lumber, scientific instruments, electric tools, and aircraft. The canning of oysters forms one of the chief industries of B., and many thousands of vessels are engaged in their quest. The splendid appearance of many of its buildings has made additional fame for the tn; among these buildings the most notable are the chamber of commerce, the Rom. Catholic cathedral, the custom-house, the Maryland Institute, and the Peabody Institute. In Feb. 1904 the greater part of the business quarter was destroyed by fire. In 1920 the city area was nearly trebled by the inclusion of the adjacent dists., and its water-front was much enlarged.

There are five noteworthy public monuments, the chief being that of Washington, a column 210 ft high. The fineness of these erections has caused B. to be called the monumental city. The most famous of its many beautiful parks is the Druid's Hill Park of nearly 700 ac. in extent. Since the first decade of the present cent. great improvements have been carried out in B.; cobbled streets have been converted into smooth-paved ones, and new water and sewage systems have been installed. There are approximately 200 churches, conspicuous among which are the Rom. Catholic, Protestant, Episcopal, and Methodist. One of the first seats of learning in the country is the Johns Hopkins Univ. (q.v.). It was opened in 1876. Other educational centres are the B. city college, the academy of science, the law school, St Mary's Univ., and Loyola College. The Enoch Pratt library contains over 350,000 books. In addition to its main building it has 26 branches. As a social centre and a tn famous for its enthusiasm for art, B. is specially to be noted. It is the see of an Anglican bishop and a Rom. Catholic archbishop, who acts as primate of U.S.A. Dr John Carroll was the first archbishop. The pop. includes a large element of Ger. descent, with Irish and Fr. creole families. Negroes number over 100,000. In the days when B. was a

colony, the Puritans and Scottish-Irish Presbyterians were in great numbers. The city was founded in 1729 in honour of Lord B., who estab. Maryland colony. During the wars of 1812-15 it became the scene of many engagements. Pop. (1950) 949,708.

2. A fishing vil. in co. Cork, Rep. of I., on B. Bay, 8 in. from Skibbereen.

Baltimore Bird, or **Oriole** (*Icterus galbula*). It is very common all over N. America, and is something like a finch, measuring about 7 in. from the tip of its long, sharp beak to the end of its rounded tail. The beak is conical and longer than the head, and the wings long and pointed. The males come N. early in May, preceding the females by a few days. They choose a spot preferably near houses, and build a beautiful hanging nest, from 6 to 7 in. long, in a tulip-tree or pea-vine, taking their materials from moss patches, cattle hairs, or fibres. Their plumage, especially of the males, is very gay, glossy black, orange, and vermilion. Orange and vermilion were the colours of the livery of Lord Baltimore, whence the name. It is also called fire-bird from its bright plumage, and hang-nest from its method of building. The B. B. has a strong and sweet song particularly pleasing during its mating season, and is gregarious in its habits. Although it does much damage among the fruit, it rids the orchards of such insects as the canker-worm and tent-caterpillar. See Baird, Brewer, and Ridgway, *N. American Birds*.

Baltimore, George Calvert, 1st Baron (c. 1580-1632), statesman, founder of the state of Maryland, U.S.A. *b. Kipling*, Yorks, and educ. at Trinity College, Oxford. From 1619 he was secretary of state, but in 1625 he became a Catholic, resigned his office, and acquired his title with large estates in Ireland. He estab. a settlement at Newfoundland in 1621, and attempted a similar settlement in Virginia, but *d.* before the charter was completed. It passed to his son, the 2nd Baron B.

Baltinglass, mrrkt tn, 30 m. W. by S. of Wicklow, Rep. of I. It has fine eccles. remains, and is close to the Glen of Imaal. H.Q. of the '98 guerrilla chief, Michael Dwyer. Pop. 2000.

Baltistan, otherwise **Little Tibet**, mountainous region of Kashmir below the Karakoram Mts on their S. side. Its mean elevation is 11,000 ft. The Upper Indus flows through the region, which contains the largest glacier in the world outside the Arctic. The inhab. numbering 52,000, are Muslims of Tibetan origin.

Baltiysk, see **PILLAU**.

Baluchistan (**Beluchistan**), vague geographical term applied to a large area comprising the S.E. corner of Persia and the N.W. of Pakistan. 1. **Persian B.**, prov. of Persia, bounded on the N. by Sistan, E. by Kalat, W. by Shagird, and S. by the Sea of Oman. It is a barren, sparsely populated area with a hot climate. In the centre of the prov. is the volcanic mt. Kuh-i Taftan (9500 ft). Zahedan is the main tn. Pop. c. 300,000.

Formerly separate, it is now part of the 8th Ustan (*see* PERSIA).

2. A prov. of Pakistan bounded on the W. by Persia, on the NW. by Afghanistan, and on the S. by the Arabian Sea. It has a total area of 134,002 sq. m. and a pop. (1951) of about 1,174,036. It is composed of 5 dists. (Quetta-Pishin, Sibi, Zhob, Loralai, Chagai) and 4 states (Kalat, Las-Bela, Kharan, Mekran). The chief tn is Quetta with a pop. (1951) of 84,343. The pop. is mainly Muslim (1,137,063), composed of Baluchis, Sindhis, and Pathans, with a sprinkling (approximately 13,000) of Hindus and a few

Baluchitherium, giant hornless Oligocene rhinoceros, probably the largest known land mammal. Its limbs were long and massive, the skull about 4 ft in length, and it stood about 18 ft high at the shoulders.

Balus, Jean de la (1421-91), Fr. cardinal and minister of Louis XI. He became chaplain to the king, comptroller of finances, secretary of state, Bishop of Evreux, 1464; Bishop of Angers, 1467; and cardinal, 1483. He intrigued with the Duke of Burgundy, Charles the Bold, against Louis, for which he was imprisoned in an iron cage in the castle of

BALUCHISTAN: THE BOLAN PASS

E.N.A.

Christians and others. The prov. consists largely of barren mts, deserts, and stony plains and the climate is subject to extremes of heat and cold. Rainfall is scanty and uncertain. Agric. products include wheat, barley, millet, lucerne, rice, maize, and potatoes. Coal is mined at Sharigh and Harnal on the Quetta-Pishin railway, and there are important chrome mines near Hindubagh in the Zhob dist. The NW. railway bifurcates at Sibi, one branch to Khost (83 m.) and the other via Quetta to Chaman (271 m.). From Spezand, 16 m. S. of Quetta, there is a line to Zahidan (440 m.) in Persia. A metre gauge line runs from Quetta to Fort Sandeman (184 m.). *See* G. P. Tate, *The Frontiers of Baluchistan*, 1909; T. H. Holkitch, *The Indian Borderland*, 1909; D. Bray, *Ethnographic Survey of Baluchistan*, 1913; Sir M. Aurel Stein, *Archaeological Tour in Waziristan and N. Baluchistan*, 1929.

Onzain, 1469. He was, however, released in 1480, and went to Rome.

Baluster, or **Banister** (from Gk *balaustion*, flower of the pomegranate), name given to pillars or shafts supporting a cornice, coping, or the handrail of a staircase. The pear-shaped swelling at the lower end of the pillar accounts for the origin of the name.

Balustrade, range of equidistant balusters, together with the cornice, coping, or handrail they support. They are used as parapets or to enclose stairs, and may be decorated with various devices.

Baluze, Etienne (1630-1718), Fr. historian. He was bursar at the univ. of Toulouse, 1646-54, and afterwards acted as librarian to Le Tellier and the Archbishop of Auch, obtaining, in 1667, a similar post with Colbert, which he held until 1700. In 1707 he was appointed inspector of the Royal College of France. His chief works are *Capitularia Regum*

Francorum, 1677, *Miscellanea*, 1678-1715, *Nova Collectio Conciliorum*, 1683, *Vitae Paparum Avenionensium*, 1693, *Historiae Tutelensis Libri III*, 1717. On account of his *Histoire généalogique de la maison d'Auvergne*, 1708, B. was exiled in 1710, but was recalled to Paris in 1713.

Balzac, Honoré de (1799-1850), Fr. novelist, b. at Tours, of a well-to-do bourgeois family. From 1806 to 1813 he attended the Collège de Vendôme, and for the following 3 years the Collège de Tours, but he showed no aptitude for study, though he must have read widely in his early youth. Much of his school life is reflected in the pages of *Louis*

which are written in a Rabelaisian vein, and must be classed separately from his novels: *La Maison du chat qui pelote*, 1830; *La Femme de trente ans*, 1831; *La Peau de chagrin*, 1831; *Le Chef-d'œuvre inconnu*, 1831; *Eugénie Grandet*, 1833; *Le Père Goriot*, 1834; *La Recherche de l'absolu*, 1834; *Les Illusions perdues*, 1834; *La Cousine Bette*, 1846.

B. conceived the idea of uniting his various pieces into one mighty whole, under the title *La Comédie humaine*, which should comprise all the multifarious aspects of life—*scènes de la vie parisienne*, *de la vie militaire*, *de la vie privée*, and so on. This vast scheme was not completed.

In Paris he made numerous friends, including Victor Hugo, Vigny, George Sand, and Lamartine. He fell in love with a Polish lady, Mme Hanska, who was his ideal to the end of his life. Though her husband d. in 1840, debts and other causes prevented B. from marrying her till a few months before his death. He was buried in Paris on 29 Aug. 1850, the pall-bearers being Dumas, Hugo, Baroche, and Sainte-Beuve. Hugo delivered the funeral oration.

B.'s genius is undeniable. He flashed on all the little, unnoticed things the lurid light of his imagination, and therefore he has been called both a realist and a romanticist, according to the point of view of the reader. Nothing escaped his notice, and in the remorseless handling of his material he has been accused of exposing the sordid, unhealthy side of life. But it cannot be doubted that his aim was moral, in the widest sense of that term. His stage is so vast, his persons so true to life, that as a creative genius he stands among the greatest writers of all time.

See Everyman's Library (trans. of 15 of the best-known novels); A. le Breton, *Balzac, l'homme et l'œuvre*, 1905; J. M. Burton, *Honoré de Balzac and his Figures of Speech*, 1921; W. H. Royce, *A Balzac Bibliography*, 1929; P. Bertault, *Balzac, l'homme et l'œuvre*, 1946; S. Zweig, *Balzac*, trans. 1947.

Balzac, Jean Louis Guez de (1597-1654), Fr. essay-writer, b. Angoulême. He went to Italy with Cardinal de la Valette, and was struck by the rich smoothness of the It. style as compared with that of his own country. His writings mark the beginning of polish and elaboration, before unknown in Fr. composition. His *Letters* were pub. in 1624; *Le Prince*, 1631; *Discours*, 1644; *Le Barbon*, 1648; *Le Socrate chrétien*, 1652; *Aristippe*, 1658. He became a member of the Fr. Academy in 1634, and was a friend of Richelieu. His collected works were pub. in 2 vols. (1665).

Balze, Jean Etienne Paul (1815-84), Fr. artist, b. Rome, and made his début at the Salon in 1835 with a painting from Scott's *Lady of the Lake*. He painted murals in the palace of the senate representing the scientific, agric., and industrial discoverers of the 19th cent.

Balzico, Alfonso (1825-99), It. sculptor, b. Cava di Tirreni, near Salerno. He studied at the academy of Naples and at

French Embassy

PORTRAIT OF BALZAC BY LOUIS BOULANGER

Lambert (1832). His father put him to study law at the Sorbonne, but B. kicked over the traces, refused to practise, and in 1819 went to Paris, confident of his real vocation. From 1820 to 1829 he tried his hand at tragedy and at novel writing, but made little progress in either. It was a period of hard work and privation. In 1825 he started business as a publisher, printer, and type-founder—a speculation which entailed debts that harassed him almost to the end of his life. The publication of *Les Chouans* in 1829 marks the beginning of his literary career. Though it has been termed melodramatic, it is superior to his previous work, giving a brightly coloured picture of Brittany in 1799. The imitation of Scott is obvious.

From 1829 B. worked with untiring energy. In 20 years he produced 85 novels, in addition to his dramatic attempts, articles to the newspapers, miscellaneous minor works, and a lengthy correspondence, addressed chiefly to his sister Laure and her friend Mme Zulma Carrand. Some of his best-known works may be mentioned: *Les Contes drolatiques*,

Rome, where he executed the colossal statue of John the Baptist. 'Cleopatra,' 'The Coquette,' 'Revenge,' and 'The Tree' were executed by special request of King Victor Emmanuel. His other works include 'Massimo d'Azeglio,' 1873, 'Duke Ferdinand of Genoa,' both at Turin, and 'Victor Emmanuel,' 1897, at Naples.

Bam, dist. and tn of Persia, situated on the SE. borders of the Great Desert. It formerly contained a celebrated castle, the ruins of which are still to be seen. Pop. of tn, 13,500.

Bamangwato, African tribe, of the Bantu race, and the largest tribe of the Bechuanaland Protectorate, numbering over 100,000. See BECHUANALAND and SERETSE KHAMA.

Bambarra, or **Bambara**, name sometimes given to a dist. of W. Africa, in the colony of Fr. Sudan (until 1920 known as Upper Senegal and Niger), the name being that of the Negro tribe that inhabits the area. Segou (pop. 8229) is the cap. of the dist.; Sansandig, on the Niger, was once an important trading centre. The dist. is fertile. See SUDAN, FRENCH.

Bamberg, Ger. tn in the *Land* of Bavaria (q.v.), 125 m. N. by W. of Munich (q.v.), on the Regnitz near its junction with the Main (q.v.). It was ruled by prince-bishops from 1007 (when its bishopric was founded by the Emperor Henry II (q.v.), until 1802. In 1460 one of the first books in the Ger. language was printed here. During the Thirty Years War (q.v.) the tn suffered at the hands of the Swedes, and during the Seven Years War (q.v.) at the hands of the Prussians. There is a splendid Romanesque and Gothic cathedral (1004-1237), containing the famous 13th-cent. statue of the 'B. Rider,' and containing also the tombs of Henry II and of Pope Clement II (q.v.). Among the sev. other anct churches is the baroque *Michaeliskirche*, once a celebrated Benedictine abbey. The Renaissance Old Palace, and the baroque New Palace are both now museums. Textiles, tobacco, and electrical components (spark-plugs) are manuf. Pop. 80,000.

Bamberger, Ludwig (1823-99), Ger. politician and economist, b. Mainz, of Jewish parentage, studied law at Giessen, Heidelberg, and Göttingen. He took part in the revolutionary movement at the time when he was editing the *Mainzer Zeitung* (1848-9) and afterwards lived in exile in France for sev. years. He was a member of the National Liberal party in the Ger. Reichstag (1871-80). He was a free-trader and opposed the economic policy of Bismarck. With other Liberals he seceded from the party, forming a group of 'Secessionists,' the later Liberal union which opposed the colonial policy of the Gov. His books include a life of Bismarck, 1868, and *Reminiscences*, 1899.

Bambino (It., babe), term in art applied to the swaddled figure of the infant Christ, and particularly to the Santissimo B. in the church of Ara Coeli, Rome, which is supposed to have miraculous healing power. It is a richly decorated figure carved in wood. The festival of the B. takes place at Epiphany.

Bamboccio, Pieter van Laer (1613-c. 1673), Dutch artist, b. Laer, Holland. Studied at Rome. He neglected classical art but delighted in fairs, rustic parties, banditti, etc., subjects which the Italians comprise under the general name *bambocciati*. Hence his name, B., not, as some have said, owing to the deformity of his person.

Paul Popper

GIANT BAMBOOS, CEYLON

Bamboo (*Bambusa*), genus of Gramineae which grows in the tropics of Asia, Africa, and America. The plants are in reality gigantic grasses with a jointed subterranean rhizome, which is the true trunk of the B., the shoots being the branches. The stems are hollow and contain only a light pith, but they are jointed and at the nodes strong partitions stretch across the inside. The B.s grow in clumps, and may reach a height of 120 ft and a thickness of 10 in. The young plants for the first few years produce a well-stored rhizome, but when once they begin to increase in height their growth is very rapid. Some species flower only once, some every year, and others at longer intervals.

The B. is noted for its great economic importance, and serves a variety of useful purposes. The young shoots of some species are cut when tender and eaten like asparagus; the seeds also are sometimes used as food, and for making beer; some species exude a saccharine juice at the nodes which is of domestic value; the rhizomes and shoots, when pickled, form a condiment; silica, found in the stems of *B. arundinacea*, is used in E. medicine. The hard stems are converted into bows, arrows, quivers, lance shafts, masts of

vessels, bed-posts, walking-sticks, poles of palanquins, rustic bridges, beehives, water-pipes, gutters, furniture, ladders, domestic utensils, and agric. implements. Split up finely they afford a most durable material for weaving into mats, baskets, window blinds, ropes, and even sails of boats. Perhaps the greatest use to which they are put is in building, for in India, China, Japan, Assam, Malay, and other countries of the E., houses are frequently constructed solely of this material.

Bambuk, country in W. Africa, formed by the angle between the R. Senegal and its trib. Falemé. The climate is unhealthy, but the soil is rich and remarkable for its fertility. The vegetation consists of tamarind, baobab, calabash, acacias, and palm-trees. Maize, rice, millet, cotton, and water-melons are cultivated. The country is rich in iron-ore and there is some alluvial gold in the R. Falemé. The pop., estimated at 800,000, consists of Mandingoes, professedly Muslims. The B. country belonged to the Portuguese in the 15th cent., and was recognised as part of the Fr. Sudan in 1858. The chief tns are Kayes, Faranaba, and Mardinka.

Bamburgh Castle, in the vil. of B., on the coast of Northumberland, 16½ m. SE. of Berwick. According to the A.-S. Chronicle it was first built by Ida, first King of Northumbria, in 547, and called Bebbanburgh after Bebb, the wife of his grandson Ethelfrith. It has massive strength and dignity, rising high out of a rock 150 ft above the sea. The present castle mainly belongs to the Norman period, and has a fine keep and an apsidal chapel dedicated to St Peter. The castle was attacked by Penda, King of Mercia, in 651, and was twice taken by Dan. invaders. In 1095 Robert de Mowbray surrendered the castle to William Rufus. During the Wars of the Roses it was twice taken by the Yorkists and twice recaptured by Margaret. Elizabeth appointed Sir John Forster to be its governor, and the castle remained in the possession of his family until 1704 when the Forster estates were sold to Lord Crewe. The restoration of the castle was carried out under the direction of Rev. Dr John Sharpe, one of the trustees under the will of Lord Crewe, and from this time onwards the proceeds from the castle went to charitable purposes till in 1894 it was bought by Lord Armstrong for almshouses. B. was a royal borough in the time of Edward I, and returned 2 members to Parliament. Grace Darling's (q.v.) grave is in the churchyard.

Bambusa, see BAMBOO.

Bamian, valley in Afghanistan, 50 m. NW. of Kabul, near the N. base of the Koh-i-Baba Mts. The B. or Hajikhak Pass, at an elevation of 8496 ft on the road from Kabul, is the only known pass for military purposes over the Hindu Kush, and was once crossed by Alexander the Great. There are a number of cells hewn in the rock, and carved human figures of enormous size. The largest figure stands 173 ft high. These remains seem to indicate that the place was once

a centre of Buddhist worship. There are tombs belonging to the old city Ghulghuleh, which was destroyed in 1221 by the Mongols under Genghis Khan.

Bampton, mkt tn in Devon, England, 6 m. N. of Tiverton. There is a monthly market, and a fair held on the last Thursday in Oct. at which Exmoor ponies are sold. Pop. 1300.

Bampton, John (1690-1751), Eng. divine and the founder of the B. Lectures (q.v.). He graduated from Trinity College, Oxford, 1709. He held a preferment in Salisbury Cathedral from 1718 till his death.

Bampton Lectures, course of 8 divinity lecture sermons, called after their founder, Canon John B. (q.v.), who left an estate of £120 for their endowment. They are preached in alternate years at Great St Mary's, Oxford, and 30 copies are pub. within 2 months of their being preached, at the expense of the estate. The lecture is chosen on the fourth Tuesday in Easter term by the heads of colleges, and the lecturer must be an M.A. of Oxford or Cambridge, and cannot be chosen twice. The lectures must be based 'upon the divine authority of the holy Scriptures—upon the authority of the writings of the primitive Fathers as to the Faith and Practice of the Primitive Church—upon the Divinity of our Lord and Saviour Jesus Christ—upon the Divinity of the Holy Ghost—upon the articles of the Christian Faith, as comprehended in the Apostles' and Nicene Creeds.'

Ban, word found in many European languages, in various senses. The idea of pub. or proclamation runs through them all, showing that it is the anct word B. still preserved in Gaelic and Welsh, with the sense of proclaiming. It occurs in Spenser, Marlowe, and Shakespeare. On the foundation of churches and monasteries, writings were drawn up specifying with what lands the founders and other benefactors endowed them; as these frequently concluded with curses which would fall on anyone who should attempt to divert the lands from the purposes for which they were bestowed, the word has come to be associated with cursing. Hence the common use of the term. Persons who escaped from justice or opposed the church were placed under a B. (see BANISHMENT). A similar word was used in Germany with the sense of outlawry. In France a proclamation to call the people to arms was called a B., and those people liable to be called out came under the same name, so we have the *banlieue* of a city, and hence the modern use of the word. The French also use the word in the sense of the Eng. word bans (q.v.), under MARRIAGE.

Ban, Banus, from the Slavonian *ban*, a chief, the name given to a governor of certain dists. in the kingdom of Hungary, Dalmatia, Croatia, Slavonia, Bosnia, and Szórény. His power was unlimited, like that of a margrave, and he took command in time of war for the defence of his banat. In 1849 the B.s of Croatia, Slavonia, and Dalmatia were declared independent of Hungary and received their orders from

Vienna. In the year 1867 these banats were reincorporated with Hungary, and one of the Hungarian ministers was appointed B. of Croatia, Slavonia, and Dalmatia by the king under the direction of the president of the council and the Hungarian ministers. See BANAT.

Banagher, mrkt tn on the R. Shannon in co. Offaly, Rep. of Ireland. Anthony Trollope, while post office surveyor, wrote his first novels there, and Charlotte Brontë's husband, Rev. A. B. Nicholls, d. and was buried at B. Pop. 800.

Banam, tn in prov. of Prey Veng, Cambodia, on l. b. of R. Mekong (q.v.) at its junction with the Tonle-toch.

BANANAS

Banana, or **Plantain**, family Musaceae, genus (*Musa*) of about 40 species of very large, tree-like, tropical herbs. The edible B.s. of commerce are chiefly varieties of the subspecies *sapientum* of *Musa paradisiaca*, cultivated in tropical countries, especially Jamaica, Mexico, Honduras, Brazil, Guatemala, Colombia, and W. Indies; and *M. cavendishii*, the Canary B., much grown in Canary Isles, Florida, and Caribbean countries. The plants may grow from 5 to 25 ft tall, with a tree-like stem producing a bunch of very large, oblong or elliptic leaves of palm-like appearance at the apex, out of the centre of which arises a spike of flowers, eventually bearing the fruits which are long, seedless berries, and much valued as food. The Plantain of the tropics, which requires to be cooked, is produced by *M. paradisiaca*. *M. textilis* of the Philippines is the source of Abaca or

Manila hemp, and *M. ensata*, the Abyssinian B., is also grown for its fibres. Together with *M. basjoo*, the Jap. B., and the Chinese *M. superba*, *M. ensata* is grown as an ornamental plant in greenhouses, and sometimes out of doors in very mild gardens in Britain.

Banaras, see BENARES.

Banat, in general, a region governed by a *ban* (Slavonic title for ruler of a dist. with certain military powers); more particularly applied to a dist. lying between the Transylvanian Alps and the Danube, Tisza, and Mureș riva. The region belonged to Hungary, except for a short period (1849-60) when it was under the Austrian crown, and was divided by the treaty of Trianon (1920) between Rumania and Yugoslavia.

Banbridge, tn in co. Down, N. Ireland, on the Bann, 22 m. SW. of Belfast. Its prin. manuf. is linen. Pop. 6100.

Banbury, tn in Oxon, England, on the Cherwell and the Oxford Canal, 23 m. N. of Oxford. The Yorkists were defeated in the neighbourhood in 1469. The old castle, built in 1125, was destroyed during the Civil war, when B. was noted for its Puritanic zeal. The term 'B. man' came to be used as an equivalent for a typical Puritan. B. Cross, of nursery rhyme fame, existed down to the time of Queen Elizabeth, and has now been replaced by a modern one. The tn is still noted for its cake; the prin. industries are live-stock and aluminium. Pop. 19,000.

Banc, legal term for a seat or bench of justice. 'Sittings in B' or 'in banco' were formerly held at Westminster before two or more judges of the king's bench and exchequer and the court of common pleas. By the Judicature Act of 1873 two or more judges of the king's bench or probate div. of the High Court, sitting together 'in B.' for the purpose of trying issues of fact, are called a divisional court.

Banchieri, **Adriano** (1568-1634), lt. composer. b. and d. Bologna, became a priest and organist at Monte Oliveto in 1596, returning there after holding a similar post at Imola in 1601-7. But his church music is by no means the largest part of his output, which also includes secular canzonets, instrumental music, over a dozen theoretical works, and about as many stage works. Historically he is most important as an exponent of the madrigal opera, though none of his became as famous as the *Amfiparnaso* of Orazio Vecchi (q.v.).

Banchory, small burgh in Kincardineshire, Scotland, 17 m. WSW. of Aberdeen, on the Dee. Pop. 2000.

Bancroft, **George** (1800-91), Amer. historian, diplomat, and statesman. He graduated from Harvard College at the age of 17, studied hist. in Göttingen, where he received a degree of doctor of philosophy, and on his return to America in 1820 became Gk tutor at his own college. In conjunction with Dr Joseph Cogswell he estab. a school at Northampton, with which he was connected till 1830, when he devoted himself wholly to historical studies. He was made collector of the port of Boston in 1837, by President

Van Buren. As secretary of the navy he had a seat in the Cabinet of President Polk, 1845. Appointed minister to Great Britain, 1846-9, minister to Prussia, 1867-74. He was a Democrat, and his historical work, written at the time of the Civil war, was influential in inspiring an ideal conception of liberty. The first vol. of the *History of the United States* appeared in 1834, the tenth and last in 1874. He revised and added to the work, bringing out an ed. known as 'The author's Last Revision,' in 1883-5. His miscellaneous pubs.: *Poems*, 1823; *An Oration* (in memory of Andrew Jackson), 1845; *Martin Van Buren*, 1889.

Bancroft, Hubert Howe (1832-1918), Amer. historian, b. at Granville, Ohio, 5 May. He opened a bookshop at San Francisco in 1852, and made a large fortune, which he devoted to collecting documents—chiefly about Amer. hist.—and forming a fine library. His own contributions to historical literature include *The Native Races of the Pacific States*, *The History of the Pacific States*, and *Essays*, a total of 39 vols., appearing from 1875 to 1890. He also wrote *The New Pacific*, 1900, and *Retrospection, Political and Personal*, 1910.

Bancroft, Richard (1544-1610), prelate, b. Farnworth, Lancs. He was sent, at the expense of his great-uncle, Hugh Corroen or Curwen, Archbishop of Dublin, to Cambridge. In 1576 he became rector of Teversham, near Cambridge, and rose rapidly to the bishopric of London in 1597. He became Archbishop of Canterbury in 1604, and chancellor of Oxford Univ. in 1608. In the reign of James I he was appointed commissioner on behalf of the Church of England in the Hampton Court conference. He opposed Puritanism, and was a supporter of the theory of the divine origin of episcopacy. He was the founder of the Library at Lambeth Palace.

Bancroft, Sir Squire (1841-1926), actor-manager, b. in London. His first appearance on the stage was at the Theatre Royal, Birmingham, as Lt. Manley in *St Mary's Eve*. In 1865 he appeared in London at the Prince of Wales's Theatre as the leading actor, under the management of H. J. Byron and Marie Effie Wilton. Two years later he married Miss Wilton and continued with her the management of the Prince of Wales's till 1880, when they moved to the Haymarket. They retired from management together in 1885. He was knighted in 1896. Collaborated with Lady B. in *Mr and Mrs Bancroft On and Off the Stage*, *Written by Themselves*, 1888, and was the author of the *Bancroft Recollections of Sixty Years*.

Band, linen appendage to the neck-cloth or collar as part of clerical, legal, or academic costume. Some derive it from the amice, others from the collar worn by laymen in the reign of James I. It still forms part of legal costume in England, but has been replaced in Scotland by the white tie, except for king's counsel. It is worn by ordained Presbyterian ministers as distinguished from licentiates.

Band, in architecture, the name given to a flat strip or fascia, encircling a building or continued along a wall, usually horizontally. Also used of a B. of foliage, quatrefoils, or bricks. Special varieties of B.s are indicated by the terms lintel course, frieze, platband, string course, and so on.

The B. of a shaft is the moulding which encircles clustered pillars of small shafts, characteristic of Gothic architecture, especially in the Early Eng. style.

BANDS

Band: 1. *Military, etc.* Military B.s are composed of wind instruments and percussion, but their composition is not uniform, varying in different countries and even in different regiments. The authorised Brit. military B. is flute, E \flat clarinet, oboe, 7 B \flat clarinets, E \flat and B \flat saxophones, bassoon, 2 horns, 3 cornets, 3 trombones, euphonium, 2 basses, 1 percussion; this is a B. of 25 performers for programme work. For a B. of 40 there would be added a piccolo, 5 B \flat clarinets, a bassoon, 2 horns, 3 cornets, 2 basses and 1 percussion. In 1956 the authorised maximum estab. of regimental B.s was 40 plus conductor, and from this number would be drawn the B. of 25. For marching the instrumentation is adjusted to the conditions. Light Infantry and Rifle regiments use bugles with the military B. at times, while some countries have been known to use bagpipes with it. In addition to the regimental military B. proper, Highland regiments have a marching B. of bagpipes, while other infantry regiments have fife and drums, bugle and drums. The brass B.—strictly so-called—is dealt with below. For cents. European armies have had their B.s which were used for making signals in battle and to give encouragement to the fighters. The idea of present-day B.s was introduced into Europe by the crusaders, who took it from the Saracens. In the 16th cent. B.s became uniform and the Eng. 'drum march' won continental fame. Modern B.s owe their inception to Frederick the Great, who used them as means to make army service popular. His B. in 1763 consisted of 2 oboes, 2 clarinets, 2 horns, and 2 bassoons. Within 15 months France, Austria, and England had adopted similar B.s. Coloured men were employed in Brit. B.s for many years as

drummers and to play the cymbals, 'jingling Johnnies,' and similar instruments. They ceased to be employed in 1843. In 1823 the War Office ordered all officers to contribute towards their B.s. Valve instruments were introduced in 1830. In 1857 the gov. instituted a Royal Military School of Music, at Kneller Hall, near Twickenham, which was at first supported partly by gov. and partly by the various Brit. regiments. In 1867 the War Office took over the entire expenses. This institution trains non-commissioned officers, recommended by their commanding officers, for the position of bandmaster, and also trains promising young instrumentalists from all Brit. regimental B.s.; potential bandmasters have a 3 years' course which includes every branch of music, and the others a one-year course on their instrument under a civilian prof. In past years regimental officers had to subscribe towards the upkeep of B.s., but the gov. now maintains all regimental B.s. completely. All line regiments have one B. on their estab., but certain other corps—Royal Artillery, Royal Engineers, Royal Tank Regiment, etc.—have 2 or more. Staff B.s., such as the Household Cavalry, Foot Guards, Royal Artillery, Royal Engineers, have more musicians than line regiments and are enabled to maintain an orchestra also. The R.N., Royal Marines, and R.A.F. have their own schools of music which supply musicians to their respective services in much the same way as does Kneller Hall. The duty of service B.s. is to play at parades, officers' mess, ceremonial functions, etc., and subject to military exigencies they may also accept civilian engagements. All service military B.s. are now pitched to conform with civilian orchestras, i.e. A = 439.

2. **Brass.** With the growth of the volunteer movement many volunteer B.s. were formed, which were organised as far as possible on the model of the army B.s. These disappeared when the old volunteer force was abolished. Practically all the infantry and such leading artillery units as the Honourable Artillery Company (H.A.C.) of the modern Territorial Army have their own B.s. The brass B. proper is a type of instrumental combination which is especially suitable for open-air performance and amateur cultivation. It is found throughout Europe and is particularly popular in the N. cos. of England, where numerous tns and dists. possess brass B.s. As a movement brass B.s. began early in the last cent., and at the beginning of the present cent. there were at least 5000 such B.s. in the U.K., exclusive of the Salvation Army B.s. As in the case of the military B. it is difficult to specify categorically the constituent instruments of a brass B., but generally they consist of members of the cornet and saxhorn family, together with trombones. A normal Brit. brass B. has 25 players, besides percussion. At one time every autumn the contest of the brass B.s. of Great Britain was a popular festival at the old Crystal Palace. The *Daily Herald* National Brass B. Festival is held annually at the Albert Hall, London, and the

century-old 'Open' Championship Festival at Belle Vue, Manchester.

3. **Dance.** The modern dance B. may vary in number from 3 to 20 or more players. In an average-sized combination of 7 performers the instruments may be piano, string bass, percussion, violin, saxophone, trumpet, and guitar. Most competent players can perform on two or more instruments (known as doubling), thus giving the B. a wider variety of effects. See also ORCHESTRA.

Band, Bund, or Bend, Persian word for a dike or an artificial embankment, is often met with as a component part of names in E. geography; e.g. in the name of the Persian dam Bandamir on the R. Kur, in Fars, so called after Amir Azud ud-Dawla.

Band-fish, marine fish of the family Cepolidae. It is elongated and has spiny rays. *Cepola rubescens*, the red B., is a Brit. species of vivid hue, and is about 15 in. long.

Band of Hope Movement, started in 1847 in Leeds with children's weekly temperance meetings, and organised itself into the U.K. B. of H. Union in 1855. The movement's work is interdenominational and has spread to many parts of the world. Its official organ is the *Band of Hope Chronicle*, and its H.Q. are at Hope House, Great Peter Street, London, SW1.

Band-pass Filter, network consisting of an inductance in series with a capacitor and with a second capacitor shunted by an inductance, all so dimensioned that oscillations of frequencies within 2 given limits are passed through on account of resonance with the network.

Banda Islands, group in the S. Moluccas, Banda Sea, Indonesia, about 50 m. S. of Ceram (area 40 sq. m.). They are volcanic in origin, with Gunung-Api, 2000 ft., still active. Agric. products include nutmeg, sago, mace, and coco-nut. There was a Portuguese settlement in the early 16th cent., but the settlers were expelled by the Dutch by 1580. Occupied by Japanese in Second World War, B. I. became part of Indonesia in 1950. Pop. 13,000, many the descendants of emancipated slaves.

Bandage, strip of muslin or other material, of varying widths and lengths, used by surgeons to support a part of the body or to restrict movement, to apply pressure in order to prevent bleeding or swelling, or to fix dressings or apparatus in their places. B.s. may be simple, when they consist of 1 piece, as the roller and triangular B.; or compound, when they consist of 2 or more pieces.

The *Roller B.* is usually a strip of calico, flannel, linen, or muslin, about 18 ft. in length and 2-4 in. in width. In bandaging a limb the turns commence at the extremity and proceed upwards, so that the blood is driven from the limb. Circular bandaging consists of taking circular turns around the part, each loop covering about two-thirds of the width of the loop previously applied. Oblique bandaging means making the loops at an oblique angle to the axis of the limb. As the arm and leg gradually increase in diameter from the extremity

upwards, simple, circular, or oblique bandaging would tend to bind the limb by the edge of the strip only, leaving portions of the skin too loosely bound. To remedy this the B. is occasionally reversed; that is, the strip is turned so that the surface previously in contact with the limb becomes the exterior surface, and vice versa. When a joint such as the knee or elbow has to be passed, the turns cross each other like a figure of 8. The 'spica,' also used for passing projections in the limb, is an arrangement resembling the overlapping of the husks in an ear of corn. When sufficient turns have been taken, the end of the B. may be split in two, one tail carried round the limb in a direction reverse to the turns and securely tied to the other tail; a better plan is to sew the end, or fasten it by a safety-pin, care being taken to pass the needle or pin through 2 or 3 previous loops, so that the whole may be held firmly together without undue pressure from any single loop. The fingers and toes should never be bandaged with 2 injured surfaces touching, as there would be considerable danger of adhesion. If the extremities of the toes or fingers are not involved in the injury, they should be left uncovered, as their appearance will indicate whether the circulation has been unduly interfered with, when the B. will have to be readjusted. Any inequalities of pressure may be remedied by the use of padding of cotton wool.

B.s of rubber fabric are used when considerable pressure is required, as in sprains or varicose veins. Martin's rubber B. is used to lend support in cases of varicose veins. It consists of a roller B. which is wound spirally about the leg while the patient is in a horizontal position. It should not be tight, and the necessity for reversing is obviated as the elasticity of the rubber tends to keep all parts of the B. in contact with the surface of the limb. Esmarch's B. is used to prevent hæmorrhage from a limb during amputation. It is wound spirally about the limb with considerable pressure, beginning at the extremity, so that the blood is driven from the limb as much as possible. When the B. has passed above the seat of the proposed operation, a thick piece of rubber is bound tightly round the limb so as to prevent the return of the blood and thus save it for the remainder of the body. Before the widespread use of anaesthetics such an arrangement was used not only to prevent hæmorrhage, but also to diminish pain.

The *Triangular B.* consists of a piece of thin calico made by cutting a sq. yd diagonally, 2 such B.s being thus provided. The 'broad B.' is made by bringing the right-angled 'point' to the 'centre' of the long side, and folding the trapezium thus formed once again. The 'narrow B.' is made by folding the broad B. yet again. The triangular B. is used chiefly in first-aid work, being adaptable to many different uses. To cover the top of the head for securing dressings on wounds, the centre should be placed between the eyebrows, the point allowed

to hang over to the back of the head, and the ends passed round to the back, crossing over the point and brought together again on the forehead, where they are secured by a reef knot; the point is then turned up and safety-pinned on the top of the head. A sling for fracture of the collar-bone or forearm is made by placing one end of the B. over the sound shoulder, the operator standing in front of the patient; the forearm of the injured part is then drawn across the chest so that the point of the B. is on a level with the elbow; the other end of the B. is brought in front of the arm and carried over the shoulder of the injured side, the 2 ends being tied behind the neck, but in such a position that the knot is not in the way of the patient when lying down; the point is then brought round the elbow and secured in front by a safety-pin. To B. the foot, the sole is placed on the B., the toes being directed to the point. The point is then brought up above the front of the ankle, the ends crossed over the instep, and the point passed under the foot and over again and tied behind the ankle. The triangular B. may also be made into a tourniquet by folding it very narrow and tying a knot to the middle. The knot is placed over the artery when the bleeding occurs in the upper arm or thigh; the ends are passed round the limb and tied tightly. Additional pressure may be imparted by pushing a thick pencil between the tourniquet and the limb and twisting it. In tying knots in B.s the reef knot must be used in preference to the granny knot; that is, after making one bend in the ordinary way, the second half should be tied in the reverse direction. See M. Farnworth, *Roller and Triangular Bandaging*, 1940, and L. Oakes, *Illustrations of Bandaging and First Aid*, 1942.

Bandaisan, volcano (height 5540 ft) situated in Fukushimaken, Japan. A great eruption occurred in 1889.

Bandanna, or **Bandana**, particular kind of silk or calico handkerchief on which has been printed a pattern made up of spots and diamonds. B. handkerchiefs were originally made in India, but are now manuf. in England. The handkerchief is first dyed one colour, and then placed between leaden plates, on which the pattern has been cut out, and put into a powerful Bramah press, when the colour is discharged by means of a bleaching liquid, and the spots are left white on the dyed background.

Bandar Abbas, dist. and tn on the N. shore of the Persian Gulf, belonging to the Kerman prov. in Persia. The tn is 12 m. NW. of the is. of Ormuz. It has port accommodation, and good anchorage for large vessels in 4-5 fathoms, about 2 m. of tn. Its trade is small. Under the name of Gombroon, it was seized and fortified by the Portuguese c. 1612, and retaken by the Persians in 1615, and made into the prin. port of Persia by Shah Abbas and given the name of Bandar Abbas. The English were allowed to build a factory in 1623, and the Dutch soon after received the same permission. The

old Dutch factory still stands. Pop. 11,000.

Bandar Gaz, port on the Caspian, Persia. Its importance has declined in recent years owing to the foundation of Bandar Shah and the recession of the sea.

Bandar Pahlavi, see PAHLAVI.

Bandar Shah, one of the prin. Caspian Sea ports of Persia (Iran) in the prov. of Gorgan, founded in 1927-8 as the terminus of the Trans-Iranian railway. Pop. 14,000.

Bandelrante (Portuguese *bandeira*, a flag). Name originally given to the 16th- and 17th-cent. slave-runners and colonisers of S. Brazil. They were active in the areas of the present states of São Paulo and Minas Gerais. The name is now used in a complimentary sense to describe a modern inhab. of the city and state of São Paulo.

Bandel, Joseph Ernst von (1800-76), Ger. sculptor, b. Ansbach in Bavaria. His chief work was a colossal statue of Arminius, at Detmold.

Bandello, Matteo (c. 1485-1561), It. writer, second only to Boccaccio (q.v.) as a story-teller. He was b. in Piedmont of good family, and early became a Dominican friar. In 1525 he left Italy after the battle of Pavia, and settled in France, where he became Bishop of Agen (1550) and d. there 11 years later. His *Novelle*, which number about 230, are one of the most important collections of the 16th cent., and provided themes for Shakespeare, Massinger, Byron, and others. There is a danger of dismissing B. too lightly on the grounds of prolixity, coarseness, and want of humour. But he was a born raconteur, with a flair for finding his own stories, even though he lacked the fecundity of invention and humanity of Boccaccio. A number of his tales are believed to have necessarily been either anecdotal or else founded on *crimes passionnels* committed at no great distance from his own circle of acquaintances. One obvious example is the story of the wicked Countess of Celano, and another the far more celebrated story of the Duchess of Malfi. The great majority are tales of trickery, often ending with a terrible scene of vengeance. B. is not lewd, though in his period it was the fashion to treat directly of certain aspects of a story which modern technique is content to leave implied. Critics may cavil at B.'s moral lessons, but his stories have a force which is more or less independent of technique. If often drawn out, B.'s style is simple and fluent, his narrative vivid and direct, his characterisation excellent and, above all, the movements of passion admirably represented. A tale which combines most of his merits is that of Anselmo and Angelica, a story of a gentleman of Siena and of the enemy whom he delivers from death. The well-known Eng. trans. of 13 'Tragical Discourses or Tales' is that of Sir Geoffrey Fenton, which first appeared in 1567; and it gave the impetus to that wholesale pillaging by which poets obtained the material for so many of their greatest pieces. Fenton, who resided in Paris,

seems to have chanced upon these popular stories from reading the rendering of Belleforest. His trans. is one of the most notable surviving specimens of that stream of It. trans. which filled the book-shops of the period. The latest ed., *Bandello: Tragic Tales. Translated by Geoffrey Fenton*, ed. by R. L. Douglas and H. Harris, was pub. in 1924. Wm Painter's *The Palace of Pleasure*, 1566, also contains trans. from B., either direct or from the French.

Bandera, Stepan, leader of the extreme nationalist Ukrainian organisation Ukrainian National League in Galicia (q.v.) before and during the Second World War. After the occupation of Lvov by the Germans in 1941 B.'s followers proclaimed an independent Ukrainian state and set up a gov., but were arrested by the Germans and sent to concentration camps in Germany. After the war the name *Bandorovites* came to be used for all militant Ukrainian nationalists in the W. Ukraine who carried on guerrilla warfare against the Soviet authorities.

Banderoles, or **Bannerol** (It. *banderuola*, little banner), narrow flag flown sometimes at the mast of a fighting ship or from the lance of a knight. The word was also used of a square banner-like flag carried at funerals and bearing the arms of the deceased's family lineage.

Bandicoot, name for the family of the Marsupials known as Peramelidae. They are all natives of Australasia, and none is larger than a hare. In the structure of the hind feet they resemble the kangaroo, but there is less disproportion between the limbs. They are all insectivorous, but sev. species are omnivorous. *Paragalia* are the rabbit B.s, *P. lagotis* being known as the native rabbit in W. Australia; *Perameles*, which are herbivorous, include *P. nasuta*, long-nosed B., and *P. myosuroides*, saddle-backed B.; *Chaeropus* are the pig-footed B.s.

Bandicoot Rat, species of *Nesokia*, its scientific name being *N. bandicota*. It is a rodent of the family Muridae, to which rats and mice belong. It is a native of the E., and its flesh is used as food in India and Ceylon.

Bandiera, Attilio (1811-44) and **Emilio** (1819-44), brothers of a Venetian family who led a rising against the Bourbon tyranny of Naples in favour of It. independence, 1843. The rising failed and they fled to Corfu. With about 20 comrades, they landed in Calabria, expecting that their arrival would be the signal for a revolt. However, they were betrayed by one of their companions and were shot, with 6 others, in the square of Cosenza, 25 July 1844.

Bandinelli, Baccio or **Bartolommeo** (c. 1489-1561), Florentine sculptor and painter, disciple of Leonardo da Vinci. According to Vasari, his affection for da Vinci and hatred for Michelangelo led him to destroy the famous cartoon of the latter, which was supposed to excel da Vinci's on the same subject. Amongst his best-known sculptures are a statue of St Peter, a fine copy of the Laocoön, 'Hercules slaying Cacus,' 'Bacchus and

Orpheus,' and 'Adam and Eve.' See Vasari's lives and Benvenuto Cellini's autobiography.

Banditti, see BRIGANDS.

Bandjermasin, see BANJERMASIN.

Bandong, or **Bandung**, tn of Java, 75 m. SE. of Jakarta. It is an industrial centre (quinine, textiles, chemicals, rubber goods, machinery) and has an Eng. college, textile institute, and Pasteur institute. Pop. 166,800.

Bandolier, also **Bandoleer** and **Bandileer**, broad leather belt worn over the shoulder, across the breast, and under the arm. As worn by the old musketeers, it had attached a bag for balls and a number of metal cases or pipes, each containing a charge of gunpowder. Later the B. was fitted with leather pockets for cartridges.

Bandoline, gummy perfumed substance, variously produced from quince seeds, gum tragacanth, and Irish or Iceland moss, used to impart glossiness and stiffness to the hair. It is usually scented with attar of roses or oil of bitter almonds.

Bandon, tn in co. Cork, Rep. of Ireland, 17 m. SW. of Cork on both banks of R. B. It has mineral water and milling industries, and is one of the tns founded by 1st Earl of Cork. Pop. 2600. The R. B., 40 m. long, rises in the Carberry Mts, near Dunmanway, and flows SE. into the harbour of Kinsdale. With its tribs. it is a very important centre for salmon and trout fishing.

Bandung, see BANDOENG.

Bandwidth, range of frequencies within two given limits.

Bandy, see ICE HOCKEY.

Baneberry, or **Herb Christopher** (*Actaea spicata*), family Ranunculaceae, a native of Europe. When mature the plant bears black and poisonous berries.

Baner, **Banner**, or **Banier**, **Johan** (1596-1641), Swedish general, b. Djursholm near Stockholm, and d. at Halberstadt in Germany. At the battle of Breitenfeld, 17 Sept 1631, he commanded the right wing of the army under Gustavus Adolphus, and on the death of Gustavus he was made field-marshal. His two most famous victories were those of Wittstock in 1636 and Chemnitz in 1639.

Banff: 1. Royal and parl. burgh, cap. of Banffshire, Scotland, at the mouth of the R. Deveron on the Moray Firth, 50 m. NW. of Aberdeen. B. is a tn of considerable antiquity, having received its first charter from Malcolm IV in 1163, and has many old buildings of architectural interest. In the grounds of the old castle, the bp. of Archbishop Sharp, is the comparatively modern castle (formerly the property of the Earl of Seafield, now belonging to the Community Association). Prin. modern buildings include the Sheriff Court House, Town House, Chalmers Hospital, B. Academy, the masonic hall, the museum, and Duff House, which was presented to the citizens of B. and of the adjoining tn of Macduff by the then Duke of Fife in 1906. B. is a holiday resort with sea and riv. fishing and a golf-course; iron founding and boat-building are carried on. Pop. 3500.

2. Post-tn, Alberta, Canada, on the

Canadian Pacific Railway, 922 m. W. of Winnipeg and 560 m. E. of Vancouver. Here is B. National Park, estab. in 1885, the oldest of Canada's national parks and the second largest in Canada (area 2584 sq. m.); it is a noted tourist resort. Pop. 2860.

Banffshire, maritime co. of NE. Scotland, bounded on the N. by Moray Firth, on the E. and S. by Aberdeenshire, and on the W. by the cos. of Inverness and Moray. Pictish remains are to be found at Rothiemay, Ballindalloch, Boharm, and elsewhere, and medieval remains at Balvenie, Auchindoun, Findlater, and Keith. The co. was the scene of many conflicts between the Scots and Norse invaders. B. is mountainous in the S., the surface being flatter and more fertile in the N. Partly in the co. are the Cairngorms (q.v.). The chief rivs. are the Spey, Avon, and Deveron, and the prin. lochs are Loch Avon and Loch Bulg. Cattle-breeding is the prin. rural industry, and other important occupations are fishing, whisky, and woollen manufs. The co. tn is Banff, and other tns include Buckie, Keith, and Macduff. The co. returns one member to Parliament. Area 630 sq. m.; pop. 50,000. See W. Barclay, *Banffshire*, 1922.

Bang, **Hermann Joachim** (1857-1912), Dan. author, b. in the is. of Seeland; educ. at the academy of Sorø and at Copenhagen. He is the chief exponent of Dan. impressionism, and his novels mostly deal with the lonely and miserable life of insignificant people. His works include *Haafløse Slægter*, 1880, *Fædra*, 1883, *Stille Eksistens*, 1886, *Liv og Død*, 1900, and *Mikaël*, 1903. He also wrote poetry and sev. critical works. See L. E. Grandjean, *H. Bang*, 1942.

Bang, **Nina Henriette Wendeline** (1866-1927), Dan. Social Democrat politician, b. Copenhagen. From 1913 to 1917 she was a city councillor of Copenhagen, and in 1918 was elected a member of the Upper House of the Dan. Parliament. In 1924 she became education minister, being the first woman to hold Cabinet rank in Denmark.

Bangalore, tn of Mysore state, India, 216 m. by rail W. of Madras, and 70 m. NE. of Seringapatam. It is situated over 3000 ft above sea level, and was a considerable European settlement. The fine botanical garden is worthy of note. The tn was a favourite residence of Hyder Ali. It was captured by Lord Cornwallis in 1791.

Bangar, tn in La Union prov., Luzon, Philippine Is., 20 m. from San Fernando. Rice is the chief product. Pop. 14,988.

Bangka, or **Banka**, is. of Indonesia, in the Java Sea off the SE. coast of Sumatra, from which it is separated by B. Strait. Area 4611 sq. m. Generally hilly, with swampy coastal areas, it is one of the world's largest sources of tin; it also has deposits of iron, manganese, gold, lead, copper, and wolfram. The miners are Chinese. Pop. (including the off-lying is. of Lepar and Liat) c. 205,500. Pangkalpinang is the cap. The Dutch gained control, 1688; B. was also occupied

temporarily by the British, 1812-14. Occupied by Japanese in Second World War. B. became part of Indonesia in 1950.

Bangkalan, tn on the coast of Madura Is., Indonesia, a trading centre. Pop. 12,000.

Bangkok, cap. of Thailand, on the Menam, 20 m. from its mouth. The area of the city is about 15 sq. m., and the pop., estimated in 1947, is 889,538, of which about one-third is Chinese. The older part of the city is built on rafts, but there are more streets than formerly and people move about in motors rather than in boats. Most heavy labour is done by Chinese, and trade conducted by Eurasians, Chinese, and Indians. Nearly every road has its trams and omnibuses, taxi-cabs, and jinrickshas. The city is the terminus of 4 railway lines. Huge structures of reinforced concrete are separated by wooden huts. The royal palace is in size a small city. The modern throne hall, about a mile away, is of white marble brought from Italy. There are many Buddhist monasteries and the Buddhist temple known as the Golden Mount (c. 400 ft high) is a notable landmark. The Chulalongkorn hospital is probably the finest in the Far E.; it has a snake park attached to it. Antidotes are made from their venom. Gambling in B. is prohibited by law. There are sev. hundred second-hand shops for the sale of curios. Fruit gardens supply the city with a bounteous supply of fresh food, including rice, the staff of life, while especially for the poorer classes fish takes the place of meat. The chief exports are rice and teak; the imports, textiles, bullion, and gold leaf. The number of its beautifully coloured temples make B. one of the most picturesque cities in the E. The city suffered severely during the Second World War. It surrendered to the Jap. forces on 13 Dec. 1941. After the war B. was the scene of a *coup d'état* by Marshal Pibul Songkram, whose party, the Tharmathipat, seized control of the gov. on 10 Nov. 1947.

Bangor: 1. Episcopal city, seaport, and municipal bor., Caernarvonshire, Wales, on the Menai Strait, 9 m. NE. of Caernarvon. The chief trade is the export of slate from the Penrhyn quarries. The cruciform cathedral was restored by Sir Gilbert Scott (1869-80). The Univ. College is situated here. Pop. 13,000.

2. Seaside resort and dormitory tn on Belfast Lough, co. Down, N. Ireland, 12 m. NNE. of Belfast. Its great monastic school was world famous. Pop. 25,000.

3. City and co. seat, Penobscot co., Maine, U.S.A., on the Penobscot R. at its junction with the Kenduskeag Stream. It is the third largest city in the state, and has extensive manufs. of boots, shoes, clothing, dental supplies, tools, machinery, and furniture; it is one of the chief lumber depots of the U.S.A. B. is a port of entry for ships, lumber, paper, and pulpwood. Pop. 31,558.

Bangorian Controversy, dispute which arose out of a sermon preached before George I in 1717 by Bishop Hoadly of

Bangor. In this sermon Hoadly (q.v.) denied the right of the Church to exercise authority over the conscience. The Lower House of Convocation was preparing to take steps against the author of these opinions, when it was prorogued by the Crown. Convocation met after this only rarely, and for purely formal business until 1847. The royal licence to transact business was granted again in 1852.

Bangs, John Kendrick (1862-1922), Amer. author, b. Yonkers, New York. Educ. at Columbia Univ., he ed. *Harper's Weekly*, 1898-1901, and *Puck*, 1904-5, and pub. many extravagantly farcical works, including *Tiddledywinks Tales*, 1890, *The Tiddledywink Poetry Book*, 1890, *Mr Bonaparte of Corsica*, 1895, *A Houseboat on the Styx*, 1895, *The Idiot at Home*, 1909, *Autobiography of Methuselah*, 1909, and *Echoes of Cheer*, 1912.

Bangweulu, lake, N. Rhodesia, 3700 ft above sea level. Area of open water, about 1670 sq. m. in dry season. It is said to be nowhere deeper than 15 ft. It was first discovered by Livingstone in 1868.

Banian Days, originally a sailor's name for the days when meat was not served to the crew. The phrase has now come to be applied to any period of indifferent feeding. The expression owes its origin to the abstention from meat practised by the Banians, a class of Hindu merchants who were a caste of the Vaisya, who, on religious principles, abstain from meat. It is estimated that there are over 3,000,000 of them scattered over various parts of Asia.

Banias: 1. Vil. formerly in Palestine, now in SW. Syria, 40 m. SW. of Damascus, on the site of the ruins of Paneas, afterwards Caesarea Philippi. It is situated near the sources of the Jordan, at the foot of the Anti-Libanus (Jebel Heish), the Mt Hermon of Scripture. B. came into prominence during the time of the crusades, about the 13th cent., when the castle of B. was built, the ruins of which may still be seen.

2. Tn of W. Syria, on the Mediterranean, 25 m. S. of Latakia, terminus of the Iraq Petroleum Co.'s 30-in. pipeline from Kirkuk in Iraq (completed 1952).

Banim, John (1798-1842), novelist, poet, and dramatist, b. Kilkenny, where his father was farmer and trader. He was educ. at Kilkenny College, and studied at the academy of the Royal Dublin Society. In 1820, after sev. years of ill health and disappointment, he removed to Dublin, ultimately abandoning art for literature. In 1821 the production of his tragedy, *Damon and Pythias*, at Covent Garden, brought B. fame and money, and in 1822 he and his brother Michael, having settled in London, set about the writing of a series of Irish tales on the lines of Scott's Waverley novels. Their *Tales of the O'Hara Family* (1st series, 1825; 2nd series, 1826) won popularity. He was granted a civil list pension in 1836. Amongst his other works is the novel *The Boyne Water*, 1826, also a book of essays entitled *Revelations of the Dead Alive*, 1824, the tragedies of *Turgesius* and

Sylla, and the poem *The Cell's Paradise*, 1821. See life by P. J. Murray, 1857.

Banim, Michael (1796-1874), novelist, b. Kilkenny, elder brother of John B. He was originally intended for the law, but was compelled to renounce his studies owing to his father getting into financial difficulties. Like his brother, he was the victim of ill health, and in his latter years lived in reduced circumstances. He was joint author of the *Tales of the O'Hara Family* and probably wrote the greater part of the delightful *Father Connell*, 1842, while he was sole author of the following tales among others: *The Croppy*, 1828; *The Ghost Hunter and his Family*, 1833; *The Town of the Cascades*, 1864.

Banishment, term derived from the old word *ban* (see **BAN**). In primitive society B. meant the exclusion of an individual from the protection of the law and the benefits of society, a sentence of outlawry which also involved the confiscation of his property. In more recent times the word has come to mean expulsion from a country or place in punishment for crime. In England B. was introduced as a punishment in judicial procedure in a statute of Elizabeth's reign, and in the form of transportation the practice received the sanction of Eng. law until far on in the 19th cent.

Banister, see **BALUSTER**.

Banja Luka ('Baths of St Luke'), tn in Bosnia-Hercegovina, Yugoslavia, on the Vrbas. It dates from Rom. times, and has many interesting, oriental streets and sev. mosques. It is the seat of Rom. Catholic and Orthodox bishoprics, has a spa, and is a commercial centre. Pop. 37,800.

Banjermasin, or **Bandjermasin**: 1. Dist., Indonesian Borneo, intersected from N. to S. by mts, and watered by the Banjar and other rvs. Rubber is the main export; the region also produces gold, diamonds, gum, wax, spices, etc. The pop. is composed mostly of Dyaks.

2. Tn, cap. of Indonesian Borneo, on the Martapura R. B. is largely built on ples. There is an extensive trade in local products, and an oil refinery. Pop. 68,000.

3. Riv. in SE. Borneo. It is navigable for about 50 m. from the sea.

Banjo (Negro corruption of the word *bandore*, derived from Gk *pandora*, a musical instrument with 3 strings), stringed musical instrument, played with the fingers, often without frets to guide the stopping. It consists of a long neck, on

which are the tuning-pegs, and a drum-like vellum body, and had from 5 to 9 strings, the 5-stringed B. being now the standard pattern. It was introduced into America by the Negroes. The pitch is one octave lower than the written notes.

Banjoemas, see **BANYUMAS**.

Banjoewangi, see **BANYUWANGI**.

Bank Holidays, first estab. by Sir John Lubbock's (Lord Avebury) Act of 1871. B. H. in England and Ireland are Easter Monday, Whit Monday, the first Monday of Aug., Christmas Day, 26 Dec. (Boxing Day, q.v.), or if that day falls on a Sunday, the 27th, and Good Friday. In Ireland 17 Mar. (St. Patrick's Day) is also a Bank Holiday. In Scotland B. H. are Christmas Day, New Year's Day, and the first Mondays of May and Aug. On these days banks are closed, bills and notes due on such days becoming payable on the next day, except in the case of Christmas Day and Good Friday. Bills, etc., due on these two days are payable on the preceding day.

Bank Note, promissory note issued (usually) by a bank and payable to the bearer on demand. It originated in the receipts given by 17th-cent. goldsmiths for the precious metals deposited with them for safe keeping during the troublesome times of the Civil war. In England the Bank of England has a monopoly of note issue; other banks issue notes in Scotland, N. Ireland, and the Isle of Man. The machinery and processes for printing B. N.s and other forms of securities employed in London were for a long time more developed there than elsewhere in the world. Orders for this kind of work still come to London from most of the important countries of the world except the U.S.A. The engraving and printing of B. N.s is a peculiarly Brit. industry; Waterlow's have carried on the business from 1811 to the present day, De La Rue's from 1815, and Bradbury, Wilkinson from 1855; and in all of these firms the staffs include men who have inherited their skill from their grandfathers and fathers before them. The business requires organisation of safeguards against forgery and other forms of fraud. Every attempt of the forger adds something to the knowledge of the B. N. printer. In these days it is the camera and photo-mechanical processes to which the forger usually resorts, and the B. N. printer has to thwart these efforts with finer and more intricate designs and engraving, with complicated colour combinations. The actual machinery and methods of engraving and printing are in themselves strong safeguards, for the machines are altogether different from those used in ordinary printing. A geometric lathe of extremely intricate mechanism is used for engraving interlacing patterns on B. N.s. The designs are obtained by combinations of gearing and pattern wheels, and without having possession of the key figures to the combination, no one could make a repeat. This is a Brit. invention, but these machines are now also made in the U.S.A. and Germany, as are the transfer presses for impressing

BANJO

the engraved designs into the steel printing plates. The lathe was originally invented by Jacob Perkins, who came over to this country to exploit it and founded a firm which to-day is still printing securities. Any person outside the recognised B. N. printers who should attempt to buy such machines would not only at once be under suspicion, but would have to give proof of his bona fides. The machines for printing from steel plates have been gradually evolved from the first crude handpress, which was practically a mangle, for printing from flat plates, the inking, wiping, and application of pressure being done by hand. A Frenchman named Guy first constructed a machine for automatic, or semi-automatic, inking and wiping, originally for flat plates and afterwards for rotary printing for curved plates. Guy's machines were shown at the Paris Exhibition of 1874, and one was purchased by Bradbury, Wilkinson, who later installed a more elaborate machine made by Voirin of Paris. Some machines used at the present day are designed and manu. by the firms using them, and the features of the design are jealously guarded. Other fully automatic machines for single and multi-colour printing are now available on the market. See BANKS and FIDUCIARY ISSUE.

Bank of England, The. owes its origin to the scheme of Wm Paterson (q.v.) for meeting the expenses of the Fr. war which followed the revolution of 1688. Other schemes were proposed, but Paterson's was eventually accepted by Montagu, Chancellor of the Exchequer, and it was agreed that in consideration of the sum of £1,200,000 subscribed and lent to the gov., the subscribers were to be incorporated under the title of the Governor and Company of the B. of E. The B. of E. remains the most famous and at the same time 'the most original' bank in the world. Its importance to the gov. and to the Eng. nation is shown by the loans made to William III and Queen Anne which enabled England to regain the position among European nations she had then to all appearance lost. The gov. of the day sought the B. of E.'s assistance on the eve of all the 18th-cent. wars, and on the day of reckoning which followed the futile transactions of the Land Bank and of the S. Sea Bubble. Further, not only the estab. of public credit by the formation of the permanent debt, but the organisation of the floating debt and even the conversion of the national debt, are, in the main, the work of the B. of E.; and in return for these services the gov. has always defended the interests of the B. of E. in times of stress.

A comprehensive hist. of the B. of E. necessitates a study of the business methods of the goldsmiths as exchangers and as discounters of bills and loans at high rates of interest. So successful had they become that large sums were deposited, and receipts for these savings circulated better than the coins. Thus goldsmiths' notes are to be regarded as the earliest form of bank notes in Eng-

land. It is therefore not surprising that the goldsmiths offered some opposition to Paterson's proposal. There was also opposition from the Tories, who declared that a State bank would be one step towards a republic; while certain Whigs opposed it on the ground that it would lead to an absolute monarchy, inasmuch as the king could then escape the financial control of Parliament; while yet others feared that the B. would absorb all the money in the kingdom and subject commerce to usurious exactions. But political necessity decided the matter. Sir John Houblon was the first governor, with Michael Godfrey deputy-governor, and a court of 24 directors. The subscription list was opened at the Mercers' Chapel, June 1694, and proved a great success. The corporation was to lend the whole of its capital to the gov. and to be paid interest at 8 per cent, and to be paid £100,000 per annum for expenses. The corporation was also to have the privileges of a bank for 12 years, the gov. reserving the right of annulling the charter after giving 1 year's notice. The corporation was not authorised to borrow or owe more than its capital, and if it did the members became personally liable in proportion to the amount of their stock. The corporation was not to trade in merchandise, but could deal in bills of exchange, gold or silver bullion, and sell any wares on which it had lent money. The B. was started on condition that a certain sum should be lent to the gov., but the increase in the following years was due to further loans to the gov. of the day, and in return the B. obtained renewals of its charter and also other advantages. The influence of the B. during the 18th cent. was almost as great as in the present day, for at that time the large issues of notes made it a very formidable opponent of London bankers. It became the chief factor in the money market, and therefore fixed the price of the loan capital. This was so because it was then the only joint-stock bank in existence, and as such held large deposits in comparison with the private banks. The rate of interest fixed by it became the key to market rates, and it still remains so. The rate charged by the joint-stock banks for advances is, by convention, 1 per cent above bank rate (with a minimum of 5 per cent for personal borrowers).

The business of the B. of E. consists of 3 divs.: (1) the management of the national debt; (2) issue of bank notes (the Bank Act of 1844 divided the issue from the banking dept and from that date the 2 offices were kept distinct); (3) gov. and central banking. The B. of E. carried on its business in Grocers' Hall until 1732. Its present building in Threadneedle Street, London, was erected to the design of Sir Herbert Baker and incorporated features of earlier buildings on the site by Sampson (1732-4), Sir Robert Taylor (1765-88), and Sir John Soane (1788-1833). There are country branches at Birmingham, Bristol, Leeds, Liverpool, Manchester, Newcastle, and Southampton.

Bank of England (Nationalisation) Act, 1946. Passed by the third Labour Gov. with the aim of bringing the capital of the B. of E. into public ownership and the B. under further control, and to make provision respecting relations between the Treasury, the B. of E., and other banks. Under the Act the whole of the B. stock was transferred to Treasury nominees 3 months after the passing of the Act. The new court of directors consists of a governor, deputy-governor, and 16 directors (8 fewer than previously)

given to any such request or recommendation.

Nationalisation did not much change the B. of E.'s status and functions. The governor still works hand-in-hand with the Treasury, and the volume of purchasing power is controlled in much the same way as before, namely, in accordance with gov. policy modified by the B. of E.'s advice. The control is exercised in 3 ways: first, directly on the volume of currency; second, on the volume of 'near-money' (short-term

Hulton Picture Library

THE BANK OF ENGLAND

appointed by the Crown. The governor and deputy-governor hold office for 5 years, the directors for 4, and all are eligible for reappointment. Members of Parliament, persons holding offices of profit under the Crown, aliens, and persons disqualified under the B.'s charter are excluded from appointment. Only 4 of the directors may be employed whole time by the B. The Act also provided for the drawing up of a new charter. The Treasury may give directions to the B. from time to time, but subject to such directions the affairs of the B. are managed by the court of directors in accordance with the charter. The B. may, if they deem it necessary in the public interest, request information from, and make recommendations to, bankers, and may, if so authorised by the Treasury, issue directions to any banker for the purpose of securing that effect is

credit nearly as liquid as cash), both directly by deciding with the Treasury the issues of Treasury bills and indirectly by bank rate; thirdly, by the ability to influence financial institutions.

Whatever the pros and cons of nationalisation, the B. of E. has undergone much the same kind of change as the central banks of other major countries: the Federal Reserve Bank of the U.S.A., the Banque de France, the Reichsbank, and others. In the last 40 years the B. of E. has taken on extended functions because of the greater volume of governmental financial activities (corresponding to the greater economic role of government). It has also passed from managing a credit policy based on international movements of gold to one based on general national political considerations. The B. of E. has become an instrument of gov. in its attempt to control the general

economic life of the nation. How far it is possible to achieve national economic objectives while at the same time belonging to a world economy is one of the great problems facing statesmanship. It may be that being part of a system of free international exchange is incompatible with the maintenance of permanent full employment in any one country, just as it is impossible to maintain full employment in Warwickshire when there is a free exchange between it and other counties of Britain.

The changes in the role of the B. of E. are illustrated by a comparison of its weekly returns in 1914 and 1954:

Consult John Francis, *The History of the Bank of England* (3rd ed.), 1848; W. J. Lawson, *History of Banking* (2nd ed.), 1855; J. E. Thorold Rogers, *The First Nine Years of the Bank of England*,

1887; Sir J. H. Clapham, *The Bank of England* (2 vols.), 1938; R. S. Sayers, *Financial Policy*, 1939-45, 1956; Sir Henry Clay, *Lord Norman*, 1957.

Bank Rate, minimum official rate at which the Bank of England will rediscount treasury bills and other first-class bills of exchange, i.e. lend money on short term. When the B. R. is effective, all other short-term rates in the London money market fluctuate with it. Thus in recent years the rate of discount on three-month treasury bills, the rates applied by the commercial banks to loans at call and short notice, to deposits, and to advances to customers, and the rates paid by discount houses and other financial institutions which accept deposits, have varied with B. R. B. R. thus governs the price of credit. For long periods before the war it exerted a powerful influence on the tempo of the economy. When it was raised it dampened inflationary tendencies by making credit dearer; it could also encourage expansion in economic activity generally by making credit cheaper and thus stimulating business, although it was less successful in this task than in that of discouraging over-expansion.

When Britain was on the gold standard, B. R. was used to maintain the exchange value of sterling. It was raised if gold was tending to flow out of the country; higher short-term rates in London then attracted short-term capital from overseas, and gold was sent to London and thus helped to maintain the gold reserve necessary for the gold standard.

Now that Britain is not on the gold standard, this function of B. R. no longer applies; but B. R. could still help to maintain a balance between payments to other countries for imports, etc., and payments from other countries for exports, etc. An adverse balance of payments must still be avoided in order to protect the gold and dollar reserves (q.v.) necessary to meet unforeseen emergencies in international trade and transactions.

It was for this reason that the B. R. was raised in 1951 for the first time in nearly 20 years. Except for a few weeks on the outbreak of war in 1939, B. R. was 2 per cent throughout this period. It was raised in 1951 because the balance of payments had become adverse and a serious drain on the gold and dollar reserves followed. B. R. was raised to 2½ per cent; and again to 4 per cent in 1952. It was reduced during 1953 and 1954 when economic recovery had restored the reserves, but was raised again in 1955 to 4½ per cent, in 1956 to 5½ per cent, and in 1957 to 7 per cent when there was more economic trouble.

The effectiveness of B. R. and the desirability of using it were questioned by some economists in the 1930's, and the doubts have been renewed since the end of the Second World War. They relate to the difficulties of changing costs and prices upwards and downwards without friction by altering the supply of money.

This affects the volume of spending and therefore of employment. In particular, a rise in B. R. reduces spending and may cause unemployment. Undoubtedly, and particularly in the post-war world when full employment and the increase in political power of the organised trade unions have increased resistance to wage reductions, it is not easy to work a monetary system which requires general upward and downward movements in prices and costs. But this difficulty applies not only to B. R. but to any method of obtaining these movements. At bottom, the objection is really to making domestic monetary arrangements part of a wider world economic system. The question is whether Britain can isolate herself from relations with the rest of the world. In view of her dependence on imported food and raw materials, such isolation does not appear to be practicable. At least, it might be practicable provided her people were prepared to accept a much lower standard of living. The difficult choice is between continued over-full employment and high living standards.

In any event, B. R. has been used since 1931 with the intention not of *deflating* the economy from a situation of full employment, but of *disinflation* it from one of over-full employment to one of full (or almost full) employment.

B. R. is fixed by the directors of the Bank of England at their weekly meeting and is announced on Thursday mornings. Changes in the B. R. since before the First World War have been as follows:

Year	No. of Changes	Highest	Lowest
1914	8	10	3
1915	None	5	5
1916	1	6	5
1917	2	6	5
1918	None	5	5
1919	1	6	5
1920	1	7	6
1921	4	7	5
1922	4	5	3
1923	1	4	3
1924	None	4	4
1925	4	5	4
1926	None	5	5
1927	1	5	4.5
1928	None	4.5	4.5
1929	5	6.5	4.5
1930	4	5	3
1931	6	6	2.5
1932	7	6	2
1933-8	None	2	2
1939	3	3.88	2
1940-50	None	2	2
1951	1	2.5	2
1952	1	4	2.5
1953	1	4	3.5
1954	1	3.5	3
1955	2	4.5	3
1956	1	5.5	4.5
1957	2	7	5

From 1932 to 1952, when B. R. was so low as to be virtually ineffective in the money markets, the Bank of England

used Open Market Operations to control the volume of credit and the gov. used physical controls (rationing, licensing, allocations, and price controls) to regulate the volume and direction of investment.

There are differences of opinion about how far B. R. has been effective since 1951 in checking inflationary tendencies. It has been argued that action by the gov. in increasing the supply of money or near-money, by expanding the volume of treasury bills and other means, has nullified the effect of raising the price of credit. Furthermore, as public bodies have, since the end of the Second World War, disposed of 35 to 40 per cent of the national expenditure, B. R. is effective only in the remainder, since the gov. can make credit available to its own organisations or local authorities at rates lower than those in the money markets.

See BANK OF ENGLAND and MONEY.

Banka, see BANGKA.

Banka, or Mengka, tn on the is. of Formosa. It is in a tea-growing dist., and its port is Tamsui. Pop. 45,000.

Banker and Customer (Law). The Eng. law rules that the relation between B. and C. is that of debtor and creditor, as was laid down in the House of Lords in *Foley v. Hill*, 1848, 2 H. of L. 28. The banker is not a trustee, responsible to the depositor for the way in which he uses his money, and the banker keeps what profit he may make with the money deposited. If the bank stops payment, the depositor ranks with the other creditors. If he has not used his account for 6 years and there has been no payment of interest or repayment by the bank of any part of the deposit or no acknowledgment in the meantime, the debt is statute-barred. A banker is obliged to honour a customer's cheques provided only that there are sufficient funds to his credit, and is liable for damages without proof of actual injury or loss if he dishonours cheques. This liability holds good only between the banker and the drawee of the cheque, and the person in whose favour the dishonoured cheque has been drawn has no right against the banker. The banker's authority to pay money on cheques is ended by the customer's death, insanity, or bankruptcy, or by notice of an act of bankruptcy. A customer may by order revoke the authority to pay cheques or a particular cheque, but such order must be in explicit terms. A garnishee order against the funds of a customer at a bank attaches to all the funds, and a banker may not pay on any cheques drawn by the customer, even if the amount of the judgment is exceeded by the funds. Valuables, such as plate, etc., deposited by a customer for safe custody with a banker, are not in the same position as funds deposited. The banker acts as a bailee, and they cannot be taken by the banker as set-off against a debt due from the customer, nor, in the case of the failure of the bank, do they rank with the bank's assets; the banker is liable for loss through negligence on his part, and they can be recovered from the banker after any lapse of time. The deposit of

valuables for safe custody differs from the deposit of securities, for on these last the banker has a lien, which covers also all cheques and bills paid in for collection by the customer. The banker can retain all such against his customer's debt, and may realise the securities. This banker's lien can, of course, only be exercised where there is no agreement between him and the customer to the contrary, or where goods are deposited only for safe custody or money is paid in to meet particular bills. Further, a banker may not alter any system of dealing which has been recognised as holding good between him and the customer without due notice. If securities have been deposited as cover for a specific loan, the banker's lien terminates when the loan has been repaid. An overdraft or advance is arranged by agreement, and interest may be charged; a customer, drawing a cheque when there are not sufficient funds to meet it, makes an implied request for an overdraft, which the banker may refuse by dishonouring it. Much of the law affecting B. and C. is that which relates to cheques, bills of exchange, and other negotiable instruments. Finally, a banker is bound to keep secret all matters relating to his customer's account, unless authorised to reveal them or compelled to do so by law. See H. Hart, *Law of Banking* (4th ed.), 1931; J. Paget, *Law of Banking* (5th ed.), 1947; E. Sykes, *Banking and Currency* (9th ed.), 1947.

Bankers, Institute of, founded 1879, association of men and women connected with various branches of banking. Its objects are to facilitate the consideration and discussion of matters of interest to B.; to afford opportunities to its members for the acquisition of knowledge; and to take measures which may be desirable to further the interests of banking. This it does in part by the arrangement of lectures on banking, mercantile law, political economy, and other subjects, and partly by the issue of certificates to those who pass the examinations approved by its council. The ordinary meetings of the institute are held in London from Nov. to May, and the papers read and discussed are pub. in the institute's *Journal*. There are local centres of the institute in the chief prov. tns of England and Wales. Its fellows, associates, and ordinary members number over 40,000. London address, Lombard Street, E.C.3.

Bankers' Association of America, see AMERICAN BANKERS' ASSOCIATION.

Bankhead, Tallulah (1903-), Amer. actress, b. Huntsville, Alabama, U.S.A., daughter of Wm Brockman Bankhead and his wife, Adeline Eugenia (Sledge). She married John Emery (marriage dissolved). Her first appearance on the stage was at the Bijou Theatre, New York, 1918, as Gladys Sinclair in *Squab Farm*. She had a successful career in America up to 1922, then came to England and appeared as Maxine in *The Dancers* at Wyndham's Theatre, 1923, with Sir Gerald Du Maurier. Her strong personality and beauty and her characteristic

husky voice caught the public fancy, and she became a star and one of the most talked-of people in the country. *Conchita* at the Queens in 1924 was a complete failure and was booed from the stage, but T. B. had many successes between 1924 and 1930, when she returned to America. Later successes included *The Little Foxes* and *The Skin of Our Teeth*. She is extremely popular, and although a good actress is more famous for her beauty and her most arresting and controversial personality than for her success on the stage.

Banking, see BANKS.

Banking in Australia and New Zealand.

Under an act passed in 1939 the Gov. of New Zealand has complete control of the Reserve Bank of New Zealand. The minister of finance is empowered to vary or suspend the minimum reserve of 25 per cent; and power is given to revalue the gold coin and bullion held by the bank on the basis of the market value of fine gold and to transfer any profit so obtained to a special reserve account. In Australia the governor in 1942 announced far-reaching measures to control the operation of trading banks and to prevent expansion of credit by the banks, in accordance with recommendations of the Royal Commission on the Monetary and Banking System.

Banking in England. The rise of B. in E. has often been dated from the seizure by Charles I in 1640 of the bullion deposited in the Tower of London by the city merchants. Though it was returned to them, for the future they deposited it for safety with the goldsmiths, who not only did business in money-changing, but were also employed in taking charge of rents and money on deposit from the country gentlemen, granting interest thereon. The goldsmiths had begun taking deposits in James I's reign, but the development of their business dates from the Civil war. They gave receipts for the money deposited, and these receipts, known as goldsmiths' notes, the earliest form of bank-note in England, circulated even more freely than coin, and large transactions were carried out by their means as late as 1696. During the Protectorate the goldsmiths were of assistance in financing the gov., and after the Restoration they became lenders to Charles II, receiving as much as 12 per cent or over, and paying less than half that rate to their creditors whose deposits they used. In 1672 came the suspension of exchequer payments, a declaration of national bankruptcy which brought ruin not only to the goldsmiths, to whom the gov. owed £1,300,000, but also to their depositors.

The successful example of the Dutch banks, the demand for better security for deposits, a correspondingly safer form of paper currency than the goldsmiths' notes, together with a lowering of the rates of interest (charged in spite of the still existing laws against usury), still further the political necessities of the gov. in the matter of loans: all these contributed to the demand for the estab. of a properly regulated bank, a banking system, and the

end of the goldsmiths. Three private banks, Child's, Martin's, and Hoare's, which later carried on business in London were descended from firms of goldsmiths mentioned in the *London Directory* of 1677. Smith's Bank at Nottingham claims to have been founded in 1688; it was later amalgamated with the Union of London Bank, under the style of the Union of London & Smith's Bank. Other early banks, now amalgamated with other firms, were the Bristol Old Bank, 1750, and the Hull Old Bank, 1754. The proposal for the foundation of the Bank of England (q.v.) came from Wm Paterson (q.v.), Michael Godfrey, and other London merchants in 1691. The foundation took place in 1694, by Act of Parliament, the charter being granted on 27 July for 12 years, to 'the Governor and Company of the Bank of England.' The restoration of the coinage, the attempt to found a rival land bank, and the gov.'s pressing need for money led to the extension of the Bank's privileges and capital by the Acts of 1697 and 1709, especially in the strengthening of its monopoly, and interest was reduced to 6 per cent. No bank whose members consisted of more than 6 was allowed in England to borrow or take up money on its bills or notes payable on demand. This was thought to be sufficient protection against competition, as at that time no bank could, it was supposed, do business without the power of issuing notes. No joint-stock banks were, in fact, founded. In 1722 the Bank's reserve, called the 'rest,' was estab. In 1750 the rate of interest on the debt was converted to 3 per cent, the debt to the Bank amounting then to over £11,000,000, and in 1751 the Bank was given the administration and management of the national debt, which it holds to the present day. Further renewals of the charter were made in 1764 and 1781. In 1795 the first issue of £5 notes was made, and later, for a short period, £1 notes. In 1797 cash payments were suspended by the Bank Restriction Act, owing to the general drain of gold and financial strain of the war; the Bank's notes were thus made practically legal tender. The Bullion Committee Report was issued in 1810 and rejected by Parliament, and cash payments were not resumed till 1821. The over-issue of notes by the small country private banks and the constant failures led to the Act of 1826, which allowed joint-stock banks, i.e. of any number of partners, and with the power of issuing notes; but they were not allowed in London or within a 65-m. radius. No notes were henceforth, until the First World War, allowed in England below £5. In 1833 joint-stock banks without note issue were allowed within the 65-m. radius; it may be noticed that the use of cheques had by this time begun to replace the use of notes. Finally, the Bank of England notes were made legal tender. In 1844 came Peel's great Bank Charter Act. The main features of this Act, as regulating the bank's position at the present day, are outlined in BANKS and BANKING. The Act also confined the

right of note issue to those banks which possessed the right before 1844; as each lapsed or became absorbed, the limit to the Bank of England was expanded to the extent of two-thirds of the lapsed issue. The note-issuing powers of Eng. banks is of little importance at the present day, and the Bank of England note is the only circulating note in England. In 1862 companies with liability limited to the amount of their shares were allowed, and in 1879 unlimited companies formed before the Act of 1862 were allowed to adopt limited liability. Practically all the joint-stock banks availed themselves of this Act.

The 19th cent. saw sev. crises in banking. The first, that of 1847, was the result of the speculation in railways and a hazardous extension of credit. On 1 Oct. all advances on public securities were stopped, and the bank rate was 8 per cent at the end of the month, when the coin and bullion reserve at the Bank of England fell to a little over £1,500,000. The Bank Act was suspended on the 25th, and though no notes above the limit were issued the panic ceased, but there had been serious failures of banks in Liverpool, Manchester, Nottingham, and the W. of England. Over-expansion of credit and a great depletion of banking reserves led to the panic of 1857, which continued even after the Bank Act was suspended on 12 Nov. On this occasion notes in excess of the limit were issued amounting to nearly £1,000,000, and the panic did not cease till the beginning of 1858. In 1866 the panic was marked by the historic failure of Overend, Gurney & Co.; it is stated that £4,000,000 in gold and notes was withdrawn from the Bank of England in one day; the rate was raised to 10 per cent and the reserve fell to less than \$500,000. The Bank Act was suspended, but no excess issue actually took place. The failure of the W. of England Bank in 1878 caused great distress, but there was no general panic. In 1890 the failure of the great financial house of Baring (*see* BARING, family) resulted in a serious crisis. London had become the centre of the money markets of the world, and consequently had to bear an international as well as a national strain. This fact was marked in the New York and Amer. panic of 1907 and 1908, when gold importation to the U.S.A. was conducted through London.

Banking during the First World War. At the outbreak of the First World War England was still the great creditor nation, most of the world's bill transactions being liquidated in London. The estimate of Great Britain's trade with the belligerent nations in Europe could be put at over £2,000 millions. An indication of the trend of events was given towards the end of July 1914, when the Ger. banks, in order to increase their cash reserves, began selling their securities in London. This caused some alarm and the London Stock Exchange was closed on 29 July. Germany's selling activities were transferred to the U.S.A., and the New York Stock Exchange was closed on 31 July.

When the war began there was a run on the banks, the reserve at the Bank of England falling to £10 millions. The bank rate rose to 10 per cent. The gov. took immediate action. The banks were closed from 1 to 4 Aug., and it was decreed that there should be a moratorium for bills falling due. This was a beneficial measure. To husband the nation's gold and to keep it concentrated at the Bank of England, arrangements were made to issue £1 and 10s. currency notes. These were made legal tender for any amount and were issued on a fiduciary basis. The issue of these notes was tantamount to the suspension of the Bank Act. The Bank of England decided to lend money to the banks to enable them to meet calls which might be made upon them while the excitement lasted. By this timely decision confidence was restored. Bank deposits rose immediately by £100,000,000 and the Bank of England deposits rose from £46,000,000 to £219,000,000. A Foreign Debt Committee was appointed to make advances to Brit. export traders against debts due to them from abroad. Advances of 50 per cent of the amount outstanding were made. A 6 months' bill was drawn by the trader upon his banker and accepted by him. The bill was left with the banker as cover for a loan of the amount required. The bill was renewable from time to time until 12 months after the close of the war. Any loss that might occur was distributed in the proportion of 75 per cent as to the exchequer and 25 per cent as to the accepting bank. As the bulk of foreign trade finance was carried on by means of bills of exchange, the gov. decided that it would be as well to let these instruments function as freely as possible. A scheme was therefore drawn up which set forth that: (1) the Bank of England would provide, when required by acceptors, the funds necessary to pay all approved promissory bills at maturity; (2) acceptors would be under obligation to collect from clients all funds due to them, such funds to go towards repayment of advances; (3) the Bank of England would not claim repayment of any amounts not recovered by acceptors for a period of 1 year after the close of the war; (4) the joint-stock banks, in order to induce new business, would arrange with the co-operation, if necessary, of the Bank of England and the gov. to advance the amounts required by clients to pay their acceptances at maturity. It is a creditable reflection on the quality of the business done by Brit. finance houses to note that the advances made by the Bank of England against bills of exchange were duly paid off. The foregoing were the chief measures adopted to meet the financial exigencies created at home by the war. Gold disappeared from circulation, its place being taken by treasury notes. These were partly covered by gold and partly by Bank of England notes and securities. Small notes had been issued by the Irish and Scottish banks for many years, and these banks were allowed to exceed their fixed issue limits of pre-war time. It is interesting to note that the

paper currency issued during the war was greater in face value than all the gold and silver produced since the discovery of America (1492).

The foreign exchanges were greatly disturbed during this period. This will be at once apparent when it is remembered that the usual method of paying for imports by exports had been so deranged. The excess of imports over exports for 1914 was approximately £450 millions, and this had to be liquidated. Matters were eased by loans raised in New York and credits arranged by the banks. As was natural, where the shipment of gold was restricted the old pairs of exchange disappeared, and the par between London and New York fell from 4·85 to 3·74.

Post-1918 problems. From the closing years of the First World War the history of banking must not be treated as abnormal, but as the evolving of new methods and means by bankers to meet conditions which had changed and were rapidly changing. The gold standard was restored in 1925, in accordance with a recommendation of the Cunliffe Commission of 1918. A treasury minute of 15 Dec. 1919 imposed a limit known as the Cunliffe limit on the issue of treasury notes and laid down that the uncovered note circulation in any year must not exceed the maximum uncovered circulation of the previous year. The policy of deflation carried out by the gov. in the following year checked the depreciation of sterling in relation to the dollar which had taken place as soon as the wartime control of the exchange rate was removed in 1919. When the pound and the dollar were near their former parity the Gold Standard Act of 1925 was passed whereby the Bank of England was again under an obligation to sell gold at the former price. The Bank was not, however, obliged to redeem bank notes and treasury notes in gold coin. In 1923 the Bank assumed control of the treasury note issue under the Currency and Bank Notes Act of the year. Bank notes of a pound and ten shillings were issued gradually to replace treasury notes. The amount of permissible fiduciary issue was accordingly raised to £260,000,000 and by the Currency and Bank Notes Act of 1939 it was raised again to £300,000,000. The fiduciary issue continues to be governed by these two Acts. The Treasury may, however, authorise a temporary increase by means of a minute laid before Parliament if requested by the Bank of England to do so. This occurred during the years which followed; by the end of the Second World War the fiduciary note issue stood at £1,350,000,000; in 1956 it had risen to £1900 millions, almost the whole of the note issue (only £500,000 of notes were backed by gold).

In 1931 it became clear that Britain could not maintain the gold standard. A financial crisis of the first magnitude had been precipitated (following a world depression), largely through the mismanagement of gold by the U.S.A. and France. That was not the sole cause of the crisis, for Brit. policy in 1925 was misconceived,

though none could have foreseen the subsequent developments. That policy implied, besides co-operative policies in other countries, adjustments in prices and therefore costs, including wages, which could not be made because of the opposition of the trade unions, who resisted wage reductions. Eventually, in 1931, in order to support the exchange, Britain was reduced to borrowing £130,000,000 in dollars and francs. But though the budget was balanced and the foreign drain on funds ceased for a time, there was another sudden drain of foreign funds. Faced with the prospect of parting with the rest of its gold reserves, the Bank of England gave up the struggle, and, for the second time since the war, Great Britain was forced off the gold standard. The Gold Standard (Amendment) Act was passed on 21 Sept. 1931, and the Bank's obligation to sell gold was suspended.

For some years before the First World War the amalgamation of banks had been going steadily on. The advent of the war hastened it considerably, and in 1918 there emerged the joint-stock banks known as the Big Five (Barclay's Bank, Lloyd's Bank, Midland Bank, National Provincial Bank, and Westminster Bank). A treasury committee appointed in 1918 decided that no further amalgamations without the approval of the gov. would be allowed, and that the Treasury and Board of Trade must give their consent before more absorptions could take place.

Financial and monetary policy in Second World War. There was no crisis on the outbreak of the Second World War, for experience in the First World War had taught what emergency measures were desirable in the way of financial and monetary policy. Yet there was nothing in the powers of the gov. taken under the Finance Bill of 1940 over persons and property which endangered money in any bank. Equally there was nothing to endanger savings in any way. Indeed the figure of small savings in savings certificates, defence bonds, and in the increase in balances in the savings banks since the beginning of the war amounted to more than £180,000,000 and the weekly figure for these savings averaged over £5,000,000. Immediately on the outbreak of war the Currency (Defence) Act was passed to amend the law with respect to the application and financing of the exchange equalisation account. The gov. announced on 6 Sept. 1939 that the gold reserve in the issue dept of the Bank of England had been transferred to the exchange equalisation account as part of the general plan put into operation for the strengthening of the nation's financial resources abroad. The value of the gold transferred (at 168s. per oz.) was about £279,000,000, and this entailed a corresponding increase in the fiduciary note issue of the Bank of England from £300,000,000 to £580,000,000. On 5 Sept. the price of gold had been fixed at 168s. per oz. by the Bank of England, and the sterling-dollar rate at \$4.04, and these prices were maintained subsequently. In pursuit of the gov.'s policy of maintaining

the purchasing power of sterling it was arranged that the vast bulk of transactions between sterling and other currencies should be conducted in London at official rates.

At the outbreak of war the gov. assumed complete control over international issues to which the money belonging to Brit. subjects might be put, but at first the gov. left the foreigner or person living outside the sterling area free to dispose of his assets, in England or elsewhere. But in June 1940 stricter control over the sale in the U.K. of securities by persons not resident within the sterling area was enforced by Orders in Council. Exchange regulations were issued by the Treasury with the object of placing the greater part of Brit. foreign trade on the basis of the official exchange rates, by tightening the exchange control and still further restricting the scope of the free sterling markets. A treasury Order prohibiting dealings in foreign securities without treasury permission was published in August 1939, under the Emergency Powers (Defence) Act, 1939. Owners of such securities were directed to make a return of their holdings to the Bank of England. Steps were also taken early in 1940 for the control of retail prices in the case of primary necessities. There was early a system of food and industrial controls designed to avoid the vicious spiral of rising costs and prices; and, to meet the problem of inflation through increased purchasing power, a substantial part of the surplus purchasing power of the public was withheld through the instrument of taxation. This was done in order to concentrate on the war effort as large a part as possible of the nation's productive resources, while at the same time satisfying the essential needs of the civil pop. and maintaining an adequate export trade.

See bibliography under BANK OF ENGLAND, and H. T. Easton, *History and Principles of Banks and Banking*, 1924; T. E. Gregory, *Select Statutes, Documents and Reports relating to British Banking, 1832-1928*, 1929; F. Lavington, *The English Capital Market*, 1934; R. Truitt, *British Banks and the Money Market*, 1936; G. Crowther, *An Outline of Money*, 1948.

Banking in France. In 1716 the celebrated John Law (q.v.) estab. the first bank of issue, Banque Générale, styled in 1718 the Banque Royale, the king guaranteeing the notes. It ceased to exist in 1721. Banks with limited issues carried on business, and there were attempts to reconstruct Law's bank. It was not till 1800 that Napoleon founded the Banque de France; at first its note issue was shared with departmental banks, which, however, were amalgamated with it in 1848, and it became the sole issuing bank in the country. It has now over 400 branches, and does an enormous business in discounting bills and making advances. Its deposit business is not so large. The specie reserves of the bank are very high, reaching before the Second World War £140,000,000 in

gold and £40,000,000 in silver, against a note circulation of nearly £200,000,000. In 1930 the gold reserve of the Banque de France was phenomenal, being the second highest in the world, the U.S.A. occupying the first place. The note issue is limited by law, but as long as the limit is not exceeded, it has not to hold any specific quantity of bullion against it. The bank can, to protect its gold reserve, pay notes in silver; the bank rate is therefore very steady. The governor and the 2 deputy-governors are appointed by the State. Other large banks in France include the Comptoir d'Escompte, 1848; Crédit Lyonnais, 1863; Société Générale... du Commerce, 1864; the Crédit Foncier, 1852, chiefly deals in mortgages. There are a large number of prov. joint-stock banks. The hoarding of gold in Fr. banks had a direct effect on the world financial crisis of 1931. By the middle of that year France had accumulated a stock of about £470,000,000 of gold which, added to the £1,000,000,000 in America, meant three-quarters of the world supply of monetary gold. This was the prin. cause—through the appreciation of the metal—of the catastrophic fall in prices that lay at the root of that crisis. On 2 Dec. 1945, a law was passed to nationalise the Banque de France and the 4 prin. deposit banks: Crédit Lyonnais, Société Générale, Comptoir National d'Escompte, and the Banque National pour le Commerce et l'Industrie. It also instituted strict gov. control over the activities of all other banks and set up a new body, the National Credit Council, to check the flow of credit in France.

Banking in Germany. The Imperial Bank of Germany (Reichsbank) received its constitution in 1875; the Bank of Prussia was merged with it in 1876. It was closely controlled by the Gov.; the Chancellor appointed the president and council, and a proportion of its profits went to the State. The right of uncovered note issue is limited by law, frequently extended, but the bank is permitted to exceed the limit repayment of 5 per cent on the surplus. The banks of Saxony, Bavaria, Württemberg, and Baden also possess the right of uncovered note issue but the amount is small in comparison with that of the Reichsbank. An important feature is the 'clearing' system (*Giro Verkehr*) of the Reichsbank; a debt to a customer of the bank can be paid by paying the money at any of the numerous branches; it will be without charge transferred to the credit of his account. It amounts to a money-order business without expense, and serves as a substitute for cheques, which are not used to the same extent as in England. The private and joint-stock banks in Germany are chiefly engaged in financing the country's trade and industries, and important banks, such as the Deutsche Bank (q.v.), took a prominent place before the Second World War in foreign and international finances. The Ger. banks are led by the 'Four D Banks'—from the initial letter of their names—viz. the Deutsche, the Disconto-Gesellschaft, the Dresdner, and

the Darmstadter. Since the end of the Second World War the banks in the Soviet zone of Germany have been nationalised.

Banking in Ireland. The Irish banks have been conducted generally on the same principles as those in Scotland. Most of those which were estab. in 1844 are still in existence—an indication of the stability of B. in I. But the assistance given in much more recent times by the existing banks to the general prosperity of Ireland has been equally marked. The Bank of Ireland was estab. in Dublin in 1783. Considerable privileges were granted to it, for, after 1820, no bank with more than 6 partners was permitted to issue notes within a radius of 50 m. from Dublin; but after 1845 this restriction was removed, and arrangements for the circulation of notes is now virtually the same as those in force in Scotland. There are 9 prin. banks in Ireland, 6 of which have the power of circulation. Their combined deposits total over £250,000,000 (1946). The Central Bank of Eire has the sole right in that country of issuing legal tender notes, and token coinage is issued by the finance minister through the bank. The Central Bank, which was estab. as from 1 Feb. 1943, in accordance with an Act of 1942, replaced the Currency Commission which was set up under the Currency Act, 1927, and had been responsible *inter alia* for the regulation of the note issue. On the dissolution of the Currency Commission its paid-up capital was returned to the shareholding banks.

Banking in Scotland. The Bank of Scotland was founded in 1695 by Act of Parliament. It issued notes of £100 to £5, and in 1704 £1 notes. In 1727 a rival bank, the Royal Bank of Scotland, was granted a charter, and in 1746 the Brit. Linen Bank. The private local banks ceased to exist by 1844, and Scotland shows an example of a small number of large banks with a highly developed system of branches, the number of offices to pop. being very high. The use of notes in business transactions is very great. The Act of 1844 fixed a limit to the issue of notes, beyond which the banks must hold specie; the banks of issue, now 8 in number, carry on the whole business of the country. Scottish banking hist. is marked by the disastrous failures of the W. Bank of Scotland, 1857, which failed for nearly £3,000,000, and the City of Glasgow Bank, 1878, which resulted in a total loss of over £6,000,000. Both these were unlimited liability companies. The Scottish banks, in addition to those named, are the Commercial, National, Union, N. of Scotland, and Clydesdale Banks. See A. W. Kerr, *History of Banking in Scotland* (4th ed.), 1926.

Banking in the U.S.A. In general, was founded upon the Eng. system; but it has developed distinctive features not found in most other countries. Amer. banks are primarily banks of deposit and credit and not of capital accumulation. In the early days of the rep. the people opposed centralisation of authority. Thus the

separate states retained among their sovereign powers the right to charter and supervise banks. As the country grew, however, purely local banks failed to meet the needs of national and international trade; and the right was granted to the Federal Gov. to charter banking institutions. Thus arose a dual system of state and federally chartered banks. The majority of the 14,186 Amer. banks in 1956 were unit banks under completely separate ownership and management. However, some states allow banks to operate branch offices, and there are affiliated banks under common ownership. This gives rise to the systems of 'branch' and 'chain' banking.

During the colonial period banking was carried on by commercial firms, and some thrift societies engaged in savings banking; in Massachusetts an attempt was made to establish a 'land bank' to capitalise land values as a basis for a currency. There was little actual money in circulation, and debts were paid in furs, tobacco, and other domestic products. What money there was included almost all kinds of European coins, from Sp. pieces of eight to Austrian thalers, of which the Bank of England had a large supply for use in Amer. trade. The official use of thalers is the reason why the U.S. monetary system was founded on dollars and not Eng. pounds sterling.

Immediately after the revolutionary war the various states chartered a number of banks; and private banking houses of trading and commercial firms began doing business. Some of them issued scrip money of purely local use and of varying value when offered in exchange for metallic coin or specie. Robert Morris, who had been Superintendent of Finance during the war, founded the first bank of national importance when the U.S. Congress chartered the Bank of N. America on 26 May 1781. It opened for business in Philadelphia in 1782. However, there was so much doubt as to the authority of Congress to grant bank charters that it secured a state charter from Pennsylvania. This bank joined the national banking system in 1863; and, although there have been changes through mergers and consolidations, its corporate existence continues to this day.

The estab. of a national currency was an important part of Alexander Hamilton's plan for a financial system under the constitution of 1789. Accordingly the first Bank of the U.S. was chartered in 1791 for a period lasting until 4 Mar. 1811. It issued circulating notes, discounted loans, and helped the gov. in financing operations. When its charter was not renewed the banking house and much of the assets were sold to Stephen Girard, who started the Girard Bank in Philadelphia. In 1816 the second Bank of the U.S. was authorised, and in 1819 the U.S. Supreme Court decided that the federal gov. had constitutional power to charter national banks. The 1816 charter expired in 1836; and, after continuing under a state charter for sev. years, the

second Bank of the U.S. was liquidated in 1841.

The period from 1836 to 1863 was a chaotic one for banking. While the banks in some states were soundly managed and supervised, those in others were purely speculative ventures for the issuing of currency. Paper money fluctuated widely in value according to the bank of issue; and business was severely hampered by the lack of a nationally accepted currency. To provide for financing the federal gov. during the Civil war, and to correct the lack of organisation among state banking systems, Congress in the Banking Act of 1863 authorised a national banking system; and since that time state and federally chartered banks have existed in the country. To-day banks of both types offer the same services, and the regulatory measures applying to them are comparable.

As the U.S. expanded across the continent, problems arose in connection with supplying various sections of the country with money to meet seasonal needs. A satisfactory solution was not found until Congress created the Federal Reserve System (q.v.) in 1913. Since its estab. the services provided by the Federal Reserve banks for the privately owned and operated banks of the country have proved of tremendous value. For example, it is estimated that 90 per cent of all payments are made by bank cheque; and, without the national system for clearing cheques between banks in widely separated cities, this transfer of funds would be seriously hampered. The Federal Reserve banks also hold the required reserves of member banks, averaging about 16.5 per cent on net demand deposits in 1956.

Because of the universal use of 'cheque-book' money and the system of fractional reserves, the Amer. banks are able to expand their net deposits about 5 times through credit transactions. The Federal Reserve System controls inflationary expansion of the money supply through credit extensions by increasing and decreasing reserve requirements, by modifying rediscount rates for member banks, and by limiting the amount of reserves available to banks through open market buying and selling of gov. securities.

Another instrumentality of the federal gov. important in banking is the Federal Deposit Insurance Corporation: an insurance fund which protects deposits in member banks up to \$10,000 for each individual depositor. Created by Congress in 1933, it became operative in 1934. All national banks are required to be members, and state banks may voluntarily qualify for membership. In 1956 approximately 95 per cent of all banks were members, and the insurance covered about 55 per cent of all deposits. The fund reported assets of \$1,640,000,000, equal to 1.41 per cent of insured deposits.

State-chartered banks which are not members of the Federal Reserve System receive services approximating to those of

the Federal Reserve by means of voluntary 'correspondent' relationships for mutual advantages.

Banks of deposit carry on overall financial service for their customers. These 'commercial banks' accept both savings and demand deposits and make loans to individuals and to business enterprises; they may provide trust services, have safe-deposit depts, and carry on other activities which cause them to be known as 'department stores' of finance. Mutual savings banks—527 in number—in 17 states specialise in savings deposits and restrict their credit extensions largely to real-estate mortgages.

The 14,186 privately owned and operated banks in the U.S.A. in 1956 reported assets of \$242,940,000,000, and deposits of \$217,930,000,000. These funds were used in loans and investments totalling \$195,730,000,000.

In addition to the privately owned and operated banks, there are federal savings and loan associations under the supervision of the Federal Home Loan Bank System, and building and loan associations under state supervision, which are share account institutions specialising in real-estate mortgages; the Federal Land Bank System; stock exchanges, and investment banking houses. In most other countries these institutions are administered as a part of the national financial system by a dept of the central bank or the treasury. See also FEDERAL RESERVE SYSTEM, U.S.A.

Bankruptcy. In England and Wales a bankrupt is a person who declares, or by his conduct makes it manifest, that he is unable to pay his debts, and whose property is accordingly distributed among his creditors under the B. laws. In its original signification the term bankrupt meant a trader who hid himself or did other acts tending to defraud his creditors. The term insolvent, which in one sense connotes any person who is unable to pay his debts, in a more restricted sense meant a non-trader who sought the benefits of the Insolvency Acts. Since 1861 bankrupt includes both traders and non-traders, and our whole modern law of B. applies indifferently to both. Insolvency now connotes the condition of a debtor who is unable to pay his debts but who has not been 'adjudged.' B. legislation dates from the time of Henry VIII, the most notable Act being that of 1825, which introduced the principle of deeds of arrangement as an alternative to B., subject to very severe restrictions. In 1869 all the previous statutes were repealed and a 'trustee,' in whom the property of the bankrupt was to vest, was substituted for the old 'official assignees.' The present law of B. rests on the general Acts 1883 and 1890, and various measures dealing with procedure, all of which Acts were repealed and substantially re-enacted in the Consolidating Act of 1914. The purpose of the Acts of 1883 and 1890 was to secure that the property of a person who could not pay his debts in full should be divided ratably among his creditors, and

that the debtor should then be freed from his debts either absolutely or conditionally. According to the present law, proceedings may be instituted by the debtor or by the creditors: in the former case the B. is called voluntary, in the latter involuntary. The claim of the creditors must amount to £50. On the petition being presented, the property of the debtor is taken over by an official receiver, who is an officer of the Board of Trade, and the debtor must make a full statement of affairs on oath in public, after which the creditors hold a meeting to determine whether the debtor shall be adjudged bankrupt or whether a composition can be arranged. Such a composition must be approved by three-fourths in value of the creditors, and must receive the sanction of court. If, however, the debtor is adjudged bankrupt, the creditors appoint a trustee to distribute his estate, under the supervision of a committee of inspection. The debtor is liable to imprisonment if he refuses to assist in the discovery of his property or conceals his goods from the trustee. After the distribution of his property among the creditors the bankrupt may obtain a discharge from the court, but the discharge is withheld under certain conditions: if he (1) has not kept proper books within 3 years before B.; (2) has traded after knowledge of insolvency; (3) has lived extravagantly or speculated rashly; (4) has been previously bankrupt; (5) has contracted debts without expectation of being able to pay them; (6) has given preference to any creditor within 3 months before B. By the B. Act of 1883 the procedure was simplified in the case of persons with property less than £300, when the official receiver became trustee, and there was no committee of inspection. The jurisdiction was transferred by this Act from the Court of B. to the High Court of Justice; it also provided for persons dying insolvent, the administration of whose property could formerly only be dealt with by a suit in chancery.

B. proceedings are now conducted under the B. Act of 1914, and the rules made thereunder as amended by the B. (Amendment) Act of 1926. By this Act previous statutes were consolidated and certain changes were made, chiefly in the direction of increasing the stringency of conditions and placing on the debtor the onus of proving himself not guilty of fraudulent intent. The jurisdiction under Debtors' Act, 1869, to commit debtors is now transferred to the B. court, which has power to make a receiving order instead of committing the debtor. An undischarged bankrupt is now guilty of a misdemeanour, the official receiver having the power to institute and conduct proceedings if he (1) either alone or jointly with another person obtains credit for £10 or over from any person without informing that person that he is an undischarged bankrupt; (2) engages in any trade under a name other than that in which he was adjudicated bankrupt without disclosing to all persons with whom he trades the name under which he was

adjudicated bankrupt; (3) has contributed to or increased the extent of his insolvency by gambling or hazardous speculation within 2 years of his petition; (4) falls on request of the official receiver in course of public examination to account for the loss of any substantial part of his estate incurred within a year before petition or to give a satisfactory explanation of the manner in which loss was incurred. An undischarged bankrupt must reveal his position when asking for credit; if he thinks such knowledge has been given to the creditor when it has not, he has no defence. General assignments of book debts not collected before B. become void unless registered as bills of sale, but this does not apply to a specific debt assigned.

A bankrupt is disqualified from holding office of (a) member of Parliament; (b) justice of peace; (c) mayor, alderman, or councillor; (d) co. councillor; such disqualification to cease if and when the adjudication of B. is annulled or the bankrupt obtains discharge with a certificate to the effect that B. was due to misfortune. An undischarged bankrupt may apply for discharge if his assets were more than 10s. in the £, if no criminal intent has been proved. A discharge order releases him from all obligations with certain exceptions, such as debts to the Crown, etc.

In Scotland a bankrupt is liable to the distributing process known as sequestration. A 'notour bankrupt' corresponds to a person who has committed what is called in England an act of B. There is no separate court of B., the jurisdiction being assigned to the sheriff of a co. or to the bill chamber of the court of session. The procedure closely resembles that in England. *See also INSOLVENCY. See Williams, Law and Practice in Bankruptcy* (17th ed.).

Banks and Banking. The term bank (derived from Fr. *banque*, a money-changer's bench or table) is applied to various forms of estab. which deal with money, including not only those institutions to which it more strictly applies, dealt with in this article, but also the great merchant and financial houses, discount businesses, and the like. Banks have been classified into banks of issue, i.e. those which have the right to issue their own notes, and banks of deposit, those which receive money from their customers. Another classification divides banks into private banks, those whose capital is owned by a limited number of partners, in Eng. law not more than 10, and joint-stock banks, where the shares are owned by a corporate body. The Bank of England is the only Eng. bank of issue, although other banks still issue notes in Scotland, Ireland, and the Isle of Man. The Bank of England notes are legal tender in England except at the bank itself. Though the bank-note is of the greatest importance in regard to the reserves held against deposits by the banks, the cheque is the medium by which business transactions of every kind are now carried on.

A bank, usually a joint-stock company, and with capital found by its shareholders, receives the money of its customers either on deposit, i.e. only to be withdrawn after certain notice, or on current account, i.e. to be withdrawn on demand during business hours. On deposit accounts interest is allowed, on current accounts usually none. The Bank of England allows no interest on deposits. These deposits, whether on deposit or current accounts, are the bank's liabilities, which it must be prepared to meet with cash on demand, and though in theory the liabilities might all be drawn upon at one moment, the system is based on experience that except in times of panic they never are. Thus the accumulation of deposits can be used by the bank for its own profit in financing the business and trade of the country, and expanding the credit on which it is built up. The balance sheet of one of the great joint-stock banks will show the kind of business which is done by them. On the debit side will be found the paid-up capital of its shareholders, i.e. the original working capital, the reserve fund, the accumulation of profits not paid out in dividends; then will follow the largest item, the deposit and current accounts of its customers, which form the bank's liabilities. On the credit side comes first the cash: (1) gold and notes in the tills, ready for the ordinary day-to-day drawings; these are normally small in amount, owing to the use of cheques; (2) cash held by the bank at the Bank of England, which, as the bankers' bank, is the centre of the Eng. banking system. Cash held at the Bank of England appears as 'other deposits' in the weekly bank return. Next upon the credit side appears the item 'loans at call or short notice'; these are day-to-day or weekly advances made chiefly to the brokers of bills of exchange at a low rate of interest. The largest amount is found in the item 'bills discounted and advances.' Not only do the banks discount bills themselves, but they finance by advances the merchants who confine themselves to that business; thus the banks play an important part in the supplying of credit to the trade and industry of the country, for it is the bill of exchange (q.v.) which is the prin. medium of the supply of credit. 'Advances' also include the loans made by the bank to its customers on securities of all kinds, from the large sums advanced to corporations, companies, bill-brokers, and discount houses, or to members of the Stock Exchange for dealings in shares, to the loans made to ordinary private persons on securities lodged with the bank or as overdrafts on personal security or guaranteed by a third person. The banks normally keep in cash about 8 per cent of their deposits, and at least 30 per cent in 'liquid assets'—cash, money at call and short notice, and bills discounted. The value of the bank's premises and investments made by it in the highest form of securities close the credit side of the balance sheet.

A bank is always faced by this problem:

if too much is laid up in cash reserve against its liabilities, there will be so much less available for making its own profits and for the financing of trade and industry; if too little, at any moment it may be called on to pay more than it can command in cash at once, with the consequence of selling its securities at heavy loss or of even suspending payment. The cash reserves of a bank are, as already mentioned, the cash in its tills and the reserve at the Bank of England, which is, in turn, a credit in the books of the bank. A control is kept by the banks, therefore, on the expansion of credit by the varying rates of discount allowed in the money market, so that some equilibrium is kept between their liabilities and their reserves (*see* MONEY).

Of all the business done by the banks, a very small proportion is carried on in gold or notes, for the commercial currency in, for instance, the U.K. and the U.S.A. is the cheque. The enormous amount of business done by the interchange of cheques is carried through not by paying in or out of notes and gold, but by book entries in the various banks through the clearing house (q.v.). The various banks at the clearing-house day by day balance all the cheques out and in against each other, and the differences are settled between them by a corresponding alteration in their accounts at the Bank of England, which is their common banker, and is not a member itself of the clearing-house. Similarly, when a loan or an advance is made by a bank, it usually consists of an entry in the bank's books, giving a credit against which the person to whom it is given has the right to draw cheques. Thus on a comparatively small capital of its own, with cash perhaps amounting to one-twelfth of its liabilities, an estab. bank does its work of providing the readiest way of settling a vast volume of transactions, and of providing the credit necessary to finance these transactions.

As the bankers' bank, the central figure is the Bank of England. (For a more detailed hist., *see* BANK OF ENGLAND.) The Bank of England is first of all the gov. bank, receiving all revenue payments, and paying the dividends, etc., to holders of gov. stock. It is the agent of the gov. in the financing of treasury and exchequer bills, and in other ways is the right hand of the gov. in the financial side of its administration. It is the only bank whose notes are legal tender, i.e. must be taken in payment of a debt. It is now the only note-issuing bank in England. The Bank of England is regulated by the Bank Charter Act, 1844, and by the Bank of England Nationalisation Act, 1946. The Bank Charter Act limited the note issue of all other banks in England and in Scotland and Ireland, but allowed the last 2 to exceed this, on an equivalent of gold for every note in excess. The monopoly of note issue in London and the 65-m. radius, granted in 1826, was retained, and no new bank could obtain the right. The Act separated the issuing and the banking depts of the Bank of England.

It could issue notes up to £14 millions, being the amount of its loans to the gov. at that date; this is the 'fiduciary' issue; above that amount the bank must hold an equivalent in gold coin or bullion. The bank is obliged to make a weekly return, reporting its financial position. This is issued every Thursday, and will be found in *The Times* and other papers on the Friday following.

Most of the notes in circulation are held in bankers' tills as their immediate day-to-day cash transactions require. The notes held by the Bank of England in its banking dept are the first line of defence against its prin. liability, that of 'other deposits,' which include the other banks' reserves, figuring in their balance sheets as 'cash at the Bank of England.' This with the bullion and coin is the Bank of England's reserve. The item on the debit side of the banking dept termed the rest is the equivalent of the reserve in other banking balance sheets, viz. the undivided surplus of profits; this is never allowed to fall below £3,000,000. The Bank of England rate, termed the bank rate, is the official *minimum* rate of discount at which the bank will discount bills; it is usually above that of the discount obtainable for money in the open money market; but if there is a shortage of cash, the tendency is for the open rate to equalise with the bank rate. *See also* BANK RATE; EXCHANGE; MONEY MARKET; BANKER AND CUSTOMER (LAW).

General History. Clay tablets have been found in Babylonia and Assyria showing some of the functions of the banker, such as money-changing, advances, and the like; we also know from the code of Hammurabi that payments were made through a banker and by drafts against deposits. Deposits bearing interest, letters of credit, and other means of transferring credits from one place to another were also known in ant. Greece and Rome. The Chinese are said to have had a paper currency about AD 800. But though it is possible to trace the evolution of banking, especially in Italy during the Middle Ages, continuously from early times, it is now accepted that the first public 'bank,' properly so called, was the Banco di Rialto, estab. at Venice by Acts of the Senate in 1584 and 1587. In 1619 the Banco del Giro was founded; this became the only public bank in the State, and was long famous as the Bank of Venice. Banking in Venice developed out of the money-changers and private exchange bankers, who as early as 1318 seem to have taken deposits, and as far back as 1270 gave security to the State for the proper carrying on of their business. It was the failure of many of these deposit banks that led to the founding of the Rialto Bank as a public bank by the State. The Bank of Venice suspended payment sev. times owing to its loans to the State, and ceased after the Fr. invasion in 1797. Another early It. bank was that at Genoa, the famous Bank of St George; this was a private bank of deposit; it was founded in 1407, and by its advances to the rep. dominated the State and managed the

public funds. The French appropriated its property in 1800. The bank had an earlier hist., dating back to 1200, as a merchant and financial company, and is the first example of a body of shareholders whose liabilities were limited to their shares.

The banks mentioned above were 'deposit' banks, receiving cash and paying it out on demand, and developed out of the business of the dealers in foreign exchanges. Another class of early banks was those which remained, at any rate principally, as exchange banks, of the utmost importance in the days when there was a large quantity of debased and clipped coin in circulation. Of these exchange banks the Bank of Amsterdam, founded 1609, lasting till 1820, and the Bank of Hamburg, 1619-1873, are the most famous. Their business lay 'in the assistance of commerce not by loans but by the local manuf., so to speak, of an international currency' (Palgrave, *Notes on Banking*). This currency was 'bank money.' Merchants brought coin or bullion to deposit, and were credited with the real intrinsic value; their credit was in 'bank money,' which they could draw on to meet their requirements. The income of the bank was gained from the small charges for such transfers in the books of the bank as were made from one merchant to another to meet their dealings. There is a good account of the working of the Bank of Amsterdam in Adam Smith's *Wealth of Nations*, iv. iii.

The next great step in advance was the appearance of the bank note, i.e. a promise to pay in coin made by the bank which issued it. If these notes were backed by a general confidence in the bank issuing them, they would circulate as cash, and thus create a great expansion of credit and business with an economy of actual metal currency. The invention of the bank note—apart, that is, from the Chinese paper money already alluded to—is due to Palmstruck, who founded the Bank of Sweden (Riksbank) in 1656; the first bank note was issued from the bank in 1658. The further hist. and development of modern banking is discussed in the entries dealing with different countries and with the various kinds of bank.

Banks, Elizabeth (d. 1938), Amer. authoress, b. Taunton, New Jersey. She began journalism as a society reporter on Baltimore papers, but later went to Peru as secretary to the Amer. minister there. She lived in England the greater part of her life, and wrote essays entitled 'The Lady of the Round Table' which appeared in the *Referee* under the pen-name Enid. She also wrote serial stories under the name Mary Mortimer Maxwell. Among her books are *A Dog of Belgium*, 1914, *On the Boat that Uncle Sam Built*, 1917, and *School for John and Mary: a Story of Caste in England*, 1925. *The Remaking of an American*, 1932, is an autobiography.

Banks, Sir Joseph (1743-1820), naturalist and explorer, b. London. In 1766 he made a botanical expedition to Newfoundland. From 1768 to 1771 he accompanied Cook in his voyage round

the world on the *Endeavour*, and his jour. proved an important source of information. In 1773 he made a trip to the Hebrides and Iceland, and was instrumental in bringing to the general notice the marvels of Staffa. He formed a valuable collection and library, which he bequeathed to the Brit. Museum. In addition to various scientific articles, he wrote *A Short Account of the Causes of the Diseases called the Blight, Mildew, and Rust*, 1805, and *Circumstances Relative to Merino Sheep*, 1809.

Banks, Nathaniel Prentiss (1816-94), Amer. politician and general, b. Waltham, Massachusetts. After being a factory worker and the editor of a local paper, he studied law and was admitted to the Bar. After a period of service in the Massachusetts legislature, he was in 1853 elected to Congress, where for some time he was speaker of the House. From 1857 to 1859 he was Governor of Massachusetts, and later became president of the Illinois Central railroad, which position he relinquished on the outbreak of the Civil war, when he joined the Federals. He was defeated by Jackson at Front Royal, and was later beaten at the battle of Cedar Mt. In 1863 he captured Port Hudson, but after his defeat at Sabine Cross Roads in 1864 he was relieved of his command. He re-entered Congress in 1865, and served as chairman of the committee on foreign relations. A mental disorder brought about his final retirement from public life in 1891. He was popularly known as the Bobbin Boy, in allusion to his early factory career.

Banks, Thomas (1735-1805), sculptor, b. Lambeth, London. Apprenticed at the age of 15 to a wood-carver, he studied sculpture in the evenings under Scheemakers. He continued his studies at the Royal Academy, where, in 1770, he gained the gold medal. In 1772 he gained a travelling studentship, worked in Italy for 7 years, and in 1781 proceeded to Russia, where he gained the favour of Catherine II, who purchased his 'Cupid catching a Butterfly' and 'Caractacus and his Family before Claudius.' He was elected R.A. in 1785. There are monuments by him in Westminster Abbey and St Paul's.

Banks Islands, group of is. N. of the New Hebrides, in the Pacific. There are 17 in all, the most important being Vanua Lava. The is. are volcanic and fertile. Pop. 2500.

Banksia, or Australian honeysuckle-tree, genus of shrubs and trees of the family Proteaceae, and named in honour of Sir Joseph Banks. They grow in sandy forest land or on rocks, and the flowers secrete a delicious honey; they do not produce good timber. *B. acmula*, *B. grandis*, *B. latifolia*, and *B. grandis* make small trees; *B. dryandroides*, *B. integrifolia*, and *B. media* are shrubs, chiefly grown for decorative use in Britain.

Bankside, riverside thoroughfare in the bor. of Southwark, London, between Southwark and Blackfriars bridges. It is the site of a famous Elizabethan and Stuart pleasure resort. Theatres (the

famous Globe as well as the Rose, Swan, and Hope), bear- and bull-baiting rings and taverns were situated here; and from earlier times there had been many brothels. As a centre of entertainment it had declined by the 18th cent. (See also *THEATRE, The Elizabethan Stage*.) On the S. side of B. stands the modern electric power station which began operating in 1952. The building is planned in 2 parts of which one has been completed.

Bann, rivs. in N. Ireland, known respectively as the Upper and Lower B. The Upper B. rises in the Mourne Mts and flows 40 m. NW. into Lough Neagh on its S. side. The Lower B., 40 m. long, issues from the NW. corner of the same lough and flows N. through Lough Beg into the Atlantic SW. of Portrush, dividing the cos. of Antrim and Londonderry.

Bannatyne Club, literary club founded in Edinburgh in 1823 by Sir Walter Scott and other Scottish antiquaries, notably David Laing, of the Signet Library, the club's first and only secretary, and Archibald Constable. It derived its name from George Bannatyne (1545-1609), the collector of the Scottish poetry of the 15th and early 16th cents. The club was formed for the printing of rare works relating to Scottish hist., literature, and antiquities. It was dissolved in 1861. Sir Walter Scott was the first president. During its career the club was responsible for the printing of 116 works, some of which are much sought after by collectors.

Banner, see FLAG.

Banneret, higher rank of Eng. knight-hood conferred for distinguished conduct on the field of battle, and which entitled the recipient to lead his vassals under his own banner. Part of the impressive ceremony consisted in the changing of the knight's pennon for a banner. The last knight B. proper was Sir John Smith, who received the dignity from Charles I for bravery at the battle of Edgehill.

Bannermann, Sir Henry Campbell-, see CAMPBELL-BANNERMANN.

Bannerol, see BANDEROLE.

Bannister, Roger Gilbert (1929-), athlete, b. Harrow, Middx. He was the first man in the world to break 4 min. for the mile, at Oxford in May 1954. This great feat had been the goal of the world's most brilliant middle-distance runners for years. His time of 3 min. 59.4 sec. stood as a world record for only 6 weeks before being broken by John Landy (Australia) in 3 min. 58 sec. B. beat Landy later in the year at the 1954 Empire Games, Vancouver, in one of the finest mile races ever run. That same season B. also won the European 1500 metres (metric mile) title and then retired to concentrate on his work as a doctor, having redeemed himself for his 'failure' in finishing fourth in the 1500 metres at the fifteenth Olympiad held at Helsinki. See his book *First Four Minutes*, 1955. See also *ATHLETICS*.

Bannock (Gaelic *bannmach*, a cake), round cake, common in Scotland, made of pease or barley meal, or a mixture of the two. A mashlum B. is one made of mixed meal. It is baked on an iron plate known as a girdle.

Bannockburn (Gaelic 'the stream of the white knoll'), tn. of Stirlingshire, Scotland, on the Bannock Burn, 3 m. SE. of Stirling, the scene of the great battle, fought on 24 June 1314, in which 30,000 Scots under Robert Bruce inflicted a crushing defeat on 100,000 English under Edward II. The victory was largely due to Bruce's device of undermining the front of his position with pits covered with turf and rushes, into which the Eng. cavalry were precipitated in helpless confusion. The English are said to have lost 30,000 men. The 'Pore Stone' is still shown on which Bruce is reputed to have set up his standard. (See J. E. Shearer, *Fact and Fiction in the Story of Bannockburn*, 1909.) B. has textile and woollen manufs., chiefly carpets. Pop. 4,000.

Banns, see MARRIAGE.

Bannu, tn. of W. Pakistan, at one time called Edwardesabad. It lies in the valley of the Kuram R., and was noted as the base for all punitive expeditions to the Tochi Valley and Waziri frontier.

Banshee, in Irish and W. Highland folklore a guardian female fairy who by shrieks and wallings foretells the death of a member of the family over whose fortunes she watches.

Báňská Bystrica: 1. Region (*kraj*) in SE. Czechoslovakia bordering on Hungary, part of the former prov. of Slovakia (q.v.). It is mountainous except in the S., and is watered by sev. tribs. of the Danube and the Tisza (qq.v.). Area 3560 sq. m.; pop. 487,000.

2. (Ger. *Neusohl*; Magyar *Besterce-banya*) Czechoslovak tn. cap. of the region of Báňská, on the Hron. It is the seat of a bishop, and has an important textile industry. Pop. 12,000.

Banstead, urban dist. of Surrey, England, 14 m. from London, comprising B., Chipstead, Kingswood, Tadworth, Walton-on-the-Hill with its famous championship golf-course (Walton Heath), and Woodmansterne; the dist. has extensive commons and other green belt land. Pop. 33,526.

Bantam, seaport of Java, 40 m. W. of Jakarta.

Bantam Fowl (*Gallus bankiva*), ornamental variety of domestic fowl noted for its small size, silky appearance, and pugnacious disposition. It came originally from the E. It weighs little over a pound and has fluffy legs; the hens are good layers, the flesh is good, and the eggs are of a delicate flavour.

Bantayan, is. of the Visayas group, Philippines, 10 m. from the is. of Cebu. Area about 40 sq. m. It grows corn and coco-nuts, and there is fishing. Pop. 28,602.

Banteng (*Bibos banteng*), species of wild ox, found in the Malay peninsula and archipelago. It resembles the gaur (*Bibos frontalis*) of India, but it is of a lighter build, has a longer, sharper head, and more rounded horns. The cow is bright dun in colour, with white legs and short hair. The back rises to a hump behind the neck. The B. inhabits jungles and forests, and is very ferocious. It has,

however, sometimes been tamed by the Malays and interbred with the zebu.

Banting, Sir Frederick Grant (1891-1941), Canadian physiologist, the discoverer of insulin. Prof. of medical research at the Univ. of Toronto, where a special institute was built for him. B. at Alliston, Ontario, and educ. in the schools of that tn and at Toronto Univ., where he graduated in medicine. In 1923, with J. J. R. Macleod—who had directed his and C. H. Best's investigations, at Toronto Univ., into the internal secretions of the pancreas, 1921-2—he was awarded the Nobel prize for medicine; these investigations having resulted in the isolation from the pancreas of the hormone insulin, making possible the treatment of *diabetes mellitus*. He was knighted in 1924. When the Second World War broke out, 1939, B. joined the Canadian Army and was appointed director of a military hospital in England; but he was recalled to Canada to take charge of medical research in connection with air warfare. He met his death in a plane accident when travelling between Newfoundland and Canada. The world owes him a great debt of gratitude for his discovery. The Canadian Gov. took the unusual step of voting him a life pension to enable him to continue his medical research.

Important progress in the study of *diabetes mellitus* was made in the 17th cent. by Thomas Willis, while late in the 19th cent. Claude Bernard, von Mering, and Minkowski made further progress in that their observations suggested that extracts made from pancreatic glands must contain some principle which prevented the accumulation of an excessive amount of sugar in the blood. B. thought that the reason why effective extracts could not be obtained was that the secretion produced by the pancreas contained a substance which could destroy the anti-diabetic principle. It was evident that the pancreatic extract must be secured in such a way that it was free from this destructive substance. B. conceived that this could be done by ligating, or tying up, the pancreatic duct and allowing time for certain cells in the pancreas to degenerate. Macleod arranged that C. H. Best should collaborate with B. on the chemical preparation and physiological testing of the extracts, and, on 23 Jan. 1922, insulin was injected into a human patient, a boy of 14 years of age, with brilliant results. Thus did a scientific achievement, centring on a single experiment, lead to important results for human welfare. See life by L. Stevenson, 1946, and N. S. Papaspyros, *History of Diabetes Mellitus*, 1952.

Banting System, diet treatment advocated for the reduction of fat. The cure was first proposed by Harvey, and was practised by Wm Banting (1797-1878), an undertaker, of St James's Street, London. At the age of 66, and scaling over 14 stone, he denied himself bread, butter, milk, sugar, beer, soup, potatoes, and beans, and took in their stead meat, fish, and dry toast. By this treatment he reduced his weight by over 3 stone and his girth round

the waist by 12½ in. B. wrote a pamphlet on the subject, entitled *A Letter on Corpulence, addressed to the Public*, 1863, which ran into many eds. See also **FOOD AND DIET**.

Bantock, Sir Granville (1868-1946), Eng. musical composer, b. London, son of George Granville B., M.D. He was trained at the Royal Academy of Music, and ed. *New Quarterly Musical Review*, 1893-6. He toured America and Australia, conducting for Gaiety Theatre touring company, 1894-5. He was director of the School of Music, Birmingham and Midland Institute, from 1900, and later prof. of music at Birmingham Univ. until 1934 when he was made chairman of the Corporation of Trinity College, London. He wrote a number of songs, orchestral music, and much choral music, including choral symphonies (without orchestra), such as *Atlanta in Calydun* and *Vanity of Vanities*, and large-scale works with orchestra, such as *Omar Khayyam*. His orchestral works include the *Hebridean Symphony*. He was knighted in 1930. Life by H. Osmond Anderton, 1915.

Bantry, seaport and tourist resort in co. Cork, Rep. of I., at the head of B. Bay, 50 m. from Cork. It has fisheries and textile manufs. The chief export is agric. produce. B. Bay, 25 m. long and 4-6 m. broad, affords fine anchorage. T. M. Healy (1855-1931) was b. in B. Pop. 2500.

Bantu, term applied to those African Negroes who speak B. languages. They are probably a mixture of True Sudanic Negroes and Hamites, and stretch from the 'B. line' in the N. of the Congo and in E. Africa to S. Africa, comprising many hundreds of tribes in E., Central, and S. Africa. Apart from their related languages they have little in common. Some of them are organised into kingdoms, others have simple organisations without chiefs. Some trace descent patrilineally, others matrilineally. Some are cultivators, others are mainly pastoral. Almost all of them practise ancestor worship, but in conjunction with other cults. They are usually subdivided into the S. B. (Zulu, Swazi, Xosa, Tswana, Basuto, Venda, Ndebele or Matabele, Pondo, Pedi, etc.); the Central B. (Shona, Bemba, Lozi, and other tribes of the Rhodesias); the W. B. of the Congo and Angola, and the N.E. B. of E. Africa (Kikuyu, Kamba, Chagga, Ganda, etc.). See **NEGRO** (and articles on tribes). See also C. G. Seligman, *The Races of Africa*, 1939, and I. Schopera, *The Bantu-speaking Tribes of South Africa*, 1950. For languages see C. M. Doke, *Bantu*, 1945, and *The Southern Bantu Languages*, 1954; M. Guthrie, *The Classification of the Bantu Languages*, 1948.

Banville, Théodore Faullain de (1823-1891), Fr. poet, b. Moulins. His first vol. of verse, *Les Cariatides*, 1842, stamped him as a romantic, and was followed by *Les Stalactites*, 1846, *Odelettes*, 1856, *Odes funambulesques*, 1857, *Nouvelles Odes funambulesques*, 1869, and *Idylles prusiennes*, 1871, this last inspired by the Franco-Ger. war. His *Petit traité de*

versification française, 1872, is a valuable work on Fr. versification, of which he proved such a dexterous master. His delightful handling of ballades, rondeaux, and other medieval forms of verse was the starting-point of a notable revival in that kind of poetry. See his *Mes Souvenirs*, 1882; also J. Charpentier, *Théodore de Banville*, Paris, 1925.

Banyan Tree (*Ficus benghalensis*), family Moraceae. The B. is a sacred tree in India. It grows on an erect plant, and its roots hang downwards like thick supporting pillars. It often covers much space and grows to a great height. Gum-lac and caoutchouc are produced from the B., and the bark is used in Hindu medicine.

Banyuls-sur-Mer, Fr. fishing-port in the dept of Pyrénées-Orientales, on the Mediterranean. It is a popular bathing resort, and has good wines. Pop. 3700.

Banyumas, or **Banjoemas**, tn of Java, on the Serajo, 170 m. SE. of Jakarta. It is an agric. trade centre, with a tobacco processing industry. Pop. 6700.

Banyuwangi, or **Banjoewangi**, seaport tn on the E. coast of Java. The prin. industries are saw-milling and rubber. Pop. 25,000.

Bao Dai, last emperor of Viet Nam (q.v.). A member of the Nguyen dynasty, B. D. succeeded the Emperor Khai Dinh in 1925 when he was only 12 years old. He remained on the throne throughout the Jap. occupation of Viet Nam, 1940-5, but abdicated after Japan's surrender in 1945 and went into exile. B. D. returned to Viet Nam in 1949 as Head of State, an office which he held until he was deposed in 1955 by a plebiscite held in S. Viet Nam. He now lives in Franco. See E. Hammer, *The Struggle for Indo-China*, 1954, and the supplement, *The Struggle for Indo-China Continues—Geneva to Bandung*, 1955.

BAOBAB MONKEY FRUIT

Baobab (*Adansonia digitata*), species of Bombacaceae found in Africa and Australia. It is one of the largest trees known, having an enormous trunk, sometimes 30 ft

thick. Various parts of the plant have different uses, the bark having a strong fibre and being the chief ingredient of a febrifuge, the fruit (called monkey-bread) consisting of a pleasant though acid pulp and a juice which makes a cooling beverage, the leaves being of use medicinally and for food.

Bapaume, Fr. tn in the dept of Pas-de-Calais. In 1871 it was the site of an indecisive battle in which the French claimed the advantage (see FRANCO-GERMAN WAR). During the First World War B. was an important position in the battles of the Somme (q.v.). It changed hands sev. times, and by the end of the war had been destroyed, but was afterwards rebuilt. Pop. 2600.

Baphomet (medieval form of Mahomet), idol with 2 heads, male and female, which the Templars were accused of worshipping in secret with licentious rites.

Baptis, genus of lepidopterous insects of the family Geometridae. The species are among the thin-bodied, day-flying, delicate moths with large wings. *B. bimaculata* and *B. punctata* are both found near London; the former is white with 2 brown spots on the front edge of the anterior wings, while the latter has the tips of its anterior wings clouded with brown.

Baptism (Gk *baptismos*, a dipping in water, a ceremonial ablution), the Christian initiatory sacrament. The use of water as a symbol of purification is so natural that it is not surprising that it is found in many religions before and after Christianity. The Jews practised a ceremonial B. of proselytes after circumcision, and John, the forerunner of Christ, baptised people (including Christ Himself) as a sign of the repentance required in preparation for the coming of the Messiah. John expressly distinguished his B. as a mere symbol of repentance, in itself ineffectual (a B. of water only), from the B. that the Messiah would bring, which would be full of power ('He shall baptise you with the Holy Ghost and with fire'). Christ applied these words to the coming of the Holy Ghost at Pentecost (Acts i. 5), upon which the effectiveness of the whole apostolic ministry depends; but He also trained His disciples to baptise (John iii. 22; iv. 2), and in His final charge after the Resurrection, recorded in Matt. xxviii. 19, told them to teach all nations, baptising them in the name of the Father and of the Son and of the Holy Ghost. The Apostles recognised a vital difference between the symbolic B. of John and Christian B. as administered at any rate after Pentecost, as is shown by the rebaptism of John's converts (Acts xix. 5). The N.T. is full of teaching as to the meaning, the nature, and the effect of Christian B. John iii. gives the direct teaching of Christ on the subject, in which He describes it as a rebirth by water and the Holy Ghost without which a man cannot enter the Kingdom of God. After His first sermon on the day of Pentecost St Peter, when asked by his hearers 'What shall we do?' replied: 'Repent and be baptised every one of you in the name

of Jesus Christ for the remission of sins, and ye shall receive the gift of the Holy Ghost.' St Paul (Rom. vi) makes use of the symbolism of B. (by total immersion) as denoting that the Christian thereby shares in the death and resurrection of Christ, dying to sin and rising to righteousness.

The Catholic teaching on B. (repeated by the Church of England in her Catechism) is that it washes away and forgives all sin (both original sin and actual sins committed before B.), that it unites the recipient to Christ and makes him a member of His Body, the Church, and that it bestows upon him, at any rate in germ, a new nature, the new manhood of Jesus Christ, which has to be nourished and developed until it replaces the old fallen manhood. Since B. confers a new nature permanently, it can never be repeated. This doctrine is one of the articles of the Nicene Creed: 'I acknowledge one baptism for the remission of sins.'

The outward sign of B. is the passing of water over the person's body, accompanied by the words 'I baptise thee in the name of the Father and of the Son and of the Holy Ghost.' No substitute for water is permitted. The person may be totally immersed in the water, or it may be poured over the body (normally over the head). The action should be performed 3 times, once at each of the 3 divine names (cf. Prummer, *Theol. Mor.* III, ii. 102). The water must wash the skin of the recipient, i.e. it must flow over it. For that reason affusion (pouring) is a proper method, while aspersion (sprinkling) is an uncertain and improper method. Affusion is now the normal method in the W. (and the Anglican) Church, though immersion is permitted and was general earlier, as the ancient baptistries in Italy (e.g. Naples) show.

The normal and regular minister of the Sacrament is a priest; but in an emergency anybody may administer B., even one who has not been baptised or who is not a Christian.

The proper subject of B. is any person of any age who has not yet been baptised. In the case of a person above the age of discretion (i.e. capable of discerning right from wrong and so of sin, and normally older than 5 to 7 years) the proper dispositions are necessary, i.e. faith and repentance. In the case of infants, however, these dispositions are adequately expressed by adult sponsors (q.v.) who promise to bring them up to have the right dispositions when they are capable of them.

At the Reformation Calvinists and Zwinglians repudiated most of the sacramental teaching of the Church, including that concerning B., though they retained the rite (as required in scripture) as a symbol of repentance and of incorporation into Christ. The Baptists and Anabaptists rejected infant B., arguing that there was no evidence for it from scripture, and that it was a meaningless rite apart from conscious faith and repentance, expressed by the individual recipient. With the abandonment of the doctrine that B.

imparts a new nature or regenerates *ex opere operato* (see SACRAMENTS), the belief that B. cannot be repeated is logically abandoned too; and baptising of adults in large numbers on repeated occasions has been a feature of many Protestant Revival meetings.

It is true that B. in the Apostolic Church was mainly of adults, since the greater number of converts at first were adult Jews, proselytes, or pagans. It seems certain, however, that infants were included in some of the B.s of whole households mentioned in Acts (e.g. xvi. 32-3). Children had always a recognised place in the Jewish Church, and it is clear that the New Dispensation did not abolish that position (cf. Mark x. 13-14). The B. of infants was a natural corollary from the circumcision of infants which it replaced. Nevertheless the severe discipline imposed by the early Church on its members who committed grave sin after B. led many (especially after the conversion of the empire under Constantine had diluted the faithful with many formal Christians) to postpone B. until late in life so as to leave as little scope as possible for such sin and to escape responsibility. This abuse was remedied by the development of a more lenient penitential discipline, and of confession (q.v.). The rite of B. was accompanied in the early Church (and still is in the Lat. and oriental rites) by a number of striking and instructive ceremonies that draw out the meaning of the simple sacramental act. The Protestant reformers abandoned all of these, but the Church of England retained the signing of the head of the infant with a sign of the cross (though consecrated oil was no longer used for the purpose). The custom of bestowing a Christian name at B. naturally derived from the similar Jewish practice at circumcision (cf. Luke i. 59-63; H. 21). Another name for B. in England is christening, the meaning of which is obvious.

Baptist World Alliance, formed in 1905 on the occasion of the first Baptist World Congress in London. Its object is to 'manifest the essential oneness in the Lord Jesus Christ and to promote the spirit of fellowship among the Baptist order and faith throughout the world.' The alliance has since organised several international congresses in the Old and New Worlds, the latest being that held in London in 1955. In its *Directory* the alliance claims churches in 90 countries, with a total communicant membership of nearly 21,000,000 (1955).

Baptist Youth Fellowship, national organisation of all the young people between the ages of 12 and 24 in churches of the Amer. Baptist Convention, totalling 400,000 in 1956. It was founded in 1941 as the successor to the Baptist Young People's Union of America, with H.Q. at 1703 Chestnut Street, Philadelphia, Pennsylvania.

Baptiste, Jean Baptiste Monnoyer (or Monoyer), see MONNOYER.

Baptiste, John Gaspar (1-1691), Flem. painter, b. Antwerp; a pupil of Bosschaert. He came to England during the Civil war, and served in Lambert's army;

but, after the Restoration, returned to his original profession, and was much employed by Sir Peter Lely in painting his draperies and backgrounds. He worked occasionally also for Kneller and Riley. He made designs for tapestries which reveal skill in drawing. There is a portrait of Charles II in St Bartholomew's Hospital by this artist.

W. F. Mansell

THE BAPTISTERY OF PISA

Baptistry, building in which Christians performed the ceremony of baptism. The most celebrated existing B.s are those of Rome, Florence, and Pisa; the most ancient is the B. of S. Giovanni in Fonte, near the church of St John Lateran at Rome, commonly said to have been erected by Constantine the Great. The plan of this building is an octagon, with a small portico at the entrance; the interior is decorated with 8 porphyry columns, the finest of the kind in Rome. The diameter of this structure is about 75 ft. The B. of Florence, which is octangular, with a diameter of about 100 ft, stands opposite the prin. entrance of the cathedral. The 3 bronze doors are celebrated for their bas-reliefs, and for the marble and bronze figures above them. The B. of Pisa, erected between the years 1152 and 1160 by Diotisalvi, is a singular design. The plan is circular, with a diameter of 116 ft; the building is raised on 3 steps, and surmounted with a dome in the shape of a pear.

In modern Anglican churches, a bay or corner near the W. end is often reserved for purposes of infant baptism. In modern Baptist churches, a sunk tank is

provided for total immersion, with steps descending to it.

Baptists, Christian denomination who differ from others in regard to the views which they hold concerning baptism. The distinctive view of the B. is that only believers should be baptised, and their method of baptism is by immersion. The modern B. generally reject any connection with the Anabaptists. They base their doctrines upon the teachings of the Apostles, and some maintain that throughout the corruption of the Christian Church during the medieval period their doctrines were maintained by the Cathari and the Albigenses. The beginning of the modern Baptist Church, however, is traced to the work of John Smyth in the reign of James I. John Smyth was originally an ordained minister of the Eng. Church who broke away from that Church and fled to Holland. Here he fell under Mennonite teaching, and after severing his connection with the independents, whom he had joined, he issued a confession of faith for the first Eng. Baptist Church 'of Eng. people remaining in Amsterdam in Holland.' This declaration of faith laid down the 2 main doctrines of the Baptist Church, 'to receive all their members by baptism upon the confession of their faith and sins,' and that 'baptism in no wise appertaineth to infants.' Smyth d. in Holland, but his chief follower came to England in 1612, the year of Smyth's death, and estab. his church in Newgate. This was the origin of the 'General' Baptist denomination in Great Britain. The General Baptist denomination repudiated Calvinistic doctrines, holding to the views of the Arminians, and maintaining the doctrine of universal redemption. The beginning of the Particular Baptist Church in England may be traced to the Jacob church in Southwark, and its foundation may be approximately dated as taking place in the year 1633. Of this Jacob church the famous Praise-God Barbon was a member. The Particular Baptist Church was the direct offshoot of the Independents, and was therefore Calvinistic in doctrine. Both sections of the Baptist Church suffered persecution during the reign of Charles II, but the passing of the Toleration Act of 1689 gave liberty of worship and freedom from persecution to the B., together with other dissenters. The B. continued in this divided state for some very considerable time—the Arminian section, who held the doctrine of a general redemption, being known as the General B., and the Calvinistic section, who held the doctrine of a particular redemption, being known as the Particular B. A schism took place towards the end of the 18th cent. in the ranks of the General B., and a General B. New Connection was formed, the old connection becoming Unitarian. The names General and Particular B. gave rise to the impression that the General B. were those who admitted to their communion members who professed faith in Christ but did not agree with their views on baptism, and Particular B. those who clung jealously to their own doctrines and refused admission.

This idea, however, is entirely wrong, the names applied respectively to convey that idea being 'open B.' and 'strict B.' In 1891 the 2 sections of the B. were united into one body, known as the Baptist Union of Great Britain and Ireland. This union was due principally to the efforts of the Rev. John Clifford (q.v.). The method of Church gov. is congregational, the officers of the Church being the pastor, the deacons, and evangelists. Each church is self-governing, and is subject to no external pressure. The B. have a fine missionary tradition, going back to Wm Carey, and a number of colleges for the training of young men for the ministry. At the present day the B. have members in every part of the world. In the U.S.A. the first Baptist church was estab. at Providence, Narragansett Bay, by Roger Williams, in 1639. Another church was founded at Aquidnek, Rhode Is., 1641, and one at Newport, 1644. The Providence church did not flourish, but the Newport church increased its influence, and a branch was formed at Rehoboth, Massachusetts, 1649. The B. suffered persecution, but this only resulted in spreading the churches, and further branches were formed. The need of organisation was felt, and in 1707 the Philadelphia Association was formed 'to consult about such things as are wanting in the churches, and to set them in order.' At Charleston the Charleston Association was formed in 1751. A Baptist college was founded in 1764 (known since 1804 as

Brown Univ.). By 1812 there were 173,972 members of Baptist churches in the U.S.A. B. are numerically strongest in the U.S.A. In the Brit. Isles there were (1954) 3800 chapels, and their members numbered 326,000. In U.S.A. the number of adherents is 18,000,000. Baptist churches were formed in the old Russian Empire about the middle of the last cent., but suffered repression under the tsardom in the interests of the Orthodox Church. In the U.S.S.R. there are 512,000 Baptist Church members. A Baptist World Alliance was formed in London in 1905. Its H.Q. are now in Washington, D.C. The total communicant membership was stated in 1955 to be: Europe, 1,106,000; Asia, 642,000; Australasia, 45,000; Africa, 222,000; Central America and W. Indies, 98,000; S. America, 132,000; N. America, 18,500,000; making a total world figure of nearly 21,000,000. Sev. Baptist Unions and Conventions are in membership with the World Council of Churches. See H. C. Vedder, *A Short History of the Baptists*, London and Philadelphia (revised ed.), 1897; W. T. Whitley, *Baptist Bibliography*, 1916, and *A History of British Baptists*, 1923; J. H. Rushbrooke, *The Baptist Movement in the Continent of Europe* (revised ed.), 1923; A. C. Underwood, *A History of the English Baptists*, 1948; E. A. Payne, *The Fellowship of Believers* (revised ed.), 1952; F. T. Lord, *Baptist World Fellowship*, 1955; also *The Baptist Handbook*, annually.
